Dr. SUMPNER, in introducing the Paper by Mr. Record and himself to the meeting in Birmingham, said that the type of instrument to which their Paper referred was one in which the magnetic field was strong and quite independent of the varying properties of iron, so that it was possible to get at the same time both accuracy and sensitiveness. The magnetism was controlled by the voltage, and the complicated relation between magnetism and magnetising current did not at all affect the accuracy of the instrument. To secure this result it was necessary simply to make the resistance of the magnetising or volt coil small compared with its impedance. The winding was of stout copper, and the reluctance of the gap was reduced in every way possible. Only one air gap was used, and the area of the opposed pole-faces was exceptionally large. In this way it was possible in their instruments to secure a magnetic field which was exactly proportional to the voltage. Although this field was in quadrature with the voltage, it was possible to get over quite readily any difficulties which arose through this circumstance and to utilise the instrument as wattmeter, voltmeter, capacity meter, &c., &c. The current for the moving coil of these instruments required to be supplied from some type of quadrature transformer. This apparatus was analogous to a shunt in an ordinary moving coil ammeter, and its purpose was to provide from the main current a small voltage suitable for the moving coil circuit and in quadrature with the main current. A small ring-form transformer was also shown, suitable for threading on to the main conductor or 'bus-bar. The phase meter was an instrument having a polyphase winding, producing a strong rotating magnetic field in an air gap in which a moving coil having inappreciable control was allowed to swing. The theory of such phase meters could be given simply in terms of the double wattmeter method of measuring three-phase power. If the two wattmeters in such a measurement were imagined to be mounted on a common spindle, then the needle attached to this spindle would take up a position in which the forces on the two moving coils were equal and opposite, and it was easy to see that this position of balance could only depend on the phase difference to be measured.

Mr. A. M. TAYLOR (Birmingham Corporation Electricity Works) referred to the fact that at the previous meeting, when these instruments were first shown by Dr. Sumpner, various forms of electro-magnet had been used, including some placed in series with the main circuit. He would like to know whether the authors still recommended this type, or whether possibly they wished to forget having spoken of it on a former occasion.

Mr. J. P. KEMP (Birmingham Corporation Electricity Works), speaking as a Central Station Engineer, said that they owed a great deal to the authors for the science and ingenuity which they had displayed in the construction of these instruments. He was especially interested in the wattmeter, and particularly wished to know whether they had given any attention to watt-meters of the integrating type. Also, could they use existing current transformers when applying these instruments, or was it essential that they should use the particular type which Dr. Sumpner had shown them. In view of the very small amount of room available for instruments on modern switchboards, he would also like to know whether these instruments could be made up in the edge-wise pattern, as this was practically the only possible type of instrument where space was a matter of consideration.

Mr. J. D. COALES (Birmingham University) asked Dr. Sumpner if he would give some idea as to how much current could be taken from the secondary of a quadrature transformer without appreciably reducing the phase difference between the primary and secondary currents below 90°. He said that he had tried the experiment of connecting the main coil of an ammeter transformer in series with the current coil of a wattmeter, and the secondary winding to the pressure coil of the wattmeter. On sending current through the transformer the wattmeter gave a considerable reading, thus showing that the primary and secondary currents were in this case not in quadrature. The secondary winding of the transformer had several hundred turns; and the wattmeter pressure coil a resistance of several thousand ohms.

Dr. D. K. MORRIS (Messrs. Morris & Lister, Coventry) referred to an explanation given previously by Dr. Sumpner of the action of his phase meter, which appeared to be more simple than the theory now given. It was clear that a coil carrying alternating current and placed in a revolving field, but otherwise not subject to control, could only take up a position such that at the moment of maximum current flowing in the coil the field where the coil found itself was zero. If the coil were in any other position, then it would naturally tend to be deflected into that position. This theory seemed quite simple, but as Dr. Sumpner did not give it he would like to know if he regarded it as unsound. He would like further to know if the indications of these phase indicators or power-factor meters depended upon the wave form, so that their calibration would be erratic at certain particular phase indications.

Mr. J. W. RECORD spoke of the instrument when used as a capacity meter, and said that it had this great advantage over other methods of measuring capacity, that the leakage current, if any, through the condenser had no effect whatever on the indication of the instrument. In cases where the capacity was small, it was desirable to use a dividing method by which high tension was used on the capacity to secure sufficient capacity current and low tension on the instrument.

Mr. WILLIAM BREW (Dublin Corporation Electricity Department), in a written communication, dealt generally with the requirements of instruments in generating stations, emphasising the importance of accuracy in voltmeters and wattmeters, upon which depended the regulation of pressure and the determination of units generated. He also made some remarks on the complications that sometimes are necessitated by the non-interchangeability of instrument transformers of different makers. The instruments described by the authors of the present Paper, by eliminating errors due to hysteresis, wave form, periodicity, &c., undoubtedly marked considerable progress towards the simplification of alternate-current working, which had been in the past not altogether free from uncertainties.

Dr. SUMPNER, in reply to the discussion, said that with reference to Dr. Morris's remarks, he had ultimately given up the simple theory of the phase meter dependent on the assumption of a true rotating field, because it was not found accurate enough. With regard to the behaviour with irregular wave form, all phase meters for three-phase circuits were quite correct on all wave forms if they were properly calibrated and if the three-line currents are equal. They were also right on all frequencies. With regard to Mr. Coales's remarks, it was unfortunate that wattmeters generally got the blame for the considerable errors which really arose through the current transformers. In practice it was often the case that it did not much matter whether a good or bad wattmeter was used, since the current transformer would introduce errors entirely throwing into the shade any trifling error which might be due to the wattmeter itself. Replying to Mr. Kemp, they had not yet got edge-wise instruments or an integrating wattmeter on the market. Ordinary current transformers could be used with the new instruments to supply current to the quadrature transformer, which latter must be regarded as the current coil of the wattmeter. Referring to Mr. Taylor, the result of four years' experience was such that they could not recommend the use of series electromagnets for wattmeters. He claimed for their instruments that they were more robust than any alternating instruments having the same accuracy. He thoroughly agreed with, and appreciated, Mr. Brew's communication. The remarks about the commercial importance of accurate measurements on alternate-current circuits were very much to the point, and particularly those in reference to the numerous installations in which the current transformers and wattmeters are supplied by different contractors.

OSRAM LAMPS FOR STREET LIGHTING

Life Tests and Cost compared with Gas

THE following observations of the life of a number of 100-volt Osram lamps used in pairs for street lighting on a 200-volt 40-period circuit have been sent us by Mr. T. P. Wilmshurst, Borough Electrical Engineer, Derby. In addition to the long average life (1,570 hours) which exceeds the figure usually quoted, a feature noticed was the small diminution of light up to the end of the life in each case. In calculating the above average, no account has been taken of the lamps still burning, so that it is not improbable that a longer test will make the average even higher.

OSRAM LAMPS IN BURTON ROAD, DERBY.

With regard to the comparative costs of gas and Osram lamps for street lighting, we have received some very interesting figures from Mr. George Wilkinson, Chief Electrical Engineer to the Corporation of Harrogate, who has proved conclusively that street lighting by Osram lamps is much cheaper than by incandescent gas mantles.

The comparative figures are given below.

	s.	d.
One 3 ft. gas mantle costs per annum for gas ...	15	0
Mantles, say	1	6
Total for 2,100 hours' burning	16	6

	s.	d.
Electricity at 1½d. per unit, for 35-watt Osram lamp, which gives equally as good light, and often better than a gas mantle	9	3
Renewals	3	0
Total for 2,100 hours' burning	12	3

With regard to the life of the lamp, which appears to have been very satisfactory, Mr. Wilkinson writes:—

"With regard to the life of Osram lamps, this appears to be very satisfactory. They appear to last much longer when used without globes or lanterns, probably due to the cool atmosphere around them; we have numbers of them in the town burning well on to 3,000 hours, and the average is probably over 2,000 hours, excepting in cases of accidental breakage."

ELECTROCHEMISTRY AND ELECTROMETALLURGY

IN the *Papier Zeitung*, **33**, 834, A. Ahlin contributes a Paper upon "Electrolytic Bleach Liquor." As a rule, rock salt is employed to prepare the liquors which upon electrolysis produce the bleaching solution. But as the sodium chloride contains considerable impurities, the results obtained with different samples of rock salt are often very various. The secondary reactions may cause oxidation, that is, chlorate formation, or, on the other hand, reduction of the hypochlorate to chloride. The chlorate formation may be direct according to the following equation:—

$$5OH + Cl = ClO_3 + 2H_2O.$$

Or it may be indirect owing to inefficient circulation of the electrolyte. The author has thoroughly studied the formation of the direct oxidation in Schuckert's apparatus. Reduction is caused by re-conversion of the hypochlorite into chloride, and takes place when the previously produced hypochlorite comes into contact with the hydrogen at the cathode, which at the moment of losing its electrical charge is in a very active condition. One method of preventing the reduction is the addition to the electrolyte of salts which, when their cations are yielded up at the cathode, form insoluble hydroxides, which act as protective diaphragms. As a matter of fact, it is not always necessary to add these salts, as they frequently occur as impurities in the salt employed to make up the electrolyte. The author recommends that the efficiency of each electrolyser should be checked by drawing a curve with chlorine strengths plotted as ordinates and times of electrolysis as abscissæ. By means of such curves it can be shown when any of the electrolysers are not giving normal results. It is also important to give constant attention to the temperature and the alkalinity of the liquor. It is necessary to keep the temperature low, and the alkalinity should also be very slight, such that 1 litre of the solution when coloured with phenolphthalein shall have its colour discharged when two drops of normal acid are added. In any case, before employing the liquors for bleaching, the alkalinity should be neutralised.

Some authorities prefer to have magnesium chloride present, but the author considers its presence objectionable, as it produces heavy deposits upon the cathode, which set up a resistance and impede circulation of the solution. He considers that the anodes, at any rate, should be of platinum, which, if the metal is polished, is very little acted upon even when employed for a long time.

According to F. Mattonet, *Metallurgie*, **1908**, 186, tin can be satisfactorily obtained from its ores by smelting in the electric furnace. Experiments were carried out with various ores in a furnace which was heated electrically. Ores which contain sulphur must first be roasted, and then the ore is mixed with a mixture of three parts of sodium carbonate and four parts of lime, the quantity of this mixture used being sufficient to produce a slightly basic slag. By proceeding in this manner from an ore containing 50·3 per cent. of tin, 7·6 per cent. of iron, 1·9 per cent. of lead, 0·5 per cent. of copper, 3·3 per cent. of zinc, 6·7 per cent. of sulphur, and 11·4 per cent. of silica, a product was obtained which consisted of 97·0 per cent. of tin, 1·8 of lead, 0·2 per cent. of copper, 1·2 per cent. of iron, and was 86 per cent. of the total tin. About 13 per cent. of the tin was lost as dust and by volatilisation; the author considers that this loss could be considerably reduced on a large scale. It was not found possible to obtain a metal free from lead, but by again melting and cautiously cooling, and treating in a manner similar to that employed in the Pattinson desilverising of lead process, pure tin can be obtained in crystals.

In Spain there are not very many electrochemical works, although, as there is a considerable amount of cheap water-power, doubtless in the near future this branch of industry will be increased. We notice that the Compania Electroquimicale of Fix, near Caspe, produced last year 3,000 tons of caustic soda. Solvay & Cie. possess a large salt-producing property at Cabezon del Sat, in the neighbourhood of Torrelavega, where they are putting up a new factory. The firm are stated to be spending £1,000,000 in building and equipping the works. It is hoped that they will shortly commence the manufacture of caustic soda.

ELECTRICAL SCIENCE

British and American

Inauguration of Lord Rayleigh as Chancellor of the University of Cambridge.—The formal ceremony of the inauguration of Lord Rayleigh as Chancellor of the University of Cambridge took place on Friday last, when, in accordance with custom, the University waited on him. The place chosen for the ceremony was the residence of his brother-in-law, Mr. Balfour, at 4 Carlton-gardens, Pall Mall. Some of the principal heads of colleges and University Professors were present. The vice-Chancellor (Mr. E. S. Roberts) presided, and the Proctors, the Public Orator, the Registrary, and the Esquire Bedells attended in their official capacities. The vice-Chancellor, in his opening speech, referred to the University career of Lord Rayleigh, and spoke of the desirability of the combination of scientific and literary culture. He looked to the new Chancellor to guide their efforts for compassing the re-endowment of the University. The actual ceremony of admission was then performed, and the customary laudatory address in Latin was delivered by Dr. Sandys, the Public Orator. Lord Rayleigh, in his reply, alluded modestly to the part he had played in the past in the affairs of his *alma mater*.

Royal Institution.—On Friday evening last the weekly discourse was delivered by Prof. Larmor; the subject was the life and work of Lord Kelvin. At the outset, Prof. Larmor pointed out how hopeless it was to attempt in one hour to give even an outline account of the numerous discoveries that Lord Kelvin had made in almost every branch of natural philosophy, and most of the hour was devoted to the work done on thermodynamics between 1846—when, at the age of 22, Kelvin was appointed professor of natural philosophy at Glasgow University—and the year 1855. To students of thermodynamics it is rather interesting to note that at first Kelvin denied Joule's contention that heat disappears when work is done by an engine, and adhered for three years to Carnot's conception as given by that writer in the now well-known essay, "Reflexions sur la puissance motrice de feu," in 1824. Kelvin communicated an account of this work of Carnot's to the Royal Society of Edinburgh in 1849, and it was in consequence of his belief in Carnot's theory that he was anticipated by Clausius in the publication of the second law of thermodynamics. His early study of Carnot's essay led him to the conclusion that temperature was dynamical, and thus to the conception of an absolute thermometric scale, independent of the properties of any particular substance. The important principle concerning the availability of energy and the fundamental equation of what is now known as Gibb's theory, which has been applied so largely in recent years to problems in physical chemistry, were given by Kelvin in a Paper in 1855.

In electricity he formed a connecting link between Faraday and Maxwell. His earliest work arose in connection with the laying of the Atlantic cable, and led to his theory of the electric telegraph, to the development of the mirror galvanometer, and to the invention of the siphon recorder. In the siphon recorder we have the principle of the d'Arsonval moving-coil galvanometer, the effect of a weak current being emphasised by using a strong magnetic field. The lecturer expressed some regret that Kelvin devoted so much time as he did to the development of practical matters such as these; the same labour and genius would have proved ultimately more profitable to the world if it had been expended on the advancement of abstract theory.

In these early years of Kelvin's scientific activity he devoted much thought to the constitution of the ether, led chiefly by his belief that all energy was mechanical in character. These efforts to construct models of the ether led him in turn to the discovery and explanation of many curious properties of rotating bodies. Applications of these discoveries are being made at the present time, for example, in the steadying of ships by the use of gyroscopes.

The lecture was illustrated by a number of experiments on the lowering of the freezing-point by pressure, on the porous plug phenomenon with hydrogen, air, and carbon dioxide, and on the stability of rotating bodies.

A New High Resistance.—One of the most satisfactory forms of high resistance is that made by depositing various forms of carbon on glass. One of the best forms hitherto described is made by depositing a smoke-film on glass, hardening it by exposure to alcohol vapour, and then covering it with shellac varnish, rubber varnish, or paraffin wax. But even these resistances increase with the lapse of time. In the April *Physical Review*, G. W. Stewart proposes a new form of carbon resistance, which is, the author declares, very satisfactory. He mixes ordinary lampblack with a commercial transparent lacquer called "Zapon L." The lacquer consists of soluble cotton dissolved in certain mixed solvents, the chief of which is amyl acetate. When the lacquer dries it leaves a film of pyroxyline, which is elastic, does not evaporate, does not crack, is a good insulator, and is unaffected by ordinary changes of temperature. In making high resistances, the mixture of lampblack and lacquer is spread upon an insulating surface by means of a brush. By trial the resistance may be regulated from 3,000 ohm to 3,000,000 ohms for a film 3 mm. long and 2 mm. wide, merely by altering the proportion of lampblack. The author uses hard rubber as the insulating base, and makes the terminals of the resistance of copper plugs screwed into the base. The resistance of the films diminishes at first with time, but later becomes very steady. The variation of resistance with voltage was found by the author to be less than one-half per cent. with 1,000 per cent. variation of voltage. Temperature variations have a negative coefficient of from 0·1 to 0·15 per cent. per degree Centigrade.

Continental

Slightly Damped Oscillations.—In No. 3 of the *Verhandlungen* of the German Physical Society, B. Glatzel describes a new method of obtaining slightly damped electric oscillations. The idea is to excite an oscillation in the primary circuit which does not run off into a damped oscillation, but stops after the first quarter period. The secondary circuit, closely coupled with the primary, then receives a single strong impulse, which produces oscillations of the proper period of the secondary circuit. If the secondary contains no spark-gap, the damping may be very slight, so that here we have a way of producing very feebly damped oscillations. The coupling may be close enough to utilise the whole force of the impulse. There will be no recoil into the primary, since the latter is open. Now, as regards the primary impulse, that may be obtained by an adaptation of the Cooper-Hewitt mercury arc. This has the peculiarity that as soon as the current falls below a certain value, there is not sufficient heat to evaporate the mercury, and the current is broken. This is secured by designing the apparatus in such a manner that the greatest possible amount of energy is absorbed during the first impulse. The oscillations cannot be more rapid than about 50 per second, as otherwise the current remains uninterrupted.

Resistance of Insulators.—The results of some tests of insulators are communicated to the *Comptes Rendus* of April 21st, by F. Nègre. One of the poles of a Wimshurst machine was connected with the neck of a bell insulator, and the other through a galvanometer with the attachment. The tension was measured with an electrometer. A simple bell insulator, 8 cm. in diameter, and a triple bell 11 cm. in diameter, were tested at 5,500 volts. In another series the voltage was carried up to 50,000. In some cases the bells were moistened with vapour or blackened with lamp black. Each insulator has a "critical tension" up to which the insulating resistance is constant. This critical tension varies with the diameter and other dimensions, and with the state of moisture and cleanliness. It was found to be 11,000 volts for a simple bell, 16,000 for a triple bell, and 32,000 for an American type designed for 50,000 volts. After the critical tension is surpassed, the resistance rapidly declines, especially if the insulator is damp or dirty, or has a small diameter. Fine drops distributed over the surface coalesce into larger drops; these congregate on the rim and become pointed. In the dark, brush discharges are seen to start from the points of the drops. These are specially marked when the potential is positive. When it is negative a faint glow takes the place of the brush discharge.

Magnetic Alloys.—The influence of thermal and mechanical history on the hysteresis and other magnetic properties of Heusler's alloys is discussed by Paul Asteroth in No. 2 of the *Verhandlungen* of the German Physical Society. It appears that quenching of the alloys eliminates the hysteresis entirely, the loop being converted into a single straight line. On heating the alloys above the temperature of transformation, cooling them for three hours, and ageing them at a temperature of 140°, the hysteresis loop reappears. The coercive force becomes 18 in a casting, and the remanent magnetism 820. For a wrought piece the figures are 3·5 and 600 c.g.s. respectively. The author points out that the magnetic properties are thus largely within our control. The hysteresis has many analogies with elasticity and crystallisation. It appears that quenching prevents the magnetic molecules from settling into positions in which they can obey magnetising forces. The formation of larger aggregates encourages such mobility, but also increases the viscosity which resists the orientation. The magnetic orientation may also depend upon the rotation of electrons attached to the atoms. If this is facilitated by larger crystalline aggregations, the influence of quenching is quite clear. The elimination of hysteresis is of great theoretical interest.

Street Lighting in the City of London.—At the last meeting of the Court of Common Council, it was decided that the experimental street lighting in Cannon Street, Farringdon Street, and Holborn should be extended for a period of three months. It will be remembered that the original period was from October, 1907, to April, 1908, and we gave full particulars of the lighting in Cannon Street, which is by means of arc lamps on wires attached to the buildings on either side of the roadway, in ELECTRICAL ENGINEERING, Vol. II., p. 693. Some photometric tests of the other experimental lamps were given on page 919 of the same volume.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 30th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.
Names in brackets indicate communicators of inventions from abroad.

1907 Patents

3,215, E. RUHMER. The nature of the arc discharge between electrodes in an atmosphere of hydrogen, as used by Poulsen and others, can be varied by altering the electrical conditions of the circuit. The arc may be stable and steady, or oscillatory. Under given conditions there is a critical value of the current, and if the current be increased above this value the hitherto active arc becomes inactive, and oscillations no longer take place. The present invention relates to a method of wireless telephony in which the arc discharge is kept at this critical value, and, by the action of a superimposed microphone current, is caused to become alternately active and inactive. Trains of undamped electric waves are thus sent out corresponding with the undulations of the microphone current. The frequency of the electrical oscillations must be higher than the highest sound tone or harmonic to be transmitted. The microphone current can act either directly or inductively on the arc current, or may be utilised to vary a magnetic field acting on the arc. Four claims, five figures.

8,641, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). An improved method of welding the ends of the leading-in wires to lamp filaments of tungsten or other refractory metals. The leading-in wire of copper or other suitable metal is flattened at its end, and the flat portion is formed into a tube. This tube is bent downwards at right angles to the wire, and forms a socket for the end of the filament. The welding arc is produced between the lower end of the socket and a carbon electrode. The lower end of the tube is fused up into a globule, making good contact with the filament, and, owing to the distance between the arc and the filament, the deteriorating effect of the arc on the latter is avoided. The welding is performed in an atmosphere of hydrogen or other non-oxidising gas. Three claims, three figures.

16,489, SIEMENS & HALSKE AKT.-GES. A process of manufacturing from tungsten compounds a plastic mass, which can be drawn into threads for manufacturing filaments, or which may be used as a binding agent for a paste made of tungsten oxides. Dry acid ammonium tungstate is heated in a flask at a temperature of about 270° C. until no ammonia is evolved. The heating is preferably done in a vacuum. The product, mixed with a little hot water, gives a soft, sticky paste. One claim, no figures.

16,513, W. L. WISE (*C. O. Mailloux*). In order to increase the output of electric railway motors without increasing the dimensions, artificial cooling by means of a draught of air blown through the motors by a fan is sometimes provided. The low pressure and the large volume of air employed makes it necessary to use large pipes. In cases where the space available for these pipes is limited, it has been proposed to use air at a high pressure. The expansion of the air, however, when it reaches the motor, causes it to cool and to produce condensation of moisture which is harmful to the motor. To avoid this, and also the large pipes, the present invention provides for the injection into the motor casing of a small quantity of air under high pressure, which air draws in with it a large quantity of air from the surrounding atmosphere. The injection may be intermittent or continuous, according to the load on the motors. Condensation is avoided, and the amount of air pumped is very small. The intermittent injection may be automatic, the valve opening when the pressure in a reservoir reaches a certain value, and closing again for the pressure to accumulate after each injection. Ten claims, seven figures.

17,655, W. G. HEYS (*Scott Electrical Co.*). An alternating-current flame arc lamp, in which regulation is obtained without any mechanical device. Two or more pairs of downwardly convergent impregnated carbon electrodes are so arranged that the magnetic effects of the separate arcs are added, and become sufficiently intense to lengthen the arcs upon an increase of current. All the carbons are suspended from a carrier free to move downwards by gravity, but held up by a stop on which rests one of the electrodes. A simple striking mechanism, which operates all the carbons simultaneously, is provided. The pairs can be arranged in series or parallel. The magnetic field is further strengthened by the presence of iron links, which are between the carbons just above the arcs, and which are part of the striking gear. Three claims, ten figures.

18,045, FELTEN & GUILLEAUME-LAHMEYERWERKE AKT.-GES. Improvements in alternating-current commutator motors of the inverted repulsion type, in which the current is supplied to the rotor. The main and auxiliary stator windings are usually in series and short-circuited. According to the present invention the stator windings are supplied with an E.M.F. in phase with the main E.M.F., from a transformer in parallel with the mains. On account of the leading E.M.F. induced by the rotation of the armature in the field produced by the auxiliary winding, the power-factor is improved. A third stator winding arranged in the commutation zone is also supplied from a transformer in parallel with the mains. At starting the main and auxiliary windings are short-circuited, and then, as the motor speeds up, the applied voltage from the transformer is gradually increased. One claim, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.
Summaries of the more important of these patents will appear in our next issue.

1907 Patents

16,530, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Refractory metallic conductors for use in incandescent electric lamps.
16,736, BASTIAN, CALVERT & SANDERS. Fusing glass around conductors.
16,956, ANGOLD & MAXIM ELECTRICAL CO. Arc lamps.
17,012, BEVIS & KRAUSE. Wall plugs and sockets.
18,515, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Protective devices for electric transmission systems.
21,476, BLOXAM (*Siemens & Halske Akt.-Ges.*). Manufacture of electric lamps having metal filaments.
21,811, BENRATHER MASCHINENFABRIK AKT.-GES. Control of electric motors.
22,467, PINOT. Rotary transformers.
22,609, CRAIG. Trolley mechanism for electric cars.
24,670, ELEKTRICITÄTS AKT.-GES. VORM. SCHUCKERT & CO. Arrangements on meters for determining the maximum consumption.
24,807, VIEL. Electric furnace.
25,391, KARNS. Rail bond for rail joint circuits.
25,919, FERGUSON. Electric generators.
26,834, HADDAN (*Synchronous Static Co.*). Production of high-frequency discharges.
27,401, RAWLINGS & SMITH. Electric fuses.
27,447, SIEMENS BROS. DYNAMO WORKS, LTD., & CLIFT. Safety devices for electric winding plants.
28,690, KITSEE. Cable telegraphy.

1908 Patents

401, EDISON. Electrolytes for alkaline storage batteries.
3,465, ANDERSSON. Clutch for electric arc lamps.

Complete Specifications open to Public Inspection before Acceptance.

1907 Patents

19,562, DEUTSCHE GASGLÜHLICHT AKT.-GES. (AUER GES.). Electric incandescent lamps having suspended filaments.

1908 Patents

4,847, WAELDE. Composition suitable for insulating flooring.
6,955, LJUNGSTRÖM. Electrical machines.
8,097, ARTOM. Wireless telegraphy.

Expiring Patent

The following patent expires during the current week after a life of fourteen years :—

9,285 of May 10th, 1894. CARL KELLNER. Compound electrodes of platinum or carbon for electro-chemical or metallurgical apparatus.

LOCAL NOTES

ABERDEEN: *Supply to Tramway Company.*—After considering the question of the renewal of the agreement of the Aberdeen & Suburban Tramway Co. for a supply of electrical energy, the Electricity Committee has decided to recommend that the question be referred to an arbitrator appointed by the Board of Trade. It will be remembered that at the company's annual meeting a complaint was made that it was largely due to the high price of current that the company was not in a better financial position. The intention was then announced that if the price were not reduced, the company would seriously consider the question of erecting its own generating station.

ACCRINGTON: *Tramcar Current Consumption.*—An experiment is being tried by the Accrington Electricity Committee in connection with the current used on the tramcars. It has been decided to fix a meter on a car to test the quantity of current used, and that the drivers be put upon this car in turn and their results noted.

ASTON: *Electricity Accounts.*—The accounts of the electricity undertaking for the year ended March 31st, 1908, show a gross profit of £9,786, against £6,616 for the year ending March 31st, 1907. After deducting interest and sinking fund charges, amounting to £6,659, there is a net surplus of £3,127, against £676 of the previous year. The connections are equivalent to 118,823 8-c.p. lamps, which includes 2,000 h.p. of motors. The total number of units sold was 2,942,384, made up as follows:—Lighting, 632,250; power, 1,113,754; and tramways, 1,196,380. The total for 1907 was 1,996,364 units.

BELFAST: *Cavehill and Whitewell Tramways.*—A Deputation from the Trades Council waited upon the Corporation on Monday with regard to the proposed arrangement with the Cavehill and Whitewell Tramways Co. This Deputation maintained that the price proposed to be paid is exorbitant, and urged the Corporation to proceed no further with negotiations at present, but should wait a few years longer, when they would probably be able to acquire the company's undertaking on much more reasonable terms. The Trades Council, the spokesman stated, was in favour of municipalisation of tramways, and they were not opposed to the municipalisation of the Cavehill and Whitewell lines, but their objection was to the Corporation having to pay too high a price for the undertaking. The Lord Mayor stated that the Council were pleased to have the views of the Deputation, which, he assured them, would be considered at the proper time.

At the weekly meeting of the Tramway and Electrical Committee on Monday, a lengthy communication was read from the Cavehill and Whitewell Tramway Co., on the proposed arrangements for running over the lines of the Corporation, so as to give a through service from Whitewell to the centre of the city. The company asked the Corporation to rent the system for four years, pay 3½ per cent. on the purchase price of £60,000, arranged for last year, but which fell through in Parliament, and some other details. (ELECTRICAL ENGINEERING, April 25rd, p. 639.) It was finally resolved to recommend that a through service be established, the company to receive the receipts on their end of the route, and the Corporation the receipts on their end, on the basis of a threepenny fare, provided that the Corporation be at liberty to purchase the undertaking at £60,000 within the next five years.

BIRMINGHAM: *Certificated Wiremen.*—The Corporation Electricity Supply Department, having decided to draw up a list of wiring contractors who are authorised to carry out work in the city area, has given notice that after June 30th, 1908, installations intended to be connected to the Corporation's mains should be carried out by authorised contractors. Applications from contractors wishing to be put on this list are now being considered.

BOLTON: *Tramway Profits.*—The Finance Committee last Friday approved of the resolution of the Tramways Committee allocating the sum of £9,745 out of the profits for the past year in relief of rates, as against £9,078 the previous year.

BRISTOL: *Electrical Showrooms.*—The Corporation has opened showrooms for the purpose of demonstrating the various uses of electricity.

CARDIFF: *Gas v. Electric Lighting.*—A sub-committee which was appointed to go into the question of lighting the Cardiff and Ely Workhouses, has reported that, after giving full consideration to the estimate of Mr. Arthur Ellis, the Borough Electrical Engineer, for an electrical installation, and also to that of the Cardiff Gas Co., they were confirmed in their opinion that it was not advisable to change from gas to electric lighting.

DARWEN: *Electricity Profits.*—The annual report of the Electricity Department shows a profit of £100 for the year ended March 31st, 1908, compared with £65 for 1907. The loss on the electric tramways will be greater than a year ago.

DUMBARTON: *Tramways.*—The Board of Trade inspection of the tramways from Dumbarton to Alexandria takes place to-day.

EXETER: *Electricity Accounts.*—The accounts of the Electric Lighting Undertaking to March 31st, 1908, show a profit of £2,200, after paying interest and sinking fund to the extent of about £9,000. In considering the question of how to deal with this balance, the committee have taken into consideration the various suggestions for the reduction in price, both to private consumers and to the tramways department, and, after consideration of these, recommend a reduction of ½d. per unit to private consumers, bringing the charge down to 4½d. per unit. The committee did not favourably consider the question of reducing the price to the Tramways Committee, and challenges the Chairman of that committee that, if he had to lay down a new plant to-morrow, and supplied the tramways from a new generating station, he could not produce at prices which he was now being charged by the electric lighting undertaking. The average price charged to tramways in similar towns throughout the country was 1·90d. per unit, whereas in Exeter it was 1·75d. With regard to the power users, instead of the present sliding scale of 2½d. to 2d. per unit, it was recommended that the charge should be 2½d. for smaller users and 1⅞d. for larger users, the scale ranging between these two amounts according to the amount consumed. The report of the committee was adopted at the meeting on Wednesday last week.

HANDSWORTH: *Tramway Purchase.*—An agreement has been come to between the Aston Manor and the Handsworth Urban District Councils, and the British Electric Traction Co., in regard to the purchase by the Councils of the company's tramways in Handsworth. The terms of the agreement set out that the Handsworth Council is to pay to the company £2 15s. per yard run of single track; the purchase money to be paid within one month of the date of the agreement; the tramway company to waive their option to a lease of the tramways so purchased; Handsworth to at once reconstruct and electrically equip the lines; the contract for the reconstruction to be placed within one month from the date of the agreement. The Aston Council is brought into the matter in connection with a proposal for through services over the lines in Aston Manor, provided the Handsworth Council offer similar facilities over certain lines in their district. The agreement, therefore, provides for these through services, which are to be controlled and arranged from time to time by the company's manager, the manager of the City of Birmingham tramways, and the engineer for the time being of Handsworth. In order to encourage traffic, a 2½d. through single fare is to be introduced, of which the British Electric Traction Co. will receive ¾d., the Handsworth Council ¾d., and the city of Birmingham the balance.

IPSWICH: *Tramways Renewal.*—Some months ago Mr. F. Ayton, the Electrical Engineer and Manager, was requested to report upon what provision, if any, should be made for the upkeep and renewals of the plant and machinery of the electric supply and tramways undertaking, in addition to the annual sums for the redemption of capital. Mr. Ayton, in his report, stated that the only portion of the plant in respect of which he considers it is necessary to form a special renewal fund is the tramway track. It appears probable, he says, that judging from the experience of other towns, the whole of the rails will require renewing in 1919, and the estimated cost of carrying out this work is put at £42,500. The Local Government Board has indicated its willingness to favourably consider an application in 1919 for leave to re-borrow the amount of capital that has been repaid, provided the Corporation in the meantime takes steps, by the formation of a renewal fund or otherwise, to raise the balance of the cost of the work. It may be mentioned that in 1919 the Corporation will have repaid in respect of the original loan for the track the sum of £10,408, and there will thus remain the sum of £32,092 to be provided by the Corporation during the next eleven years. As there appears to be little or no probability of the tramways receipts being sufficient to enable this amount to be accumulated out of revenue, Mr. Ayton reports that the only alternative appears to be to levy a rate in aid of such an amount as will have accumulated, at 3 per cent., to produce the required sum in April, 1919. In reporting upon this matter, the Finance Committee recommend that the renewals fund in question should be postponed in view of the fact that without providing anything for this in the current year, the rates of the borough will have to be increased 2½d. compared with last year, due to various other causes. At the last Council meeting the Finance Committee's recommendation was adopted.

KINGSTON-ON-THAMES: *Incorporated Municipal Electrical Association.*—The Electrical Engineer has been authorised to attend the annual convention of the Incorporated Municipal Electrical Association at Nottingham, and has been granted £6 6s. for expenses.

LONDON: *City of London: "Electrical" Fires.*—According to the annual report of the City Coroner (Dr. F. J. Waldo) 145 fires occurred in the City area during 1907. Eleven fires were reported as electrical in origin, and these were inquired into by Mr. A. A. Voysey, the City Electrical Engineer, whose expert investigation reduced the number to be attributed to defective electrical arrangements to five. Nine fires were associated with the use of gas. In thirty cases the cause is unknown.

Hackney: Tramways and Street Widening.—The Finance Committee has decided that the Borough Council contribute £15,197, being a contribution of one-third of a total estimated expenditure of £45,590, in connection with the widening of certain parts of Mare Street, and Upper Clapton Road, consequent upon the construction for electrical traction of the L.C.C. tramways.

Lambeth: Underground Telegraph Wires.—Applications on behalf of the Postmaster-General for consent to the placing of underground telegraphic wires in a number of thoroughfares, the total approximate length of the wires being 1,127 yards, have been approved by the Borough Council, subject to protective conditions.

Lewisham: Breaking Up of Streets.—The Borough Council have made claims, amounting in the aggregate to £745 10s. 4d., against companies and authorities possessing statutory powers, in respect of the breaking up of roads and footpaths during the quarter ended March 31st. Included in the claims are the following:—South Metropolitan Electric Light and Power Co., Ltd., £96 7s. 11d.; National Telephone Co., Ltd., 19s.; Greig & Mathews (contractors to the General Post Office), £200 9s. 3d.; Westminster Construction Co. (contractors to the General Post Office), £94 17s. 3d.; London County Council, £1 11s. 6d.; General Post Office, £5 3s. 7d.

LEEDS: *Large Power Users.*—As a result of the reduction in the price for power, which took place from the beginning of April, it is stated that negotiations have been opened by several large firms with the Corporation Electric Lighting Department, with a view to a change over to electric driving.

LEYTON: *Electricity Accounts.*—At the last meeting of the Council the Electric Lighting Committee submitted a report from the Engineer, from which it appeared that during the year ending March 31st, 1908, the total number of units generated was 3,604,513, as against 2,366,907 the previous year. The units sold were: private, 880,392 (last year, 871,971); public, 718,158 (last year, 683,319); tramways, 1,705,081 (last year, 497,255), making a total of 3,303,631, as against 2,052,545 in 1907. The total number of consumers connected on March 31st, 1908, was 1,900, as against 1,778 on March 31st, 1907. The maximum lighting load was 944 kilowatts, as against 948 kilowatts in 1907, equivalent to 31,466 and 31,600 8-c.p. lamps respectively, being 46·2 and 49 per cent. of total connected.

Tramway Contract.—The Tramways Committee report that they have had under consideration a claim exceeding £2,000 made by Mr. Manders for work and extras in regard to the permanent way in connection with the tramways undertaking, beyond the contract sum. After full consideration of the matter they recommended that the claim be settled by payment of £1,150, and this has been agreed to. The payment of this £1,150 will bring the amount received by Mr. Manders to a total of £128,631 13s. 10d.

LLANELLY: *Provisional Order Transfer.*—The Urban District Council propose to transfer its electric lighting Provisional Order of 1891 to the Llanelly District Electric Lighting & Traction Co. The Council may re-purchase the undertaking at the end of 30 years or any subsequent period of seven years. The pecuniary consideration for the transfer is the payment to the Council by the company of the amount expended in obtaining the order, and the further payment of the costs of the transfer and applications to the Board of Trade in connection therewith.

MANCHESTER: *Tramways Committee.*—The Tramways Committee has decided to increase their annual grant to the Royal Infirmary, Manchester, from £50 to £100. It has also been decided to allow £25 per annum to the Ancoats Hospital. These grants are in recognition of the good work done by both institutions in connection with tramway accidents.

Electricity Accounts.—After meeting interest and sinking fund charges, and providing 40,000 for renewals of plant, the accounts of the electricity undertaking for the year ended March 31st show a profit of £18,177. Of this £10,000 were allocated to the relief of rates, and the balance transferred to the reserve fund. The increased price of coal involved an extra expenditure of about £9,000. The estimates for the ensuing year enabled the committee to promise another grant of £10,000 in aid of rates.

MIDDLESEX: *Tramways and Private Property.*—In consequence of the Council being compelled by the owners in many cases to purchase the whole of properties when a portion only is required for the purposes of the light railways, the Light Railways and Tramways Committee report that it may be found necessary to apply for an extension of the Council's borrowing powers, under the Light Railways Orders of 1903 and 1907, limited at present to £1,080,000. The Council would, it was pointed out, have to sell the lands and premises which they had been compelled to purchase, and which were not required, and under the 1903 Order it would appear that the Council must apply the sale monies in repayment of borrowed monies. The Clerk had been directed to ask the Local Government Board whether they would favourably consider an application for authority to use monies received from the sale of surplus property in payment of the cost of completing the construction of light railways authorised. If the Board would give its sanction to this course being taken, it might save the Council the expense of borrowing considerable sums for the completion of the lines. The Council decided that application be made to the Board of Trade to extend the borrowing powers under the Orders mentioned by £100,000.

NELSON: *Street Box Explosion.*—As the result of a street box explosion on Sunday, the supply of electricity to the whole town was cut off for a time.

Electricity and Tramway Accounts.—The annual report of Mr. Helm, Electrical Engineer to the Council, states that the result of the year's working is a profit of £591, instead of £408 1s. 2d. estimated, upon the electricity undertaking. It has been decided to allocate £250 to the relief of rates, and £341 to capital charges. Instead of an estimated loss on the year's working of £159 upon the tramway undertaking, there is a favourable balance of £22.

NOTTINGHAM: *Electric Supply Charges.*—A further meeting of the Traders' Associations of Nottingham has been held, protesting against the present system of charging for electricity for lighting purposes. The general feeling is that a flat rate, not exceeding 3d. per unit, should be charged to all consumers. After some discussion this feeling was put into a form of a resolution, with an expression of opinion that discounts should be allowed on quarterly accounts, when they are paid within 21 days, varying from 2½ per cent. on bills up to £50 per annum, and 7½ per cent. up to £150 per annum; above this sum it is suggested that special terms should be arranged.

SALFORD: *Tramway Accounts.*—The total income of the Salford tramway undertaking for the year ended March 31st, 1908, amounted to £244,048. Deducting working expenses, viz., £147,286, there is a gross profit of £96,762. Payments to local authorities for rent of lines, &c., absorb £25,985, and interest and sinking fund charges, £41,971, the net profit thus being £28,806. The Tramways Committee recommend that the Borough Treasurer be instructed to transfer £15,000 to relief of rates, and also a further £3,000 in accordance with a previous promise, and that the balance be placed to the credit of depreciation and renewals fund. The reserve fund stands at £60,000.

STALYBRIDGE, HYDE, &c.: *Joint Tramways Committee.*—At the meeting of the Stalybridge, Hyde, Dukinfield, and Moseley Joint Tramways and Electricity Department on Monday, it was stated that the loss for the past year amounts to £10,000. For the two previous years the losses have been £16,000 and £14,000 respectively.

SUNDERLAND: *Telephone Charges.*—A conference was held at Sunderland last week, at the instance of the Sunderland Chamber of Commerce, with regard to the new telephone charges of the National Telephone Co. Mr. S. J. Goddard, the general superintendent of the company, attended. It appears that the Sunderland Corporation, in return for allowing the company to lay underground wires, were to have certain concessions, but new subscribers are to be placed under the new rates, and this, it was argued, would mean an increase in cost to an ordinary business firm of from £25 to £50 a year. Mr. Goddard, in presenting the case for the measured rate system, said it appeared to the company to be a gross inequality that a large number of calls should be made at the same cost as a small number. The new arrangement was based upon the cost to which the company was put in installing the service, and it was a remarkable thing that subscribers who had previously been upon the unlimited rate, and who had changed over, immediately decreased their calls by quite 25 per cent. From this it was clear that a large number of the calls made by some of the subscribers upon the unlimited rate were unimportant calls. The Town Clerk stated that the main question to be considered was that the company, having secured permission to lay underground wires, and having, in fact, laid these wires, desired to depart from the agreement. The proposal that all new subscribers should be placed upon the new rates was absolutely against the spirit of the agreement.

TORQUAY: *Tramways.*—The Torbay tramway route was opened to the public on Thursday, the official inspection by Major Pringle, on behalf of the Board of Trade, having taken place on the same day. In the evening Mr. O'Hara, the resident engineer of the National Electric Construction Co., was presented with a gold signet ring and an illuminated address from the staff as a token of esteem.

Telegraph Traffic.—An uneventful week has again passed as far as interruptions and restorations of communication are concerned. One cable only has given out, that between Alexandria and Larnaca, on the 29th ult., and a quick repair has been effected. The Via Hanekin and Via Fao routes have again been in trouble, but the interruptions were of short duration only. Direct telegraphic communication has now been opened with Bor, Meshra, Gondekoro, Mongalla, Rumbek, Myolo, Won, and Toni in Bahr-el-Ghazal. Restrictions are still in force on telegrams to Borneo (British), Argentine, Costa Rica, Nicaragua, Honduras, Venezuela, and Hayti, and messages for Cartagena, United States of Colombia, are still subject to delay. President Castro has instructed the Venezuelan Consul at Trinidad not to clear any more British vessels for Venezuelan ports, and, in consequence, senders of telegrams are deprived of the facilities of sending telegrams with instructions to post them at Trinidad.

TENDERS INVITED AND PROSPECTIVE BUSINESS

AUSTRALIA.—The Board of Trade correspondent at Melbourne (Mr. M. Hirsch) has forwarded particulars of a call for tenders for the supply to the Deputy Postmaster-General at Melbourne of 2,800 jacks in strips of 20; 1 mile of 64-wire switchboard cable; 50 three-conductor cords, 7 ft. long; 96 three-part plugs; and 66 listening and ringing keys. Tenders will be received by the Deputy Postmaster-General, Melbourne, up to 3 p.m. on June 9th.

The Board of Trade are notified by the London representative of the Australian Commonwealth (Capt. R. Muirhead Collins, C.M.G.) that tenders will be received at the office of the Deputy Postmaster-General, Perth, until noon on Monday, September 7th, for the supply of the following telephone material, viz. : 650 wall sets, 150 table sets, 800 protectors, 90 extension switch and bell sets, complete, 30 switchboards for four lines, 20 switchboards for six lines, 5 switchboards for twelve lines, 5 switchboards for twenty-four lines, 20 wall sets for party lines, and 10 table sets for party lines. Tenderers must state the country in which the articles tendered for have been made or produced, and, in the case of manufactured articles, where the material has been made or produced. Tenders must include customs duty, if any. A deposit, equal to 5 per cent. of the amount of the offer, will be required to qualify any tender. Specifications, conditions, and forms of tenders may be obtained at the Commonwealth of Australia Offices in London, 72 Victoria Street, S.W.

Tenders for the following are invited by the Deputy-Postmaster-General, Sydney :—Supply and delivery of eight tons of hard-drawn copper wire (400 lb. per mile), 1½ cwt. of copper tape binding (200 lb. per mile), 1,300 best white large porcelain insulators, and 2,000 tallow-wood crossarms, 5 ft. 2 in., by June 10th, and the supply, delivery, and erection of a branching metallic multiple magneto switchboard by August 12th. Specifications, conditions, and forms of tender may be obtained at the Commonwealth Offices in London, 72 Victoria Street, S.W., where also preliminary deposits on tenders may be paid.

The Commonwealth Government has called for tenders, returnable to the Postmaster-General's Department, 51 Spring-street, Melbourne, on August 26th, for the supply and erection of installations for wireless telegraphy at the following places :—(1) Cape York, (2) Thursday Island, (3) Goode Island, (4) Port Moresby, (5) Fremantle. Tender forms, specifications, and general conditions may be obtained at the offices of the Deputy Postmasters-General of the several States or of the Commonwealth Representative, 72 Victoria Street, Westminster, London. The *Australian Mining Standard* states that tenders must be accompanied by a deposit or receipt for deposit of £100. Deposits on tenders may be lodged with the Deputy Postmaster-General at any of the offices named, or at the office of the Commonwealth Representative in London, but a receipt for such deposit must be obtained and forwarded with the tender. The deposit need not be made in cash, but a banker's certificate should be forwarded by the tenderer to the Secretary, Postmaster-General's Department, to the effect that the amount of the deposit is held at the call of the Secretary to the Postmaster-General's Department. Tenderers must state the name of the country or State in which the apparatus, &c., will be manufactured. The Postmaster-General does not bind himself to accept the lowest or any tender.

BASLOW.—The possibility of introducing electric lighting into this district is being considered by the Urban District Council.

BEDFORD.—Tenders are invited for the supply of about 6,500 tons of Derbyshire and Nottinghamshire coal for the electricity works. Particulars from the Town Clerk, to whom tenders by May 15th.

BELFAST.—Five iron lattice electric light masts, 70 ft. high from ground line, are required by the Belfast Harbour Commissioners. Particulars from the Secretary, Harbour Offices, Belfast, and tenders by May 13th.

BRIDLINGTON.—With a view to installing a Tirrill regulator, the Electricity Sub-Committee and the Borough Electrical Engineer has been authorised to inspect these pieces of apparatus in use at Grimsby and Lincoln.

BRIGHOUSE.—A Local Government Board inquiry was held last week into the application by the Corporation for sanction to borrow £3,624 for the extension of the electricity undertaking. This expenditure is to be incurred in dealing with the distribution of electrical energy, which is to be supplied in bulk by the Yorkshire Electric Power Co. There was no opposition, and the inquiry was terminated.

BRISTOL.—Tenders are invited for (*a*) direct-current works switchboards at the Avonbank electricity works; (*b*) E.H.T. and L.T. sub-station switchgear for Shirehampton; (*c*) D.C. power switchgear for supply to Avonmouth Docks; (*d*) extension of galleries at the Avonbank electricity works. Full particulars from Mr. H. Faraday Proctor, City Electrical Engineer (fee, £2 2s., for each section, returnable), and tenders to the Town Clerk by May 11th, for sections A and C, and May 18th for sections B and D. (See an advertisement this week.)

BURNLEY.—On May 1st Mr. W. O. E. Meade-King inquired, on behalf of the Local Government Board, into an application by the Burnley Corporation to borrow money for various undertakings, including £26,460 for the purpose of the electricity department. £9,560 of this sum is for extension to mains, and for house service connections, and £7,100 for a generating set and pump. The extensions are expected to cover ten years' progress.

COLNE.—There was no opposition at the inquiry on April 30th, at the Colne Town Hall, conducted by Mr. Meade-King, on behalf of the Local Government Board, into the application of the Corporation for sanction to borrow £4,170 for electrical purposes. The loan is required chiefly for the purchase of a motor generator, &c., for motors for hire. A sum of £1,500 had already been sanctioned for motors, this amount having been overspent by £207 16s.

DARLINGTON.—Tenders are invited for a Lancashire boiler and superheater. Particulars from the Borough Electrical Engineer (fee £1 1s., returnable), and tenders to the Town Clerk by May 11th.

DARTFORD.—The Engineer has been instructed to obtain tenders for new condensing plant.

DOVER.—The Corporation invite tenders for the supply of large and small Welsh coal, and 3,000 tons of North Country and Midland or small coal, for the electricity works. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by May 18th.

EDINBURGH.—Tenders are invited for an electrical installation for lighting, heating, and power, at the College of Art, Edinburgh. Full particulars may be obtained from Mr. F. A. Newington, the Borough Electrical Engineer, and tenders to the Town Clerk by May 14th.

The West Calder Co-operative Society has decided to erect a new bakery with power station and electric lighting plant.

HEANOR.—The District Council has appointed a special committee to go into the question of electric lighting.

HULL.—A new sub-station is to be erected at an estimated cost of £10,000.

LIVERPOOL.—The National Telephone Co. contemplates erecting a new exchange in South John Street. It is stated that the proposed exchange will be the finest and most spacious in the North of England, and will form the headquarters of the company in Liverpool.

LONDON: *London County Council.*—Tenders are invited for the wiring and fitting for electric lighting of a tramway car shed at Mare Street, Hackney. Particulars from the Clerk, fee £2 2s., returnable, and tenders by May 12th.

Tenders are also invited for the supply and delivery of about 2,000 tons of steel girder tramway track rails and fastenings required for the electrification of further portions of the Council's tramways. The Council also invite alternative tenders for the supply and delivery of about 5,000 tons of track rails and fastenings. Full particulars from the Engineer to the Council (fee, £2, returnable), and tenders to the Town Clerk by May 19th.

Tenders are invited for the supply and delivery of (*a*) 175 double-deck, roof-covered, electric car-bodies; (*b*) 175 pairs of maximum traction swing bolster trucks; (*c*) 175 complete electrical equipments for operation upon the overhead trolley, surface contact, and underground conduit systems of electric traction. Full particulars from the Clerk to the Council (fee £2 2s. returnable), and tenders by May 9th.

The Council invite tenders for two electrically-driven centrifugal pumps, to be erected at the Greenwich generating station.

NOTICE.

Notice under Section 33 of the Patents and Designs Act, 1907.

NOTICE is hereby given that the following invention is protected by Patent No. 24,923 of 1906 (J. S. Raworth).

In traction systems in which regenerative motors are used, it is possible that the voltage of the system may rise considerably above the normal voltage. To protect the machinery and instruments, connected to the traction mains, from such excessive voltage or reverse current, a diverting circuit, including a resistance and a relay operated switch, is arranged between the positive and negative conductors. The switch is automatically closed by a rise in voltage or a reverse current, and is also automatically opened on the restoration of normal conditions. JOHN E. RAWORTH, Chartered Patent Agent, Queen Anne's Chambers, Westminster, S.W.

Digitized by Google

Full particulars from the Clerk to the Council, to whom tenders by May 26th.

Bermondsey.—In regard to the extension of the plant at the electricity works a specification has been approved for a steam dynamo, marine boiler and condenser, and tenders are to be invited for the supply and erection of the same. Alterations are to be made in the electric lighting at the Central Library, at an estimated cost of £19 10s.

Tenders are invited for a boiler, steam dynamo, condenser, and cooling tower. Particulars from the Borough Electrical Engineer (fee, £2 2s., returnable), and tenders to the Town Clerk by May 18th.

Hackney.—The Electric Lighting Committee has decided that a concentric feeder cable, 0·4 square inch section, be laid, at an estimated cost of £1,515.

Stepney.—Mains, necessitated by applications for supplies of electricity, are to be laid in four streets.

MANCHESTER.—In a report by Mr. S. L. Pearce, the Chief Electrical Engineer to the Corporation, a scheme of extensions at the Dickinson Street and Stuart Street generating station is outlined, at an estimated cost of £135,000, for which sum the Electricity Committee recommend an application to the Local Government Board. Part of the proposed expenditure will be in connection with sinking artesian wells at the Stuart Street station. Another item in the proposed loan is for wiring of consumers' premises upon the hire-purchase system. Under the proposed system the consumers will provide the necessary lamps and fittings, and the Corporation will do the wiring, the cost of which will be refunded by instalments.

METROPOLITAN ASYLUMS BOARD.—Tenders are invited for a number of stores, including electrical accessories. Full particulars from the Clerk to the Board, Embankment, London, E.C., and tenders by May 13th.

SALFORD.—The Electricity Committee invite tenders for the supply, delivery, and erection at the Frederick Road generating station of cooling towers, tanks, pumps, and pipe-work. Full particulars from Mr. V. A. H. McCowen, Borough Electrical Engineer (fee, £2 2s., returnable), and tenders to the Town Clerk by May 25th (See an advertisement this week.)

SPAIN.—A public competition will be held at the Junta de Obras (Board of Works) of the port of Tarragona, at 5 p.m. on May 31st, for the purpose of adjudicating the contract for an electric installation for lighting and motive power at that port. Tenders will be received up to the time of the adjudication. Local representation is necessary.

STOCKPORT.—A Local Government Board inquiry will shortly be held into the application by the Corporation for sanction to borrow £10,500 in connection with the electricity undertaking.

TAUNTON.—A Local Government Board inquiry was held on Tuesday into the application by the Corporation for sanction to borrow £2,000 for electric lighting purposes.

UXBRIDGE.—Tenders are invited for wiring, fitting, &c., for new building now being erected by the Uxbridge Joint Hospital Board. Particulars from the Architect, Mr. W. C. Eves, 54 High Street, Uxbridge, to whom tenders by May 14th.

TENDERS RECEIVED AND ACCEPTED

ABERDEEN.—The tender of the British Insulated & Helsby Cables, Ltd., for the supply of cables in connection with the Cults generating station, at £3,575 15s., is recommended for acceptance.

ACCRINGTON.—The Electricity Committee have this week decided that a water-cooling tower to deal with 150,000 gallons per hour be provided with the necessary foundations and enlarged dam. Applications to be made to the Local Government Board for sanction to borrow £1,400 to defray the cost. It was agreed to negotiate with Messrs. Balcke & Co., and Messrs. Worthington, who had submitted the most favourable tenders for the tower.

A quotation has been received from the Brush Electrical Engineering Co., for the supply of two single-decker cars, at £695 each. The electricity sub-committee has been given authority to complete the purchase.

CONDENSING PLANTS.—The Mirrlees Watson Co. Ltd., Glasgow, have recently received orders for a number of condensing plants, among which are the following:—Hendon Paper Works, Sunderland (surface condenser), Messrs. H. Bollinckx, Brussels (surface condensing plant), James Howden & Co., Glasgow (surface condensing plant), the British Thomson-Houston Co., Ltd., for Teesbridge Iron Works (surface condensing plant), W. & R. Jacob & Co., Ltd., Dublin (elevated jet condensing plant).

HULL.—The tender of Messrs. Siemens Bros. & Co., for mains at £592 5s., has been accepted.

LONDON: *Bermondsey.*—The Council has accepted the tender of Messrs. E. Green & Son, at £276 10s., for repairs and providing accessories to the fuel economiser at the electricity works. The following tenders have been received for the supply of insulating box compound:—Rumney & Rumney, £2 11s. 6d. per cwt.; Johnson & Phillips, £5 12s.; W. T. Glover & Co., £2 10s.; W. T. Henley & Co., £2; Siemens Bros., £6 6s.; Geipel & Lange, £1 17s. 4d.; Union Cable Co., £1 8s.; Callender's Cable Co., £2 6s. 8d.; Western Electric Co., £2 16s.; British Insulated Cable Co., £4 4s.; Cables Accessories Co., £2 10s.; Knapton & Co., £2 10s.; Neville, Williams & Co., £3; Turners & Manville, £3 14s. 8d.; British Electrical Trade Supply & Bitumen Co. (provisionally accepted), £1 10s. 6d.; Craig, Sharp, Ltd., £1.

Fulham.—The Electricity and Lighting Committee has accepted the tender of Siemens Bros. for the supply of 100 electric meters, *i.e.*, 50 each of three and five ampere size, at 29s. each. The committee has also decided that an order be placed with F. Pratt & Co., Ltd. (Halifax), for the supply of machines and tools for the workshop at the electricity works, at £140 5s.

Hackney. The Electric Lighting Committee has accepted the tender of J. Hudson & Co. for the supply to the electricity works of 2,000 tons of Broomhill coal, at 12s. 3d. per ton.

Kensington.—The Borough Council Works Committee has decided to accept the tender of Messrs. Crompton & Co., Ltd., to supply and fix lowering contact gear to 23 arc lamps in main roads, at £4 7s. 6d. per lamp.

Paddington.—The Borough Council has accepted the offer of the Metropolitan Electric Supply Co., Ltd., to fix the necessary shafting, poles, electric motors, &c., for driving the chaff-cutter, grindstone, &c., at the wharf, at an initial cost of £20 4s. 7d., and thereafter to supply current at the rate of 2d. per unit or upon the sliding scale, which commences at 3d. and is reduced according to the time the machines are working to a minimum rate of ¾d. per unit. The charge will be based on either scale at the option of the Council.

MANCHESTER.—Messrs. Marples, Leach & Co. have secured the contract for the complete electrical equipment of the new mill which is being erected by the Tyne Ring Spinning Co., Ltd., at Littleborough, near Manchester.

RAWTENSTALL.—The following tenders have been accepted:—Messrs. Chamberlain and Hookham, direct-current meters; General Electric Co., alternating-current meters; Yates & Thom, Green's economiser.

ST. PETERSBURG.—Among recent contracts obtained by Messrs. Ferranti, Ltd., Hollinwood, is that for the supply of 55 transformers for the St. Petersburg Corporation, Russia. The company inform us that owing to the very high Russian import duty, which is assessed upon the *weight* of the articles, light but bad efficiency transformers are at an advantage as regards initial cost, and they state that such transformers have hitherto been exported into Russia. Some time ago Messrs. Ferranti secured permission to submit several special high efficiency type "E X" transformers as samples to St. Petersburg. The tests on these were so satisfactory, and the saving shown to be possible over a number of years was so large, that the result has been that the above contract has been placed.

STOKE-ON-TRENT.—The tenders of Messrs. Willans & Robinson, at £2,265, for a steam generator and condenser; Messrs. Babcock & Wilcox, for a water tube boiler at £1,410; Reason Manufacturing Co., for meters, and of the British Insulated and Helsby Cables, Ltd., for street box fittings and house service cut-outs, have been accepted.

STOWMARKET.—The following tenders have been received for public lighting:—Suffolk Electricity Supply Co. (the Council to provide necessary lanterns, wires, and fittings at an estimated cost of £632), £160; the Stowmarket Gas Co., £247 14s. for one year, and £227 14s. for five years. On the recommendation of the Lighting Committee the latter tender, on the basis of a five years' contract, has been accepted.

WIMBLEDON.—The Electric Lighting Committee has accepted, subject to the usual sanction, the tender of James Howden & Co., Ltd., Glasgow, to supply a turbine, direct coupled to a Siemens single-phase 1,000-kw. alternator and switchgear, with a Worthington condensing plant, and the necessary pipework and valves, for £7,275. A sub-committee inspected the "Curtis" and "Zoelly" horizontal turbines, and gave the preference to the latter. The Electrical Engineer has been authorised to obtain a supply of alkali from Brunner, Mond & Co., Ltd., at £5 per ton.

Birmingham Tramway Accident.—The trolley of an open-car left the overhead wire when the car was proceeding along Coventry Road. Before the conductor, who was on the top of the car, could replace the trolley-pole, the latter caught the span wire. The cast-iron standard supporting the trolley-pole fell on the conductor and two passengers, injuring the latter.

COMPANIES' MEETINGS AND REPORTS

BARNSLEY & DISTRICT ELECTRIC TRACTION.—At the annual general meeting on Wednesday last week, presided over by Mr. E. Garcke, the report and accounts were adopted. The revenue for 1907 amounted to £9,065, and the expenditure, including £408 placed to renewals accounts, to £7,455. To the balance is added £452 brought forward, leaving a sum of £2,062 available for distribution. Of this £250 have been placed to depreciation and reserve, £350 to sinking fund for redemption of loans, &c., £1,200 is absorbed by preference dividend, and the balance of £262 is carried forward. Provision is to be made for renewals account by setting aside out of revenue 0·5 per car mile for this purpose. The total capital expenditure at December 31st, 1908, was £647,403. The traffic revenue showed an increase of £279 over that of 1906, but the expenditure was higher, chiefly owing to the necessity for a complete overhaul of the cars, and their electrical equipment. There was a net increase in profits of £27 over the previous year of 1906. The company has made application to the Corporation for a revision in the price charged for electrical energy, but up to the present the Corporation have not acceded to this request, and the directors now have under consideration the further steps that can be taken.

BRISBANE ELECTRIC TRAMWAYS.—The annual general meeting was held in London on Wednesday last week, Mr. H. R. Beeton presiding. The accounts for 1907 show total receipts amounting to £159,230, compared with £141,732 for the previous year, and an expenditure of £88,116 compared with £82,770. There was thus a net improvement over 1906 of £12,151. The Brisbane Tramways Co., of which the Brisbane Electric Tramways Co. hold all the shares, has raised its renewals fund to £39,000 by the addition of a sum of £15,000, bringing the total of undivided profits available for renewals, &c., to about £58,000, and had paid in dividends a total for the year of £57,000. This enables them to satisfy debenture stock interest and preference dividends, and to pay a dividend of 4 per cent. on the ordinary shares, and to carry forward £2,130. The chairman, in his speech, stated that the receipts during the first quarter of 1908 show an increase for the same number of days of £5,000 compared with 1907, and the receipts per car mile amounted to 12·2d. compared with 10·77d.

BRITISH WESTINGHOUSE ELECTRIC & MANUFACTURING.—The annual general meeting was held on Monday at Hamilton House, Victoria Embankment, London, Mr. J. Annan Brice, M.P., presiding. The Chairman first dealt with the crisis which occurred in the affairs of the American Co. and the bearing which it had upon the British Co. The American Co., he said, was forced, owing to the sudden stringency of the United States money market, to seek the temporary protection of the Courts, but he was very glad to say that the Westinghouse Machine Co. had been relieved from its receivership as from March 31st, and, in the case of the Westinghouse Electric Co., negotiations were proceeding to the same end. In consequence of this state of affairs the English Co. had to consider how they could provide for the future needs of their business. They could not hope to raise further share capital, owing to the conditions of the money market, neither could they issue further debenture stock ranking *pari passu* with that already existing, except at a prohibitive cost. The only solution, therefore, was the creation of Prior Lien Debentures, of which £300,000 had been created, and £250,000 had been placed at £98 per cent. Prolonged negotiations with the receivers of the American Electric and Machine Cos. had resulted in their agreeing to take Traction & Power Securities Co.'s shares at par for the amount shown in the balance-sheet to the credit of this company, namely, £186,374. The whole amount had been liquidated by the transfer of a corresponding amount of those shares at par. This released £186,000 of capital hitherto invested in securities. Dealing with the balance-sheet, which was given in our last issue, he referred to the marked improvement over the last accounts, and to the fact that they had been able to provide not only for interest on debentures and bank loans, but also certain sums for the depreciation of stock on hand and in process of manufacture. During the year 1907 each department of the works, so far as the accounts were concerned, had been run as a separate business, with the result that economies had been effected, which had not been practicable hitherto. The cost of manufacture had been reduced to such an extent that with a pay roll of 2 per cent. less an output having an additional value of 10 per cent. was produced. Economy in maintenance and operation, machinery and tools, had also resulted in a saving of £10,000. Further reductions in the salary list and general expenses had resulted in an additional saving of £26,000. The total output increased by 17 per cent. over that of the previous year. With a view to improved efficiency and economy in manufacture many important lines of apparatus have been re-designed. Several contracts have been taken on the Continent in co-operation with the French Westinghouse Co. In conclusion, the Chairman referred to the death of Lord Kelvin, who had acted as technical adviser to the company since its foundation. The report and accounts were adopted.

CRAIGPARK ELECTRIC CABLE.—At the annual meeting on Monday, the report and accounts given in our last issue were adopted. The Chairman, Mr. J. T. Tullis, stated that the past year had been one of the best years since the formation of the company. During the year the company had joined the Cable Makers Association, for the reason that many of the specifications issued now stipulated that the cable was to be purchased from firms connected with the association.

DIESEL ENGINE.—The accounts for the year ended March 31st, 1908, show a credit balance of £20,731, to which has to be added £3,488, making a total balance of £24,210. A 10 per cent. dividend is recommended, £7,000 is to be placed to reserve account, and £7,209 carried forward. The meeting is on May 14th.

EASTERN EXTENSION, AUSTRALIA & CHINA TELEGRAPH.—The report for the half-year ended December 31st, 1907, shows gross receipts amounting to £304,416, compared with £296,393 for the corresponding period of 1906. Working expenses amounted to £154,203, compared with £139,549. From the balance of £150,212, income tax, payable in England, interest on mortgage debenture stock, and other extraordinary expenses, absorb £19,770, leaving a net profit of £130,442, to which has to be added £74,947 brought forward. One quarterly dividend of 1¼ per cent. has been paid, and the directors now propose to distribute similar dividends, which, together with the interim dividend paid for the first half-year, make 5 per cent. for the year. A bonus of 4s. per share, or 2 per cent., is also recommended. £50,000 have been transferred to the general reserve fund, and £20,389 are carried forward. An expenditure of £28,848, which has been incurred in renewals of the company's cables, has been charged against general reserve fund. Since the close of 1907, the new cable between Java and Cocos Island has been laid and opened for traffic.

EASTERN TELEGRAPH.—The report and accounts for the six months ended December 31st, 1907, shows a revenue of £595,483, from which are deducted £198,229 for the ordinary expenses, and £63,527 for expenditure relating to maintenance of cables, depreciation of spare cable, sundry differences in exchange, and income tax payable abroad, leaving a balance of £333,727, to which is added £41,651 brought from the preceding account, making a total available balance of £375,378. After providing for income tax payable in England, interest on mortgage debenture stock, and dividends on the preference stock, which in all absorb £82,583, there remains a balance of £292,795, out of which the directors have placed £7,000 to the reserve fund for maintenance ships, and £70,000 to the general reserve fund, and have paid an interim dividend of 1¼ per cent. on the ordinary stock, amounting to £50,000. The directors now recommend the declaration of a final dividend on the ordinary stock of 1¼ per cent. and a bonus of 2 per cent., amounting together to £130,000, both payable on the 12th inst., free of income tax, and making, with the three previous payments on account, a total distribution of 7 per cent. for the year ended December 31st, 1907. It is proposed to carry forward the balance of £35,794 19s. 11d. to the next account. The meeting is on the 12th inst.

GREAT NORTHERN TELEGRAPH.—At the annual meeting held in Copenhagen on April 25th, the report and accounts given in our issue for April 9th were adopted. The Chairman and Managing Director, Commodore E. Suenson, D.R.N., in rendering an account of the working of the company during the year 1907, stated that the company's submarine system had not been subject to more frequent interruptions in 1907 than in previous years. There had been sixteen interruptions on eight cables in Europe, and ten interruptions on seven cables in the Far East. Referring to the remarks made in last year's report with regard to the improvement of the Kiachta route, by which the telegrams are transmitted between Peking and England with only two re-transmissions (at Irkutsk and St. Petersburg), the working of this important route between Europe and the Far East had continued to improve, and the same may also be said of the Wladiwostock route. The new cable between Russia and Denmark had to be laid under great difficulties on account of the intricate nature of the Baltic Sea and the laying consequently required a great deal of skill. The length of the eastern section of the cable (St. Petersburg-Libau) is 472 nautical miles, and of the western section (Libau-Stevns) 319 nautical miles. The telegrams between St. Petersburg on the one side, England and France on the other side, can be sent by the new cable with only one re-transmission. Their Iceland cable had a most propitious inauguration last summer, when the Faroe Islands and Iceland were honoured by the visit of H.M. King Fredrik VIII., accompanied by several members of the Danish Parliament. The company had acquired a new building for the company's offices and station at Shanghai, the most important telegraphical centre of China. Parts of this building had been let to the Eastern Extension Telegraph Co. and Commercial Pacific Telegraph Co., by which arrangement the exchange of the telegrams between the three companies will be facilitated. Dealing with the situation in the Far East, the Chairman referred to the difficulties which have arisen in the Far East as a consequence of the great political changes in that part of the world after the war, and of the approaching expiration of the company's exclusive privileges in Japan. The directors had

Digitized by Google

been engaged all through the year in complicated negotiations regarding this question, which necessitated their Shanghai representatives spending nearly the whole of the year at either Peking or Tokio. Although the proposals which were submitted to the Imperial Administrations of China and Japan were, in the opinion of the Board, very liberal, still they had been somewhat modified during the negotiations in order to meet the views of the two countries in question, and appeared now to be satisfactory to the former Administration. In Japan, on the contrary, they have been less fortunate, although the negotiations were continued right up to the month of February of this year, when they were suspended in order to be resumed in Europe, during or after the International Telegraph Conference, where all the interested parties will be represented. He could not pass by in silence the remarkable progress of wireless telegraphy during the last year by the opening of a direct public service between Europe and America. It would, no doubt, be remembered that in March, 1903, the Marconi Co. announced the opening of such a service, which, however, failed a few days later. Since then nothing had been heard of it until October, 1907, when the same company advertised the re-opening of the service for press telegrams only. Later on, in February of this year, they extended the service to comprise private telegrams to and from Montreal in Canada. To judge from information obtained from independent and neutral sources, the re-opening of the service after four or five years' silence was still far from being a complete success. Although the rates have been fixed at about one-half of those of the Transatlantic cables, the public, and even the press, had hitherto made very little use of the new service, which suffered from slowness, uncertainty, and want of secrecy. However confident they might feel of the absolute and lasting superiority of the telegraph by wire for the transmission from one country to another of political, commercial, and private communications, the new invention had in the course of a few years made such remarkable progress that it might, nevertheless, in course of time, perhaps, become necessary to reckon with it, not only as a supplementary and auxiliary service, but also as a competitor of the telegraph by wire. The "revenue account" showed that the downward tendency of the traffic receipts had not yet ceased, as they decreased by about £13,200 as compared with 1906. As to expenses, "salaries and wages" had increased by about £6,520, and will continue to grow, the more so, as the enhanced cost of living appeared to have become chronic in Europe. "Expenses of stations, &c.," had increased by about £1,480; "ordinary supervision and maintenance, &c.," had decreased by about £500, and "instruments and cells" by £120. The "maintenance of buildings" had increased by about £1,200, "rates and taxes" by about £1,700, and "travelling expenses" by about £200. "Bank commission" had decreased by about £300, and "sundries" by about £1,700. Altogether the ordinary expenses" were about £8,500 higher than those of 1906. The balance-sheet showed under "assets" that the investments had decreased by about £3,560 on account of drawn bonds. It had been impossible to increase this item, because they had been in exactly the same position in 1907 as in the preceding year, viz., that all the receipts of the reserve fund, and something more besides, had been absorbed by the expenses towards the St. Petersburg-Libau-Denmark cable, &c. The "advances guaranteed by banks" had been reduced by about £55,555, whilst the cash balance had been increased by about £28,000, it being necessary to have funds available, and, lastly, "sundry debtors" had been increased by about £9,000. Under "liabilities" the "reserve and renewal fund" had decreased by about £21,500, on account of the heavy extraordinary expenses. The "dividend equalisation fund" had been increased only by the ordinary interest of its capital, about £14,000. The Board of Directors was, however, happy to be in the position to propose the same dividend and bonus as in the previous year, viz., 20 per cent., of which 5 per cent. has already been paid as interim dividends. The Chairman concluded his speech with expressions of regret for having been obliged on account of failing health to ask for the consent of his colleagues on the Board to his resigning the position of managing director in the course of the present year. The business of the company had gradually developed so much that in the future it would be impossible for one single person to attend to all the details. The Board had therefore decided to substitute for the managing director a Board of Management, composed of several persons who, in view of their personal qualifications and meritorious collaboration with the Managing Director, offered the greatest guarantee for future effective administration of the company.

ISLE OF WIGHT LIGHT & POWER.—The accounts for the year 1907, after providing for debenture interest and loans and preference dividend, show a net profit of £3,190. £2,500 have been transferred to the reserve fund for renewal of plant, £500 written off wiring stocks, and £190 carried forward.

LISBON ELECTRIC TRAMWAYS.—The report for 1907 states that the result of the operations for the past year, after deducting interest and amortisation due on the debentures of "The Companhia Carris de Ferro de Lisboa," and after the payment of £25,000 for interest on the debentures of this company and the payment of London office expenses and directors' remuneration, shows a net profit of £92,805, which, added to £15,711 brought forward, gives a balance of £108,514. From this amount £35,000 has been placed to depreciation, and after writing off £9,077 for renewal of permanent way, the balance of £135,922 is placed to depreciation reserve account. After placing £5,000 to the credit of exchange, there is an available balance of £68,514, out of which the usual preference dividend amounting to £25,555 has been paid, and the directors now recommend the payment of a dividend of 5 per cent. for the year 1907, amounting to £29,709 on the ordinary share capital of £594,188, leaving £13,271 to the credit of profit and loss to be carried forward. Operating expenditure also shows a considerable increase due to the enhanced price of coal and other supplies; but, notwithstanding these drawbacks, the operations of the company during the past year have practically maintained the satisfactory figures of the previous year. Capital expenditure has amounted to £72,271, mainly on additional machinery, rolling stock, cables, and the electrification of the lift on the Elevador Do Carmo. The lease of the Elevador Do Carmo entered into in the previous year has resulted in a fair return being earned on the expenditure incurred. The meeting is on May 15th.

MUSSELBURGH & DISTRICT ELECTRIC LIGHT & TRACTION.—The accounts for the year 1907 show a net revenue, including the balance brought forward, of £3,599. After providing for debenture interest and a 2 per cent. dividend upon the preference shares, there is a balance of £119 to be carried forward. The report makes mention of the fact that the revenue has been affected by the strike in August. At the meeting on Friday the report and accounts were adopted.

NATIONAL ELECTRIC CONSTRUCTION.—The report for the year 1907 shows a gross profit of £29,776, and after deducting expenditure there is a balance of £18,116, to which is added the balance carried forward from previous accounts, making a total of £20,460. The directors recommend the placing of £3,000 to reserve, and after meeting expenses of debenture issue (£2,487), capital charges on town lighting installations (£1,200), debenture redemption fund £1,550), doubtful debts (£500), and depreciation (£673), there is a sum of £9,047 to be carried forward. The report states that the depression that had prevailed during the past year appears to be passing away, and hints at the possibility of commencing some of the concessions which the company secured before the depression set in. The directors anticipate, from negotiations which are now in progress, that at least two concessions will shortly be put into practice. The debenture issue referred to in last year's report was successfully placed. The meeting is on May 11th.

POTTERIES ELECTRIC TRACTION.—The report for 1907 shows capital expenditure of £3,880, mainly on permanent way. The revenue amounted to £111,670, an increase of £2,404 over the previous year, and after deducting expenditure, including £11,381 for debenture and other interest, there is a surplus of £27,874, to which has to be added £616 brought forward. The directors recommend the placing to renewal fund of £5,500, and to depreciation and reserve accounts of £2,500, in addition to a 4 per cent. dividend on the ordinary shares. The amount carried forward is £441. The expenditure upon the improvement, renewal, and repair of the permanent way during the year amounted to £13,773, of which £6,299 has been charged against revenue, and the remainder to the renewals suspension account. An application is being made to Parliament for powers to double any of the existing lines from time to time, as may be required. The meeting is on the 12th inst.

ORIENTAL TELEPHONE & ELECTRIC.—At the annual general meeting held on Wednesday last week, the report and accounts given in our issue for April 23rd were adopted. Mr. B. St. John Ackers, chairman of the company, who presided, stated that the financial crisis in Egypt had not affected the company appreciably, and that, so far from losing ground from that cause, there was very good reason for looking forward to a further considerable access of business very shortly. A lengthy reference was made to the death of the company's chairman, Sir Auckland Colvin, who occupied that position for ten years.

RANGOON ELECTRIC TRAMWAY & SUPPLY.—The report and accounts, which have been made up to November 30th, 1907, in Rangoon, and December 31st, 1907, in Liverpool, have been duly certified by the auditors. During the year 25,000 ordinary shares of £1 each, and 10,000 6 per cent. cumulative preference shares of £5 each, were issued, making the total issued share capital £577,001. The final instalment on these 10,000 preference shares became due on March 26th, 1908. The 25,000 ordinary shares were subscribed for at a premium of £1 per share, and the premium received, £25,000, has been set against the formation expenses, underwriting and brokerage, and costs of share issues, reducing the balance on account of these expenses to £2,606 17s. 11d. Difficulties have been experienced with the machinery, especially the two turbines, causing a delay of several months, and consequent prejudice to the company. It is only recently that these difficulties have been finally overcome, and the company placed in a position to supply a continuous twenty-four hours' service. The machinery is now working satisfactorily. The electric tramway is now completed and running; the final portion of the track (Pootoodoung route, 1·94 single miles) was opened on March 12th, 1908. The measurements are: single track mileage, 24·61; route mileage, 15·95. Notwithstanding that traffic was considerably interfered with during the year, the receipts were very satis-

Digitized by Google

factory, and show steady improvement. Under the agreement with the municipality the number of lamps to be installed in the streets total: arc, 350; incandescent, 1,050. A portion of the lamps were lighted on December 16th, 1907. The manager in Rangoon reports that the whole of the municipal street lamps will be completed and in operation at the end of April, 1908. A partial supply over a limited area was commenced in March, 1907, and a 24 hours' supply is now being given. The demand for energy is increasing as rapidly as can be dealt with by the company. The laying of the necessary mains is, however, a tedious process, as this can only be carried on during the dry season. Including the estimated profits for the month of December, 1907, and after deducting the proportions of the expenses in Liverpool and of the debenture interest chargeable to revenue, the profits amount to £7,664, to which is added £1,775 brought forward from last year. Deducting preference dividend to December 31st, 1907, viz., £9,000, there is a balance to be carried forward of £440. The meeting is on the 14th inst.

SOUTH METROPOLITAN ELECTRIC TRAMWAYS & LIGHTING.—The report for 1907 shows a capital expenditure during the year of £40,580, making a total capital expenditure to December 31st, 1908, of £486,800. The total revenue for 1907 amounted to £51,370, and after deducting expenditure, including £6,000 interest on debenture stock, and providing for payments to local authorities under agreements amounting to £1,230, there is a surplus of £8,477, in addition to £339 brought forward from previous accounts. The dividend on the preference shares absorbs £8,386, and there is a balance of £430 to be carried forward. The traffic receipts upon the tramways and light railways, namely, £41,413, are an increase of £23,688 over those of the previous year. The bad weather experienced during 1907 has adversely affected the traffic receipts, but the increased receipts upon the through service of cars between Penge and Croydon indicate that the facilities thus provided have been appreciated by the public. Likewise, the extension of the London County Council tramway system to the company's terminus at Tooting has resulted in increased traffic receipts on the Croydon-Tooting section. In April of this year a parcels delivery system was inaugurated. The receipts from the electricity undertaking during 1907 amounted to £7,371, against £5,435 for 1906, and after deducting depreciation in respect of a battery sold, to the extent of £469, there is a balance of £2,975, compared with £2,671 for the previous year. The connections at December 31st last represented the equivalent of £43,657 8-c.p. lamps, an increase of 59 per cent. over the previous year. The number of consumers were 603 against 472. The meeting will be held on the 11th inst.

WEST COAST OF AMERICA TELEGRAPH.—At the annual general meeting on Thursday, the report and accounts given in our last issue were adopted. Sir John Denison-Pender, who presided, in explaining the decrease in the gross receipts for the year compared with the previous year, stated that both the local and the international traffic had fallen off. In addition the exchange in 1907 was 11¾d., whereas in 1906 it was 14⅛d. With regard to the increase in expenditure, the main cause of this was due to the earthquakes, which had devastated the country and had necessitated much expenditure in repairs.

Bournemouth Tramway Disaster.—On Friday evening last a car, belonging to the Corporation, with about 30 passengers aboard, left the rails on a curve, after descending a steep hill at a high speed. The car was fitted with hand and magnetic brakes, but apparently all failed to act. The car fell into a garden some 20 ft. below the level of the road. Seven passengers were killed, and nine seriously injured. At the top of the hill the system is changed from the overhead trolley to the underground conduit system. When the car left the rails the plough was left sticking in the conduit. The Board of Trade inquiry was opened on Monday by Major J. W. Pringle. One witness said that he believed that the wheels of the car were skidding. The usual speed down the hill was six to seven miles per hour. Mr. Cecil Barber, traffic manager, said, at the inquiry on Tuesday, that both hand and magnetic brakes were fitted, the magnetic brakes, however, depended on the rotation of the motors for the operating current. After the accident the hand brake was found fixed tightly on the eight wheels; the position of the magnetic brake indicated that it was not working at the time of the accident. One of the four magnetic brake shoes was broken before the car went out, but this shoe was purposely disconnected so as to allow the other three to work. Mr. W. B. Lait, depôt superintendent, who examined the car shortly after the accident, found the barrel of the rear controller in the reverse position, which would prevent the magnetic brakes from working. This controller had been found previously to be defective, but had been repaired. The driver who was on the car all the morning of the day of the accident stated that he had descended the same hill three times and had used both hand and magnetic brakes. Another driver who was in charge of the car in the afternoon, stated that he left it at the depôt at about three o'clock, as the controller was defective. The controller was repaired and the car sent out again. An inspector who was on the car at the time of the accident did not think the wheels skidded during any part of the journey.

PARLIAMENTARY INTELLIGENCE

BLACKBURN CORPORATION BILL.—This Bill, which has been before the Police and Sanitary Committee of the House of Commons this week, proposes under part 3 the borrowing of £9,000 for new tramways, repayable in 20 years, and seeks powers to purchase the Blackburn, Padiham, and Whalley Light Railway, which, when purchased, is to form part of the Corporation tramways undertaking. Powers are also taken to run omnibuses in connection with the tramway service.

NATIONAL PHYSICAL LABORATORY.—An account has been ordered of the receipts and expenditure, with balance-sheet, of the National Physical Laboratory for 1907.

PACIFIC CABLE.—In the House of Commons on Monday Mr. Bellairs asked the Under-Secretary of State for the Colonies whether the estimated loss to the British taxpayer of £62,590 on the Pacific cable for 1908-9 was mainly due to the faulty route selected to the barren rock called Fanning Island; and whether it was practicable, and, if so, would the question be considered in conjunction with the Colonial Governments, to underrun and relay the cables to the shipping port of Honolulu, where the American cables land, so as to benefit British shipping, afford alternative routes by the American cables, and gain a fresh route to the Far East. Colonel Seely, in reply, stated that the estimated loss on the Pacific cable for the year 1908-1909 was £69,000, of which only five-eighteenths, or under £14,000, will fall on the British taxpayer. The route viâ Fanning Island was adopted in accordance with the desire of the Colonial Governments concerned that the route should touch only British territory. In the absence of any suggestion from those Governments, His Majesty's Government do not propose to consider the question of relaying the line so as to touch at Honolulu.

PROGRESS OF ELECTRICAL BILLS.—In the House of Commons last week the London United Tramways Bill was read a second time.

SCOTCH PROVISIONAL ORDERS.—The Tramway Provisional Order of the Ayr Corporation came before Commissioners of the Private Legislation Procedure (Scotland) Act last week. The chairman was Sir J. Dewar, Bart., M.P. The order seeks to extend the Corporation tramway system in a number of directions, with the object of more completely connecting up the various lines now working. There was some opposition by the Glasgow and South-Western Railway Co., but after an adjustment of clauses all opposition was withdrawn, and the preamble was found proved.

Another Order dealt with was that of the Lanarkshire Tramways Co., the purpose of which was to extend the time for the completion of certain tramways authorised in 1903. There was no opposition to the Order. It had been found impossible, however, to finish the work by August 11th, 1908, the time given in the Order of 1903. Another purpose of the Order was to run omnibuses in connection with the tramways, whilst it was also proposed to obtain powers for raising additional capital, and also for additional borrowing powers. The original capital of the company was £200,000, the whole of which had been issued, and of the £50,000 borrowing powers, there have been issued £30,400 in debentures. Under the Order of 1903, an additional share capital was authorised, amounting to £216,000, and borrowing powers to the extent of £72,000. None of the latter had been exercised, and there was an unexhausted balance of ordinary capital amounting to £108,000. The promoters desire to increase the share capital by £153,000, and the borrowing powers by £51,000. The reason for this additional capital, it was stated, was that in the Parliamentary estimates of 1903 the engineers only dealt with the construction of the track and the power-house, but when before Parliament certain other matters were thrust upon the company, which caused a great deal of money. The preamble was found proved.

APPOINTMENTS AND PERSONAL NOTES

The Accrington Corporation have decided that the salary of Mr. A. W. Clegg, Assistant Electrical Engineer, be increased from £150 to £165 per annum, with an additional sum of £10 next year.

Mr. Donald M'Coll, formerly chief assistant in the Accountants' Department of the Glasgow Corporation, has been appointed General Manager of the Shanghai Electric Tramways.

The salary of the Wimbledon Borough Electrical Engineer, Mr. H. Tomlinson Lee, having been increased at the last meeting of the Council from £400 to £500 per year, the Electricity Committee has approved the following increases of salary being granted to other members of the staff:—Mr. R. N. Torpy, deputy electrical engineer, £200 to £225 per annum; and Mr. R. W. Klitz, mains superintendent, £175 to £200 per year.

The following increases in the salaries of members of the staff of the Fulham electricity and dust destructor department have been granted:—N. A. Chesterfield, chief clerk (present salary, £180), £10; T. Welch, assistant engineer (£130), £6 10s.; H. Ellis, assistant engineer (£130), £6 10s.; E. Haywood, assistant engineer (£117), £6 10s.; F. J. White, assistant mains superintendent (£125), £5.

MISCELLANEOUS CITY NOTES

CALCUTTA ELECTRIC SUPPLY CO.—A final dividend at the rate of 9½ per cent. per annum for the half-year to December 31st, 1907, has been recommended. This makes, with the interim dividend already paid, 8 per cent. for the year.

CITY OF BUENOS AIRES TRAMWAYS CO. (1904).—The directors have declared a dividend of 1s. 3d. per share, less tax, for the quarter ended March 31st, 1908.

COMPAGNIE GENERALE DE TRAMWAYS DE BUENOS AYRES.—A statement has been issued by this company, says the *Financial News*, which was formed by Belgian and German capitalists as a tramway trust about a year ago, that the company's capital has been devoted to the acquisition of shares in the Anglo-Argentine Tramways Co., the Capital Traction & Electric Co., the Buenos Ayres Grand National Tramways Co., and the Buenos Ayres Electric Tramways Co. (1901). In addition, the company has acquired the rights to the concessions and all the installations of the Belgo-Argentine Tramways de Buenos Ayres, together with the undertaking, installations, and concession rights of the Buenos Ayres & Belgrano Tramways Co. The price in the latter case amounts to £1,348,000, of which the sum of £1,148,000 has still to be paid. By virtue of the right reserved to it, the Compagnie Générale has decided to pay this balance of £1,148,000 at one time in 1908, instead of making an annual payment of £60,500 down to 1957, but, on the other hand, the company has ceded to the Anglo-Argentine Co. the Belgrano undertaking with all its rights and charges. By reason of the payment of £1,148,000 the Anglo-Argentine Co. will be freed from the date of payment of the annuity of £60,500 which was incumbent upon it. The effect of this cession will be that the Compagnie Générale will become the possessor of 316,000 ordinary £5 shares of the Anglo-Argentine Tramways Co., and in addition to having "B" preference shares, the ordinary shares will assure the company a majority in the Anglo-Argentine Co. The seven tramway undertakings which are sought to be brought under a uniform system of working in Buenos Ayres have a total length of 310 miles, and the duration of the concessions varies from 50 to 91 years.

COVENTRY ELECTRIC TRAMWAYS CO.—A dividend of 3½ per cent. (7s. per share) for the year 1907 is recommended. The sum of £3,900 is placed to reserve for depreciation, and £114 carried forward. The directors propose to apply £4,000 in reduction of the company's indebtedness to the New General Traction Co., Ltd.

EASTERN TELEGRAPH.—The accounts for 1907 show, after making a contribution to the general reserve fund, payment of interest on the 4 per cent. mortgage debenture stock, dividends on the 3½ per cent. preference stock, and 3 interim dividends of £1 5s. per cent. on the ordinary stock to September 30th, 1907, that there is a balance available, to which the directors recommend payments of a final dividend of £1 5s., and a bonus of 2 per cent. (free of tax), making 7 per cent. on the ordinary stock for the year.

RIO DE JANEIRO TRAMWAY LIGHT & POWER CO.—Messrs. Edouard Quellenec and Jean Laval, of Paris, and the Verstraeten of Brussels have been elected directors of the Rio de Janeiro Tramway Light & Power Co., Ltd., to represent the French and Belgian bankers, who have recently taken a large interest in the securities of this company.

MISCELLANEOUS BUSINESS NOTES

EVERSHED & VIGNOLES.—Mr. S. Thomas Pemberton, of Council Chambers, 109 Colmore Row, Birmingham, has been appointed agent to Messrs. Evershed & Vignoles, Ltd., for the Midland counties. He will have his headquarters in Birmingham, and his district will embrace the counties of Warwick, Worcester, Nottingham, Derby, Leicester, Stafford, and Shropshire. Inquiries and orders relating to the firm's measuring instruments, meggers, bridge-meggers, and other manufactures from firms in this district, may be addressed to Mr. Pemberton, and will receive prompt attention.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The public examination in the bankruptcy of A. F. Mander, trading as Mander Bros., and F. M. Mander, Electrical Engineer, &c., late of 62 Victoria Road, and 258 Lovell Road, Aston, Birmingham, took place at the Court House, Corporation Street, Birmingham, last week. The statement of affairs shows a deficiency of £243. In 1906 debtor started business as electrical engineer with a capital of £30. The business was subsequently turned into a limited liability company, with a capital of £1,000, with the debtor as one of the directors. The examination was concluded.

Ernest Noel Owen, Electrical Engineer, 1 Grove Cottage, Hampstead, has been adjudicated bankrupt. The first meeting of creditors will be held on May 11th at 2.30 p.m. in the Bankruptcy Buildings, Carey Street, London, and the public examination will be held at the same place on June 19th at 11.30 a.m.

Singapore Tramways, Ltd., is to be wound up voluntarily, and Mr. G. G. Walker, 19 St. Swithin's Lane, London, E.C., has been appointed liquidator. Creditors are requested to send in claims by June 20th.

MORDEY-FRICKER PREPAYMENT METER.—The Board of Trade has approved of the Mordey-Fricker electrolytic prepayment meter.

SIMPLEX CONDUITS, LTD.—New premises at 16 Corporation Street, Manchester, and 72A Waterloo Street, Glasgow, have been opened by Simplex Conduits, Ltd., where stocks of conduits, cables, fittings, lamps, &c., are held. The telephone numbers and telegraphic addresses remain as before.

VICKERS, SONS & MAXIM, LTD.—The employees of the Electrical Department of Messrs. Vickers, Sons & Maxim, Ltd., held their second dance in Sheffield on Wednesday last week.

NEW COMPANY

PILGRIM HOUSE.—This company was registered on April 28th, with a capital of £14,000 in £1 shares, to acquire certain freehold premises in Pilgrim Street, Newcastle-on-Tyne (part known as "Pilgrim House"), to adopt an agreement with the Right. Hon. R. S. Watson, W. S. Burton, and P. Corder, and to carry on the business of landowners, builders, contractors, suppliers of electric energy, electricians, merchants, financiers, estate agents, &c. The subscribers are:—W. S. Burton, R. S. Watson, P. Corder, W. H. Golding, T. Jameson, J. J. Bramwell, T. R. Hutchinson. No initial public issue. The number of directors is not to be less than two nor more than five; the first are W. S. Burton, R. S. Watson, and P. Corder. Qualification, 100 shares. Remuneration as fixed by the company. Registered office, Pilgrim House, Pilgrim Street, Newcastle-on-Tyne.

TENDERS INVITED.

(*Continued from page* vi.)

CORPORATION OF BRISTOL.

ELECTRICITY DEPARTMENT.

THE ELECTRICAL COMMITTEE will be glad to receive Tenders for the Supply, Delivery and Erection of the following:—

(*a*) D.C. Works Power Distribution Boards at the Avonbank Electricity Works.
(*b*) E.H.T. and L.T. Substation Switchgear for Shirehampton.
(*c*) D.C. Power Switchgear for supply to the Avonmouth Docks.
(*d*) Extension of Galleries at the Avonbank Electricity Works.

Copies of the Specifications and Forms of Tender, together with the necessary drawings, may be obtained from the undersigned on payment of a deposit of Two Guineas for each section (which will be returned on receipt of a *bona fide* tender), on the following dates:—

(*a*) and (*c*) 11th May.
(*b*) and (*d*) 18th May.

The Corporation do not bind themselves to accept the lowest or any Tender.

H. FARADAY PROCTOR,
City Electrical Engineer.

City Electrical Engineer's Office,
Temple Back, Bristol.

COUNTY BOROUGH OF SALFORD.

ELECTRICITY DEPARTMENT.

THE ELECTRICITY COMMITTEE OF THE SALFORD CORPORATION invite tenders for the supply, delivery and erection at the Corporation Electricity Station, Frederick Road, Pendleton, of the following Plant:—Specification No. V. 16, Cooling Towers, Tanks, Pumps and Pipe-work.

Specification and form of tender may be obtained on application at the office of Mr. Victor A. H. M'Cowen, M.I.E.E., the Borough Electrical Engineer, Frederick Road, Pendleton, on payment of a deposit of two guineas, which will be returned provided a *bona fide* tender has been sent in and not withdrawn.

Extra copies may be obtained at 10/- each, which is not returnable.

Sealed tenders endorsed "Tender for Cooling Towers, &c.," addressed to the Chairman of the Electricity Committee, must be delivered at the aforesaid offices of the Borough Electrical Engineer at or before noon on Monday, May 25th, 1908.

The Committee do not bind themselves to accept the lowest or any tender.

L. C. EVANS,
Town Clerk.

Town Hall,
Salford.

MARCONI'S WIRELESS TELEGRAPH COMPANY

AT the annual general meeting of Marconi's Wireless Telegraph Co., on Thursday, Sir Charles Euan-Smith, K.C.B., C.I.E. (chairman of the company), presiding, the report and accounts given on page 665 of our last issue were adopted. The chairman, in expressing regret at the long delay which had occurred since last the shareholders were called together, said that up to the middle of last year political considerations weighed with them mainly in deferring the publication of any details connected with the company's position. The question as to the ratification of the Berlin Convention and the extent to which that ratification would be accepted by foreign Governments was still unsettled, and the Government finally announced their intention of ratifying the Convention. Mr. Marconi was on the point of solving the question of Transatlantic communication. The report and balance-sheet had, therefore, been delayed in order that the directors might be able to state to the shareholders that the main object of their enterprise had been achieved.

Giving a general review of the progress of the company, the chairman referred to the cable companies. It was, he said, not till nine to ten years after the first cable was laid that even a minimum of success was achieved, and at one time it was actually in contemplation to take up and sell at scrap value the cable first laid in the bosom of the Atlantic. The Board could afford to rejoice in the success of the cables, because it was the firm opinion of the directors that there was ample room for the profitable operation of both the wireless and cable services. But the memory of the early difficulties and struggles of the first cable company should afford encouragement to them. But the past, he continued, with all its difficulties, its obstacles, and its disappointments, might now be regarded as finished and done with. The tremendous achievement of regular Transatlantic communication was an accomplished fact. Wireless telegraphic communication with the United States of America was now as easy, and, when the contemplated improvements were completed, would, the directors believed, be as rapid and as easily available as that carried on by the cable companies, the difference being that they hoped to accomplish the service which they rendered to the public at a little more than 50 per cent. of the present cost. Henceforward, all the efforts of the directors would be concentrated on turning to profitable account the enormous advance in all branches, and especially in the transoceanic service. The multiplication of facilities was now merely a matter of expenditure, which, as compared with the results that should be realisable from this multiplication and completion of the system, might be regarded as trivial and insignificant. It was, therefore, in a spirit of confidence that the directors solicited the further support of the shareholders and of the general public for the purposes of exploiting the immense resources that had recently been opened up, and of securing substantial returns. The company had been subjected to some criticism, inasmuch as no profit and loss account was issued with the balance-sheet, as had been done on two or three former occasions. In this they acted on advice given, after prolonged consideration, by their solicitors and auditors. As a matter of fact, they had by the sale of shares and in other ways realised an apparent net profit of over £32,000, which has been put back into the capital account, but as the balance-sheet and report would be looked upon as forming the basis for the issue of fresh capital, it was considered advisable not to put anything before the public which could, in any way, be regarded as laying claim to making regular profits. The progress that had been made in their ship-to-shore business in connection with what is now an established "Marconi Wireless Exchange" had been constant. The change in their policy in February last had been productive of promising results. They had accepted, under certain provisos, the principle of intercommunication, and the Post Office, on their side, had acquiesced in, and promised their most favourable consideration and support to, several very important matters. They believed they would also now receive the support of the Post Office, the Colonial Office, and the Admiralty. The Foreign Office had also recently accorded their support in a matter of great importance in a foreign country, which had secured for us another most promising field of action. The general terms in which he had intimated the friendly intentions of the Post Office had been embodied in a letter from the Postmaster-General, which laid down in so many words his willingness at once to enter upon a favourable consideration of many of the points which were submitted for his consideration. As to their general progress throughout the world, they were now securing profitable business all over the face of the globe, America, Canada, South America, France, Italy, Russia, Belgium, and China having all come to the company for apparatus and installations. Their manufacturing depôt at Dalston was splendidly equipped and designed to meet all foreseen demands, and their training school for teaching wireless telegraphy was accomplishing all that they hoped for when it was first installed. In Paris a receiving office had been opened at the headquarters of La Compagnie Française Maritime et Coloniale de Telegraphic sans Fil, 35 Boulevard des Capucines, where messages could be handed in for transmission by wireless telegraphy to passengers on board such ships at sea as may be fitted with their apparatus. As to Lloyd's, their relations with this great association had now been placed on so satisfactory a footing that they hope to avoid in the future the litigation that has been not infrequent in the past. The directors believed they had acted on the best advice obtainable as to the form which the new increase of capital should take, and it was felt that an issue of preference shares to the public bearing a satisfactory rate of interest would be the best course to pursue. It was unnecessary to enlarge on the fact that the expenditure of this money must place the ordinary shares on a far more satisfactory position than they held at present. The directors had every reason to believe that the 10 per cent. which it was proposed to allot as dividend to them after the payment of 7 per cent. on the preference shares would be easily realised.

Mr. G. Marconi, in seconding the adoption of the report, stated that the transmission of messages between Ireland and America was commenced before the stations at Clifden and Glace Bay were completed. The working of the Transatlantic service during the seven and a-half months since it was inaugurated has in every way confirmed the view which he had long held—namely, that wireless telegraphy could furnish, and would furnish, a new and economic method of communication with America and other far distant countries. The experience gained so far had been sufficient to enable him and his assistants to indicate exactly what modifications and extensions of the present equipment of the stations would be necessary for the continuous operation of the stations on a 24-hour day basis at a high rate of speed. For some months past the majority of messages had been carried out across the Atlantic during the daytime, and no interference whatever with the working of the ship to shore stations had resulted from the long-distance Transatlantic stations. No special attempt had been made, so far, to work at high speed, although he had recently been informed that a speed of 24 words per minute had been achieved in communication from Canada to Ireland. He was confident that with slight modifications of the apparatus a speed of at least 30 words a minute could be obtained.

Quite recently he had carried out some tests with short-distance stations, with the result that duplex working was possible. If this were applied to the Transatlantic stations it should double the effective rate of telegraphing. The Italian high-power station at Coltano was nearing completion. Some delay had been caused by the buildings which the Government had undertaken to construct not being ready in time. The installation of electrical plant was now being proceeded with, and the station would be completer by the end of the year. The Italian Government had also entered into a contract for the construction of high-power stations in Abyssinia, Eritrea, and also on the Somali Coast. It was also hoped by the Italian Government that communication might be carried out with ordinary Post Office or commercial services between England and Italy, and negotiations had been going on between the Italian Post Office and the British Post Office in this connection.

During the course of a short discussion Mr. J. D. Rees, M.P., said the Postmaster-General's attitude towards the company was perfectly friendly. Mr. John O'Connor, M.P., expressed the opinion that the directors had been well advised in accepting the Government's condition. Financial conflicts with Governments were always futile and sometimes disastrous. An extra-ordinary meeting was afterwards held, when a resolution to increase the capital by the issue of 250,000 preference shares of £1 each was carried.

Birmingham Local Section of the Institution of Electrical Engineers.—At the annual general meeting held yesterday, the report of the committee was presented. Owing to the loss sustained by the Institution in the death of Lord Kelvin, the President, the Local Section annual dinner was not held this session. The officers for the season 1908-9 are as follows:—Chairman, Prof. G. Kapp. Vice-Chairman, Mr. R. K. Morcom. Ordinary Members of Committee:—Messrs. V. Bornand, A. R. Everest, A. Lindsay Forster, C. W. Hill, J. P. Kemp, Henry Lea, J. F. Lister, Dr. D. K. Morris, Messrs. A. Pearson, M. Railing, A. M. Taylor, J. C. Vaudrey. Hon. Secretary, Mr. H. B. Matthews. In accordance with the rules governing Local Sections, Messrs. A. H. Bate and W. E. Groves retire from the committee, having served in the same capacity for three years consecutively. These gentlemen are eligible for re-election in 1909-10.

THE MUNICIPAL EXHIBITION

THERE are very few exhibits of electrical interest at the Municipal, Building, and Public Health Exhibition, which was opened on Friday last at the Royal Agricultural Hall. The first exhibit to attract our attention, taking the stands in the order in which they are numbered, was that of Messrs. Mountain & Gibson, Ltd., of Elton Fold Works, Bury, Lancashire. This firm showed several types of traction trucks, and also brakes and sand gear for tramcars. The type of truck supplied by the firm to the London County Council for their new rolling stock is so designed as to allow a large percentage of the weight to the borne by the driving wheels. An entirely new system of brake rigging, adapted to the use of the magnetic brake in conjunction with the hand-operated wheel brakes, has been provided. When the magnetic brake comes into action, the wheel brakes are automatically put into use. The sand gear (Whittaker's) exhibited is of very simple construction, and can be easily fitted to any existing cars. The valve can be operated from either end of the car by depressing a pedal.

The next exhibit of electrical interest was that of the Lahmeyer Electrical Co., Ltd., of 109-111 New Oxford Street, London, W. Apparatus for electrically sterilising water or air by means of ozone is on view. The Otto Ozoniser described in ELECTRICAL ENGINEERING, March 12th, page 392, has been fitted with an improved form of tap in which the contact closing the primary circuit of the transformer is made by the pressure of the water on a tin diaphragm. This is a distinct improvement on the original tap, in which the contact-pieces and wires were exposed. The air ozoniser is constructed on exactly the same principle as the water ozoniser. The air is drawn between the plates between which the discharge is taking place by means of a small fan driven by an electric motor, which, in the case of a continuous-current supply circuit, also operates as a converter supplying the transformer with alternating current.

Messrs. Boulton & Paul, Ltd., of Rose Lane Works, Norwich, exhibited a 1·8-kw. portable paraffin-electric generating set for 65 volts 32 amps. direct current. This set, which runs at a speed of 1,200 r.p.m., is sufficient to supply one hundred 16-c.p. metallic filament lamps. "Chloride" and "Exide" accumulators, manufactured by the Chloride Electrical Storage Co., Ltd., of Clifton Junction, Manchester, are exhibited. The "Chloride" cells are fitted with the patent thin wood separator.

A complete X-ray installation, by Alfred E. Dean, of 82 Hatton Garden, E.C., is on view, and demonstrations are given daily by the staff of the London Hospital. The various methods employed for protecting the operator from the harmful action of the rays are of particular interest. The "Alpha" shield, made of very thick lead glass, effectively cuts off all the rays, except in the one direction, and other protective aprons, gloves, and large screens are on view. Messrs. Heenan & Froude, Ltd., of 4 Chapel Walks, Manchester, exhibit a model of the 100-ton-capacity refuse destructor, as erected for the Wood Green Urban District Council. The principal features of the destructors built by this firm are the undulating construction of the furnace roofs, and the use of steam-driven fans for creating the necessary draught. The air which is taken from inside the building is blown by the fans through heating pipes, and reaches the refuse at a high temperature, thus helping to dry up any moisture and considerably assisting the combustion.

The Tramways Department of the London County Council exhibits a full-size section of the underground construction for their conduit system of tramways. A plough collector complete and one in pieces are also shown. A section model of the "G.B." surface-contact system of electric traction, showing the cable and contact mechanism, is also on view. In connection with the exhibition a municipal conference is being held. A Paper was read yesterday by Mr. Leon Gaster on "Efficient Illumination and Municipal Requirements," and on Monday next Mr. J. S. Dow will read a Paper on "The Measurement of Light and Illumination." Both Papers will be illustrated by demonstrations of various systems of lighting, and several manufacturers of electric lamps are lending lamps and other apparatus for these demonstrations.

NEW PUBLICATIONS

"Questions and Answers in Electrical Engineering." By A. E. Moore and Frank Shaw. (London: Longmans, Green & Co.) 2s. 6d.

"Journal of the Institution of Electrical Engineers," April. (London: E. & F. N. Spon, Ltd.) 5s.

"The Calculus for Engineers and Physicists," by Robert H. Smith. Second edition. (London, Charles Griffin & Co., Ltd.) 7s. 6d.

"Elementary Manual of Applied Mechanics," by Andrew Jamieson. Eighth edition. (London: Charles Griffin & Co., Ltd.) 5s. 6d.

"Science Abstracts," April. Section A, Physics. Section B, Electrical Engineering. (London: E. & F. N. Spon, Ltd.) Price 1s. 6d.

CATALOGUES AND PAMPHLETS RECEIVED

METALLIC FILAMENT LAMPS.—We have received from Messrs. Neville Williams & Co., 11 and 13 Southwark Street, a leaflet containing a price list of metallic filament lamps of British manufacture. These are of the following sizes:—130 volt, 30 c.p.; 50 volt, 16 c.p.; 25 volt, 8, 16, or 25 c.p. A special 25-volt, 15-c.p. lamp is also made for candle fittings. The efficiency is given as 1·2 watts per c.p., and the firm guarantee to replace lamps which break down during the first 100 hours. Another list gives particulars of the automatic transformer switch described in ELECTRICAL ENGINEERING, March 19th, p. 449.

ARC LAMP LOWERING GEAR.—A 44-page catalogue from the London Electric Firm, of George Street, Croydon, deals with the various forms of their well-known "one working part" arc lamp lowering gear. Illustrations and particulars are included of contact devices, counter-weight lowering gear, two-stage lowering gear, stranded wire lowering gear, centre-pole lowering gear, inverted gear, self-sustaining winches, flexible wire rope, guide pulleys, arc lamp brackets, &c. Many of the useful appliances have already been illustrated in ELECTRICAL ENGINEERING.

STORAGE BATTERIES.—A leaflet from the Hart Accumulator Co., Ltd., at Stratford, calls attention to advantages of a new type of separator known as the "Hexite" patent separator, which they are putting on the market.

THE McGRAW PUBLISHING CO.—We have received an interesting booklet from the McGraw Publishing Co. in West 39th Street, New York, describing the large new buildings, where our three American contemporaries, the *Electrical World*, the *Street Railway Journal*, and *Engineering Record* are produced. A complete description of the constructive features of the building and the arrangement of the various departments is given with excellent views of the offices, printing plant, &c., and some historical notes on the development of our great American electrical contemporary.

SINGLE-PHASE MOTORS.—A list is to hand of single-phase motors of sizes ranging from ¼ to 20 h.p., for various voltages and frequencies, which Messrs. E. H. Brook, Ltd., of Colne Road, Huddersfield, have in stock for immediate delivery, together with a price list of standard back gear for fitting to these motors.

The Journal.—Accompanying the last issue (No. 188, Vol. 40) of the *Journal* of the Institution of Electrical Engineers is a most excellent reproduction of a portrait of the late Lord Kelvin, together with a few notes on the life of the late president. The following Papers, with their discussions, both in London and the Local Sections are included: "The Development of Turbo-generators," by Dr. R. Pohl; "Cost of Electrical Power for Industrial Purposes," by Mr. J. F. C. Snell. Two Papers discussed only in the provinces are also given, viz., "Magnetic Oscillations in Alternators," by Mr. G. W. Worrall, and "The Commercial Aspect of Electric Power Supply," by Mr. W. B. Woodhouse.

Claim Against Rand Central Electric Works.—Before Mr. Justice Swinfen Eady, in the Chancery Division of the High Court, on Wednesday, a claim by Mr. Spengel against the Rand Central Electric Works, Ltd., was heard. The question to be determined was the amount for which Mr. Spengel had to prove in the winding-up of the company. He had been appointed general manager of the company, and was to be paid a salary and a further remuneration by percentage on the profits. No question arose now about his fixed salary: the whole question was with regard to his further remuneration. This was to be on the basis of equivalent five per cent. of the surplus net profits of the company. For a time the company carried on business, and in 1907 it was sold to the Victoria Falls Power Co., Ltd. The claimant said that on the sale of the assets the proceeds were more than sufficient in value to repay the capital account, that there was a surplus left, and that he was entitled to a percentage. Plaintiff had an alternative claim. He said that the liquidator, in estimating the profits for the period from December 31st, 1905, to January 31st, 1907, had made a mistake, because he had debited £6 against the profits of the year. His Lordship said the short answer to the first part of the claim was that the claimant had failed to prove that the proceeds of the sale were such as he alleged. As regarded the alternative claim, he was satisfied that the claimant's objection was not well founded. In his Lordship's opinion, the claimant was not entitled to take as the net profit for the 13 months the gross profit. He was bound to allow a proper sum for depreciation, and the £26,000 so-called renewal was, in fact, 13 months' depreciation, and that must be deducted before the net profits were arrived at. The claimant was entitled to £64 6s. 11d., the balance, *plus* £144 12s. in respect of a slip which had occurred. Though in principle the claim failed, the claimant had got something, and his Lordship thought the best course would be to allow him to pay his own costs, and allow the liquidator to take his out of the assets.

SUMMARY

OWING to pressure on our space we have been obliged to hold over a number of interesting letters relating to the suggested use of the term "wire lamp" in place of "metallic filament lamp."

LORD CROMER'S Committee of the House of Lords commenced consideration of the first of the three Electric Power Bills relating to London which have been deposited in Parliament, namely, the London and District Electricity Supply Bill—the Bill known as the Parshall-Hammond Bill. The Hon. J. D. FITZGERALD, K.C., in opening the case for the Bill, said that, now that the London County Council had definitely decided not to introduce another Electric Power Bill, the way was clear for private enterprise. The main feature of the Bill is the low price at which electrical energy is to be sold: £3 per annum per kilowatt of maximum demand, *plus* 0·25d. per unit for untransformed alternating current: £3 10s. per kilowatt, *plus* 0·3d. per unit for transformed alternating current; and £4 10s. per kilowatt, *plus* 0·33d. per unit for direct current. It is proposed that the company shall be empowered to supply direct to all consumers of 250 kw. maximum demand or over, and that for all consumers under this quantity the authorised distributor must supply at a price 1 per cent. above that offered by the power company in respect of each 10 kw. below 250 kw. The object of this clause, Mr. Fitzgerald said, was to do away with the necessity for appealing to the Board of Trade in the case of all small consumers, to determine whether there should be competition, but the promoters offer to agree to the latter alternative, which is the course laid down in a number of existing Electric Power Acts, and is known as the "KITSON" Clause. Another clause in the Bill relates to purchase, and is based upon a tenure of 42 years, at the end of which the company is to be repaid the whole amount of capital expenditure, *plus* any sum that may be necessary to bring the dividends of the company to the equivalent of 6 per cent. if such an amount has not been paid. The clause, however, leaves the question still to be determined by Parliament as to whether purchase shall take place or not, and by whom. Mr. H. F. PARSHALL on Friday dealt with the engineering details of the Bill. The proposal is to erect a generating station at Barking, having a capacity for dealing with a maximum load of 60,000 kw., and ultimately of 120,000 kw. The capital expenditure upon the first stage (60,000 kw.) is put at £2,600,000, and for the completed station £4,270,000. The capital powers of the company are £4,500,000 in share capital and £1,500,000 borrowing powers. The system of generation will be three-phase current at 15,000 volts, and a frequency of 50 cycles. There will be 14 control stations throughout the area,

Digitized by Google

to which duplicate mains will be connected, and these in turn will be connected to transformer stations from which the supply will be given. Tables have been put in showing estimated savings to all the existing authorised undertakers if they were to take the whole of their day load from the power company and deal with the peak loads from their own stations. Mr. Parshall added that the estimates of the undertaking have been based upon contracts which responsible firms will be willing to enter into should the Bill be passed. The general feeling on the part of the opposition is that, in the event of the Bill being passed, the purchase clause should be amended to provide that the undertaking should be liable to purchase in 1931, the date when the existing companies' undertakings are purchaseable by the local authorities, and that the terms of purchase should be upon the basis of the Electric Lighting Acts and not upon the basis of the return of capital expenditure. General objection is also taken to the modification of the Kitson clause which is proposed in the Bill. (Page 721.)

A report on the Halifax tramways system was delivered to the Corporation by Major Cardew and Mr. H. Graham Harris last week. The report says that on account of the adverse physical conditions the system must be kept at the highest possible level of efficiency in order to ensure safe and economical working, and that in the past this level has not been maintained. The use of single-deck cars on the steep gradients is advised, and it is recommended that the emergency and the ordinary braking should be performed by one piece of apparatus. The use of different types of controllers is severely condemned. (Page 736.)

The new plant which has been put down in the generating station of the Central London Railway consists of a slow-speed horizontal cross-compound engine directly coupled to a 2,000 kw. three-phase alternator. In connection with this set a condenser of the barometric type and a brick cooling-tower of special design have been erected. The new plant has been provided partly to meet the extra traffic in connection with the Franco-British Exhibition, for which an extension to the line has been made with a new station opposite the Wood Lane entrance to the Exhibition. (Page 731.)

Illustrations and particulars are given of the new 6,000 kw. Willans-Siemens' turbo-alternator at the Manchester Electricity Works, which generates at 6,500 volts and runs at 1,000 r.p.m. An interesting feature in the design of the alternator is the arrangement of the forced ventilation, which is supplied from a special electrically-driven fan plant. A full load steam consumption of 15·85 lbs. per kw. hour is guaranteed. (Page 735.)

It has been found that filaments of the metal tungsten, which in ordinary circumstances and at ordinary temperatures are brittle and cannot be easily manipulated, become sufficiently ductile to permit of their being drawn into finer filaments, which in turn can be bent or coiled to any shape, if they are heated to a temperature just below red heat. It has also been discovered that by the addition of a certain amount of the oxides of certain of the rarer metals, the resistance of tungsten filaments can be considerably increased without decreasing the life of the filaments. (Page 738.)

We are able to publish the experiences of several engineers who have adopted metallic filament lamps for street lighting. In several cases where the lamps are run in series the average life of the lamps has been much improved by care in pairing them suitably. In those undertakings where the lamps have been in use long enough to enable accurate figures of costs to be arrived at, it is evident that this form of lighting is a good deal cheaper than gas. Experience seems to vary as to the effect on the life of the lamps of enclosing them in globes and desirability of allowing a certain amount of play in the holders to allow of movement in windy weather. In order to avoid the inconvenience of series running, 240 lamps are beginning to be adopted. There are a few complaints as to variations in different batches of lamps, and some engineers have purposely underrun the lamps somewhat with a view to obtaining better life at a slight sacrifice of efficiency. On the whole, however, the life records are excellent. (Page 740.)

In a Paper read before the Institution of Electrical Engineers on Thursday last, Mr. G. F. Mansbridge described the methods employed in the manufacture of electrical condensers. In the author's process, used by the Post Office for manufacturing condensers for telegraph and telephone work, metallic tin, precipitated chemically or electrically from a solution of tin in nitrohydrochloric acid, is mixed with an adhesive and pasted on the paper; after drying, the metallised surface is burnished, and forms a coherent thin metallic film. The paper is then subjected to a high voltage, which fuses away the film of metal surrounding the weak spots in the dielectric. The drying, impregnation and compression of the rolled sheets are dealt with at length, particular stress being laid on the fact that too much pressure, although it increases the capacity, considerably decreases the insulation resistance, and also the resistance to breakdown. The author recommended the use of good paraffin in preference to any other wax for condenser work. In the Appendix to the Paper are given the Post Office and National Telephone Co.'s specifications for condensers for telegraphic and telephonic use. (Page 741.)

Under Electrochemistry and Electrometallurgy we abstract two Papers read before the Faraday Society. The first describes a method for determining the boiling point of very small quantities of liquids. The second deals with the industrial uses of ozone, particularly in connection with the purification of potable water. The plant particularly described is that of Siemens & Halske, who have installations for purifying the water of Paderborn and Wiesbaden, and who have worked out a process which is not only economical but is very satisfactory from an engineering and chemical point of view. We also describe a new alloy for soldering aluminium and aluminum alloys. (Page 745.)

Under Electrical Science, in the British and American Section, appear notes on the theory of graded cables, and on a new theory of gravitation. A report of a Paper on continuous Electrical Oscillations and their application, by Dr. H. Manders is also included. In the Papers abstracted in the Continental Section, Galletti describes a method of producing continuous oscillations from a direct-current dynamo, Doumer advances some novel theorems concerning the electrolysis of hydrochloric acid, Austin describes some types of contact rectifiers, and Baumgardt gives a method of obtaining E.M.F.'s of any desired wave form. (Page 747.)

Among the Patent Specifications published on Thursday last is one by the British Thomson-Houston Co. relating to the manufacture of tungsten filaments. Another by the same company describes an improvement in electrolytic lighting arresters whereby the tendency for single cells to increase in voltage and to over-heat is prevented. A specification by C. O. Bastian and others relates to the substitution of copper or other cheap metal for platinum for the leading-in wires of incandescent lamps. The Siemens & Halske Akt.-Ges. have one concerning the use of twisted filaments in lamp manufacture, and one by J. J. Rawlings and R. T. Smith relates to the

Digitized by Google

strengthening of fuse-wire at the contact ends. According to a specification by THOMAS A. EDISON, the capacity and life of the nickel element of the Edison alkaline cell can be considerably improved by the addition to the electrolyte of a certain amount of lithium hydroxide. (Page 749.)

THE hire purchase wiring scheme which the Manchester Corporation Electricity Committee put before the Council last week has been abandoned, but the scheme for an artesian well for Stuart Street station and other extensions has been approved.—In connection with the dispute between the East Ham and Ilford Councils, Mr. J. B. Hamilton, the tramway manager to the Leeds Corporation has been asked to act as arbitrator to settle the through-running basis.—No fewer than 210 applications were received for the post of electrical engineer to the Watford Council.—A new installation of electro-pneumatic signalling at the Glasgow Central Railway Station was inaugurated last week. The main frame contains 340 levers.—A new arrangement is proposed between the Bath Corporation and the syndicate which was to acquire the electricity undertaking, by which the payment of the purchase-money is to be spread over a number of years. (Pages 751–753.)

THE East Ham Corporation proposes to expend £4,600 on mains, cooling plant, &c.—The Haslingden Guardians propose to adopt electricity for lighting, &c., at the new infirmary.—A condensing plant is required by the Walsall Corporation.—Extensions of tramways at Southend are contemplated at a cost of £14,000.—The Dartford Corporation will shortly invite tenders for condensing plant.—The Local Government Board has sanctioned the borrowing of £64,317 for new works in connection with the West Ham electricity undertaking.—Messrs. Willans & Robinson have secured orders for a large number of condensing plants, including Johannesburg, Durban, Sydney, and Southampton. (Page 753.)

AT a meeing of the Underground Electric Railways Co. of London, on Monday, the scheme for dealing with the profit-sharing notes, which fall due in June, was sanctioned.—Meetings of the Buenos Aires New Tramways Co. and of the Buenos Aires Grand National Tramways Co. are to be held to-morrow to consider resolutions for raising new capital.—At the meeting of the National Electric Construction Co. on Monday it was stated that the receipts from the Dolter Surface Contact Tramways at Torquay average 12·18d. per car mile. The Dolter system at Mexborough and Swinton is to be replaced by the overhead trolley system. (Page 756.)

THE 6,000 kw. (or to be more accurate, 7,050 k.v.a.) turbo-generator which has just been taken into use in Manchester, is the largest generator in the United Kingdom. From the description which we publish on p 735 of this issue, it will be seen that a notable feature is the provision for cooling by means of a motor-driven fan external to the set. This fan drives air through a duct leading to the alternator, to which the air is admitted through an opening in the bottom. The air is subsequently led away from the alternator through outlets communicating with another duct which conveys the air outside the station. To those who have not closely followed the more recent developments in the design of turbo-alternators, the desirability of the arrangement might at first glance not be apparent; yet the appropriateness or, one might say, the necessity of such an arrangement, if the design of an alternator of this size and speed is to conform to generally accepted modern standards as regards heating and voltage regulation, is now quite universally recognised by the leading firms engaged in the manufacture of this type of apparatus. Although the efficiency of the machine is about 95 per cent., this means that the heat developed at full load is in the order of 300 kw. As a rough means of comparison, the number of watts per ton weight of the machine that can be dissipated in heat may be compared. In slow-speed alternators 1 kw. per ton is rarely exceeded, and the high speed of turbo-driven alternators does not, in itself, permit of working the material at higher watts per ton; for in consequence of the constrained dimensions, it requires the utmost ingenuity to provide any liberal amount of air passages through the interior of the machine, whereas in slow-speed alternators the large diameter and small length conspire in providing ample surfaces which are in constant contact with the surrounding air. The weight of the alternator at Manchester is less than 100 tons, so that the rate of 1 kw. per ton is more than trebled in this case, and some artificial means of cooling become absolutely essential. But quite aside from the local heating of the alternator, there is the closely related problem of maintaining the engine-room at a suitably low temperature. In Manchester, it is true, the engine-room is large, but in a works originally designed for turbine plant, an engine-room containing, say, half-a-dozen 6,000 kw. turbo-alternators would be of by no means extensive dimensions, and, were the heat developed in them to be permitted to remain in the room, and in addition to the heat losses in the turbines and other plant, the temperature would become oppressively high. One can thus realise the great advantage of conducting the heated air outside the station through a duct, so that it shall not come in contact with the air in the engine-room, and it is evident that the artificially-cooled turbo-generator must be regarded as more than a passing fashion in dynamo design.

THE London electric power problem is once again being investigated by Parliament; a Committee of the House of Lords, of which Lord CROMER is chairman, commenced on Thursday last consideration of the three Bills which have been deposited this Session. To a large extent, the position is identical with that of the year 1905, when the Administrative County of London and District Electric Power Bill was first promoted, but in some respects the issue is less involved by the withdrawal of the London County Council from the contest. It is, however, even now not a straight fight between two commercial bodies, for the chief opponents to the Bill may be divided into three factions—two groups of existing supply companies, and the Borough Councils with electricity supply stations. The Bill of the London & District Electricity Supply Co. is in substance similar to that of the Administrative Company, with one or two differences in important clauses, *i.e.*, it proposes to give a supply of electrical energy over an area embracing the whole of the County of London, and a large area in the adjoining counties, to authorised distributors, railways, tramways, canals, &c., and to individual consumers taking 250 kw. and over. The second Bill is promoted by eight of the London electric lighting companies, and this has for its object the linking up of the various generating

Digitized by Google

stations and the creation of a Joint Committee to manage the various undertakings as one, while the Bill also schedules a certain area within which practically all the powers sought in the London and District Bill are taken. The Bill also contains clauses enabling other companies, or even local authorities, to come into the Joint Committee if they so desire. The third Bill is promoted by a few of the West-End electric lighting companies, and is a less ambitious "linking-up" scheme, with the object of mutual assistance. The London and District Electricity Supply Bill, the engineers for which are Mr. H. F. PARSHALL and Mr. ROBERT HAMMOND, is being considered first by the Committee, and inasmuch as it proposes to create an entirely new condition of affairs, it may be regarded as the most important. In any Bill of this character the main obstacle to be overcome is how to deal with the large number of existing electric supply authorities in that part of the area which is regarded as the most suitable for power supply. Mr. MERZ took the bold course of dividing the ground into an "industrial" and a "non-industrial" district, and declaring competition practically for all power purposes in the former. The first London County Council Bill was much less heroic, and was confined to supplying the authorised distributors if they required it, and to railways, and so on. This Bill was met with the response from a House of Commons Committee that it was not sufficiently comprehensive, and consequently, in the next year, 1907, a Bill more on the lines of the Administrative Bill of 1905 was introduced, but owing to a change in the balance of political power upon the Council after the Bill had been drafted, it was amended at the last moment to provide for the lease of the Council's powers to a company.

The promoters of the present Bill, therefore, profiting by the experience that has gone before, now propose to supply to all consumers taking 250 kw. or over, and that for all consumers below that amount, the authorised distributor must supply at a price greater by only one per cent. for every ten kilowatts below 250 kw. than the price which the power company could supply the authorised undertaker. In other words, if the authorised distributor refuses to, or cannot, supply at this price from his own generating station, and also refuses to take a supply in bulk to enable him to do so, then the power company may compete. This is an important modification of the "Kitson" clause, which in a number of other power Acts has relegated to the Board of Trade the task of deciding by arbitration when competition should take place between the power company and an authorised distributor in respect of any consumer. Coming to the purchase clause, here again a new proposal is made for the first time. The Bill will leave open for Parliament to decide hereafter whether, and by whom, purchase shall take place at a date not less than 42 years after the passing of the Bill; when this is settled the purchase price is to be upon the basis of the capital expenditure, plus an amount sufficient to give a return upon the capital of six per cent., should this not have been earned by the company. To this many objections have been taken. First, it is contended that the purchase should be upon the terms of the Electric Lighting Acts, as in the case of the London electric lighting companies. The promoters retort that they have a clause limiting the dividends which may be paid upon the ordinary capital to 8 per cent., whereas many of the existing companies have paid much higher dividends, and are allowed to do so under the Electric Lighting Acts. Again, it has been suggested that in the event of the existing companies being purchased in 1931, the undertaking of the power company should be also purchased then. This point of view was put forward by the London County Council, and to judge by Mr. FREEMAN'S questions, the inference is that the County Council is not without hopes that it will be selected as the purchasing authority of all the electric supply companies' undertakings in London when the time arrives. The main opposition is, of course, on the broad principles as to the need for a bulk supply undertaking, and of the equity of allowing the existing authorities, who are admittedly working under legislative restrictions, to be interfered with. With practically the same facts to put before the Committee, the promoters of the Bill have a valuable precedent in the passing of the Administrative County of London and District Electric Power Bill, although it is a feature of Parliamentary procedure that the decision of one Committee in no way binds another Committee. On the other hand, the position of the opposition is considerably stronger than it was in 1905, when most of the supply authorities were somewhat taken by surprise by the boldness of Mr. Merz's methods and doctrines. The position of the Bill, again, is improved by the fact that the London County Council is not now a militant opponent as was the case in connection with the Bill of 1905. Comparatively little progress, however, has as yet been made, and it is understood to be the intention of the Committee to endeavour to evolve a scheme for the solution of the problem from the evidence and facts put before it during the consideration of the three Bills referred to it.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 14TH.

Iron and Steel Institute.

10.30 a.m. Annual Meeting at the Institution of Civil Engineers, 25 Great George Street, Westminster, London.

7 p.m. Annual Dinner in the Grand Hall of the Hotel Cecil.

Institution of Electrical Engineers.

8 p.m. Ordinary General Meeting at the Royal Society of Arts, John Street, Adelphi, London. Paper to be read:—"Switchgear Control Apparatus and Relays for Alternating-Current Circuits," by Dr. C. C. Garrard.

FRIDAY, MAY 15TH.

Iron and Steel Institute.

10.30 a.m. Annual General Meeting at the Institution of Civil Engineers, 25 Great George Street, Westminster, London.

SATURDAY, MAY 16TH.

Birmingham and District Electric Club.

7 p.m. Meeting at the Colonnade Hotel, New Street, Birmingham. Paper to be read:—"Electrical Porcelain" by H. W. Brady.

THURSDAY, MAY 21ST.

Institution of Electrical Engineers.

8 p.m. Meeting at the Royal Society of Arts, John Street, Adelphi, W.C. Paper to be read:—"Recent Progress in Tungsten Metallic Filament Lamps," by H. Hirst.

FRIDAY, MAY 22ND.

Physical Society.

5 p.m. Meeting in the Physics Laboratory, Royal College of Science, South Kensington. Among the papers to be read is the following:—"On the Production of Small Alternating Currents of variable frequency suitable for Telephonic and other Measurements," by B. S. Cohen.

SATURDAY, MAY 23RD.

Junior Institution of Engineers.

Visit to the Avonmouth Docks Works and Electricity Works, Bristol.

Digitized by Google

LONDON ELECTRIC POWER BILLS

A HOUSE OF LORDS Committee, presided over by Lord Cromer, commenced consideration on Thursday of the three Bills relating to the supply of electric power in London, which have been deposited in Parliament this year. The committee is as follows: Lord Cromer (Chairman), Lord Welby, Lord Lytton, Lord Lamington, and Lord Saunderson. Lord Saunderson takes the place of Lord Cobham, who was originally selected. The Bills in question are the London and District Electricity Supply, London Electric Supply, and London (Westminster and Kensington) Electric Supply.

At the commencement, the chairman mentioned the fact that Lord Welby was also a member of the Metropolitan Water Board, which was petitioning against some of the Bills. The committee, said the chairman, did not think, however, that this should deprive them of Lord Welby's assistance on the committee. None of the counsel representing the three Bills raised any objection to Lord Welby remaining on the committee. The Hon. J. D. Fitzgerald, K.C., is leading for the London and District Electricity Supply Bill, Mr. Balfour Browne, K.C., for the London Electric Supply Bill, and Mr. Seymour Bushe, K.C., for the London (Westminster and Kensington) Electric Supply Bill. It was decided to consider the London and District Electricity Supply Bill first, but it is at present not settled whether a decision shall be given on this at the close of the opposition, or whether the decision will be postponed until the evidence for and against all three Bills has been heard.

London and District Electricity Bill

The Hon. J. D. FITZGERALD, K.C., who appears with Mr. Talbot, K.C., Mr. Clode, and Mr. Thomas, said this Bill proposed the incorporation of a company, and to authorise it to construct a large generating station at Barking, in the County of Essex, on the banks of the Thames, and from that to supply electricity in a large area, comprising the whole of the County of London and considerable adjacent districts in Essex, Middlesex, Kent, and Surrey. The supply intended to be given from the proposed station at Barking was, firstly, to authorised undertakers, and, secondly, for power purposes. The Bill was similar in provisions to Power Bills of previous years, but no such scheme had yet been passed for London, although the question of the best method of dealing with the supply of power in London had been before Parliament for four or five years. The present scheme was an attempt to settle the question on workable and business lines, and profiting by the experience of previous years. Of the urgency of the question there could be no doubt. Before dealing with the precise proposals of the Bill counsel briefly sketched the history of electrical legislation, commencing with the Electric Lighting Acts, under which, he argued, all owners of provisional orders were granted them, not as a monopoly, but subject to competition and upon the terms of purchase so far as companies were concerned set forth in the Electric Lighting Act of 1888. In this way, he said, London was now parcelled out between thirteen companies and sixteen local authorities. Having dealt with the general features of the Power Bills in the provinces, the history of the efforts, so far as London is concerned, was reviewed, beginning with the Administrative County of London and District Electric Power Bill of 1905, which was "simply lost by time." In 1906 followed the London County Council Bill, and also the Administrative County of London Bill, but only the former was read a second time and came before a committee of the House of Commons. It was, however, rejected, the committee making a special report, in which they referred to the importance of the subject, and urging that it should not be allowed to drop. In 1907 another Bill was presented by the London County Council, in which it was recommended that the undertaking should be leased to a company. This, however, was not approved by Parliament, and as the London County Council had not provided another Bill, the way was clear for private enterprise to put a scheme before Parliament. Accordingly, the promoters of this Bill presented their scheme as one which would, if sanctioned, give a cheap supply of electricity for all purposes throughout the whole of the area shown on the map. In this area at the present time there were, he said, 66 generating stations, 29 different systems of generation in these stations, and 18 different systems of supply. None of these stations were capable of giving the sort of supply proposed under the Bill; many were badly situated with regard to the supply of coal and water, and in many the plant was obsolete. At the time of the Administrative County of London and District Electric Power Bill the existing companies took up the position that no such scheme was needed, and that they themselves were doing all that was necessary. For all that, however, whilst the Bill was in progress, six of the companies came to terms with the power company, and clauses were inserted by which they agreed to take all additional supply from the power company. The capital expenditure upon the present companies' stations was £47·5 per kw., and of the local authorities £34·2 per kw., or an average of £40·85 per kw. In the station proposed by the present Bill, the expenditure would be from £10 to £12 per kw., and this illustrated the immense saving there was in capital expenditure when generation on a large scale was carried on. The first object of the Bill was to supply electricity to authorised undertakers, but it was quite optional for this supply to be taken. The drawback of there having been no such option in the past was demonstrated by the number of electric power houses which had been erected by railway companies in London, and he would call witnesses from other railway companies who would say that the large capital expenditure involved in having to erect a power station of their own was delaying the working of their lines by electric traction. Of the railway companies which had adopted electricity, the only one that had not erected a power station of their own was the London, Brighton & South Coast Railway, this company having entered into a contract with the London Electric Supply Corporation for a term of years. The other main object of the Bill was to supply factories, and in this connection the promoters were of the opinion that there was an enormous field to be served.

With regard to the price, the second schedule to the Bill, he was informed, prescribed the lowest prices that had ever been put before Parliament in a Bill dealing with the supply of electricity. The second schedule reads as follows:—

SCHEDULE OF CHARGES.

"The charge to be made by the company to any authorised undertaker or to the proprietors or trustees of any railway, tramway, tramroad, canal, or navigation, or to any power user whose maximum demand exceeds two hundred and fifty kilowatts, shall not exceed the following at each point of supply, namely:—(*a*) For a supply of alternating current untransformed at the rate of a fixed sum of three pounds per annum per kilowatt of maximum power required to be supplied, and in addition a sum of 0·25d. per unit for all units supplied to such consumer. (*b*) For a supply of transformed alternating current at the rate of a fixed sum of three pounds ten shillings per annum per kilowatt of maximum power required to be supplied, and in addition a sum of 0·3d. per unit for all units supplied to such consumer. (*c*) For a supply of direct current at the rate of a fixed sum of four pounds ten shillings per annum per kilowatt of maximum power required to be supplied, and in addition a sum of 0·35d. per unit for all units supplied to such consumer."

The average prices now charged by the London Companies, continued Mr. Fitzgerald, varied from 2·47d. per unit to 1d. per unit. It was not unworthy of notice that the St. James, Pall Mall, and Westminster Companies were supplying at the lowest rates in districts which were not industrial at all, where the demand was mainly for lighting purposes, and where the bulk of the income, certainly in the case of the St. James' Company, was earned from electricity for lighting in a purely residential area. Consequently they supplied power at a rate which would not be remunerative if power purposes constituted their main business. Last year the St. James' Co. supplied about 671,000 units at 1d. per power, and over seven million units for lighting at 3·46d. per unit. Consequently it was possible for them, in supplying power in small quantities, to charge at a rate which was not remunerative in itself, but, if the figures of output were reversed, they could not supply the power at this price at all without suffering a loss. As a matter of fact, the chairman of the St. James' Company had admitted this at the annual meeting, when he stated that as long as the supply for power was only 12 per cent. of the whole, and was taken mainly during hours of daylight, it could be regarded in a nature of a by-product, and consequently 1d. per unit was sufficient to cover the extra cost of coal and water for keeping the boilers running, there being no addition to the capital charges. With regard to local authorities, the average price varied from 2·55d. per unit in Stoke Newington, to 0·95d. in West Ham. In only two cases throughout the area did an undertaking have a considerable power load.

Dealing with the most important clauses in the Bill, Mr. Fitzgerald first referred to Clause 52, which reads as follows:—

CLAUSE 52.—CONDITIONS AFFECTING SUPPLY.

"The powers of the company for the supply of electrical energy under this Act shall be subject to the following provisions:—

"(1) Subject as hereinafter in this Act provided electrical energy shall be supplied under this Act only—

(*a*) To authorised undertakers; and

(*b*) To persons requiring a supply for power.

Digitized by Google

"(2) The electrical energy supplied to any authorised undertaker may be used for any public or private purpose for which such undertaker is authorised to use the same, and the electrical energy supplied to any person for power may be used by such person for lighting any premises on any part of which the power is utilised. Provided that where electrical energy is supplied to any person for power within an area in which any authorised distributor is authorised by Act of Parliament or Provisional Order confirmed by Parliament to give a general supply of electrical energy, the energy used by such persons for such lighting purposes shall not in any year, except with the consent in writing of such authorised distributor, exceed twenty per centum of the total amount of energy supplied to such person, and save as aforesaid and as hereinafter provided the company shall not supply electrical energy for lighting purposes.

"(3) Electrical energy shall not, save as hereinafter provided, be supplied under this Act by the company (except to authorised undertakers or to the proprietors or trustees of any railway, tramway, tramroad, canal, or navigation lawfully entitled to use electrical energy, or to any power users whose maximum demand exceeds two hundred and fifty kilowatts), in any area being at the passing of this Act the area of supply of any authorised distributors, except with the consent of those distributors. Provided always that the company may supply electrical energy to any person using or desiring to use the same for power at any premises within the company's area of supply under this Act, if such person is unable to obtain at such premises from the authorised distributors within whose area of supply the said premises are situate, a sufficient supply of electrical energy at a price which does not exceed the price at which the company are supplying, or are willing to supply, electrical energy to such authorised distributors by more than one per centum in respect of each ten kilowatts or part of ten kilowatts by which the maximum demand of such person falls below two hundred and fifty kilowatts.

"(4) Any electrical inspector appointed under this Act may from time to time, and on the application of any authorised distributor, shall enter upon and inspect any premises within the area of such authorised distributor in which energy supplied by the company is used, in order to ascertain whether the provisions of this section are duly observed:

"Provided always that nothing in this section contained shall operate to restrict the exercise by the company of any powers which may be transferred to or become vested in them under the provisions of the section of this Act, of which the marginal note is 'Transfer of undertakings of local authorities and others to company,' or of any powers which may be hereafter conferred upon them by any Act of Parliament or Provisional Order confirmed by Parliament."

In sub-section 3 of this clause, Counsel pointed out a variation of the standard Kitson clause, by which the Board of Trade would not be brought into the question of deciding when an authorised distributor is supplying at a reasonable price. This sub-section provided that an authorised distributor must supply a consumer at a certain percentage above the price which he paid the power company, and which would vary according to the amount of the consumption. In this way they thought they had got over the difficulty, which, it had been represented to them, distributors felt themselves to be in, under the standard clause in which the Board of Trade was appealed to to determine each case on its merits. Supposing, for instance, the price at which an authorised distributor was supplied by the power company was 0·5d. per unit, then if the demand of the power consumer was, say, 200 kw., the authorised distributor would be entitled to add 5 per cent., *i.e.*, 1 per cent. for each 10 kw. below 250 kw. If the demand of the power consumer was 100 kw., they would be entitled to add 15 per cent. to the price paid to the Power Company, and if the demand was only for 50 kw. they would be entitled to add 20 per cent. The result was that no question of arbitration could arise; the whole matter was fixed by the Bill. But the promoters were not wedded to this solution of the matter, and if the committee came to the decision that it would be more desirable to insert the ordinary Kitson clause, they would be quite willing to accept it. The figure of 250 kw. had been fixed as representing a very considerable consumer; in many districts in the area scheduled there would be only two or three such consumers, and in some of the districts no such consumer at all.

Clause 61 limits the dividends of the company to 8 per cent., unless a larger dividend be paid at any time necessary to make good the deficiency of any previous dividends.

Clauses 62 and 63 provide for the investment of any surplus dividends in insurance funds, or reserve funds.

Sub-section 3 of Clause 64 prescribes what, in the event of the undertaking being purchased, in fixing the purchase money there shall be deducted a sum equal to the aggregate amount of the value of the investments and moneys representing at the date of the purchase the sinking insurance and reserve funds, and these funds shall remain the property of the company.

Clause 65 is the purchase clause, and we give it in full below:—

CLAUSE 65. PURCHASE CLAUSE.

The undertaking of the company shall be liable to purchase by any county council or joint committee of county councils, body of trustees, or other public authority or body who may be authorised by Parliament to purchase the undertaking (hereinafter called "the purchasing body") on and subject to the following terms and conditions (that is to say):—

(1) The purchasing body may, on giving not less than twelve months' previous notice in writing to the company of their intention to acquire the undertaking, purchase the same at the expiration of forty-two years from the thirty-first day of December, one thousand nine hundred and eight, upon the terms of the purchasing body paying to the company a sum equal to the amount properly expended by the company upon the undertaking, and chargeable to capital account at the date of the purchase as certified from time to time by an auditor appointed as hereinafter provided, together with such a sum (if any) as would be required to make up the aggregate amount of the dividends paid by the company up to the date of purchase to six per cent. per annum, upon the capital from time to time paid up after deducting from the aggregate of those sums the aggregate amount of the value of the investments and moneys representing the sinking fund and the insurance and reserve funds provided for by this Act.

(2) The purchasing body may also, on giving not less than twelve months' previous notice in writing to the company of their intention to acquire the undertaking, purchase the same at the expiration of any period of ten years, subsequent to the expiration of the said period of forty-two years upon the terms of the purchasing body, paying to the company a sum equal to the amount properly expended by the company upon the undertaking, and chargeable to capital account at the date of the purchase as certified from time to time by an auditor appointed as hereinafter provided, after deducting therefrom the aggregate amount of the value of the investments and moneys representing the sinking fund, and the insurance and reserve funds provided for by this Act.

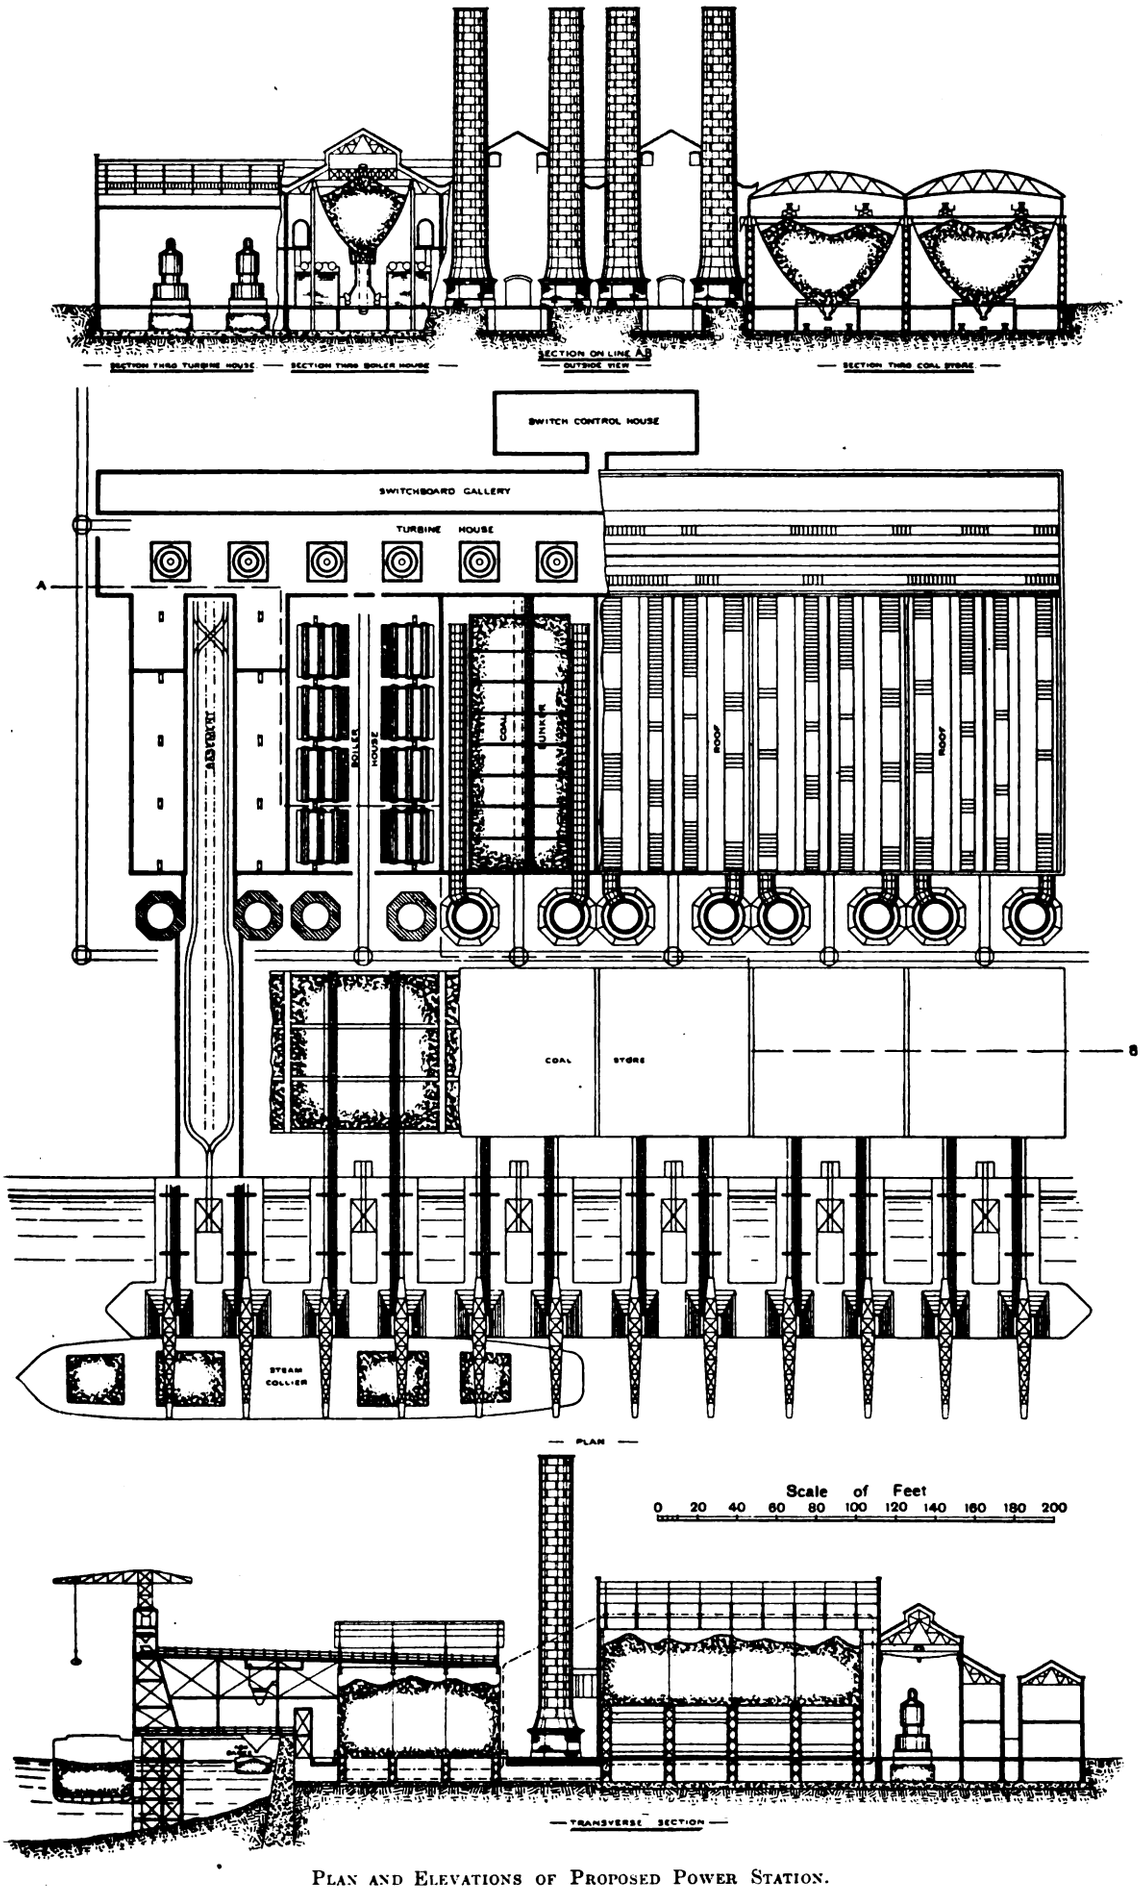
(3) No allowance shall be made to the company for compulsory purchase or for goodwill, or for the prospective or future value of the undertaking.

(4) For the purposes of this section the accounts of the company for each year prior to the date of purchase, including the year in which the purchase occurs, or any part thereof, shall be audited by an auditor appointed as hereinafter provided, and a copy of the accounts as audited shall be filed with the Board of Trade.

(5) The Board of Trade shall, and are hereby empowered to appoint, such person as the Board shall think fit to be an auditor for the purposes of this section, and the remuneration of any such auditor shall be fixed by the Board, and shall be borne and paid by the company in such manner as the Board shall direct.

(6) The purchasing body shall also pay to the company for the materials and stores on hand at the date of purchase a price to be agreed on, or, in case of difference, to be determined by an arbitrator to be appointed by the Board of Trade, and in addition the value of the debts due to the company, the amount of the cash in hand or at the bankers, and securities for money other than those representing the sinking, insurance, and reserve fund provided for by this Act, and the company shall discharge all debts due by the company at the date of purchase and all liabilities with respect to any debenture stock or mortgage debt of the company.

(7) The expression "undertaking" shall, for the purpose of this section, include all rights of generating, purchasing, using, transmitting, transforming, distributing, supplying, and utilising energy, and all other rights, powers, authorities, and privileges of the company, and all such property, real and personal, and all other interests and rights in, to, and out of the property real and personal, and obligations and things in action, as may be in the possession of the company, or belong to them immediately before the date of purchase, and all books, accounts, and documents relating thereto, but subject to all liabilities and obligations of the company other than the debts due by the company, and the liabilities with respect to the debenture stock and mortgage debt of the company.



(8) As from the date of purchase, the undertaking shall be transferred to, and vested in, the purchasing body, and such body shall have, and may exercise, all the rights, powers, authorities, and privileges of the company, and shall, to the exclusion of the company, be subject to all the duties, obligations, agreements, and liabilities of the company in like manner as if they were the company's, except the debts due by the company at the date of purchase, and the liabilities with respect to the debenture stock and mortgage debt of the company.

Hitherto, continued Mr. Fitzgerald, there had never been a purchase clause in a power Bill, but with regard to London there had been a strong feeling that some provision as to purchase at the expiration of forty-two years, or a longer period, ought to be inserted, and Clause 65 has been inserted in the Bill to meet this view. The clause, however, left the question as to whether purchase should take place, to the decision of Parliament hereafter.

Clause 66 allows the Board of Trade to revise the maximum prices charged by the company at the end of five years, and recurring periods of five years.

The capital of the company is to be £4,500,000, with borrowing powers of one-third, making a total capital of £6,000,000.

PLAN AND ELEVATIONS OF PROPOSED POWER STATION.

E

Digitized by Google

The promoters believed they would have no difficulty in raising this amount if the Bill passed in substantially the same form as it was now presented.

Dealing with the petitions, Mr. Fitzgerald said that originally 70 petitions had been presented against the Bill, but only fourteen were appearing by counsel, and the opposition so far as the existing companies and local authorities owning electricity works were concerned was on the grounds of competition. He would, therefore, ask the committee to consider what the competition was going to be. It could not be denied that lighting was the main business of the existing authorities, and so far as this was concerned, the power company would not compete for this to any appreciable extent, or, indeed, at all. With regard to railways which the power company hoped to supply, was brought forward to solve. The main proposal of the London (Westminster & Kensington) Electricity Supply Bill was simply to enable each of the companies mentioned in it to supply each other. The other Bill promoted by eight London companies proposed the establishment of a joint committee to manage their undertakings or any others that might come into the scheme, and in fact it only proposed to do, on a larger scale, what the previous Bill proposed to do. No powers were taken for the acquisition of land or the erection of new generating stations, nor to give a large supply in bulk. That it was not the intention under this Bill to deal with the problem in the same way as was proposed by his own promoters, was proved by the statement of the chairman of the Charing Cross Company to his shareholders this year. In this it was stated that there

Map showing Proposed Area of Company's Operations.

there was no serious competition, because none of them supplied railways for power purposes. With regard to tramways, practically all of them were the property of, and were supplied by, the existing undertakers, so that there could be no competition here. Therefore, it seemed to him the only competition would be for the large consumers for 250 kw. With regard to the smaller power users, they could only supply them if the authorised undertaking was not willing to do so at the increased percentage of charge, mentioned in the Bill, above the rate which they could get the energy from the company. Against this limited competition was to be set the enormous advantage which the authorised undertakings would have of having a large company in their midst, and from which they could get a supply whenever they required an additional supply, and in consequence of which they could save much additional capital expenditure, and at the same time would get the energy at a lower rate than if they generated it themselves. With regard to the petition of the promoters of the other two Bills, he said that he did not regard these Bills as competing with his at all, or as offering any solution of the question which his own Bill was no intention of raising the £1,000,000 for which powers were taken in the Bill, or anything like £1,000,000 at once. A few thousand pounds, the chairman of the Charing Cross Company stated, would, in his view, be sufficient. He thought there was no doubt that sufficient electricity was generated at the present time to supply all needs. If the business was to grow and grow to any great extent, then more capital would be wanted, but at the start, the statement continued, it was believed that it would only be necessary to spend a few thousand pounds, which would be required mostly for mains. This, said Mr. Fitzgerald, absolutely demonstrated that this Bill was not attempting a solution of the question at all.

It may be pointed out that although the North Metropolitan Electric Power Supply Co. and the North Metropolitan Electric Power Distribution Co. are not opposing the Bill in the House of Lords, they reserve their right of doing so in the event of the Bill coming before the House of Commons. The opponents to the Bill appearing by counsel are the following:—The London County Council; Islington Borough Council; City Corporation;

Digitized by Google

Croydon Corporation; West Ham Corporation; City of Westminster; Shoreditch Borough Council; St. Pancras Borough Council; Hampstead Borough Council; Stepney Borough Council; London, Tilbury, & Southend Railway; and the promoters of the other two Bills which are before the Committee.

FRIDAY, MAY 8TH.

Mr. H. F. PARSHALL, examined by Mr. Talbot, K.C., first of all gave particulars of the number of generating stations in the area, together with the different frequencies and pressures, capital cost per kilowatt and cost of generation. He then went on to make a comparison between the proposal of linking up the existing stations and the erection of a new generating station on modern lines. If all the existing stations had to be interconnected the only proper way to do it would be to put in a system of interconnecting mains between the different points and a system of motor generators. This would involve a new system of transforming plant and a new system of mains. The cost of carrying out this interconnection, apart from the obvious engineering difficulties involved, would be, on a rough estimate, about the same as that required for the undertaking proposed in his Bill; thus there would be no saving of capital at all, whilst the result of linking up the stations would be that the scheme thus evolved would not be a comprehensive one. Linking up did not provide for efficient steam generation, for it only made use of the existing steam units, and, as a matter of fact, a great many of these steam units were obsolete, and a number of the stations were burning twice as much coal per unit generated as a modern plant would. The cost of generation would be considerably greater, for it would involve generation at a considerable number of points instead of in one centralised power house. He, therefore, disagreed with the idea that the Bill of the Electric Supply Companies of London was a bulk supply Bill, first, from the engineering standpoint, and, secondly, from the amount of capital which the Bill proposed, namely, £1,000,000. He considered a proper system for London would require the whole of the £4,500,000 proposed by his own Bill, and if the areas of the two Bills were to be compared exactly, he estimated that it would require £3,500,000 to deal with the electric supply companies' proposed area adequately. The intention of the promoters of this Bill was not that all existing stations should be at once scrapped, but that they should be regarded as peak-load stations, with the works of the power company to fall back on for their normal supply. As an example of the feasibility of this, he mentioned that the Niagara Power Plant supplied a great many horse-power hours throughout the year to a number of steam generating plants. He had satisfied himself that there was a much larger demand to be met in London than the electric lighting companies seemed to think. Official returns showed that at the present time there was from 300,000 to 400,000 h.p. of plant not provided for to-day by electricity, and the owners of many of these plants had told him that they did not use electricity because they could not obtain it cheaply enough. Existing companies were handicapped by the purchase clause, and as they approached the year 1931, when they were all liable to purchase, they would not be in a position to put down new plant as freely as they would otherwise. So much did the companies feel this position in 1905 that no less than six of the leading companies made agreements with the Administrative Company to take any extra supply from the power company when they had reached the limit of their existing plant. The terms of these agreements were similar to those proposed in the present Bill, and he saw no reason why the companies should not enter into similar arrangements with his company.

The promoters of the present scheme had arranged it in accordance with the report of the Committee of the House of Commons, which dealt with the London County Council Power Bill of 1906, and stated that a scheme of this nature should be provided either by the London County Council or by some competitive body of promoters. As an instance of the remarkable disparity between the cost of the existing undertakings and the cost of a new undertaking built on modern lines, he mentioned that the land and buildings, exclusive of plant, of the stations now existing in London, had cost £3,900,000, whereas the erection of a station capable of giving a supply equal to that now given could be erected in one spot upon land which could cost less than £500,000. The position of Chicago some years ago was very similar to that now existing in London. There were a number of small stations supplying on low-pressure systems, but the Chicago Edison Co. erected a large central station such as was now proposed, and the result of the smaller undertakings supplying only their peak loads from their own stations was that in ten years the selling price of electricity to individual consumers was reduced 40 per cent. The Chicago company's bulk supply station had approximately the same capacity as the one now proposed, and it had been completed for a sum within his estimates, so that he knew from actual experience what he was proposing to do. The general price in Chicago was £3 per kilowatt and 0·25d. per unit. Some of the petitions against this Bill had raised the question that it was unwise to rely upon one station for the whole supply of a district, but in reply to this he could only point to the large number of stations which he had designed in similar circumstances, and in connection with which no hitch whatever had occurred. For instance, the whole working of the Central London Railway, Glasgow Corporation Tramways, Dublin United Tramways, and the London United Tramways depended upon individual stations for their electrical energy, and no mishap of any kind had ever occurred. Whilst on this point, he mentioned that the plant for the proposed station at Barking had been arranged on what he called the "Bulkhead" system, the station being split up into sections, as shown in the plan on p. 725, the working of each of which was quite independent of the other. The area proposed in the Bill was the same as that settled by the London County Council last year, and comprised 451 square miles, 117 of which were in the county and 334 without. A map is given opposite.

The tables on pp. 726 and 727 show the main estimates for the undertaking.

In a comparison of present costs of generation of authorised distributors, with the prices contemplated under the Bill, Mr. Parshall showed that the total actual cost of generation incurred by authorised distributors during twelve months ending variously on March 31st, 1907, and December 31st, 1906, was £515,000 for the local authorities and £872,384 for the companies, making a total cost per annum of £1,387,989. The total cost at which a similar quantity of energy could have been supplied to the authorised distributors by a bulk supply undertaking at the prices set out in the Bill was £747,917, showing an actual saving of £640,072, which Mr. Parshall emphasised was a generation loss, and consequently would all have been to the advantage of the consumer. With a capital, however, of £9,500,000 already sunk in generating works, he contended it would be unsound to perpetuate this uneconomical state of things by adding to the generating plant in the various existing generating stations, and all future supplies, he contended, could be more economically drawn from a central generating works. Detailed tables were handed in, showing the savings which would accrue to specific authorised distributors from carrying out this plan. In these tables a comparison was made between the extension of the existing works to deal with increasing load and the taking of the supply from the bulk company instead. The price for the bulk supply, which it is estimated would be obtained, are £3 10s. per kw. and 0·2d. per unit for transformed alternating current and £4 10s. per kw. and 0·22d. per unit for direct current. On a total of 43 undertakings these tables showed that a saving of £224,596 would be made by taking the bulk supply, in comparison with the cost of extending the works, to meet a demand based on the growth of the previous year. Other tables showed a saving to 26 selected local authorities of £56,385 in the present generating costs over the costs they would be put to if they closed their works and took the whole of their supply from the power company, and in the case of thirteen companies the saving on a similar basis would be £96,547.

Other tables worked out the price to authorised distributors, or railways, tramways, canals, &c., upon the maximum prices scheduled in the Bill, from which it was shown that upon a 10 per cent. load factor the total price for untransformed alternating current would work out at 1·07d., and for transformed alternating current 1·25d. per unit, and for direct current 1·56d. per unit; on a 20 per cent. load factor the prices would be 0·66d., 0·77d., and 0·94d. per unit respectively; on a 30 per cent. load factor 0·52d., 0·61d., and 0·74d.; on a 40 per cent. load factor 0·45d., 0·53d., and 0·65d.; and upon 100 per cent. load factor 0·33d., 0·39d., and 0·45d. For bulk supply and large power users the prices are worked out as follows:—10 per cent. load factor, untransformed A.C., 1d. per unit; transformed A.C., 1·15d. per unit; direct current, 1·45d. per unit; 20 per cent. load factor, 0·59d., 0·67d., and 0·83d.; 30 per cent. load factor, 0·45d., 0·38d., and 0·63d.; 40 per cent. load factor, 0·38d., 0·43d., and 0·52d.; 100 per cent. load factor, 0·26d., 0·29d., and 0·54d. In another table Mr. Parshall compared the maximum prices scheduled in his Bill, namely, £3 per kilowatt and 0·25d. with £5 per kilowatt, *plus* 0·35d. per unit in the case of the London Electric Supply Bill, both prices being for untransformed extra high pressure. This comparison showed that upon a 10 per cent. load factor the price in the London Electric Supply Bill would work out at 60·4 per cent. higher than those of the other Bill, and varying from this down to 46·6 per cent. in excess in the case of a 100 per cent. load factor.

The generation at Barking will be upon the three-phase alternating-current system at 15,000 volts and 50 cycles. Referring to the frequency of 50 compared with 25 in the Administrative Company's Bill, Mr. Parshall pointed out that this permitted of better generation with turbine drive, and that, in his opinion, had the Administrative Company been promoting a Bill now they would have adopted a frequency of 50, as this was much more in favour than was the case three years ago. The coaling at Barking would be carried on direct from the ocean-going steamers. There would be 14 controlled stations, to which duplicate mains would be connected, but the actual supply to the consumer would be given from transformer stations connected to the control stations. His intention was to lay plenty of ducts when the roads were first opened, so that fresh mains could be drawn in as the business increased without interfering with the roads again. All the estimates, Mr. Parshall stated, had

Digitized by Google

been based upon offers from firms who had expressed their willingness to carry out the work upon certain prices should the Bill be passed.

MONDAY, MAY 11TH.

Lord CROMER, the Chairman, at the commencement of proceedings said he wished to raise a question of some importance to the promoters, to which he did not press for an answer which would cut off the supply of anything to a town, but he would like to hear the opinion of counsel upon these points.

Mr. FITZGERALD, K.C., for the promoters, said he thought he could answer the question at once. The Barking station was arranged in separate units, and the breakdown of one did not interfere with the working of the others. This was the method by which any ordinary contingency would be met. If the committee went further, however, and included the case of warships

Table I.

DETAILS OF THE OUTPUT OF THE PROPOSED BARKING STATION.

Upon these figures are based the Estimates of Capital Expenditure, Revenue, and Working Expenses shown in Tables II., III. and IV.

	Stage A			Stage B		
Total Plant Capacity installed (normal rating)	72,000, kilowatts.			144,000 kilowatts.		
" " " (overload rating)	90,000 "			180,000 "		
Maximum Load on Generating Works	60,000 "			120,000 "		
Power required for loss in Transmission and Transformation at maximum Load	6,000 "			12,000 "		
Maximum Load delivered to Consumers	54,000 "			108,000 "		
Extent to which the sum of the maximum demands reached by individual Consumers at any one time in the year is estimated to exceed the maximum simultaneous load	1·5.			1·66.		
Total of the Maximum Loads reached by individual Consumers at some time during the year	81,000 kilowatts.			180,000 kilowatts.		
ENERGY SOLD :—						
Authorised Distributors –	Kilowatts.	Load Factor. Per Cent.	Units.	Kilowatts.	Load Factor. Per Cent.	Units

immediately. The committee wished to know what would happen in the event of anything occurring which completely cut off the supply from the Barking station. How would London and the whole area get on with regard to electric supply, assuming that the present authorised distributors took advantage of the facilities offered? Supposing we were engaged in a war with a foreign Power, and the mouth of the Thames was left temporarily unguarded; what was going to happen in the event of a foreign warship being able to steam up the river as far as Barking and shell the station? also in the event of anarchists attacking the premises with bombs, or in the event of a strike? He believed that it was a penal offence under the Criminal Law Amendment Act to create a trade combination landing a force and taking possession of the station at Barking, he was afraid the supply would be stopped. Generating stations were substantially required to be in a place where there was a plentiful supply of coal and water. If there were to be more than one station, and the hypothetical ship of war could destroy one, it could destroy the others equally well. Therefore the construction of two stations, one at Greenwich and another at West Ham, as was proposed in the Bill of the Administrative County of London and District Company's Bill, would not alter this condition of things. And the same applied to anarchists. With regard to a strike, this again would equally affect several stations as one, for it would be a strike among the employees of the company.

Digitized by Google

Mr. BALFOUR BROWNE, for the Electric Lighting Companies, said that neither New York, Paris, and Berlin relied on one station. With regard to strikes, although the Criminal Law Amendment Act applied to gas and water companies, it did not apply to electricity.

Mr. PARSHALL stated that Mr. Balfour Browne was wrong with regard to New York. The Riverside station of New York supplied the whole of that district.

Mr. PARSHALL'S cross-examination was then opened by Sir RALPH LITTLER, K.C., on behalf of the City Corporation, who first intimated that his main point of objection to all the Bills was that the City Corporation wished to be excluded.

forward without the City, said that there were a large number of factories whom it would be desirable to supply. He denied that the effect of the Bill would be to postpone the purchase powers of the City Corporation for 42 years.

Mr. BALFOUR BROWNE, for the promoters of the London Electric Supply Bill, first put questions to show that the difficulty of supplying the existing authorities with their varying voltages and frequencies would be as great with the new power scheme as if the existing companies were to link up, but with this Mr. Parshall disagreed. On the question of the cost of linking up, Mr. Parshall estimated that the cost of linking up would be about £40 per kw., including extra generating plant,

Consequently he would not himself ask questions on engineering matters at this stage. Some questions were therefore put bearing upon the need for including the City, and the congestion of the streets in relation to the laying of mains. Sir Ralph Littler pointed out that, in consequence of this, the City Corporation had been granted special powers of control and regulation in the laying of mains.

Mr. PARSHALL, whilst admitting that the scheme could go

which it would be necessary to install if the problem was to be dealt with in an efficient manner. Exact figures were not obtainable, because he did not know in what manner the matter would be dealt with.

Mr. BALFOUR BROWNE pointed out that this figure must be erroneous, because all the companies had land and buildings available for extensions. He failed to see, he said, how the promoters were going to give a supply at a cheaper rate by

Digitized by Google

incurring a capital expenditure of £6,000,000 on top of the £20,000,000 already spent by the companies and local authorities, the interest upon which had to be paid in any event.

In the course of a long series of questions relating to Mr. Parshall's estimate of the amount of other forms of power in factories in the area, viz., 300,000 to 400,000 kw., Mr. Parshall stated that he was unable to give the sources of his information, as much of it was given confidentially. He had also to some extent relied upon information given him in connection with the London County Council Bill last year, and upon a return of the factories in Greater London issued by the Home Office. He had personally visited many factories to satisfy himself of the accuracy of some of the figures given him, and a number of the owners of such factories were going to give evidence as to their willingness to take a supply if the Bill were passed. For instance, Messrs. Bryant & May's had 200 h.p. supplied from producer gas, with which they were by no means satisfied, and although Messrs. Maple's cabinet factory had their own electrical plant, they would come and express their willingness to take a supply from the power company. In arriving at the total horse-power not dealt with electrically in factories, the following allowance in h.p. per head had been the basis according to the different businesses:—Chemical works, 0·75 h.p.; breweries, 1½ h.p.; general engineering, 0·5 h.p.; printing, 0·25 h.p.; builders' materials, 2 h.p.; textile works, 1 h.p. The average power in London was about 50 h.p. per factory.

Mr. BALFOUR BROWNE pointed out that Mr. Merz put it at 50 h.p. in 1905, and if the estimate was coming down he did not see the need of a new power company.

Asked as to the origination of the idea of promoting this scheme, Mr. Parshall said it came about in a general way after the London County Council Bill was rejected last year, and it was decided that the London County Council did not intend to promote another Bill. The promoters are Sir Hugh Bell, Mr. R. W. Blackwell, Mr. Guinness, M.P., Sir Robert Miller, Mr. G. D. Rowe, and Mr. O. H. Smith. As some of these gentlemen are to be called later, Mr. Balfour Browne, who questioned the stability of the promoters, refrained from pursuing the point.

Mr. PARSHALL was then questioned as to Chicago. He said a number of companies combined and built one large bulk generating station, a point which Mr. Balfour Browne suggested was in favour of the Electric Supply Companies Bill. With regard to New York, Mr. Parshall said that the Riverside station dealt with all lighting and power; the Ninety-sixth Street station with the tramways; the "Interborough" station with the underground railway system in its entirety; the Seventieth Street station with the overhead railway system, and another station supplied the New York Central Railroad. In Paris there had been an amalgamation of the electric supply companies. In Berlin there were two stations, and if there were a strike at one of them it would be impossible for the other to maintain the whole of the load, as neither was large enough.

The effect of metallic filament lamps upon the output of stations in the future was next touched upon by Mr. Balfour Browne in an endeavour to show that this would alter the whole effect of the tables of increase in the future, but Mr. Parshall was of the opinion that the tables could very well stand. In reply to another question he stated that all these tables had been prepared from balance sheets. Mr. Balfour Browne upon this pointed out that whereas the tables gave the working costs of the Metropolitan Electric Supply Co. at £50,001 for the year 1906, they were, in fact, only £44,418. To this Mr. Parshall replied that he had been unable to obtain any exact figures from the company, and that he had been obliged to calculate as nearly as possible from the accounts.

Mr. BALFOUR BROWNE: If all your other figures are calculated the same way, I do not quite see their value?—With the exception of a few cases which are indicated in the tables, all the figures are correct.

Dealing with the Board of Trade return of the electricity supplied in London (ELECTRICAL ENGINEERING, February 13, 1908, p. 227), Mr. Balfour Browne pointed out that the average cost for all purposes was 2·839d. per unit, and that, assuming all the savings suggested by the promoters could be effected, the cost would only be reduced to 2·5d. per unit. Mr. Parshall replied that this would be 10 per cent., or £225,000, a quite satisfactory result to himself.

Asked as to whether he had had any experience of a scheme similar to this, Mr. Parshall replied that no one had, but that he had had experience as near to it as possible.

With regard to the cost of the mains system, it was pointed out that the cost of the trunk mains was estimated at £650,000, whilst £937,000 had been allowed for distributors. Mr. Balfour Browne pressed Mr. Parshall for the complete details of this latter, and after some hesitation it was agreed that they should be handed in. Similarly, at the request of the Chairman, Mr. Parshall will prepare a statement giving as much information as he feels he can of the material used in arriving at the quantity of power in London not dealt with electrically.

With regard to prospective consumers, Mr. Parshall said that none of the authorised distributors had been negotiated with, but in view of what happened in connection with the Administrative Company's Bill of 1905, he saw no reason why, in the event of the Bill passing the House of Lords, similar agreements should not be entered into with his company on similar terms. With regard to railway companies, the Central London Railway Co., although it had its own power station, would save £20,000 a year by taking current from the power company, and witnesses would be called to say that the company would be prepared to do this.

Mr. Balfour Browne here stated that the witness had expressed the opinion that the majority of large consumers were inside the County of London, and that people employing several hundred men would come and state their present position with gas engines and other forms of power, and say that if they could get a cheap supply of electricity they were prepared to take it. He wished to make an application to the Committee that the promoters should furnish him with the names of these people in order that his clients might see whether they had not absolutely refused to take a supply on any terms. The whole of the districts of the companies which he represented had been canvassed, and the Committee would hear that many of the power users had refused to take electricity even when offered very low terms

Mr. FITZGERALD, for the promoters, objected to doing this, and said that the proper course was for him to call his witnesses and for the opposition to cross-examine. If it was necessary for any witness to be recalled, he would have no objection.

Mr. BALFOUR BROWNE said that not one of the thirty power companies, working independently of a distribution company, had paid a dividend except the North Metropolitan Power Co. The South Wales Power Co., which was one of the most promising of all had been disintegrated and broken up.

Mr. PARSHALL, in reply to this, said that he had frequently advised people to keep their money out of electric power schemes, and, as a matter of fact, he did this when he was called in to advise in connection with the South Wales scheme. He admitted he had never found it easy to persuade people to find money for these schemes, nor, he added, for any other purpose.

Mr. SEYMOUR BUSHE, for the Kensington and Knightsbridge, and Westminster Electricity Supply Companies, first put questions to show that as the Barking power station of the promoters was eight miles away from his area, it would not pay the company to lay mains into Westminster for the exceedingly small power load which existed. He said that out of 194 persons using power in his area, no less than 145 took electricity from the two companies which he represented, and, as a matter of fact, according to Mr. Parshall's tables, the small power users would have to pay 1·159d. per unit, against 1d. which they were now being supplied at.

Mr. PARSHALL pointed out that the prices in question were the maximum under the Bill, whereas the maximum which the electric lighting companies could charge was 8d. per unit.

Further questions were directed to showing that the clauses with regard to supply in the Bill were so framed as to force existing undertakers to take a supply in bulk from the company on the threat of competition if they did not. To this Mr. Parshall replied that the clauses had been drafted to ensure the small power user getting a supply of electricity at a cheap rate. He admitted that the Bill proposed to deal direct with railways, and with individuals, and that he did not know of any other power Bill which did this.

With regard to supply to authorised undertakers, Mr. Bushe pointed out that in Westminster the local authority happened to be an authorised undertaker, and that the companies carried out the street lighting under contract. In these special circumstances, Mr. Parshall admitted that the power company could compete with the electric lighting companies for lighting. Mr. Bushe also put the possibility before Mr. Parshall of his power company purchasing, say, the London Electric Supply Corporation (at present in competition with the Westminster Company), and so to compete more effectually with the Westminster Company himself, to which Mr. Parshall replied that the consent of the Board of Trade would have to be obtained to any such proceedings.

Mr. BUSHE: In all these circumstances you are not surprised that we look upon your coming with considerable apprehension?—I should have thought you would have looked upon us with considerable pleasure, considering the advantages we can offer you.

Mr. ERSKINE POLLOCK, K.C., cross-examined briefly on behalf of the Middlesex County Council, urging that as the County was already served by two power companies, namely, the North Metropolitan Electric Power Supply Co., and the Metropolitan Electric Supply Co., it should be excluded from this Bill. Mr. Parshall refused to strike out Middlesex.

Mr. FREEMAN, K.C., on behalf of the London County Council, indicated that his opposition to the Bill was with regard to certain clauses, and that if these were not amended to meet his wishes he should ask for the Bill to be thrown out. He asked Mr. Parshall if it would not have been possible to have provided a schedule of prices for small users, with a condition making it compulsory upon the company to supply them on their agreeing to take a supply for a certain definite period.

Mr. PARSHALL thought this was by no means an impossible question, and promised to consider it.

Digitized by Google

Mr. FREEMAN next intimated that the London County Council was in favour of the Kitson clause in its original form in preference to the modified one in the Bill.

Mr. PARSHALL said that personally he had no very great objection to the Kitson clause, but he had come into contact with hardly anybody who was in favour of it.

In answer to other questions, Mr. Parshall said that there was no intention of desiring to pay 8 per cent. interest on capital during construction, and that if the drafting of the Bill permitted of this it would be altered.

Mr. FREEMAN next dealt with the purchase clause. The purchase clause in the Bill of the Administrative Company was, he said, on the terms of the electric lighting Acts, namely, the payment of the then value of the plant, &c., without any allowance for goodwill. The promoters in this case stipulated for the return of their capital expenditure and a sufficient sum to bring their dividends up to 6 per cent., if such an amount had not been paid. Why, he asked, should not the established law be followed in this case?

Mr. PARSHALL said he did not know that there was any established law on this point, as no power company was liable to purchase.

Lord WELBY said that the difference between the two clauses was that the administrative company's clause prevented purchase of obsolete plant, whereas this clause did not.

Mr. FREEMAN said there was no obligation in this case to keep the plant in proper condition.

Mr. PARSHALL said the clause would not be fair if the plant was not maintained in proper working order.

Mr. FREEMAN, in referring to the fact that the existing electric lighting companies were purchasable by the local authorities in 1931, asked Mr. Parshall if, assuming a purchasing authority was created to acquire all the existing companies and wished to acquire the undertaking of the power company at the same date, did he think he ought to have such an amount for goodwill as would represent the period between 1931 and the expiry of the forty-two years, in the proposed purchase clause.

Mr. PARSHALL said that the difficulty was the great uncertainty as to what the "then value" meant. This made all the trouble in financing undertakings. The promoters thought the "then value" should mean the money properly spent on the plant providing it had always been maintained in good working order.

Lord WELBY suggested that there should be a definition of "properly expended" in the purchase clause, based upon what any first class firm of accountants would allow as having been properly spent on the undertaking.

Mr. FITZGERALD said he read this as "properly expended" on capital account, and it was not an auditor's duty to go into this at all.

Mr. FREEMAN said he wanted to make quite sure that when the time for purchase arrived, the purchasing authority would not be required to pay for machinery which, although perfectly properly bought at the time it was purchased, would then be obsolete, and ought to have been renewed some years ago.

Mr. FITZGERALD said that in no previous power Bill had a purchase clause been inserted. If the promoters had followed the precedent they would have promoted their Bill without any purchase clause, but in regard to London there seemed to be a strong opinion that there ought to be a purchase clause. If they proceeded on the basis of the water and gas companies, they would get profits, whilst there would at the same time be taken into account the question of obsolescence. With regard to electric lighting, the existing companies which were purchasable at the "then value" of their undertakings had been paying 10 per cent., 12 per cent., and 14 per cent., quite properly, but against this the promoters were asking only for limited dividends. The promoters regarded this clause as a much better one for all concerned than the terms of the electric lighting Acts. For instance, assuming that at the time of purchase there were £5,000,000 of capital paying 10 per cent., the purchasing authority would make an admirable purchase. The promoters were not departing from any ordinary practice in this matter, but were making a concession that had not been asked of any promoters of any power Bill that had been passed. With regard to the Administrative Company's Bill of 1905, this was brought in on the footing of an ordinary power Bill, and it passed Lord Camperdown's Committee of the House of Lords without any purchase clause in it. On second reading in the House of Commons it was opposed, and during the second reading debate a Member of the House, who was authorised to speak for the promoters, agreed to assent to a purchase clause being inserted. Consequently, the Bill passed the House of Commons Committee with a clause which was not, as had been stated, similar to the terms of the Electric Lighting Acts, nor was it the same purchase clause as it was now proposed to insert.

Mr. FREEMAN asked that the clause contained in the Bill of the Administrative Company of 1905 should be inserted in this instance.

TUESDAY, MAY 12TH.

Mr. FITZGERALD, referring to the question of strikes, mentioned by the Chairman yesterday, stated that, although there would be no objection on the part of the promoters to the insertion of a clause making it a criminal offence on the part of an employee to strike and cause a cessation of supply, he thought this must be brought about by a public Act of Parliament and not in a private Bill. With regard to the estimate of horse-power in London, about which there was so much discussion yesterday, he mentioned that this was based primarily upon the return of the Home Office to the London Traffic Commission, and also upon information acquired by the London County Council as the authority under the Factories Act with regard to means of escape from fire. It was this latter information to which there was an objection to publication. The object of the estimate was to show that there was a large demand in the area not already catered for.

Mr. WEDDERBURN, K.C., on behalf of the Croydon Corporation, put several questions to show that the promoters were asking for powers which the existing distributors did not possess, and which would enable the promoters to compete unfairly with the existing distributors.

Mr. FITZGERALD, for the promoters, said that all the provisions of the Bill were substantially the same as in all power Acts, and that the provisions of Electric Lighting Provisional Orders were always different. All the standard clauses of Power Bills were settled years ago by Sir James Kitson's Committee.

In answer to another question, Mr. Parshall thought the financial promoters of the Bill would have no objection to the insertion of a clause stipulating that a certain proportion of the capital must be raised in cash within a certain period of the passing of the Bill.

Mr. BLENNERHASSETT, K.C., for the Westminster City Council, in the course of his cross-examination, indicated that the Council had the right to purchase not only the seven companies supplying electricity in their area under the Electric Lighting Acts, and also upon similar terms, but also the bulk supply station of the Central Electric Supply Co. Consequently, Westminster, being in this exceptional position, the Council should be cut out of the area in so far as the power company should not give any supply there except to the Council, should they desire it. Mr. Parshall, asked if he would agree not to attempt to purchase any of the undertakings serving Westminster without the Council's consent, and so not to prejudice the Council's right of purchase, said he would prefer to leave this in the hands of the Board of Trade.

Mr. MORTEN, for the West Ham Corporation, directed his questions to the large number of docks, railway stations, and power users in that district, all of which the power company could compete for. He also pointed out that in certain cases, unless the Corporation supplied at exactly the present works cost, they would be compelled to take from the power company. Mr. Parshall said if they obtained a supply cheaper than they could generate it for themselves, it would be a good thing for the consumer. On the question of breaking up tramways, it was pointed out that the Bill exempted the general law with regard to breaking up streets. Mr. Parshall said it was not intended to break up streets for laying mains without the consent of the Corporation.

Mr. FITZGERALD offered to give a protecting clause for the tramways.

Mr. A. B. CAINE, for the Marylebone Borough Council, went through the history of the purchase, by the Council, for the portion of the Metropolitan Electric Supply Co.'s business, for £1,125,000, on arbitration terms, of which, he said, the useful plant only represented £200,000, leaving about £1,000,000 for goodwill. Was it fair, under the circumstances, that this power company should come in and compete? In common with all other cross-examining counsel, Mr. Caine disputed the accuracy of the figures in the tables in so far as they related to his district, and endeavoured to show by his questions that the savings to the various authorised distributors, indicated in the tables of the promoters, did not, in fact, exist. On the other hand, Mr. Parshall maintained that the figures, which were based on the latest published returns, were correct. Mr. Caine also raised the question as to whether the "standby" clause in the Bill was applicable to an authorised distributor, and that it might possibly happen that the power company would, seeing that all authorised distributors could be held to have a separate supply, refuse to supply upon the schedule of prices. Mr. Parshall, however, expressed his willingness to supply an authorised undertaker during his peak load upon the same terms as during the day time.

In reply to Mr. COURTHOPE MUNROE, for the St. Pancras Borough Council, Mr. Parshall agreed, if it could be shown that the Power Company offered no present or prospective advantage to the power users in that area, that the committee would be justified in saying they should leave St. Pancras alone. On the question of prices, Mr. Munroe pointed out that immediately after the passing of the Administrative Bill in 1905, St. Pancras adopted the prices in the Bill. Following on this, Messrs. Scott & Middleton, who were constructing a tube railway station in the borough, and were using current day and night, asked to be taken off the 1d. per unit, and put on the same terms as those in the Administrative Bill. The result was that the price worked out at 1·9d. per unit, and they came to the Council, cap in hand, and asked to be charged 1d. per unit. In another case the price to the same firm worked out at 2·1d. per unit.

Digitized by Google

Similarly, Messrs. Moy's, Ltd., asked to be taken off the 1d. per unit flat rate, but their price worked out at 1·57d. on a 10·2 per cent. load factor. At Oetzmann's, also, instead of 1d., on Mr. Merz's scale, the price came to 2·1d. per unit on a 6·7 per cent. load factor.

Lord SAUNDERSON pointed out that, according to the tables, as the load factor increased the price decreased, and that these cases were low load factors.

Mr. MUNROE said the large number of power users in London had a low load factor, and his object was to show that, inasmuch as the charges in the present Bill were similar to those of the Bill of Mr. Merz in 1905, no benefit would be conferred upon St Pancras, and therefore that district should be omitted.

Mr. PARSHALL said he was not surprised at the results given by Counsel upon such load factors. With regard to the case of the tube railway construction work, it had always paid to put down independent plant for these purposes.

Mr. WILLIAMS, for the Stepney Borough Council, suggested, in his cross-examination, that the reason for the promoters taking five years in which to acquire the necessary land for the generating station at Barking was that the financial position was doubtful. The land, he said, was in the hands of one owner, and the matter could be very quickly settled. Mr. Parshall asked Counsel to wait until he had heard the financial evidence.

At the end of a long series of questions on matters of detail, and many references to the agreement entered into between the Stepney Council and the Administrative Co. of 1905, Mr. Fitzgerald, for the promoters, said that if Mr. Williams would submit a clause on the lines of that of 1905, he would be prepared to consider it.

To Mr. SAUNDERS, for the Islington Borough Council, who was endeavouring to ascertain how much must be added by the authorised distributor to the price paid the Power Company before distribution, Mr. Parshall said that, as an abstract theory, it did not follow that anything need be added, and yet a profit might be made. The authorised distributor had the benefit of the better load factor, and the difference between the station load factor and that of the consumer left a margin of 20 per cent. to 25 per cent. Mr. Saunders said the average difference between the consumer's load factor and the station load factor in Islington was two per cent. or three per cent. Another point raised by Counsel for Islington was that the purchase clause of the Bill was precisely the one first proposed by the promoters of the Administrative Bill, and that this was rejected by Sir James Kitson's committee in preference to the one finally accepted, which was upon the terms of the Electric Lighting Acts.

This closed the cross-examination.

WEDNESDAY, MAY 13TH.

Mr. PARSHALL was re-examined by Mr. Fitzgerald, and Mr. R. Hammond gave evidence in support of the Bill. A full report will appear in our next issue.

THE REPORT ON THE HALIFAX TRAMWAYS

MAJOR CARDEW and Mr. H. Graham Harris, who were recommended to the Halifax Corporation by the Institution of Electrical Engineers and the Institution of Mechanical Engineers respectively for the purpose of conducting an inquiry on the working and management of the Corporation tramways, particularly with regard to the safety of the public, delivered their report to the Corporation on Thursday last. The tramways at Halifax are on the overhead trolley system, and have a total length of route of thirty-seven miles, representing fifty-two miles of single track. Steep gradients are very much in evidence, the gradient on some portions of the route being as steep as 1 in 9. It will be remembered that in October last year a serious accident occurred in Halifax, due to a car getting out of control and running backwards down a gradient of 1 in 10 on Pye Nest Road (*see* ELECTRICAL ENGINEERING, Vol. II., pages 669, 694, and 735, and for the complete report of Lieut.-Col. E. Druitt on the accident, see the same volume, page 1023). With reference to the difficult conditions of the tramway system, the present report says:—

"Generally speaking, it may be said that your tramway routes are bordering upon the limit of possible safe working by electric cars fitted with ordinary flanged wheels running on grooved rails; for not only are the gradients steep, but the hills are long and with many curves, and the exudations from the soil and deposits from the air and from other traffic frequently produce a greasy surface on the rails. Safety can only be secured, even with every possible mechanical safeguard and with the most careful regulations, by constant and unremitting attention to the maintenance of the efficiency of every working part of the cars and stock, including also that of the human element of "drivers" and "conductors."

It is pointed out in the report that such a system as that of Halifax must necessarily be somewhat more expensive as regards working costs than a system in which there were fewer heavy gradients, but the expense in the case of Halifax appeared excessive. Attention is drawn to the increase in the consumption of energy per car mile over those of previous years, and also to the increase in the number of accidents. It is also stated that the undertaking has not been maintained at the level of perfection which was essential to economy and safety. The following is an abstract of that part of the report containing the recommendations of the experts:—

With regard to the permanent way, the joints should be properly anchored in all cases where relaying is undertaken, and granite setts should be used exclusively in the paving of all steep grades exceeding 1 in 20, and of curves of short radius. The surface of the rails on all steep grades should be washed and swept, and for this purpose a tank car sweeper is recommended. The cars are stated to be of fairly suitable design and size, but single-decked cars are recommended, the increased height of the centre of gravity with double-decked cars being distinctly prejudicial to the efficiency of the brakes. It is strongly urged that no cars with covered upper decks (of which pattern the Corporation possess two) should be allowed to run on the routes with steep grades. Emphasis is laid on the point that all controllers should be absolutely similar in their modes of working (it will be remembered that the braking movements for the two controllers on the car which ran back in October were quite different). According to the report the Corporation have in use controllers of five different patterns. The motions of most of these types are similar on the forward steps, but for braking the movements were entirely different. Dealing with brakes, Major Cardew and Mr. Harris strongly emphasise their opinion that every car should be fitted with an efficient emergency brake and an adjustable brake for continuous use, and that these brakes should form one piece of apparatus. The latest form of "Spencer" track-brake fulfilled the necessary conditions more satisfactorily than any other brake which the Corporation had in use, but it requires to be handled promptly and by a skilled driver. A satisfactory magnetic track-brake is more rapid and powerful than any hand-brake could possibly be. An improved form of sand-gear is recommended, which would not only deliver the normal quantity of sand under normal conditions, but would also in emergencies deliver a much larger quantity in front of the wheels, whether the car were running forward or backward, and which could be operated from either end of the car.

On the question of upkeep and repairs, the report runs as follows:—

"We would most strongly impress upon the Committee the necessity for more careful attention to the upkeep and cleaning of the motors and all accessories than appears to have been exercised in the past. Numerous motors under repair were shown us in which there was evidence of damage caused by the motor having been allowed to run too long without attention. These remarks also apply to the rheostats, cut-outs, wiring, and electrical and mechanical equipment generally."

Glasgow Local Section of the Institution of Electrical Engineers.—The annual report of the Glasgow Local Section of the Institution of Electrical Engineers, which was submitted to the general meeting last Tuesday, records the holding during the session of six meetings, and the discussion of three Papers, two of which had previously been read in London. The membership of the section shows a steady increase, and now numbers 294 (including 83 students). Among the social functions held during the session have been the annual dinner and a smoking concert. No further nominations have been received for office-bearers for the next session beyond the list already given (ELECTRICAL ENGINEERING, April 30th, page 667), so that these gentlemen are duly elected. The Glasgow students' section has held six meetings, and had three visits to works, &c.

Assessment of Wakefield Tramways.—In the House of Lords on Friday last, the case of Wakefield Corporation *v.* Wakefield and District Light Railways Co. was heard before the Lord Chancellor, Lord Macnaghten, Lord James of Hereford, and Lord Atkinson. This was an appeal from a decision of the Court of Appeal, which affirmed an order of the King's Bench Division, dated April 10th, 1906. The justices for the city of Wakefield held that certain of the Tramway Co.'s lines laid in streets in Wakefield should be assessed at their full net annual value. The King's Bench Division reversed this decision, holding that the lines should be assessed at one-fourth part only of their net annual value, in accordance with Section 211 of the Public Health Act, 1875. Their lordships affirmed the judgment of the King's Bench Division and the Court of Appeal, and the appeal was dismissed.

THE CENTRAL LONDON RAILWAY

New Generating Plant and Shepherd's Bush Extension

A LARGE new generating set, complete with special condensing plant and a new cooling tower, has just been added to the equipment of the power-house of the Central London Railway, of which, owing to the courtesy of Mr. H. F. Parshall, we are able to publish some illustrations and interesting details. Before, however, setting forth the actual particulars of the new plant, a few facts concerning the existing plant, working of the railway and the circumstances which led up to the necessity for extensions will not be out of place.

The railway was opened for traffic in August, 1900, and, as is well known, is worked by direct current supplied from a number of sub-stations along the route, which in turn receive their supply from the generating station at Shepherd's Bush in the form of three-phase alternating current at 5,000 volts and at a periodicity of 25 cycles per second. The principal sub-stations are at Notting Hill Gate, Marble Arch, and the Post Office, and at these points are placed at the bottom of the lift shafts. There is also a fourth sub-station at Bond Street, which is situated at the surface, and which acts as a stand-by, this being necessary owing to the space at the other sub-stations being too limited to accommodate the required spare plant. The position of the Bond Street sub-station is approximately at the middle of the line, and the whole of the railway can be supplied from this point in cases of emergency. It also serves as a distributing centre for the lighting of the tunnels and the working of the lifts. The sub-stations

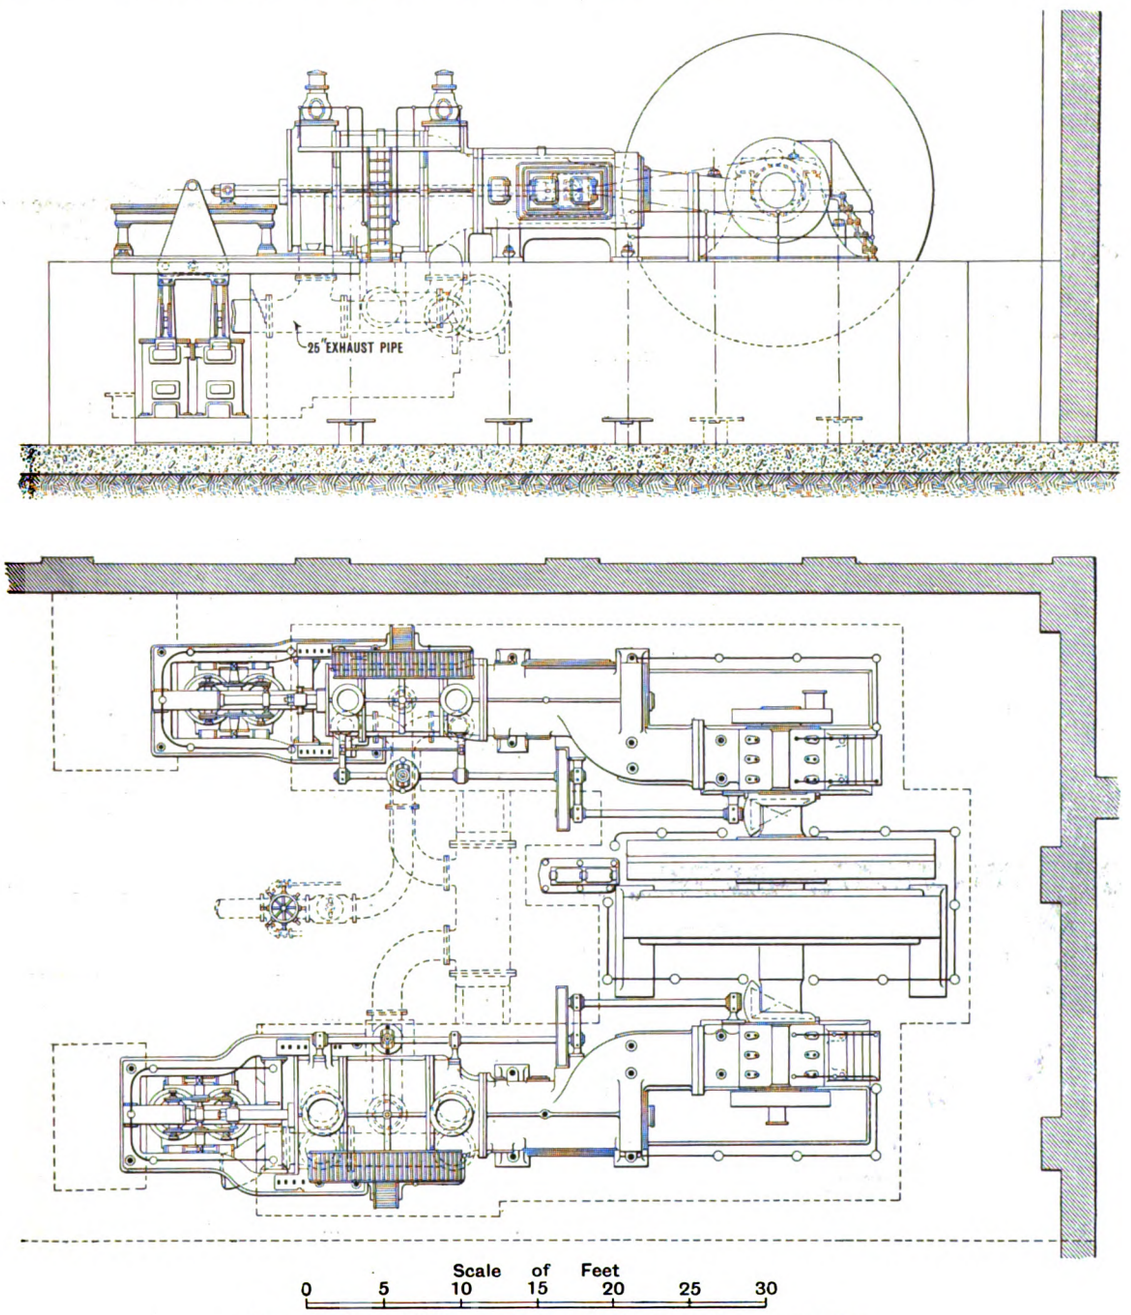

FIG. 1.—NEW 2,000 KW. MUSGRAVE-B.T.-H. GENERATING SET.

Digitized by Google

are equipped with static transformers, which transform the current from a pressure of 5,000 volts to 330 volts, and with rotary converters, which receive the three-phase alternating current at a pressure of 330 volts and convert it to direct current at 500 to 550 volts for supply to the collector rail.

This system of generation, distribution, and working the railway is that which has since been adopted by the Metropolitan District Railway, the Metropolitan Railway, the Great Western Railway, and by the newer tube railways in London, and may practically be regarded as the standard system throughout the world wherever the service is a severe one involving frequent stops and rapid acceleration. This system for this purpose is claimed to be the most reliable, the cheapest in first cost, and most economical in operation. The problem of long-distance traffic is, of course, essentially distinct.

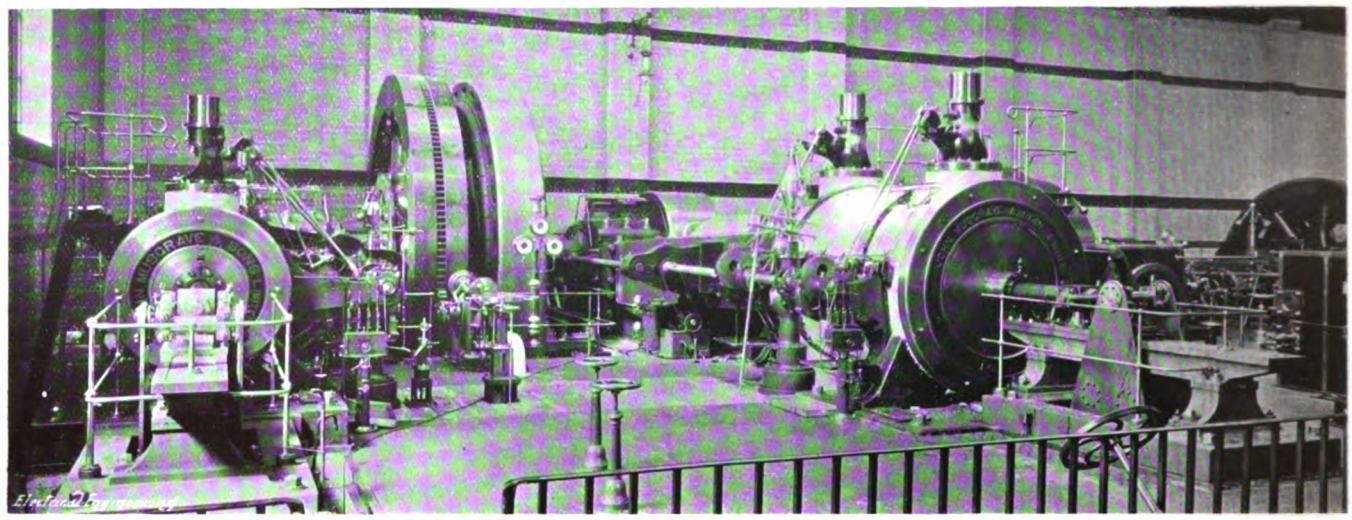

FIG. 2.—NEW 2,000 K.W. MUSGRAVE–B.T.-H. GENERATING SET.

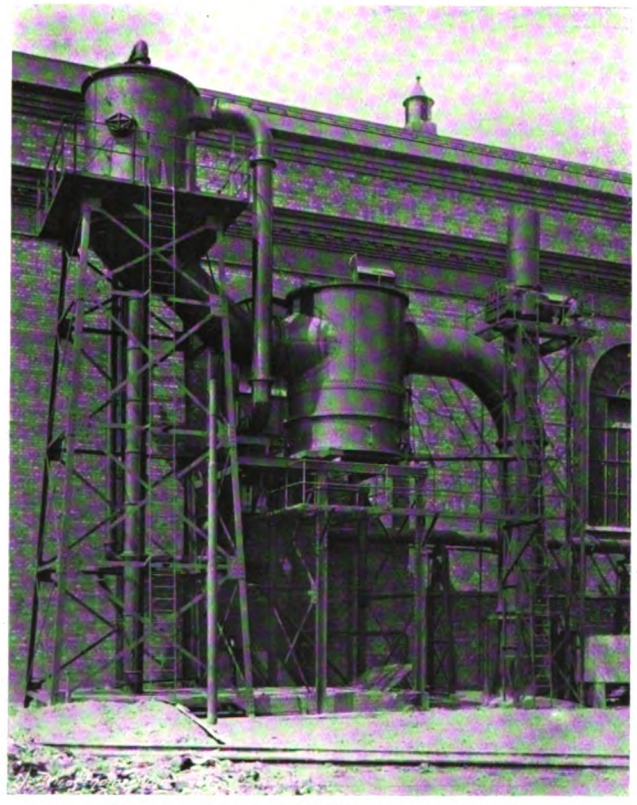

FIG. 3.—BAROMEIRIC CONDENSING PLANT.

The following is a table showing the cost of operation per train mile, per car mile, and per ton mile, together with the percentages for 1905, that is for the year during which the extensions were decided upon. The figures for 1907 are still better; the total cost of operation was 6·848d. per train mile, made up of 3·991d. charged against generating station, 0·412d. charged against sub-stations, 2·2d. against locomotion, including motor-men's wages, inspection, lighting and repairs to motor-cars, and 0·245d. for superintendence. Stated in percentages the generating station costs are 58·28 per cent., sub-station costs 6·01 per cent., locomotion 32·13 per cent., and superintendence 3·58 per cent. The total cost of running the line for the year 1907 was 2s. 10d. per train mile, including management, rates, and taxes. It will be seen, therefore, that the toal cost of operation in terms of the total cost is 20·1 per cent. The generating station costs are 11·7 per cent., sub-station 1·2 per cent., and locomotion expenses 6·5 per cent. It should be particularly noticed that the sub-station costs are a very small proportion of the whole cost of running the line.

service, higher acceleration, and consequently increasing the maximum load on the power-station. The maximum load in 1902 was 3,850 kw.; in 1903 this was increased to 4,000 kw.; in 1904, 4,500 kw.; in 1905, 4,600 kw., with a momentary load of 6,000 kw. The capacity of the generating station before the installation of the new plant was 5,100 kw. in six units of 850 kw. each, so that the margin of plant capacity was insufficient for the safe and efficient working of the line.

With a view to meeting any further increase in the load, and to provide for the additional traffic anticipated in connection with the Franco-British Exhibition, an additional unit of 2,000 kw. was considered advisable, this size being determined by the load during the slack hours, and arrangements were made for installing a unit of this size, complete with condenser, pumps, cooling towers, &c.; extensions were not, however, required in the boiler house. A drawing of the set is given in Fig. 1, and Fig. 2 is reproduced from a photograph taken just before its completion.

The engine was built by Messrs. T. Musgrave & Sons, of Bolton, and is of the horizontal cross-compound type, with cylinders 38 and 74 in. in diameter and 52 in. stroke, developing 3,000 I.H.P. normal load at 83 revolutions per minute, and capable of 50 per cent. overload and 100 per cent. momentarily when supplied with steam at 150 lb. pressure and exhausting to a vacuum of 26 in. of mercury. The bearings are each 28″ diameter by 54″ long; the crank shaft is 34″ diameter in the largest part; the flywheel is 20′ 6″ in diameter, 2′ 8″ wide, and weighs 120 tons, 75 tons of which are in the rim; the crank pins are 10″ diameter by 12″ long, pressed into crank discs 6′ 10″

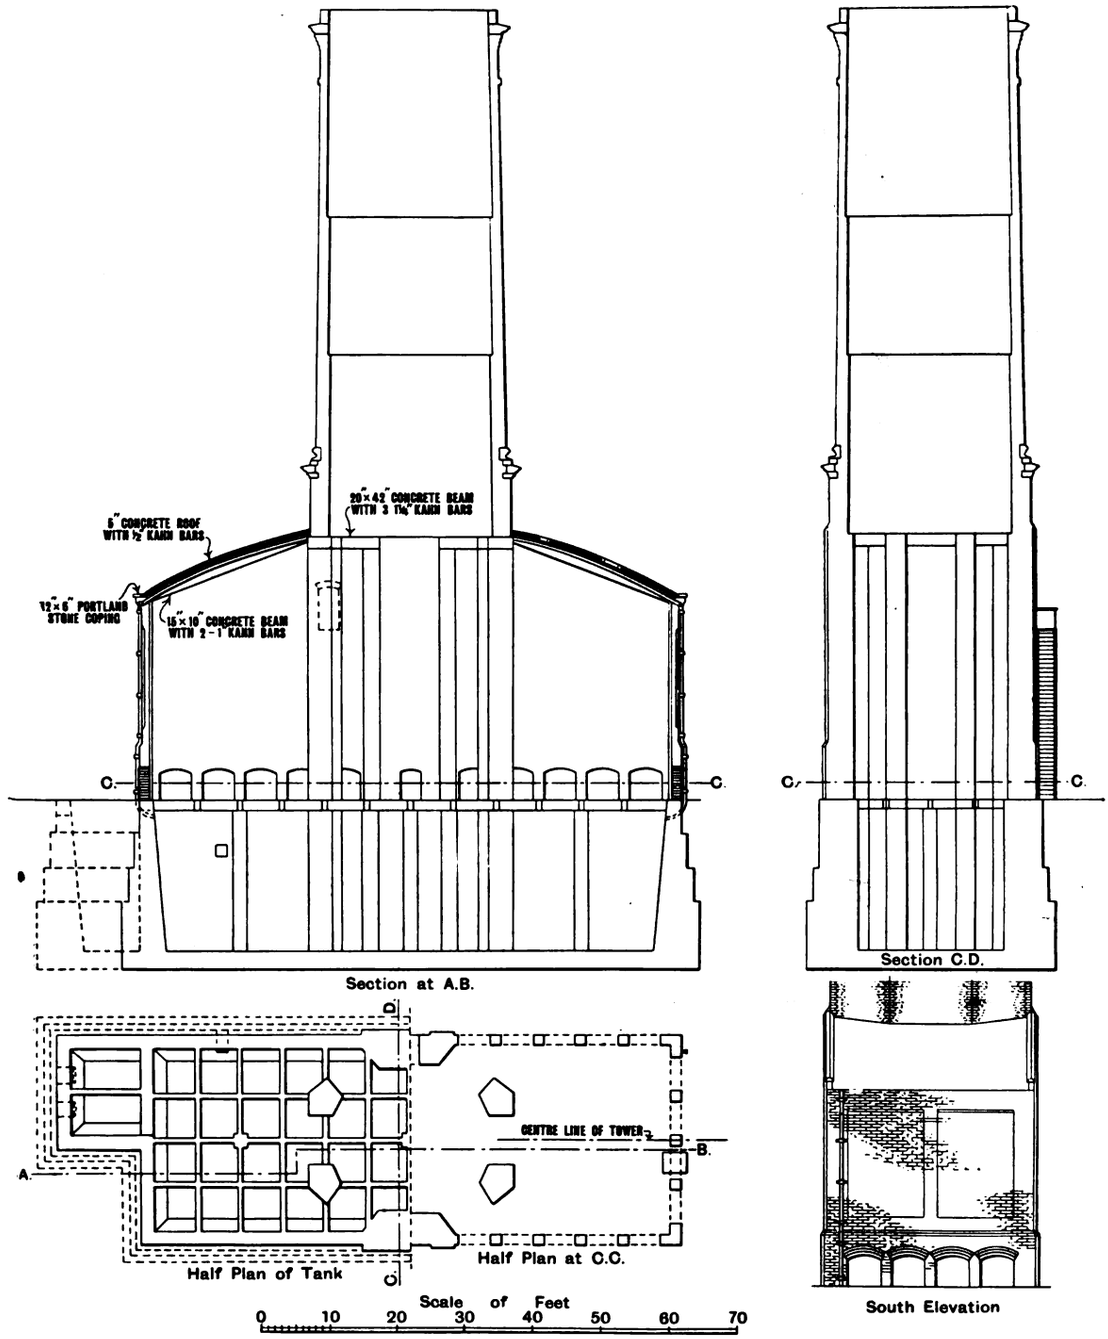

Fig. 4.—Plan, Sections, and Elevations of Cooling Tower.

Digitized by Google

diameter by 13½″ wide. The connecting-rod is six times the length of the crank. The total weight of the engine is 320 tons. Drop valves of slightly different design are employed on the two cylinders.

The alternator is a three-phase revolving-field machine, manufactured by the British Thomson-Houston Co., of Rugby, and rated at 2,000 kw. normal, 3,000 kw. for two hours and 4,000 kw. momentarily when running at 83 r.p.m. at 5,000 volts and 25 cycles per second. It is mounted on the engine crank-shaft between the bearings and on the L.P. side of the fly-wheel. The total weight of the alternator is 60 tons.

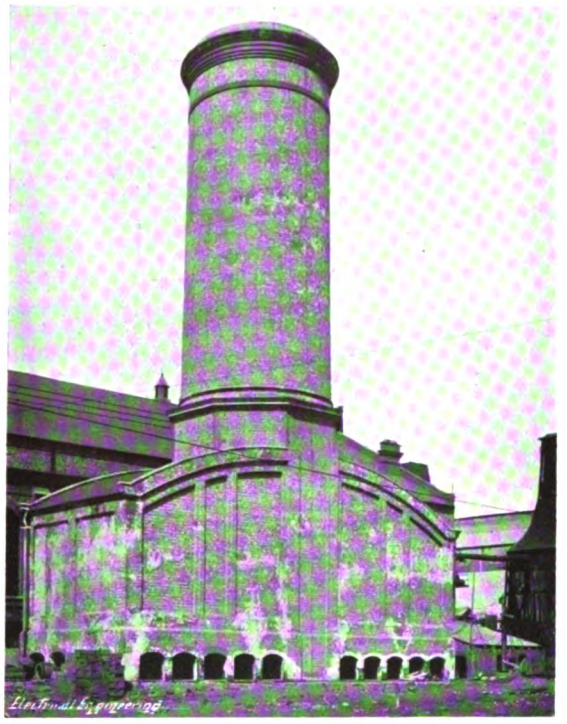

Fig. 4.—Brick Cooling Tower.

The engine exhausts through a 26″ pipe to a barometric condenser placed outside the engine-room, and shown in Fig. 3. This plant was supplied by the Mirrlees-Watson Co., of Glasgow. The condenser is of vertical counter-current design, with a volumetric capacity of 530 cubic feet; it is fitted with a series of trays and baffles for distribution of the cooling water, and so arranged that the water is prevented from entering the exhaust pipe, while ensuring the thorough mingling of steam and water. The air is drawn from the highest point of the condenser and passed through a separator on its way to the air-pump. The water is drained from the condenser by a tail pipe of 15″ diameter leading to a hot well beneath the condenser. An oil separator is inserted in the exhaust pipe immediately in front of the condenser, and the oil from the exhaust is withdrawn by a small steam pump and lifted to a large separating tank.

The cooling water is circulated by means of pumps situated in the basement and driven from the tail rod of the main engine. The water is drawn from the hot well beneath the condenser and delivered through a "Venturi" water meter to a specially designed cooling tower, constructed to deal with 200,000 gallons of water per hour. The tower is shown in Figs. 4 and 5 and is a brick tower of the natural draught type, provided with a chimney 24′ diameter and 115′ high, the building itself being 79′ 3″ long by 30′ 9″ wide, and fitted with an elaborate arrangement of triangular slats. The water enters a main trough at a height of 26′ from the foundation, the trough running centrally the whole length of the building; from this trough the water flows into smaller troughs, branching at right angles and on either side of the main trough. The water leaves these smaller troughs through short lengths of galvanised gas tubes, situated at intervals along the bottom, and falls upon small flat galvanised

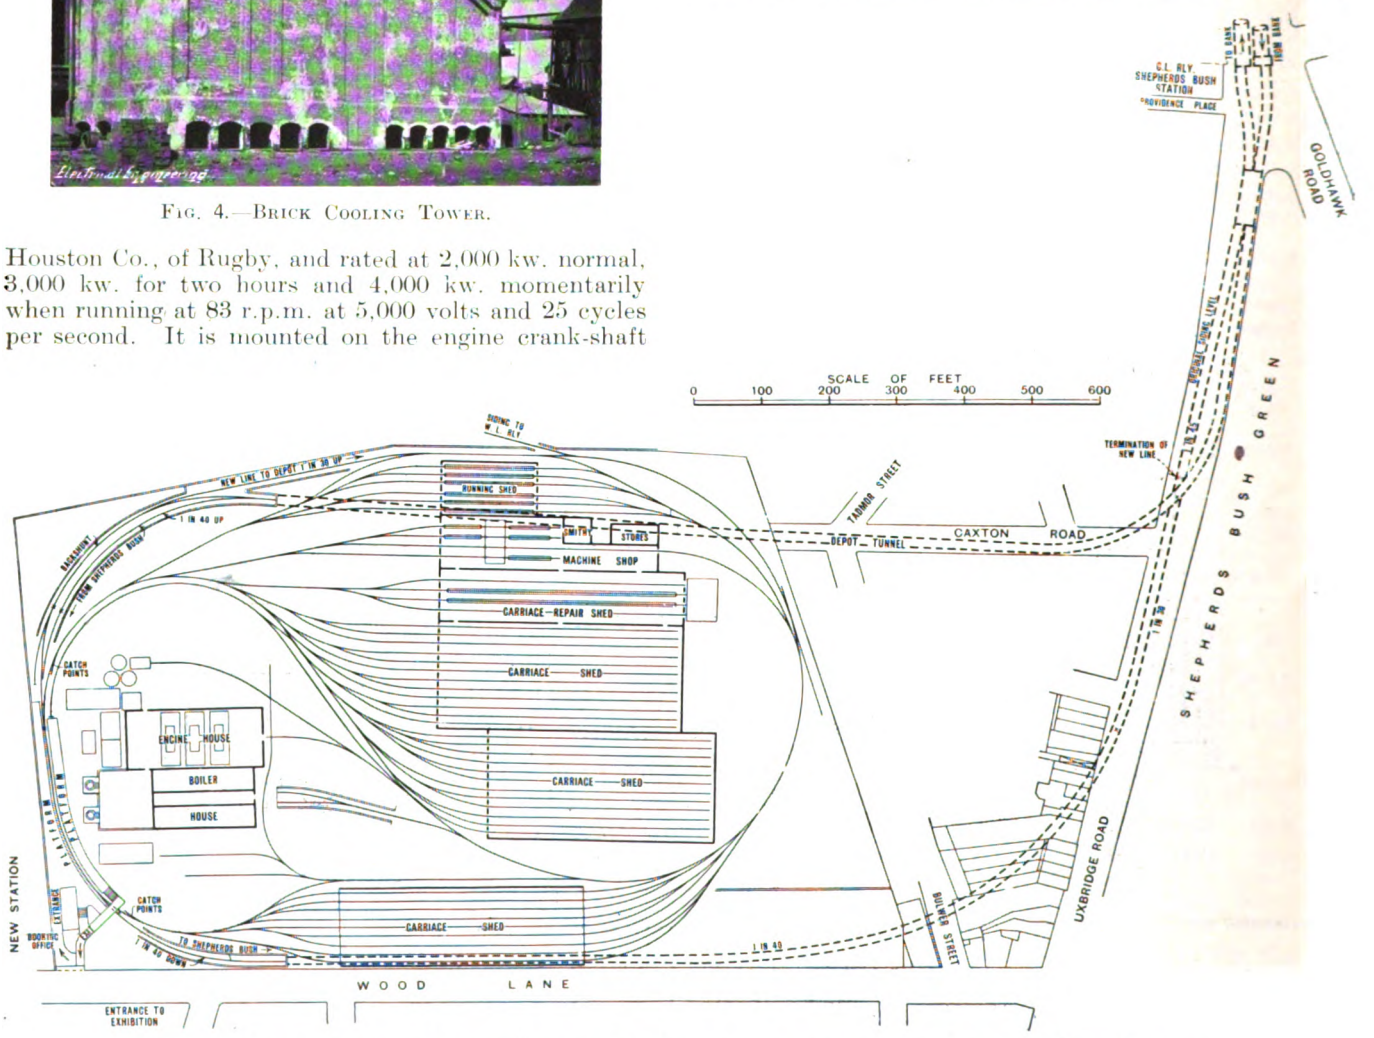

Fig. 6.—Plan of Central London Railway Depôt, showing extensions of Line and New Station.

Digitized by Google

steel plates placed directly beneath the tubes. Upon striking the plates the water is divided into spray, after which it falls upon triangular laths, which are staggered and arranged so that each gets its proper share of water. The whole arrangement is such that the water is split up and distributed evenly over the whole of the irrigation area, thus utilising the whole of the cooling surface and obtaining the maximum cooling effect.

No iron parts are used in the construction, all nails being of copper, and the distributing apparatus is supported on a substantial pitch-pine framework. The water falls into a concrete tank forming the base of the cooling tower; the air is admitted through small openings situated at the ground level in the four walls of the tower, the necessary draught being produced by the chimney above referred to.

This tower is the only one of its kind in the country. The whole of the interior fitting was carried out by Messrs. Balcke & Co., and the contractors for the actual brickwork were Messrs. J. Jarvis & Sons, Ltd. Many of the details of the construction and arrangement are due to Mr. Parshall, under whose supervision the designs were prepared.

We have already referred to the special arrangements which the Central London Railway Co. have made to deal with the special traffic in connection with the Franco-British Exhibition. Although there is an entrance to the exhibition in Uxbridge Road, close to the original Central London terminus, it was decided to construct an extension to the line and a new station opposite to the Wood Lane entrance of the exhibition, by the use of which passengers will avoid having to walk through the 900 yards of covered way connecting the Uxbridge Road entrance with the exhibition proper. The extension has been arranged in the form of a loop, through which all the trains will be run, avoiding the shunting, which was formerly necessary. A general plan of the extension is given in Fig. 6. The trains arriving at the old Shepherd's Bush terminus will proceed to the surface by the original tunnel leading into the depôt yard up a gradient of about 1 in 40 to the curve at the extreme end of the company's ground and the new station marked in the plan. From here a new piece of line leads down an incline, also of about 1 in 40, to the new length of tunnel just completed, which, after a slightly stiffer gradient under the Uxbridge Road, leads to the main tunnel towards the Bank. The tunnel is of the usual cast-iron tube construction, and neither it nor the new track equipment call for any particular remark, except that near the point where the new tunnel dips under the original depôt tunnel, a short length of the original siding tunnel was lowered and has now an elliptical section. The station platforms and most of the line from where it leaves the depôt tunnel are directly under the overhead covered way, forming part of the Franco-British Exhibition and connecting the Uxbridge Road and Wood Lane entrances.

In conclusion, we wish to express our thanks to Mr. Parshall for having given us full particulars of the new generating plant, and also to Mr. Basil Mott, under whose direction the extensions of the line were carried out, and to Mr. E. P. Grove, chief engineer to the Central London Railway, for affording facilities to our representative.

NEW 6,000 KW. TURBO-ALTERNATOR AT THE MANCHESTER CORPORATION ELECTRICITY WORKS

We are now able to illustrate the fine new turbo-alternator which, as mentioned in our last issue, was formally started by the Lord Mayor of Manchester at the Stuart Street Electricity Works last week. Although the turbo-alternator is the largest yet built in this country, it cannot be regarded as an experiment. It was mentioned at the dinner which followed the inaugural ceremony, that the alternator is practically a replica of one at the Vienna Electricity Works; it has, however, been built in this country, at the Stafford works of Messrs. Siemens Bros.' Dynamo Works. The turbine, although the largest that Messrs. Willans & Robinson have built, follows the same lines as those previously manufactured with success by the

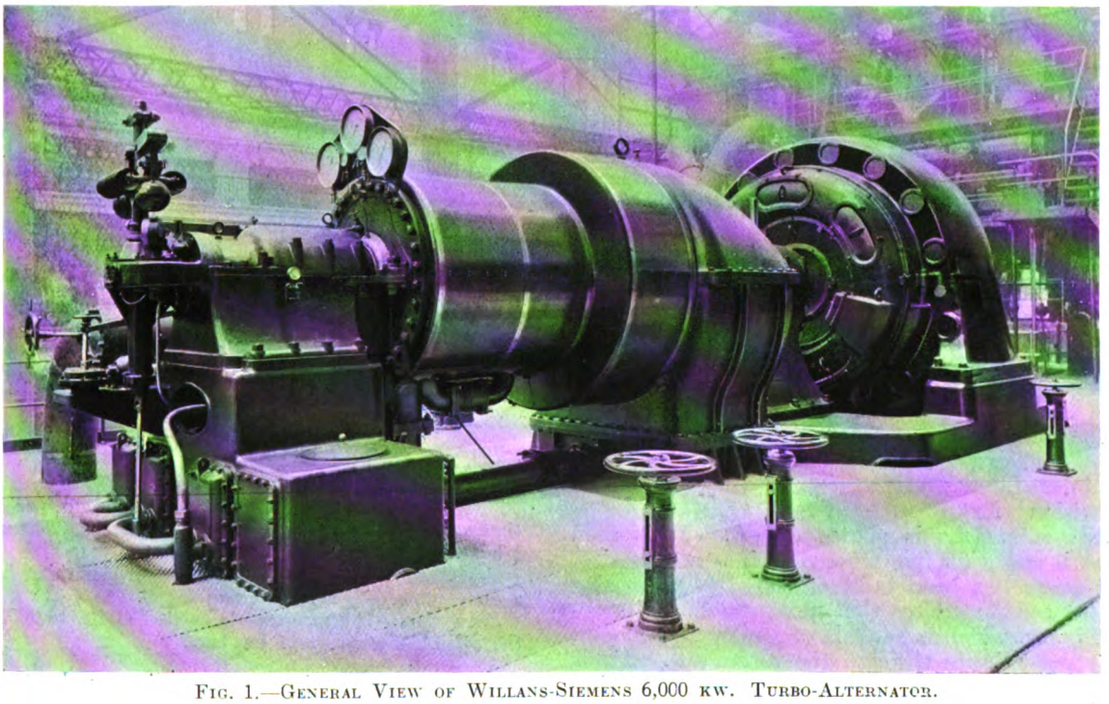

Fig. 1.—General View of Willans-Siemens 6,000 kw. Turbo-Alternator.

Digitized by Google

firm for electricity works. Fig. 1 is a general view of the machine taken in the electricity works.

The Willans' shrouded blading is familiar to our readers; a description of it appeared in ELECTRICAL ENGINEERING, Vol. I., p. 961. A similar governor to that of the turbine then described (a 2,000-kw. machine for Sydney) is also employed. It is a ball governor, which can be adjusted from the switch-board gallery. A small motor attached to the machine turns a screw, which varies the tension of a helical controlling spring attached to the governor lever. A feature is the comparatively small length of the machine: its over-all length is only 36 ft., and the overall length of the turbine and alternator is 46 ft. 3 in. The diameter and the high-pressure expansion chamber is 34 in., the intermediate pressure 51 in., and the low pressure 77½ in. The length of the low-pressure blading is 8 in. The diameter of the turbine shaft is 11 in., the weight of the rotor 13 tons, and the total weight of turbine and alternator 158½ tons. The speed is 1,000 revolutions per minute.

A feature of the alternator is the system of forced ventilation. The machine is totally enclosed, and air is forced in to the stator at a pressure of 3 in. of water, passes through the stator and rotor, and out again through the hollow feet of the stator to an exhaust duct which leads outside the engine-room. The general arrangement of the ventilating plant is shown in Fig. 2, in which the present machine is shown in full lines, and the provision for subsequent extensions is shown dotted. It is seen that there is space for five more machines of this size. A small house has been built outside the generating station to accommodate the motor-driven Sirocco-blower (Fig. 3), which is capable of forcing 21,000 cub. ft. of air per minute through the alternator. Air is drawn in to the fan-room through a dust-filter consisting of zigzag screens of woolly cloth mounted on a bamboo frame, supplied by Messrs. K. & T. H. Möller.

The fan is driven by a 23 b.h.p. motor. There is a double door to the room, so that no air can get into it except through the filtering screen. The position of the fan is seen in Fig. 2, and separate fans and filters will be put in for each succeeding machine. To avoid confusion in reading the drawing, we must point out that the two lines in Fig. 2 apparently connecting up the fans do not represent a common shaft, but are merely a line of girders. In Fig. 3 a part of the dust filter is seen on the left, and in front of it is a motor-driven vacuum cleaner which will be employed for removing dust from the filtering material. The two air ducts leading to the machine are seen in Fig. 2. The lower one leads the air to the projecting air inlet at the base of the stator casting seen in Fig. 4, and passes across the stator windings, through the rotor, and out again through the hollow feet of the stator to the exhaust air duct leading to a short exhaust shaft outside. Fig. 6 shows the stator unwound, Fig. 5 the rotor, and Fig. 7 gives two elevations of the alternator. The holes in the stator seen in Figs. 4, 6, and 7, and also in Fig. 1, are fitted with covers which can be removed in the event of any accident to the fan, so that the machine may still be run nearly at its full-load capacity as there will still be a certain amount of ventilation.

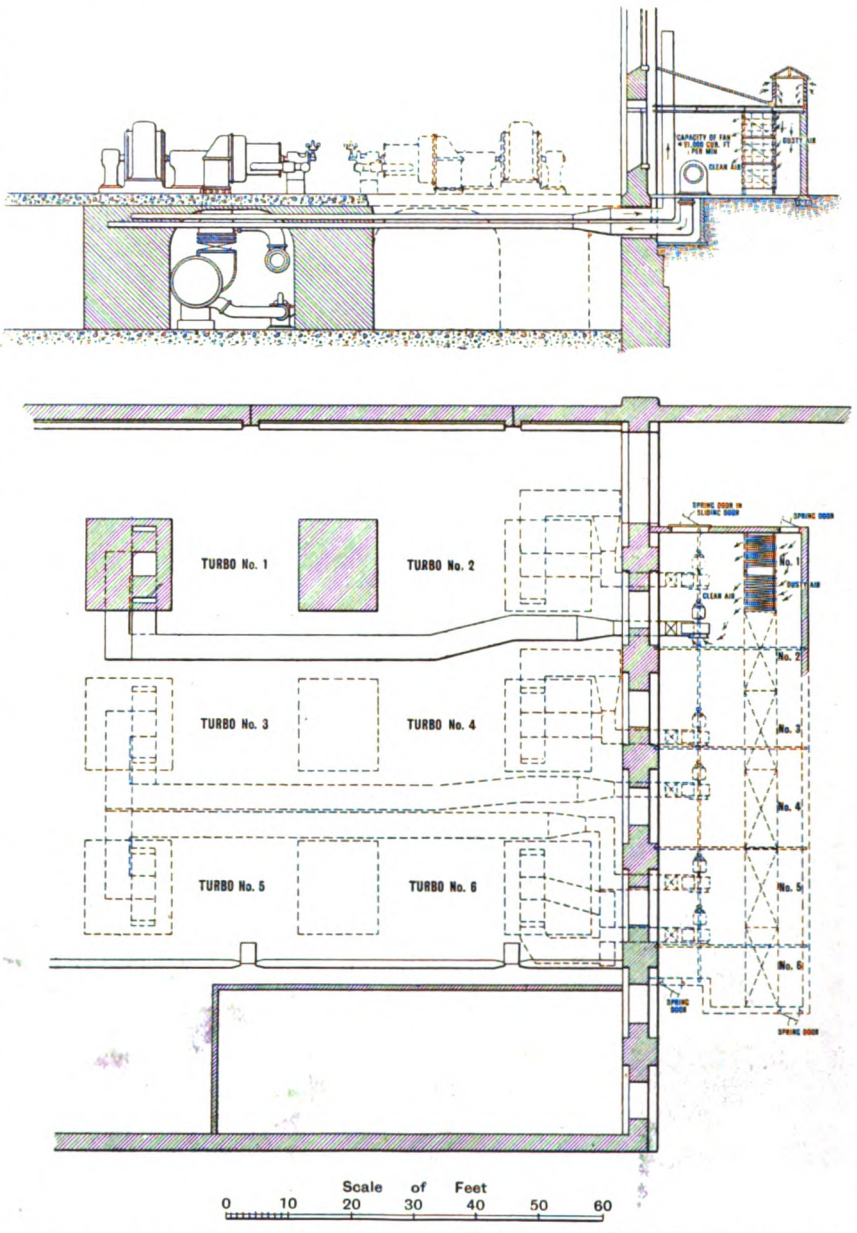

FIG. 2.—GENERAL ARRANGEMENT, SHOWING POSITION OF TURBO-GENERATOR AND VENTILATING PLANT.

The following are the leading specified particulars with regard to the alternator:—

Output. — Normal full load output, 7,060 k.v.a. or 6,000 kw. with a power-factor of 0·85.

Generator supplies three-phase current at a pressure of 6,500 volts between phases, and a frequency of 50 cycles per second, when running at 1,000 r.p.m.

Overload. — The machine is capable of dealing with overloads of 15 per cent. continuously, 25 per cent. for 1½ to 2 hours, and 50 per cent. for ¼ hour.

Temperature Rise.—At normal load the machine is rated for a temperature rise not exceeding 45° C.

Excitation.—The generator is excited at 200 to 225 volts from the station direct-current bus-bars.

The alternator is of the salient pole type, there being six poles of round section, each pole being a separate casting. The field windings are of flat copper, insulated with presspahn between turns, and pressed together with a pressure of 100 tons.

Digitized by Google

The efficiency of the alternator, including windage, is stated by the makers to be as follows:—

7,500 K.W.	with power factor of	·85	95·9	per cent.
6,250 ,,	,,	,, ·85	95·2	,,
5,000 ,,	,,	,, ·85	94·9	,,
2,500 ,,	,,	,, ·85	90·9	,,
1,250 ,,	,,	,, ·85	83·7	,,

FIG. 3.—MOTOR-DRIVEN BLOWER, DUST FILTERS, AND VACUUM CLEANER.

The inherent regulation of the machine is such that with full non-inductive load thrown off, the rise in pressure will not exceed 3·5 per cent., and with full inductive load thrown off it will not exceed 13·5 per cent. The stator of the machine consists of open slots with former wound coils, there being four slots per pole and per phase.

A steam pressure of 190 lb. at the stop-valve is employed, and steam is taken from the existing boilers in the station. Additional boilers of the marine type will, however, shortly be erected. The steam is superheated, and, with a temperature of 483·8° F. at the stop-valve, and a 27-in. vacuum, the following steam consumptions per kw.-hour are guaranteed: At $\frac{1}{4}$-load, 21·4 lbs.; at $\frac{1}{2}$-load, 17·67 lbs.; at $\frac{3}{4}$-load,

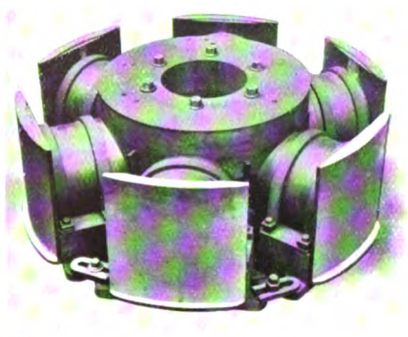

FIG. 5.—ROTOR.

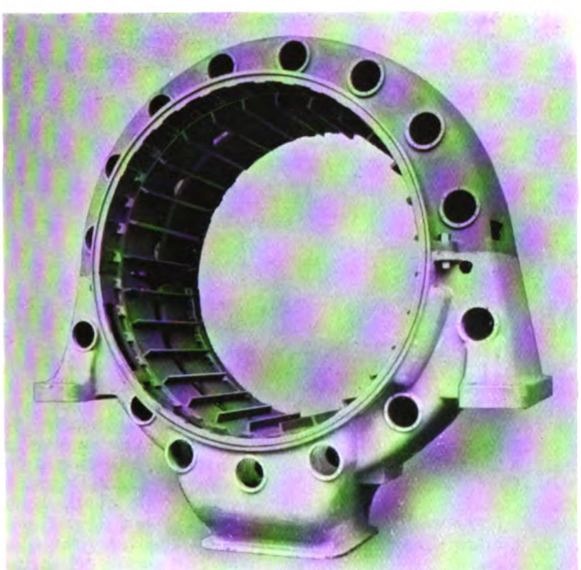

FIG. 4.—STATOR CASTING.

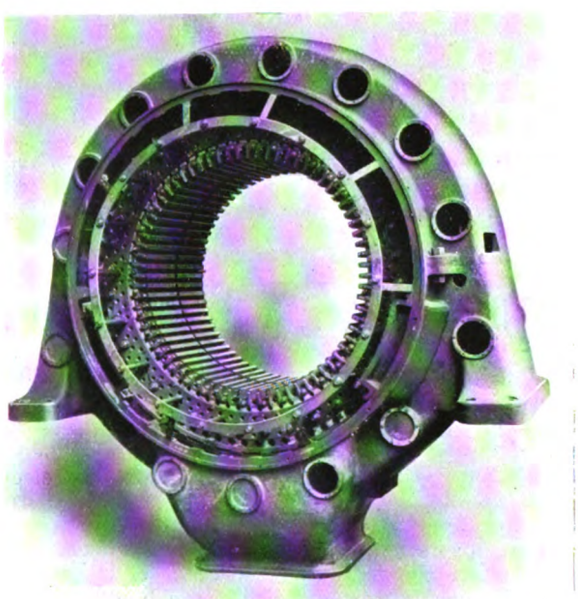

FIG 6.—STATOR UNWOUND.

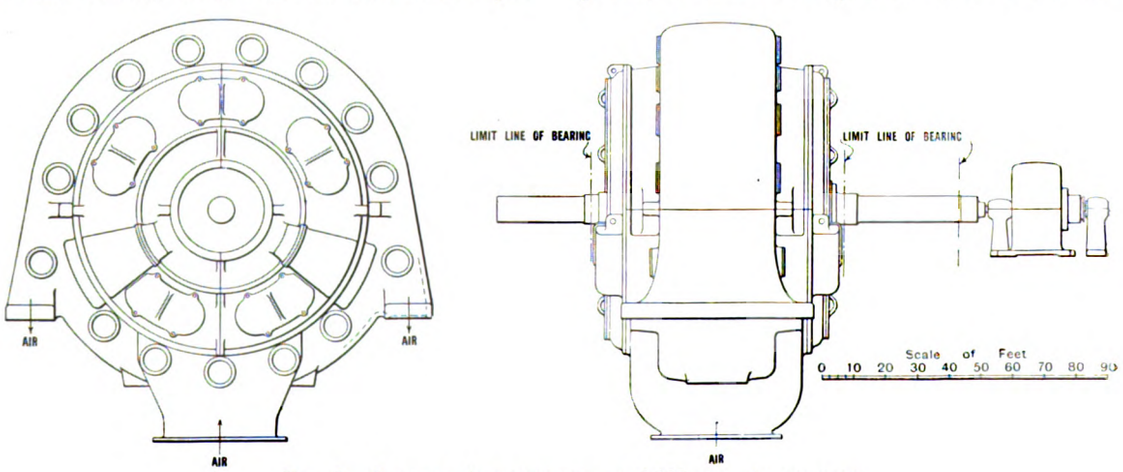

FIG. 7.—GENERAL ARRANGEMENT OF 6,000 KW. ALTERNATOR.

Digitized by Google

16·6 lbs.; at 25 per cent. overload, 15·85 lbs.; and at 50 per cent. overload, 16·95 lbs. These figures are based on a rated capacity of 5,000 kw., so that as the machine will normally be run at 6,000 kw., 15·85 lbs. may be taken as practically the full-load steam consumption. For a 26-in. vacuum an increase of 3·3 per cent. in steam consumption is allowable, and a similar percentage decrease if the vacuum is 28 in.

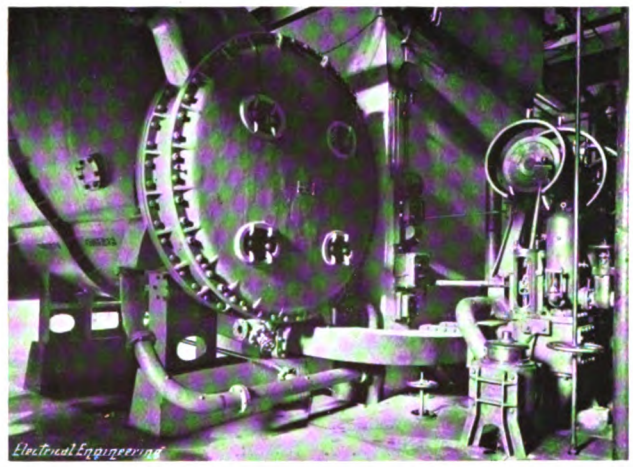

FIG. 8.—CONDENSER AND AIR-PUMP.

The condenser is placed immediately beneath the turbine. It is of Messrs. Richardsons, Westgarth's "Contraflo" type, with a cooling surface of 10,500 sq. ft. Its three-throw Edwards type air-pump is fitted with a 12 h.p. Greenwood & Batley force pump. The air-pump is driven by a 50 h.p. Siemens motor, whose speed of 590 revs. per min. is reduced to 110 revs. per minute by spur gearing. Fig. 8 is a view of the condenser and air-pump. The circulating pump (Fig. 9) is driven by a 250 h.p. Siemens motor. It is a Worthington circulating pump, is directly driven at 600 revs. per min., and supplies 7,700 gals. per min. with a head of 70 ft. These motors are all supplied with continuous current at 400 volts from the works' distributing board. At present the existing cooling towers are used, which are of the fan draught pattern, but two natural draught towers will shortly be supplied by the Blasberg Engineering Co., of Glasgow.

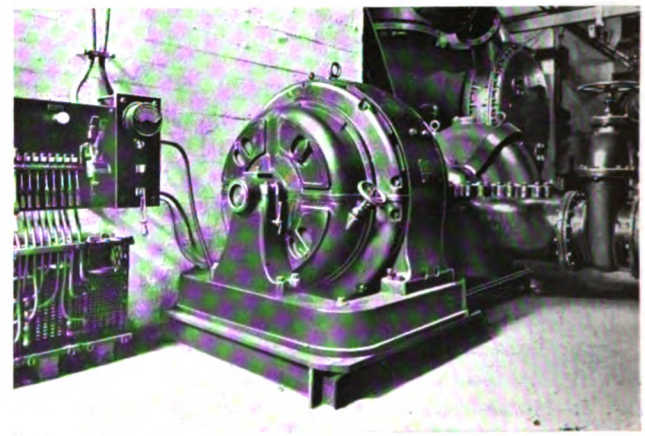

FIG. 9.—CIRCULATING PUMP, DRIVEN BY 250 H.P. MOTOR.

Mr. S. L. Pearce, City Electrical Engineer, and Mr. McKenzie, Resident Engineer at the Stuart Street Station, were kind enough to afford us every facility for inspecting and photographing the plant.

MANUFACTURE OF METALLIC FILAMENTS FOR ELECTRIC LAMPS

Two recent Patents

UP to the present, tantalum has been the only one of the refractory metals used commercially in the manufacture of metallic filaments for electric lamps, which is sufficiently ductile to permit of its being drawn out into a fine wire. Tungsten, under ordinary circumstances, is so brittle that in all the present methods of manufacture the metal, or the oxide of the metal, is first mixed as a powder with some binding solution, or is made into a colloidal solution, as first described by Prof. Kuzel, of Vienna (see ELECTRICAL ENGINEERING, April 2nd, p. 525, and April 16th, p. 589). In connection with the former method the following description of a proposed process of manufacture, abstracted from a Patent Specification (No. 16,530 of 1907) by the British Thomson-Houston Co. (a communication from the General Electric Co. of New York), is of interest.

Tungsten powder of relatively good quality can be readily produced by reduction of tungsten tri-oxide with hydrogen according to well-known chemical methods. The powder so obtained is non-coherent and is exceedingly refractory. In order to consolidate it into a coherent conductor we may proceed as follows:—The tungsten powder is rubbed into a warm and plastic amalgam, consisting of, say, equal parts of cadmium and mercury, forming a homogeneous ductile mixture; the tungsten may be added in the proportion of 30 per cent. or more by weight of the final mixture. The product thus obtained may be squirted warm through a diamond die and may be otherwise manipulated without difficulty. The squirted wires are ductile, and probably consist of a mere mechanical mixture of the tungsten powder with the amalgam. The proportion of mercury and cadmium in the amalgam may be varied through relatively wide limits, and a very suitable mixture consists of 44 parts cadmium to 56 parts mercury. Other binders can be used in place of the cadmium amalgam, as, for instance, cadmium bismuth alloy having 112 parts cadmium to 208 parts bismuth; or an alloy containing mercury cadmium and bismuth in the following proportions:—Mercury 53 parts, cadmium 42 parts, and bismuth 5 parts. It will be noted that all the materials of the binder have relatively low vaporisation points, and can, therefore, be distilled at low temperatures. To remove the vaporisable components above-mentioned, we may bake the ductile wires in an evacuated tube to the temperature at which most of the mercury and part of the cadmium vaporises out; this leaves a relatively strong and somewhat brittle residue, consisting mainly of tungsten and cadmium, and also bismuth, if the latter has been used in the binder. The wires may then be removed from the baking receptacle and suspended in a treating bulb, and there subjected to the heating action of current passed through the wires. A vacuum or inert atmosphere should be maintained about the wires during this treatment. The current distils or vaporises the remaining cadmium or other component of the binding material, and then consolidates the porous residue of tungsten into a homogeneous and relatively compact wire. The tungsten particles seem to sinter together and thus decrease the porosity of the structure. The wire shrinks in length very materially during treatment. The wire is then allowed to cool, and when taken from the treating chamber is found to be strong and firm and somewhat elastic, but without the capability of taking a permanent set and practically devoid of ductility in the sense in which that term is applied to such metals as copper, silver, platinum, &c. Assuming that we desire to coil this coherent body of pure tungsten into a spiral, we may utilise an apparatus consisting of a rotatable mandrel of platinum or other material, supported in a wooden block, and heated by a small gas flame. The mandrel need not be very hot, but may be considerably below a visible red heat. The tungsten wire can be secured to the mandrel in any suitable manner, as by insertion in a slot cut across the end of the mandrel. We find that as soon as the tungsten is heated by the mandrel it becomes soft and ductile and feels pliant like copper-wire. By simply rotating the mandrel between the fingers, the tungsten wire can be wound on the mandrel without danger of fracture, and with

Digitized by Google

every evidence of ductility in the metal. The feature of the process, which seems most striking, is that the temperature of manipulation may be below the oxidising temperature of the tungsten, or at least below the temperature at which the tungsten blues or otherwise changes in colour or appearance. After the spiral has been completed, it may be cooled on the mandrel, and then slipped off over the end. The material when cold appears to have returned to its elastic and non-ductile condition, and appears to have been in no wise chemically changed by the heat treatment. As a modified method of treatment, we may keep the tungsten wire hot during its manipulation by the passage of current through it or through the mandrel, or we may utilise a heating coil on the mandrel. If desired, a shallow screw thread may be cut in the mandrel to secure uniformity of pitch in the winding. The elasticity of the finished spiral is sufficient to obviate any difficulty in removing the spiral from the mandrel. As another industrial application of our invention, we may mention the method which consists in winding the tungsten filaments on a spider, similar, for instance, to those used in tantalum lamps, while maintaining the tungsten in a ductile condition by the continuous passage of current through it, or in any other suitable way. We may even secure the desired ductility by merely heating the ends of the supporting spider while the filament is being bent around them. All these manipulations can be carried out while the tungsten is at a temperature lower than that at which it oxidises appreciably in the air.

The principle involved in the above simple manipulations can be applied to rolling or drawing and other complex manipulations, and bars or rods of coherent tungsten can be worked down into filaments without cracks and without flaws, and without appreciable discolouration. Warmed tungsten seems very much softer than many materials which are now successfully drawn through diamond dies. To produce drawn lamp filaments of tungsten, we may first make a well-sintered rod of tungsten, say, one-quarter inch in diameter, by use of the cadmium amalgam or other suitable consolidating process. This rod may then be passed between hot-grooved steel rolls until the diameter has been brought down to one-sixteenth inch, and from then on it may be drawn hot through a series of dies, such as diamond dies. The tungsten piece should be kept up to the temperature at which it is ductile, as by heating the rolls and dies, and also the reels on which the wire is wound; the temperature should, however, be kept lower than that at which tungsten oxidises appreciably in air. The advantages of rolling and drawing tungsten bodies are numerous. The original characteristics of the metal, as its fineness, crystalline conditions, &c., become matters of minor importance, as with sufficient working these characteristics largely disappear. By rolling long lengths of filamentary conductors from a single stick of tungsten, the filaments are of great uniformity, and are obtained without the trouble of individual treatment or handling. The consolidation of the material in the rolls and in the drawing plates no doubt renders the wire stronger than tungsten not so treated, and therefore better adapted to stand shipment and rough handling.

The above method of working the conductors is also employed for connecting lamp filaments with their leading-in-wires, thus avoiding the use of any foreign materials, such as cements and pastes, to form welded joints which might possibly contaminate the filament or spoil the lamp vacuum. To mount coherent filaments of tungsten in a lamp, a central pedestal of glass is provided, carrying a number of copper or nickel wires, bent to form radial arms and having sockets at their outer ends for engagement with twisted wire loops of tantalum. The filaments may be supported by these tantalum loops, and may be symmetrically disposed about the central pedestal. The leading-in conductors at the base of the lamp may be of nickel or platinum, and each provided at its end with a loop or spiral forming a socket for the lower end of the filament. To complete the joint between the filament and the leading-in conductor, we squeeze the joint with a heated body as between the jaws of a pair of heated pliers. We find that the heat of the pliers will soften the tungsten and render it ductile and pliant, and that by squeezing the joint we can distort the filament and can press the platinum or nickel wire into intimate contact therewith. The pliers need not be very hot, and, in fact, should preferably be at about visible redness. At such low temperatures the tungsten filament does not oxidise, and is not injured by the operation. Even if the pliers be hotter and the tungsten be oxidised superficially, the product is still serviceable. As soon as the joint cools, the tungsten resumes its non-ductile and brittle character. It retains permanently its distorted shape, and the joint is entirely free from vaporisable material.

In a simple form of apparatus, suitable for carrying out a modified method of shaping tungsten conductors, two metal plates are arranged in a vertical position and serve as guides for a metal block, movable vertically between the plates, and having a projecting portion cut to form a sinuous curve meshing with a similar curve in the top of one of the plates. These two curved surfaces serve as jaws, between which a tungsten filament can be shaped to correspond with the curve of the block. The movable block may be provided at the top with a handle, and it may rest on a flat spring. This block is preferably made of metal or other good heat-conducting material, and may be heated or warmed electrically or by a gas flame. In carrying out the bending or shaping operation, we lift the block and insert a non-ductile tungsten wire between the curved surfaces of the blocks, and then depress the movable block, thereby bending the wire to conform with the curved surfaces. We find that the heat imparted to the tungsten by the blocks is sufficient to change it over from the non-ductile condition to such ductile condition that the tungsten bends instead of breaking. When the tungsten wire is released from the jaws and cooled, it is found to have taken a permanent set conforming to the shape of the jaws, otherwise it is the same as before treatment. By proper regulation of the heating flame, the tungsten wire will come out without discolouration, or other evidences of oxidation, but for some purposes a little oxidation does no harm and need not be vigorously guarded against.

We have found that the peculiar characteristics of tungsten above mentioned are common to molybdenum, and that the latter, though non-ductile when cold, can be manipulated when warm, and even at a temperature below that at which appreciable oxidation occurs.

The following two claims are appended to the specification:—

(1) In the manipulation of refractory metallic conductors of tungsten, or the like, heating the material in the open air to a temperature below visible redness to render it ductile.

(2) The method of manipulating refractory metallic conductors of tungsten, or the like, which consists in winding the conductor on a heater mandrel, or shaping it between heated metal blocks in the open air, the temperature of the mandrel or blocks being such as to raise the temperature of the material to a point below visible redness or below the point at which the material oxidises.

The long filaments which are necessary for high voltage metallic filament lamps, and the consequent inability of the manufacturer to produce lamps of moderate candle-power for the usual pressures, is due to the high conductivity of the refractory metals used for the filaments. Attempts have been made from time to time to increase the resistance of such metal filaments by the addition of some of the high resistance and refractory oxides, such as oxides of zirconium, thorium, and cerium. These oxides, however, were found to be unsuitable for this purpose, as in time the oxides are decomposed as a result of the high temperature, the vacuum is impaired, and the filaments rapidly fall to pieces. Another objection to the addition of these oxides was that the temperature coefficient of such a filament loses its positive character and becomes negative. As a result of much research in this direction, the Allgemeine Elektricitäts Gesellschaft have found that if oxides of yttrium, ytterbium, and certain other rare metallic earths having high atomic weights and high affinity for oxygen are added to the filament, the resistance is considerably increased, the vacuum is not impaired, and the life of the filament is not decreased. According to the Patent Specification No. 8,841 of 1907 by the above company, ytterbium oxide has been found most suitable for this purpose. The metallic tungsten or the tungsten oxide powder is mixed with about 20 per cent. ytterbium oxide, and the mixture made into a paste with a suitable binder. The filaments made from this paste are heated to a high temperature in a reducing atmosphere, until the tungsten oxide is reduced, the binder vaporised, and the filaments have become hard. When a filament prepared in this way is placed in an evacuated bulb and heated to a very high temperature, the bulb remains quite cold, a proof that gases are not given off by decomposition.

The German Institution of Electrical Engineers.—The yearly conference of this institution, the Verband Deutscher Elektrotechniker, will be held in Erfurt next month. The following are some of the Papers which are to be read and discussed:—"New Developments in Electric Lighting," by Prof. W. Wedding; "The Influence of Pressure Variation on the Life of Metallic Filament Lamps," and "A Comparison of the Working Costs of Small Arc Lamps and Large Osram Lamps," by J. Remané; "The Heating of Electrical Machinery," by Dr. R. Goldschmidt. Five Papers by different authors refer to pressure-rise phenomena and protective devices, and there are others on miscellaneous subjects, making a total of fourteen in all.

Digitized by Google

METALLIC FILAMENT LAMPS FOR STREET LIGHTING

IN connection with the figures for life tests and costs of Osram lamps for street lighting, founded on experience at Derby and Harrogate respectively, given on page 703 of our last issue, we have received communications from several engineers of undertakings where metallic filament lamps are in use for street lighting, extracts of some of which will be found of some interest.

Mr. J. B. Morgan, Electrical Engineer to the Horsham Urban District Council, on whose system all the side street lighting is carried out by tantalum lamps, reports some trouble before proper precautions were taken as to pairing the lamps in series, but is now obtaining excellent results. He writes as follows:—

The first experiments were very successful, and the life averaged well over 1,000 hours, some lamps running 2,000 hours, the pressure of supply being five volts below the marked voltage of the lamp. When we adapted the whole of the streets to tantalum lamps, we had very bad luck, and the life results were very poor, and I quite believe that this was due to insufficient care being exercised in grading the lamps for voltage, as I found on testing a batch of 50 lamps all marked for series burning, that the current varied considerably, the lowest reading being 0·295 amps. and the highest being 0·395. This discovery prompted me to test every lamp and pair them. We also found that two 115-volt lamps, burning on 230 volts, only averaged about 600 hours, notwithstanding our pilot-recording voltmeters show a very steady line, and so we use two 120-volt lamps in series on the more important streets, and two 125-volt lamps in series on the more out-of-the-way side streets. The lower candle-power of the three lamps is not noticeable, and we are now obtaining an average life of 1,100 hours. When a lamp does fail we remove its fellow lamp and re-test it for current, and use it again with another partly used lamp in the summer time, when the burning hours are short.

We had many complaints from our consumers owing to very short life, until we adopted this pairing from all the local wiring contractors' lamps. With regard to costs of street lighting compared with gas, it is hard to say how it works out, as our district is growing so fast that we are continually putting new posts up, and the gas lighting was so shockingly poor. The gas lamps were charged on a basis of 5 ft. per hour, flat-flame burners for 1,900 hours per annum, price 4s. 2d. per 1,000 cubic feet; this worked out at 39s. 7d. for gas per annum, plus 13s. for lighting and cleaning, or £2 12s. 7d. per post for a very miserable light, as the pressure was so low as to only allow about 4 ft. of gas to pass, and the candle-power per post was never more than 13. We have two 25-c.p. tantalums, and on our voltage we obtain about 40 c.p. per post, taking 76 watts per hour, or 144 units per post per annum, at 4d. per unit, or £2 8s. for current plus the lamp maintenance, say 8s., or a total of £2 16s., and, as the lighting is all done from the works, there is only the cost of cleaning, so that the comparison is practically £2 12s. 7d. for gas with about 13 c.p. (mantles were tried, but given up), against £2 18s. for electric light with 36-40 c.p.

On the system of the Bray Urban District Council (Ireland), some 50 posts have already been fitted with Osram 35-watt lamps, replacing 60-watt carbon lamps, and Mr. W. J. U. Sowter reports that the consequent increase in the illumination has been very favourably commented on, and has doubtless led to a considerable increase of business. Mr. Sowter has not used a sufficient number of these lamps to obtain a reliable average life figure, but says that many lamps which have been running well over 2,000 hours are still unblackened. With regard to Mr. Wilkinson's remarks last week Mr. Sowter writes as follows:—

I am particularly interested in Mr. Wilkinson's remarks regarding the life of these lamps when enclosed in an outer globe, as my experience is exactly the reverse of his. I find that an Osram lamp protected by an outer globe *lasts very much longer*. I should very much like to have other engineers' opinions as to whether these lamps should, in order to ensure immunity from breakage, be fitted to a rigid lamp-holder, or whether the lamp-holder should be allowed a certain amount of play. I find that many breakages of filaments occur in pillars where the lamp-holder is not rigid, due to movement of the lamps in windy weather, but, on the other hand, other engineers with whom I have discussed the matter inform me that their experience is the reverse of mine in that respect.

Mr. W. A. Walker, Engineer to the Kettering Urban District Council, writes as follows:—

I am afraid I have not much data that I can give you at the present time, but from my experience so far, especially with Osram lamps, this has been very favourable. I have, at the present time, sixty 32-c.p. Osram lamps on street lighting, and most of these have been connected since last July, and all of them were connected by the end of last September, and only two renewals have been required, so that the burning hours in most of these lamps are over 2,000, which I think you will agree is a splendid result. These seem to me very suitable for street lighting, as vibration does not seem to affect them much. As regards consumption, our battery discharge is now only about half what it was a year ago. We were at that time using 32-c.p. carbon filament lamps, and I am now using two 120-volt lamps in series on a 230-volt circuit.

Osram lamps are now being adopted exclusively for street lighting at Sutton Coldfield, but it is not yet possible to give very full particulars as to life and costs. Mr. W. Duesbury (Electrical Engineer to the Corporation) states that, exclusive of the few lamps that have failed in the first few hours and which have been replaced by the makers, the average life has been fully 1,000 hours. With regard to the preliminary experiments and the question of series running, Mr. Duesbury writes as follows:—

We have had about 60 posts fitted with two 30-c.p., 35-watt, 120-volt "Osram" lamps, burning in series on 230 volts for the past six months for a street-lighting test, and as a result of this test we have now decided to use "Osram" lamps throughout for our street lighting, exclusive of arc lamps. The arrangement outlined above will be continued, with the exception of important corners, where the complete extinction of the lamps owing to the failure of one of the two series lamps would be a serious matter, where we are installing two 50-c.p. 240-volt lamps. We are inclined to believe that the success which we have attained has been due to the fact that one series number only is used throughout the street lighting for the series running, and that the lamps are handled by what is to a certain extent skilled labour.

The experience of Mr. A. J. Abraham (Electrical Engineer to the Lanark County Council) at Cambuslang has not been quite as satisfactory as at some other places. Some 500 tantalum lamps are in use, and run two in series on a 250-volt circuit. Mr. Abraham complains that the average life of these lamps during 1907 was considerably lower than in 1906, which he attributes to ill-luck in having met with a batch of lamps not quite up to the standard. Now that the lamps are manufactured in such enormous numbers, a certain amount of variation is, of course, unavoidable, but we are inclined to think that Mr. Abraham's trouble could be avoided to a great extent by precautions as to pairing, to the success of which we have alluded in another case.

Metallic filament lamps have been used for street lighting for about six months at Yarmouth, but actual figures of costs are not yet available. Mr. G. Bryant (Borough Electrical Engineer), however, writes as follows:—

I have, of course, gone into the matter fully in estimates and quoted the Corporation Street Lighting Committee as follows:—To supply cable, posts, fittings, &c., with two lamps of 32 c.p. to each post, to be burning 3,400 hours per annum, at £3 5s. per lamp. This was against previous prices from the local gas companies of about £3 10s. for incandescent gas fittings. I need hardly say that an order for about 100 lamps (most of which were to be changed over from gas) was immediately given, and wherever possible new lamps are to be electrically lighted. The Electricity Committee has decided to pay for all extensions needed for public lighting from surplus revenue rather than raise a special loan for the purpose. The lamps that have been fixed are giving every satisfaction both to the Lighting Committee and the residents of the districts affected.

THE MANUFACTURE OF ELECTRICAL CONDENSERS FOR TELEGRAPHY AND TELEPHONY

MR. G. F. MANSBRIDGE, in a Paper on the above subject, read before the Institution of Electrical Engineers in London last Thursday, explained that until about 1888 practically the whole of the supplies were for telegraph-work, but since then the situation has been entirely changed by the great development of the telephone service of the world, and particularly of the common-battery system in which condensers play a modest but important *rôle*. The magnitude of the present demand may be gauged from the fact that the aggregate output of condensers in Europe and America during 1907 is estimated at the once-inconceivable capacity of 5 farads.

With manufacture established on this scale, economy in production is imperative, and the skilled hand of the 'nineties, who laboriously assembled or "built" his 1 or 2 microfarads per day, has given place to the machine hand who, with less physical distress, readily turns out one hundred times that quantity per diem. As a result, condensers equal in quality to those produced ten years ago can now be purchased at approximately one-tenth the price, and it now pays to employ condensers for many services from which they were previously shut out by their high cost. Many of the data in the Paper are gleaned from the records of the Post Office factory at Mount Pleasant, Clerkenwell, E.C., and for permission to publish these the author acknowledges his indebtedness to Mr. J. W. Willmot, I.S.O., the Controller of the Factories' Department of the Post Office.

Mica Condensers.—On account of the very high cost of mica sheet suitable for the work, condensers of this form are but little used. Mica condensers, when well made, retain their capacity and insulation better than those made of paper, and they have also a higher dielectric strength for the same thickness, but the cost per microfarad is approximately ten times greater than that of paper condensers. Fortunately, the inductive capacity of mica is high (about twice that of paraffined paper), or the labour cost would be excessive, since the size of the sheets is limited to about 4 in. by 3 in., the cost of larger sheets of uniform thickness being prohibitive. A good working thickness is 0·0015 to 0·002 in., and if the material is carefully selected there is no necessity, for ordinary purposes, to use more than one sheet between consecutive foils. For purposes where mechanical strength in the condenser plate itself is of special advantage mica is very satisfactory, and for standards it is unrivalled.

To obtain constant capacity with efflux of time, it is necessary that the mica and tinfoil sheets be perfectly flat and free from inequalities, so that they will build up under pressure into a solid mass without flexure or mechanical strain; it is also necessary that in assembling the sheets all air-bubbles be excluded. Dr. Alexander Muirhead * discovered that mica sheets have a positive temperature coefficient if coated with shellac, and a negative temperature coefficient if coated with paraffin. By building a condenser in two sections, one treated with shellac and one with paraffin wax, the variation of capacity within ordinary limits of temperature can thus be brought practically to vanishing-point. To obtain high insulation and low absorption, it is necessary to use only selected sheets of the finest clear "ruby" mica, which must be uniform in thickness throughout the sheet, and free from cracks, veins, or flaws; spotted or "speckled" mica is useless for the purpose.† The shellac employed should be the finest button lac dissolved in absolute alcohol and carefully strained until perfectly free from suspended matter. The building up or assembling of the sheets of foil and mica may conveniently be done on a "hot plate," the greatest care being taken to exclude air-bubbles, grit, or excess of paraffin or shellac. The desiccation should be slow but thorough, and the temperature should not exceed 212° Fahr. The finished condenser should be carefully and not excessively pressed, and should be allowed to cool under pressure in the ordinary way.

Glass Condensers.—The requirements of wireless telegraphy and X-ray work have latterly increased the importance of apparatus of this character. As is well known to wireless workers, Leyden jars, like other condensers, are prone to fail in use if at any point there is imperfect contact between the conductor and the dielectric, and to avoid this difficulty the best plan is to silverplate the glass. This may be done by precipitating metallic silver on to the glass in the form of a bright continuous film by the well-known method employed for silvering galvanometer mirrors, &c. The solution generally used is nitrate of silver which has been treated with ammonia until the precipitate first formed has been completely re-dissolved. The surface of the glass must be cleaned with the most scrupulous care before plating is attempted, or an imperfect coating will result. The silver coating should then be mechanically strengthened by a protecting layer of varnish, or it may be over-plated with copper. An important development of this silver-plated Leyden jar is to be found in the Moscicki high-tension condenser recently placed on the market.* In the author's opinion this condenser represents the most satisfactory and practical high-tension condenser for commercial work which has been introduced up to the present. Excessive strains are avoided at the point of high dielectric stress (the edges) by suitably thickening the dielectric at this point, and the effects of local heating are minimised by water-cooling. In view of the large number of stations working with a power factor ranging about 0·75, and of the advantages to be gained by improving this power factor, the author suggested that the question of installing a battery of modern glass condensers at such stations is worthy of more than passing consideration.

Condensers with Paper or other Fibrous Dielectrics.—The standard practice up to the last decade was to use separate sheets of tissue paper and separate sheets of thin metallic foil, and the method employed was to dry the paper by heat, then to transfer it to a bath of hot paraffin wax, and after due soaking to build up the condenser on a "hot plate," the paper being taken sheet by sheet from the bath of hot wax. At least two sheets of paper were used between consecutive foils, the alternate foils being bunched into two books in the well-known way. A good working thickness of paper was 0·001 in. The metal foil was usually of tin, the thickness being about 0·0003 in. This method of building condenser plates was slow and expensive, and it had the further disadvantage that as the workmen who handled the material were exposed to a high temperature, the risk of contamination of the wax by emanations from the body was great; indeed, the difficulty was such a serious one that in London it often became necessary to cease manufacture during the summer months. Even in cooler weather it was necessary to select workmen who were not prone to perspire freely, as only such men could be depended upon to produce condensers with satisfactory and permanent insulation. In consequence of this difficulty, the author found it of advantage to build up the condenser plates "dry" in a separate room and to desiccate and impregnate the condensers as a subsequent operation. The slow process of assembling the sheets one by one and of handling about 250 separate pieces to make up a 1-microfarad plate had, however, still to be reckoned with, and the percentage of failures through short circuit or low insulation was considerable, so that the labour cost remained an important factor.

The next step was in the direction of bringing down this high labour cost by reducing the number of pieces to be handled. The method adopted was to wind up into the form of a roll long strips of metal foil, two strips of paper being interposed between each foil—that is, six strips in all. This method, which was introduced to the Post Office by Sir John Gavey in 1899, had, however, difficulties of its own. Pure tin foil of the requisite thinness could not at that time be obtained in strips longer than a few feet, and the alternatives were: (1) to feed between the rolls of paper a series of strips of pure tin foil some 4 ft. long, each strip overlapping its predecessor by an inch or two so as to maintain continuity; or (2) to use an alloy of lead and tin which could be obtained in continuous lengths. The former was an awkward and unmechanical arrangement, and the latter had the disadvantage of producing a heavy and bulky condenser. Both methods also involved a considerable proportion—rarely less than 10 or 15 per cent.—of short circuits in the finished plates brought about by grit in the foil or by defects in the paper. In endeavouring to overcome these difficulties, the author hit upon the idea of using metallised or "foiled" paper of the same character as that sometimes employed for wrapping up packages of tea, &c. Experiments showed that commercial "tin-foiled paper" as then made was not sufficiently reliable as an electrical conductor for the purpose, but after careful investigation, the difficulties in the way of producing a thoroughly reliable conducting surface on such paper were found to be insurmountable.† For assistance in carrying this part of the work to a successful issue, the author expresses his indebtedness to Messrs. Olive & Partington, Ltd., of Upper Thames Street, London, who were the first to produce foiled paper for electrical purposes on a commercial scale. As soon as supplies of good electrical foiled paper became available the manufacture of condensers on this principle was taken up by the Post Office, and subsequently by various commercial firms, under licence from the patentee.

The ingot tin—previously granulated or "feathered"—is dissolved in nitrohydrochloric acid, and after all scum and insoluble matter have been removed, the solution is diluted and the tin is carefully precipitated by metallic zinc, or by the action of a weak electric current. For the best results the most minute subdivision of the tin is essential, since only the thinnest layer of metal is desired, and unless this layer is uniform metal will be wasted or imperfect continuity will result. After precipitation the powder is repeatedly washed to free it from all traces of acid, and is sifted through sieves of the most minute mesh so as to eliminate all large particles of tin or any grit. A suitable adhesive such as size is added, and the tin mud is then passed to the coating machines. These are provided with mechanical stirrers to prevent the metal settling, and with rotating brushes and spreaders to distribute the metal evenly over the surface of the paper as the latter passes through the machine. In some machines the paper is passed over heated cylinders so as to dry the coated surface quickly, but as this is liable to reduce the efficiency of the adhesive it is preferable that paper for electrical purposes should be dried more slowly—for instance, by exposure to currents of warm air. The paper then passes to the burnishing rolls which consist of heated heavy steel calenders or friction rollers between which the paper is fed. These friction rollers compress the dull magma of tin powder into a coherent thin film having the lustre of the polished metal. During this process any comparatively large crystals of tin or particles of grit which may have escaped untrapped will be driven partly or wholly through the paper, but the effect of this is eliminated by the subsequent electrical treatment. The paper is now passed to the slitting machines where it is trimmed and cut to any desired width.

It is interesting to note that prior to the calendering process referred to, the film of tin powder is non-conducting, but in properly calendered foiled paper, with a fairly heavy coating, the conductivity of the coating may be as much as 50 per cent. of that of a continuous strip of pure tin of equivalent weight. On the foiled paper as usually made for condensers, the quantity of tin averages 25 grains to the square foot, and the conductivity is about 25 per cent. of that of pure tin, the resistance of a strip 1 ft. wide averaging 0·3 ohm per foot run, that is, 0·3 ohm per foot square or per metre square. This density of coating gives a surface of 280 sq. ft. to the pound of tin, or say, 57 sq. metres per kilogramme of tin. The average thickness of the tin film is therefore as nearly as possible 0·0001 of an inch, or say, 0·0025 millimetre. Seeing that the material is semi-transparent, the current-carrying capacity of this film is surprisingly high, the fusing current in air being rather more than 1 ampere per inch of width for the standard coating of 25 grains per square foot; this is assuming that the paper has not been creased. Bending the paper round even a very small radius does not affect the continuity, but if the paper be very closely folded back on itself so as to put the film sharply in tension or compression, the fusing current is correspondingly lower. By using a greater density of coating, say, 40 grains per square foot, the effect of creasing is greatly diminished, but there is no necessity for this higher density in condenser work since the creases in the rolled condenser even at the centre of the roll are not very sharp.

Continuous reels of electrically-conducting foiled paper being available, all that is necessary is to roll up together two strips of foiled paper, interleaved with two strips of plain paper.

The foiled papers may be placed with their metallic sides facing each other, but separated by the two plain papers, in which case the two body papers form the dielectric on the opposite side, or, alternatively, the papers may be arranged so that the dielectric on each side is made up of one body paper and one plain paper. The latter plan is preferable, as it gives a more even distribution of the dielectric strain. Interleaving paper is invariably used for telegraph or telephone condensers, since the insulation, otherwise obtainable, is but a few megohms. The machine usually employed for the rolling operation accommodates two reels of plain and two reels of foiled paper, and is provided with a set of interchangeable winding mandrels of various diameters. The winding of the strips on to the mandrel is usually done by hand if the number of turns per condenser is small, but in some instances more than a hundred turns have to be wound on, and the mandrel may then be power driven with advantage, but in this case a mechanical counter becomes essential. The placing of the strips in position and the starting must be done by hand, and this also applies to the insertion of the connecting lugs, which should be strips of annealed copper foil, about 0·001 in. thick and $\frac{3}{8}$ or $\frac{1}{2}$ in. wide. These strips are simply slipped into place between the foiled surface and the interleaving paper, and are so light that they readily retain their position; they should make contact with the foiled surface over practically its full width and should protrude about 1 in., so as to serve subsequently as a soldering point for the wire connection. The two lugs should be placed at the middle of the foiled strips rather than at the beginning or end, so as to avoid interposing any appreciable resistance into the condenser circuit. This plan has the additional advantage that thereby the innermost layers, which possibly may have been rather sharply creased, are not called upon to transmit any considerable current on charge or discharge.

From first principles it would be expected that the capacity would be directly proportional to the area of the electrodes, but in practice it is found that, within limits, plates of high capacity require appreciably less area per microfarad than those of low capacity. This is particularly the case where the thickness of the plate is small in comparison with its length and breadth. There is therefore a saving in material as well as in labour by building the plates in as large units as possible. Further, it is found that plates built with narrow foiled paper require less material per microfarad than those built with wide paper. This effect is doubtless due to the wider paper offering greater facilities for trapping the paraffin instead of allowing it to be pressed out. The two effects taken together indicate that a condenser in the form of a cube would require less material than one in any other shape. The cube is, however, not the most suitable shape for manufacture, and as the conditions of service are often such as to demand the adoption of thin, flat plates, the usual compromise has resulted. The capacity most in demand for telephone work is 2 microfarads, and as plates of this size form a convenient manufacturing unit, they are usually taken as the basis on which to frame standard data for manufacturing purposes. Condensers of larger capacity are almost invariably built up by assembling standard units. The usual sizes of paper at present in use are: for interleaving paper, $7\frac{1}{8}$ or 4 in. wide by $\frac{1}{2}$ mil thick giving about 400 sq. ft. to the pound; for foiled paper, $6\frac{3}{8}$ or $3\frac{1}{2}$ in. wide by $1\frac{1}{4}$ mils. thick, giving 100 sq. ft. of conducting surface to the pound, and consisting of 35 per cent. tin and 65 per cent. paper.

At one time an unfoiled margin was left on each side of the foiled strip, but since the introduction of the "breakdown process" subsequently referred to, this has been found unnecessary. With $1\frac{1}{4}$-mil foiled paper and $\frac{1}{2}$-mil interleaving paper, the area required for a 2-microfarad plate is about $12\frac{1}{2}$ sq. ft. for each electrode. The volume of the plate after waxing and pressing is approximately $7\frac{1}{2}$ cub. in., and the weight 7 oz. The insulation between the electrodes taken at 60° Fahr. with 400 volts after one minute's electrification, usually lies between 1,000 and 2,000 megohms per microfarad.* Any lower insulation than 1,000 megohms per microfarad is an indication of imperfect desiccation, excessive pressure, or faulty material.

It should be noted that the specific insulation of foiled paper is lower than that of plain paper, the difference being due chiefly to the fact that the former is heavily sized. When condensers of extremely high insulation are demanded for special purposes, it is possible to obtain an insulation of nearly 20,000 megohms per microfarad (400 volts, 60° Fahr., 60 seconds). Such condensers are invariably built up of sheets rather than by the rolling process, and metallic foil may be used in preference to foiled paper. Three sheets of paper are usually interleaved between consecutive foils. Increasing the number of interleaving papers, while increasing the actual insulation of the plate, does not increase the "megohms per microfarad" since the capacity falls in proportion to the rise of insulation.

For certain purposes, such as absorbing the spark across the break of sparking coils, leaky condensers, that is, condensers with specially low insulation, are of advantage. The low insulation necessary may conveniently be obtained by rolling up foiled paper without any interleaving paper, the plate being in other respects treated in the ordinary way. An important detail in the manufacture of condensers for spark suppression is that there must be no appreciable resistance in the condenser circuit, that is, in the electrodes or thin connections. The insertion of even 1 ohm in series with the condenser of a high-frequency spark coil markedly increases the sparking at the primary contacts.

Even with foiled paper, although the quantity of metal per unit area is extremely small, the conductance of the electrodes is in excess of the actual requirements, whilst if solid foil is employed, it is necessary to use fully ten times the weight and volume of metal that would suffice if only the conductance had to be considered. The necessity arises from the fact that metal foil cannot be rolled in continuous lengths to give a greater covering surface than about 90 sq. ft. per pound (about $18\frac{1}{2}$ sq. metres per kilogramme), and even with this thickness the foil is extremely tender and requires delicate handling, as, if made of pure tin, it is only 0·0003 in. thick. The metal foil is in addition expensive, and is by far the most costly item in the construction of a condenser. Further, when metallic foil is used, short circuits are very apt to develop both during manufacture and in subsequent use. The short circuits are due to grit in the foil, or to pinholes or other defects in the interleaving paper, or are consequent upon disruptive discharges caused by the application of a voltage in excess of the dielectric strength.

Now with respect to these short circuits or disruptive discharges, however produced, condensers made of foiled paper have the peculiar advantage of possessing to an almost perfect degree the property which in a pneumatic tyre is called self-sealing, and consequently they are practically proof against short circuit, and can be subjected to much higher voltages than is permissible with those made from metallic foil. Owing to the extreme thinness of the conducting film, the small quantity

* The expression "megohms per microfarad," though incorrect, is so generally employed that the custom has been followed throughout this paper; the phrase should, however, invariably be interpreted as "megohm-microfarads."

Digitized by Google

of heat generated at the point of short circuit by the sudden discharge of the condenser through that point is sufficient to cause the film of metal immediately surrounding the point of breakdown to be fused into minute globules. The segregation of these globules from each other and from the surrounding metallised surfaces effectually isolates the point of breakdown, and the defect is instantaneously sealed up. So rapid, indeed, is this effect, that if a pin is stuck into an insulated charged condenser so as to produce short circuits between the foiled papers, the short circuits seal up without fully discharging the condenser, and a dozen or more of such short circuits may be created one after the other before the condenser becomes fully discharged. Consequent upon the observation of such an effect as this, the author conceived the idea of electrically treating the foiled paper before making it up into condensers in such a way as practically to eliminate all pinholes or defective places by subjecting them momentarily to currents of such strength as to produce a minute non-conducting ring round each defect, thereby isolating it from the surrounding surface.* All that is necessary is to pass the paper, foiled side uppermost, over a conducting roller, and to maintain a suitable potential difference between the roller and the foiled surface. When any pinhole or weak place in the paper reaches the roller a short circuit occurs, and the effect of the spark is to isolate the defect by volatilising or fusing the film of metal immediately around it. In this way all the weak places in the dielectric are detected and isolated before the paper is brought into use, and in consequence it is possible to use thinner paper, both foiled and plain, than would otherwise be safe. If current from lighting mains is employed a series resistance is necessary to limit the short-circuit current. With 100 volts this resistance should be about 15 ohms, and with 200 volts about 150 ohms. Experience shows that the searching effect of the voltage is increased by connecting a condenser of considerable capacity, say 20 microfarads, across the potential terminals, but a series resistance of about 50 ohms in the condenser circuit is needed to tone down the suddenness of the condenser discharge. The values given above for voltage, capacity, and resistance are in no sense "critical," and they may be varied considerably; the result desired is the production of a small uncharred hole surrounded by a minute ring of

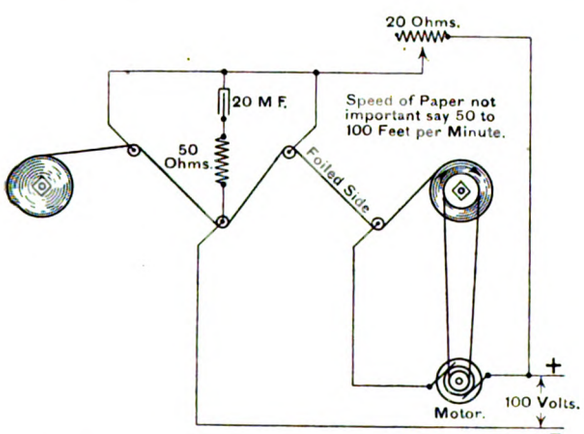

Fig. 1.—Device for Treating Tinfoil Paper.

perfectly clean white paper. The author's experience is, however, that the majority of defects are shown up and removed by a comparatively low voltage, and that there is little to be gained by using more than 200 volts for this process if the condensers are for telephone or telegraph work. As regards the direction of the current there appears to be little to choose; if anything the preference may be given to connecting the positive pole to the plain side of the paper, but the device works quite satisfactorily with alternating current. When the breakdown device is driven by an electric motor it is of advantage to have two rollers making contact with the foiled side of the paper at separate points, preferably not less than 2 ft. apart; the current driving the motor may then be led along this strip of foiled paper between the two rollers, so that should there be any break in continuity in the foiled surface the current driving the motor would be broken when the fault passed the first roller, and the stopping of the machine would call attention to the want of continuity. Fig. 1 shows the connections of the breakdown rollers as arranged for motor driving. If the apparatus is mechanically driven, a suitable relay may be connected between the second and fourth rollers so that a local circuit is completed and a bell rung whenever there is any break of continuity between the two rollers.

Joints in the paper may have to be made from time to time.

* U. K. Patent 22139, 1905, G. F. Mansbridge.

A simple way of making them electrically continuous is, after the ends have been joined by lapping and pasting in the ordinary way, to paste on to the foiled surface a 6-in. strip of foiled paper placed face downwards, so that part of the foiled surface of the strip makes contact with one side of the break and part with the other. It is not desirable to paste the whole of the surface of the strip since the continuity of the film may thereby be destroyed; the usual plan is to paste merely the edges on each side leaving the middle portion clean. Good flour paste is found to give satisfactory results.

The condenser plates having been wound then pass to the drying oven, and subsequently to the vacuum pans and screw-presses. Ovens heated by gas, steam, and electricity are in use for desiccations prior to waxing. Electrical ovens are preferable owing to the ease with which the temperature can be controlled, and the facility with which the heat can be kept to its legitimate purpose instead of being dissipated throughout the shop. For an oven of about 25 cub. ft. capacity which will accommodate five hundred 2-microfarad plates, a power consumption of 2 kw. suffices. The temperature permissible is limited by the necessity to avoid scorching the paper, since cellulose suffers adverse physical changes if heated much above 212° Fahr. for any considerable time. Consequently the practice at one time was to dry the condensers at a temperature of 212-220° Fahr., but this involved from three to four days stoving unless the plates were composed of only a very few sheets or layers, and were disposed in such a way that the heat could readily permeate, and the moisture readily leave, the innermost layers. This in commercial work is impracticable since some condensers of ordinary size have over 100 convolutions, that is 800 layers of paper in the flat roll, and a great many have to be accommodated in the oven at the same time. To expedite the drying process, the author tried the plan of utilising the resistance of the strip of foiled paper to generate heat in the interior of the condenser when a current of suitable strength was passed along it. It was found in this way, that with an oven temperature of 212° Fahr., and an additional expenditure of 4 watts per 2-microfarad plate, thorough desiccation could be effected in 8 to 12 hours, without any scorching of the paper, although the temperature inside the rolled condenser reached 270° Fahr. Although fairly simple in manipulation, this method did not lend itself very readily to commercial manufacture on the large scale, but it eventually led to the use of a simple process which has been found most satisfactory and efficient, namely, the vigorous churning of the heated air inside the oven by means of a fan. The use of a fan in this way permits of temperatures as high as 290° or 300° Fahr. being employed without scorching the paper. It will be understood that the fan does not create a circulation of air from outside, but merely churns the hot air in the oven, and although after a time this air becomes more or less moisture-laden, the high temperature enables it to absorb an enormous weight of water before reaching saturation point. By running up the temperature in this way satisfactory desiccation can be obtained in as short a time as 8 hours.

One point calling for attention as regards the drying of condensers is the shrinkage in length which takes place with many papers during desiccation. In the case of plain paper newly come from the mill, this may amount to ½ per cent. after 24 hours' drying at 212° Fahr., and there is a further shrinkage on waxing. In the case of foiled paper, the shrinkage on drying is much less, and the whole of this occurs prior to waxing. If perfectly fresh and undried interleaving paper is wound up tightly with foiled paper and the compound roll is then dried and waxed, there will be a tendency for the great shrinkage of the interleaving paper to cause the foiled paper to crinkle or crease when pressed. To guard against this, the plain paper should either be matured for a few months in stock, by which time it will have shrunk considerably, or it should be oven-dried for some hours before use.

After being effectively desiccated the plates have to be impregnated with paraffin wax. The function of the paraffin is not only to increase the inductive capacity of the dielectric, and to prevent moisture from again reaching the highly hygroscopic paper, but also to retain the condenser in the closely compacted form into which it is compressed while the wax is hot. The inductive capacity of the layers of paper and air which separate the electrodes before the plate is impregnated is approximately 1·2, and on the air being replaced by paraffin this increases to approximately 3·2. Obviously the more thoroughly the air is replaced by the paraffin the greater will be the gain, and to facilitate this it is advantageous to impregnate the condensers *in vacuo*. As the result of tests of some batches aggregating a thousand plates, it was found that the gain in capacity due to impregnation under vacuum averaged 11 per cent. This means that 11 per cent. less material is required for a given capacity, while in addition the condenser produced is more reliable, since every isolated air-bubble tends to reduce the dielectric strength by causing unequal distribution of strain, and also tends, by expansion and contraction, to cause, in time, a drop in capacity by separating the layers, and a drop in insulation by affording an opportunity for moisture to enter the interior of the plate. An obvious way of impregnating *in vacuo* is to exhaust the air from the pan containing the condensers, and then after complete

Digitized by Google

evacuation to run in the not paraffin; but equally good results can be obtained by plunging the plates into a pan of hot wax, fastening the lid, and then maintaining a vacuum in the upper portion of the pan. The advantage of the latter plan is as follows:—In order to facilitate the exhaustion it is necessary to heat the paper; this heat can most conveniently be conveyed into the inside layers of paper by means of the hot wax. If the exhaustion is carried out with the paper dry there is no vehicle to carry the heat into the interior of the condensers, and only radiated heat from the sides of the pan is effective since the air has been withdrawn; for other reasons also the plan of evacuating over the wax is found to have the balance of advantage. An illustration of a gas-heated vacuum pan was shown which would accommodate 150 2-microfarad plates per charge. To prevent deterioration of the paraffin by scorching, the bottom of the pan is made exceptionally thick, and several rows of

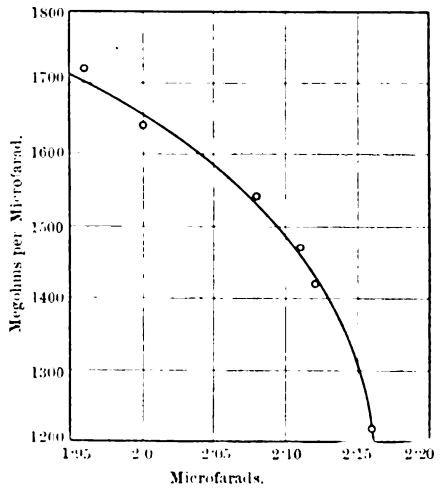

Fig. 2. Foiled Paper Condensers. Relation between Capacity and Insulation of similar Condensers, subjected to differing Degrees of Mechanical Pressure.

minute gas jets are provided so as to distribute the heat uniformly over the bottom. To facilitate the circulation of the hot wax the plates are not allowed to rest upon the pan itself, but are laid upon a loose metal grid which stands up an inch or so from the bottom of the pan. Two hours' impregnation at 212° Fahr. is sufficient if a thoroughly good vacuum is obtained. After full impregnation the vacuum is broken and the condensers are left subjected to atmospheric pressure for ten minutes, and are then removed from the hot wax and at once pressed. No advantage can be traced from the employment of more than atmospheric pressure in the pan after evacuation is complete.

The method of pressing and the manipulation at this stage are of considerable importance. In the first place it will be obvious that the greater the pressure, the greater, within limits, will be the capacity obtained, and with this object it is the practice in certain factories to employ hydraulic machinery and to compress the plates to the utmost limit. The objections to this course are, however, considerable. First, there is a great tendency to drive the paraffin out of the pores of the paper. Secondly, the enormous pressure greatly increases the liability to short circuits. Thirdly, the excessive pressure results in lowering the insulation to an extent which is out of proportion to the increased capacity. This effect, which is shown graphically in Fig. 2, necessarily follows from the reduction in the proportion of paraffin to paper, since the wax has much the higher specific insulation. A further objection to hydraulic pressing is that for commercial reasons it involves the simultaneous pressing of a vertical pile of plates, and this procedure is to be deprecated since the cooling of such a pile is necessarily slow, and the wax continues to drain out of the inner condensers to such an extent that when cold there is comparatively little left in them. As the result of experience, it can be said that for a condenser which is required to maintain its insulation and capacity for many years it is of first importance that a good body of wax be left in the plate. For this reason the pressing of even two plates one above the other is not permitted at the Post Office factory. The same objections do not apply to the pressing of a number of plates laid flat, and placed side by side on a water-cooled plate. This is the current practice, and it is found to give satisfactory results; the presses are water-cooled both on the top and on the bottom. With cooling water at a temperature not exceeding 60° Fahr., five minutes' cooling in the press suffices for a condenser ¼ in. thick; for plates of greater thickness a correspondingly longer time is necessary. Contrary to what might be expected, experience shows that more uniform results can be obtained with screw-presses than with levers and dead weights, and the latter form has consequently been altogether abandoned at the Post Office factory. Even the use of gauge-blocks for the screw-presses, by means of which the condensers are pressed to a certain definite thickness, seems to give less uniform results than can be obtained by a careful workman with a little practice, without any guide other than the "feel" of the press, and an occasional capacity test of the plates as they come from the presses. One objection to the gauge-blocks is that they do not allow for the small commercial variations which are constantly met with in condenser manufacture, and another is that they tend to reduce the operation of pressing, which is one that really requires some little skill and care, to the mere manipulation of a machine.

As soon as the plates are fairly cold they should be placed aside to settle down in temperature before being tested, and in the meantime they should be protected from atmospheric moisture; paraffin, contrary to the opinion of the layman, is markedly hygroscopic.

In addition to or in substitution of paraffin, various waxes and mixtures have from time to time been proposed for condenser work. Beeswax, resin, shellac, ceresine, stearine, lead stearate, &c., have all been suggested, but the author has been unable to find that any one of these substitutes possesses the all-round advantages of good paraffin. For condenser work a high quality of wax is necessary, but this does not necessarily imply a high price. For use in tropical countries paraffin of a specially high melting-point is desirable, but for use in the temperate zones wax with a melting-point of about 130° Fahr. answers most requirements. For condenser work the wax cannot be considered satisfactory unless it is chemically neutral and free from unsaturated hydrocarbons. Its suitability in this respect can readily be ascertained by the usual chemical tests. Before being run into the vacuum pan the wax should be strained through sieves of the finest mesh (a few thicknesses of muslin will answer very well) to remove mechanical impurities.

In all stages of condenser manufacture handling by the workmen should be restricted to a minimum, and no operative who is inclined to perspire freely should on any account be permitted to handle the plates prior to boxing. The ideal method of manufacture is to place the dried plates in metallic cases, to plunge the whole into the hot wax, then to exhaust the air, and finally to take out the condenser complete in its case so that the plate, after impregnation, suffers no handling whatever. The objections to this plan are that there is so little control over the capacity, and that there is such great waste of material, since the pressure which can be brought to bear is so small; the method can, however, be recommended where long life is of more importance than first cost.

Reference has already been made to the question of dielectric strength. As a rough approximation, it may be said that with ordinary paraffined paper at 60° Fahr. the breakdown-point is

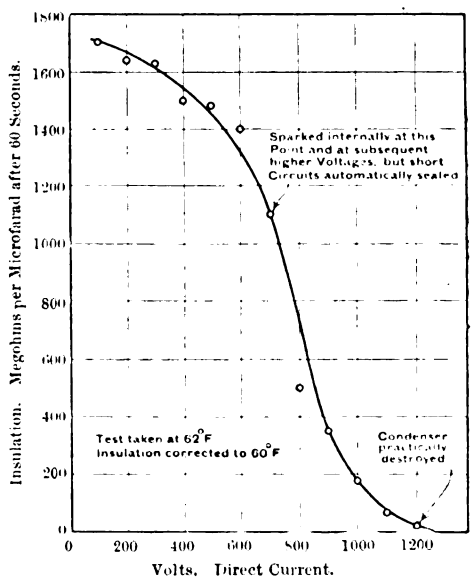

Fig. 3.—Foiled Paper Condensers. Curve showing Relation between Testing Voltage and Observed Insulation.

approached when the pressure reaches the equivalent of 150,000 volts per centimetre. With foiled paper, however, the result of the automatic sealing is practically to double the effective dielectric strength.

Fig. 3 shows graphically the results obtained on subjecting an ordinary telephone condenser, made from foiled paper, to steadily

Digitized by Google

increasing pressure. As the voltage rose above the normal point of dielectric strength the paper broke down, possibly at several places, but each short circuit sealed up as fast as it was formed, and not until the pressure reached 1,200 volts was the condenser rendered useless.

For telegraph condensers, which are generally required to be adjustable, an outer wooden case carrying a plug-switch is provided; the internal construction is as follows:—Separate condensers of suitable capacity are selected, and after a preliminary test are assembled between a pair of sheet-iron plates, which are then bolted together. The object of these clamping plates is two-fold; first, to build up the separate condensers into a substantial mechanical structure; and, secondly, to keep upon them a certain degree of pressure so as to counteract the natural tendency towards a drop in capacity. The batch of plates so assembled is built up into a solid mass with plastic paraffin, and is then hermetically sealed in a tinned-iron case, the opening where the wires are brought out being sealed with a non-contracting mixture of gutta-percha, resin, stearine pitch, and Stockholm tar.*

This compound does not flow at high temperatures, does not get brittle when frozen, adheres firmly to metal surfaces, and contracts very little on cooling. The same mixture is used for sealing the top of the tin cases of telephone condensers, the metal cap which is subsequently soldered in position being merely a mechanical protection. On the Continent *papier-mâché* cases have been adopted to some extent, but their use cannot be recommended, since *papier-mâché* readily absorbs moisture.

In speaking of the insulation resistance of a condenser it is necessary to be most precise as to exactly what is meant. The insulation is usually expressed either in terms of the percentage loss of charge after the charged condenser has been insulated for a certain time or as so many megohms per microfarad. The "percentage-loss-of-charge" method is used chiefly for standards and for submarine cable condensers; for ordinary telegraph and telephone condensers the insulation is more often reckoned as "megohms-per-microfarad." Neither expression is a precise specification of the insulation value unless certain datum lines are assumed or stated. The first of these necessary data is the temperature at which the test is taken, the second is the value of the voltage applied, and the third is the time which is allowed to elapse between the first application of the voltage and the moment at which the leakage is measured. For the loss-of-charge method the periods of charge and of insulation have to be stipulated. The latter period is commonly taken as one minute, but the period of charge is not so well standardised, 15 seconds being taken by some observers and 60 seconds by others. The pressure often employed for this test is 100 volts. Of the scanty literature on this subject the most noteworthy seems to be that contained in an article† by Messrs. Dearlove and Sayers, who have given the results of some interesting experiments made by them on tinfoil and paper condensers as made for submarine telegraph work.

With respect to temperature, 60° Fahr. is in this country the standard generally accepted for tests made by both methods.

The voltage adopted for the "direct deflection" or megohms-per-microfarad method varies according to the nature of the duty demanded of the condenser. The period of application of the pressure in this case is usually two minutes; the leakage is measured at the 60th second after the moment of application, and the insulation is calculated on the basis of that moment's reading. During the whole period of the test the leakage should steadily decrease; and as a measure of this absorption or "electrification," it is usual to take the difference between the readings at the end of the 60th and the 120th second respectively, and to express this difference as a percentage of the reading at the 60th second. With a good condenser this percentage will usually fall between 25 and 35 if the test is taken at 60° Fahr. The degree of electrification falls markedly with a rise in temperature. The behaviour of a condenser in respect to electrification is an important indication of its quality, as incipient defects give the first indication of their existence by producing unsteady or "negative" electrification.

The correcting temperature coefficient for foiled-paper condensers is as nearly as possible 3·50 per cent. per degree Fahr., or $Y_{60} = Y_t\ 1{\cdot}035^{t-60}$, where Y_t and Y_{60} are respectively the observed insulation resistence at $t°$ Fahr. and the corrected insulation resistance at the standard temperature of 60° Fahr. This assumes that the insulation is measured after 60 seconds' application of a pressure of several hundred volts. It is not suggested that this formula has an accuracy which is comparable with that of a copper-resistance temperature coefficient, since the difficulties of measurement are so much greater in the former case, but it is thought that the formula will be found generally to give, over a considerable range of temperature on both sides of 60° Fahr., results sufficiently accurate for commercial purposes.

* The mixture consists of:—

Gutta-percha scrap	...	...	...	20	parts
Resin ...	...	...	...	14	,,
Stearine pitch	...	...	...	6	,,
Stockholm tar	...	...	...	14	,,

Commercial stearine pitch varies considerably in hardness, and if the mixture so made proves too hard it may be tempered by the addition of a little boiled linseed oil.

† *Electrical Engineering*, March 21, 1907, "Relative Dielectric Resistance at various Temperatures of Paraffined Paper Condensers."

From general considerations one may state the relation—

$$\Omega = \alpha \frac{s}{vt}$$

where—

Ω = megohms per microfarad.
s = seconds after application of voltage.
t = temperature in degrees Fahr.
v = applied voltage.

Analysis of a number of insulation and electrification curves shows that this expression may be thrown into a simple numerical form, and for foiled-paper condensers the following approximate empirical formula is obtained:—

$$\Omega = 400 \frac{s^{\cdot 5}}{v^{\cdot 1} \times 1{\cdot}035^{t-60}}$$

For metallic-foil condensers the expression becomes—

$$\Omega = 4{,}000 \frac{s^{\cdot 5}}{v^{\cdot 1} \times 1{\cdot}035^{t-60}}$$

These empirical formulæ are, of course, only applicable to thoroughly desiccated condensers properly constructed of good material.

Electrolytic Cells.—These have not been received with much favour in this country, but they were at one time used to a considerable extent in Germany for common battery telephone work. They have, however, been almost entirely discarded in favour of paraffined-paper condensers. The only advantage which these "polarisation cells" possess over condensers is with respect to size, a cell, or a set of cells capable of stemming back a direct current at 25 volts having a volume of only about 5 cub. in. On the other hand, the cost of such a set of cells is from three to four times that of a condenser of equal effectiveness. The cells used appear to be of three classes, viz.: "Acid cells," consisting of two small electrodes of platinum dipping into an acid solution; "sodium cells" (Natronzellen), in which the electrolyte is a solution of a sodium salt; and aluminium cells, in which the electrodes consist of aluminium, and the electrolyte is some kind of basic solution. The acid cells have a damming effect of about 1·8 volt each, the sodium cells about 2·7 volts, and the aluminium cells as much as 30 or more volts. It is probable that the polarisation cell would never have been developed as a practical device if the modern condenser had been available at a reasonable price in the early stages of telephone development. The disadvantage of the polarisation cell is that it is more or less leaky, both electrically and mechanically. The permanent polarisation current passing through each cell is small, but on a system of many thousand subscribers the aggregate leakage becomes considerable. The mechanical difficulty is, however, the more serious one. If the cells are hermetically sealed they are liable to burst owing to the gradual accumulation of gas, which has been known to cause pressures up to 20 atmospheres. To avoid this difficulty some forms are provided with a simple release valve. This is particularly necessary with aluminium cells, as these are of larger size and evolve a greater quantity of gas. It is, however, almost impracticable to prevent some leakage of the solution, and in all the circumstances it is not surprising that the chemical cell has been ousted by the static condenser.

An appendix to the Paper contains a set of specifications for condensers.

In Post Office wooden-cased condensers for telegraph purposes, the plates are to be secured between substantial iron clamps, and to be boxed up solid and air-tight with an approved insulating compound, the clamp being secured to the side of the case by means of suitable lugs and screws. The capacity of each section is to be not more than 5 per cent. higher or lower than the nominal value in the case of plates of 1 microfarad and above, and not more than 10 per cent. higher or lower in the case of capacities of less than 1 microfarad, and, in the case of signalling condensers, the difference between the two halves of the condenser is to be not more than 0·25 microfarad. The capacity of each section is to be measured by taking the instantaneous discharge after the section has been charged for a period of 10 seconds with an electromotive force of 50 volts. The tests for insulation and electrification are taken on the condenser as a whole, and not on the separate sections, and the tests are made with an E.M.F. of 400 volts as follows:—The condenser being at a temperature of approximately 60° Fahr., apply the battery for a period of two minutes. The deflection shown after one minute must indicate such an insulation resistance in megohms that when multiplied by the capacity in microfarads the products shall be not less than 1,000. The deflection shall steadily decrease during the second minute, and the difference between the readings at the beginning and end of the second minute shall be not less than 20 per cent. of the first minute reading for 1 microfarad and the larger sized condensers, and 10 per cent. of the first minute reading for condensers less than 1 microfarad.

The overall dimensions and weight of a complete metal-cased condenser for telephone purposes, including the outside soldering

Digitized by Google

tags, is specified by the Post Office not to exceed the following, viz. :—

	Dimensions.	Weight.
For condensers 0·5 mfd.	$4\frac{3}{4}$ in. × $2\frac{5}{8}$ in. × $\frac{5}{8}$ in.	4 oz.
,, 1·0 ,, ...	$4\frac{3}{4}$ in. × $4\frac{3}{4}$ in. × $\frac{5}{8}$ in.	8 oz.
,, 2·0 ,, ...	$4\frac{3}{4}$ in. × $4\frac{3}{4}$ in. × $\frac{5}{8}$ in.	12 oz.
,, 2·0 ,, ...	$4\frac{3}{4}$ in. × $1\frac{3}{8}$ in. × $1\frac{3}{8}$ in.	10 oz.
,, 4·0 ,, ...	$4\frac{3}{4}$ in. × $4\frac{3}{4}$ in. × $1\frac{1}{8}$ in.	20 oz.
,, 10·0 ,, ...	$4\frac{3}{4}$ in. × $4\frac{3}{4}$ in. × $2\frac{1}{16}$ in.	46 oz.

The actual capacity, measured in the same way as the telegraph condensers, is to be not more than 10 per cent. higher or lower than the marked value.

The insulation tests are made with an E.M.F. of 300 volts instead of 400 volts, and the megohms per microfarad, after one minute's electrification, must be not less than 300. The difference between the readings at the beginning and the end of the second minute must be not less than 20 per cent. of the first minute reading. The insulation resistance between either of the outside soldering tags and the metal case must be not less than 300 megohms. The condenser plates are to be tightly fitted in the metal case, and the top is to be hermetically sealed before the metal top is put on. The sealing composition must not be brittle or so soft that it will flow at a temperature of 75° Fahr., and it must adhere firmly to the tinned iron case.

The technical details in the National Telephone Company's specification for condensers are as follows :—

1. The capacity to be not less than 1·8 nor more than 2·2 microfarads when tested with direct current at 4 to 5 volts, and with an alternating current (sinusoidal wave at 4 to 5 volts and 800 periods per second.

2. The insulation resistance to be not less than 100 megohms between the two plates and between the plates and the case when tested with an E.M.F. of 100 to 200 volts.

3. The condensers to withstand an E.M.F. of 400 volts maximum (not R.M.S. value), alternating at 20 to 25 cycles per second applied at the terminals for a period of half a minute.

Owing to pressure on our space, we are obliged to hold over our report of the discussion until our next issue.

ELECTROCHEMISTRY AND ELECTROMETALLURGY

AT the meeting of the Faraday Society of Tuesday, there were two Papers on the agenda. The first was by L. O'Dowd and Dr. F. Mollwo Perkin upon the "Determination of the Boiling Points of Very Small Quantities of Liquids." The authors pointed out that in dealing with very small quantities of liquids, the ordinary method of distillation was not satisfactory owing to the loss of material which took place in the apparatus, and to the time required to bring the thermometer to the correct temperature, practically all the liquid being distilled off before this ensued. They therefore devised the following method, by means of which it is possible to determine the boiling point of such small quantities of liquids as ¼ c.c. The apparatus is shown in Fig. 1. It consists of a wide-mouthed flask, capable of holding about 100 c.c. of liquid. This is used to receive the liquid which is to serve as heating material. The liquid the boiling point of which is to be determined is placed in the small test-tube (*A*), which is slightly inclined so that the end of it comes exactly against the thermometer bulb. A stirrer (*B*) is passed through a rather wide glass tube inserted through the cork, which serves as an outlet for the air as it expands. The tube (*A*) also passes through a glass tube, and is therefore slightly widened at the top edge to prevent it slipping down right into the liquid. A capillary tube (*C*), about 1 c.c. long, closed at one end, is placed in the liquid, and the flask heated, the outer liquid being stirred meanwhile. Shortly before the b.p. of the liquid in the tube is arrived at, bubbles are seen to be given off from the bottom of the capillary tube. As soon as the stream becomes rapid, and the bubbles rise in continuous succession, the heating is stopped and the temperature allowed to slightly fall, the outside liquid being continually stirred. The speed of the bubbles coming off from the small tube rapidly slackens until finally they stop altogether. At this point the thermometer is read and gives the correct b.p., because it is at this point that the pressure of the vapour is equal to the atmospheric pressure, and that, of course, is the b.p. of the liquid. The authors have determined the b.p. of a considerable number of substances, varying from ether, b.p. 36°, to safrol, 232°, and in all cases, either with low boiling substances or high boiling substances, accurate results have been obtained. In research work it is very often of the greatest importance to be able to determine the boiling point of very small quantities of liquid, because it frequently happens that the amounts of liquid which one has to deal with are of the minutest. Of course, in dealing with mixtures, this process would only give the common b.p. of the mixture, and it would be necessary to separate the mixture in the usual manner.

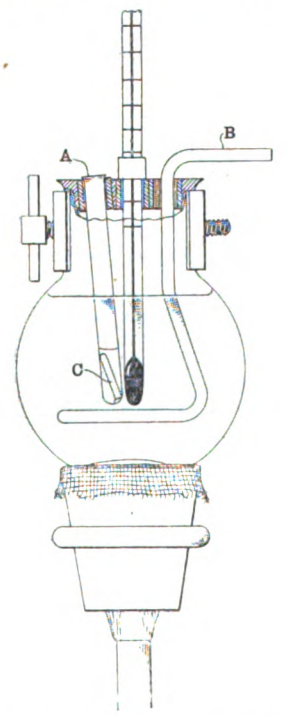

FIG. 1.—APPARATUS FOR DETERMINING THE BOILING-POINT OF SMALL QUANTITIES OF LIQUIDS.

The second Paper was by Dr. F. M. Perkin, upon "The Industrial Uses of Ozone, Particularly in Connection with the Purification of Water." The author commenced with a brief historical survey of the various methods employed for the purification of potable water. These may be mechanical, that is, methods of filtration through beds of sand, such as is usually employed in this country; purely chemical, by the employment of various oxidising agents, such as the addition of chlorine, bromine, permanganates, and the like; electrolytic, in which the electrodes produce both a chemical and mechanical purification, but which, although frequently tried, has never been found practicable upon a large scale; and, lastly, chemical and mechanical methods combined, as employed in the ozonising processes. This might, however, be better designated as electrical, mechanical, and chemical combined, because in the first place electrical energy is employed for converting the oxygen of the air into the active chemical product which causes the sterilisation of the water—ozone. The mechanical part of the process is the previous filtration, which is frequently of advantage. In dealing with large volumes of water which is employed for domestic purposes, there are two considerations of prime importance. In the first place it is essential that the water, when delivered to the consumers, shall be in such a state of purity that when used by the population it shall be incapable of propagating any form of disease or illness. The second consideration is, how can this be brought about satisfactorily and cheaply? The method employed for purification will naturally depend largely upon the source of the supply. Filter beds of sand are fairly cheap, and, given ordinary conditions, usually fairly efficient. But with sand filters it must be remembered that the purifying action is partly bacteriological. The surface of the sand becomes coated with a form of slime which consists largely of bacteria, which are able to destroy noxious bacterial substances originally in the water. The water, therefore, filters first through this bacterial filter, and then passes through the sand. If the amount of water which passes through is of so great a volume that the action of the bed is not sufficiently rapid, then disease may be propagated. Another objection to

Digitized by Google

the sand-bed method is the large area of land which is necessary if the town or city to be supplied be of large dimensions. Now ozone is one of the most powerful bacteria-destroying agents, but it has been found that not only does it sterilise by destroying bacteria, but it is also able to eliminate iron, even when that iron is united with humic acid, which is frequently met with in sewage contaminated water. In this country very little appears to have been done in connection with sterilising of potable water, but in Germany the firm of Siemens & Halske have installed plant for dealing with the water supply of Wiesbaden and Paderborn. The construction of the ozoniser is illustrated in Fig. 2. The discharge space is bounded by concentric pipes fitted into one another, an outer glass cylinder *E* surrounded by a conducting liquid and an inner metal cylinder *D*, which is cooled by means of a current of water circulating through it. The dried air to be ozonised enters the apparatus at the lower pipe *T*, and passes up between *D* and *E*, where it meets with the silent electric discharge, becoming ozonised, and finally passes out at the upper pipe *T*. The whole apparatus consists of a cast-iron box divided up into three spaces; a lower compartment for receiving and conveying the air to the pipes, an upper ozone collecting chamber, and an hermetically sealed middle chamber, into which the ozone pipes are inserted by means of a stuffing box. In the middle air chamber, in which the pipes are contained, cold water is circulated, and, being in contact with the other high-tension pole, conducts the current to the glass cylinder *E*. As the iron box which constitutes the one pole is upon the ground, and the other pole is very carefully insulated and is contained in a closed pipe, the apparatus can be handled and interchanged without any danger and without stopping the plant. The iron box has a plate-glass window, so that the blue light in the discharge chamber can be viewed in order to ascertain whether the apparatus is working satisfactorily. The

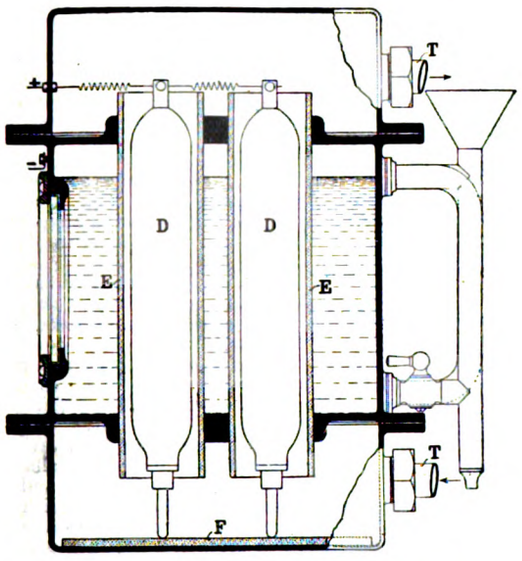

FIG. 2.—SIEMENS AND HALSKE OZONISER.

room in which the plant is working is usually kept dark, so that the attendant on entering can see at a glance whether the apparatus is working properly. An ozoniser such as described takes current at a potential of about 8,000 volts, and requires for its operation 1 h.p., and yields 13·5 to 27 grams ozone per hour, according to the volume of air which is passed through it, and also to the degree to which moisture has been removed. In Paderborn and Wiesbaden the average consumption of ozone per cubic metre of water is 1·3 gram. Consequently with water of this quality one ozoniser can sterilise sufficient water for a town of from 2,400 to 4,800 inhabitants, reckoning the consumption of water at 100 litres per head (about 22 gallons per head; in this country we require more like 30 gallons per head). At Paderborn the sterilisation towers are about 4 metres (13 ft.) high, and are constructed of concrete, their action being similar to the scrubbing towers used in chemical works. The water trickles through a layer of pebbles of about the size of pigeons' eggs; it is thus broken up into numerous little streams, and consequently a very large absorbing surface is presented to the current of ozone, which is forced by means of a slight pressure from the bottom to the top of the tower. The construction of the tower is made clear by Fig. 3, which shows the vertical section. Every tower is divided into three parts: (1) the reservoir for water which is to be treated, *H*; (2) the sterilisation space; (3) the collector for the sterilised water. The interior of a tower is divided by two partitions into four independent shafts, all of which obtain their water from a common supply pipe fitted with a valve *C*. Every single tower is in turn divided by an iron grating into an upper sterilisation space, which is filled with a layer of pebbles two metres deep, and a lower part for collecting the water after treatment. Each tower has a cross-section of one square metre, and about 15 to 20 cubic metres of air is passed up, and meets 15 to 20 cubic metres of water in one hour. After collecting at the bottom of the tower, the water at Paderborn flows out in cascade form as represented in

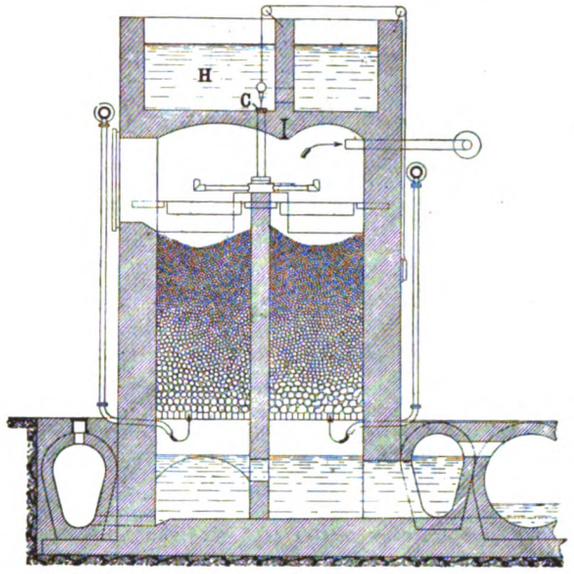

FIG. 3.—STERILISATION TOWER.

Fig. 4. It thus loses any excess of dissolved ozone which it may contain. In case of interruption of the electric current or accident to the blowers, the supply of water to the sterilisation towers is automatically shut off, thus preventing any flow of unsterilised water into the town supply. If, for example, the current in one of the ozonisers is interrupted, thus stopping the ozone formation, the lever of an electro-magnet drops and closes an independent circuit, and this in turn causes a floating conical rubber valve to drop and shut off the water supply to the four towers. On the other hand, should the blower fail, an aluminium disc, which is inserted into the main air-pipe and under normal conditions is kept raised by the air current, falls, and likewise by electromagnetic action, shuts off the water supply to the towers. In either case an indicator at the switchboard points out which set of apparatus and in which tower the trouble has arisen, and at the same time an alarm signal rings continuously until the defect is remedied. Consequently it is impossible for unsterilised water to flow into the water mains. The plant at Wiesbaden is worked upon similar lines, and is constructed to treat 250 cubic metres of water per hour. Although ozonising of water may be called a chemical process, yet nothing is ultimately left in which was not already there, because, should a certain quantity of ozone remain after the water leaves the sterilising towers, this is removed when the water flows over a cascade into the final reservoir. On the other hand, bacteria are practically non-existent after the water has been ozonised. The cost of the process is also extremely low; thus, with a steam plant capable of dealing with 2,000 cubic metres per hour, the cost, including 4 per cent. interest on the capital and a 4 per cent. sinking fund, works out to about three-fifths of a penny per cubic metre of water treated (35·3 cubic feet). Other apparatus for ozone production was also mentioned, and a laboratory apparatus in working was also

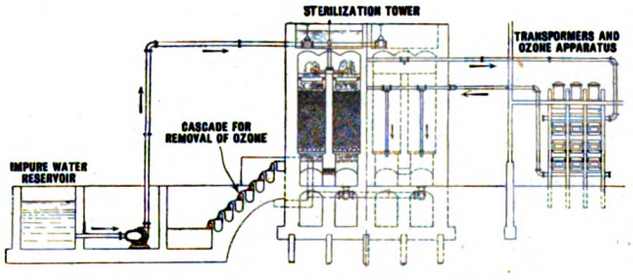

FIG. 4.—PADERBORN WATER STERILISING PLANT.

shown. Dr. Perkin also referred to the use of ozone for the production of artificial vanallin, for the bleaching of flour, and other purposes.

Martin Gruber, in the German Patent 197,510, describes a new

Digitized by Google

solder which can be employed in soldering aluminium and its alloys. It consists of 10 parts of copper, two parts aluminium, 25 parts zinc, 60 parts tin, and three parts cadmium. This alloy has a low melting point, and therefore can be used for soldering together very thin sheets of metal. The alloys which have been used up to the present have always had a very high melting point; consequently it was always necessary to heat to a very high temperature the parts which had to be united, and as a consequence it was difficult in dealing with very thin sheets, and was apt to spoil the character of the metal.

ELECTRICAL SCIENCE

British and American

Theory of Graded Cables.—At the Physical Society meeting last Friday, C. S. Whitehead read a Paper which examines the formulæ given by O'Gorman and by Russell for the "grading" of cables, that is to say, for the due adjusting of the electrical constants of the different layers so that the electric intensity radial to the axis may be constant throughout the covering. The object of the Paper was, in fact, to corroborate the formulæ arrived at by approximate methods by the authors named, by the rigorous use of Maxwell's general equations. The result is to confirm the approximate formulæ, provided that the electrical waves propagated along the cable are not short waves. If λ is the specific inductive capacity of the dielectric at distance r rom the axis of the conductor, and σ the specific resistance of the dielectric at the same point, the rule for alternating current is make the product λr constant; and for continuous currents the rule is make σ/r constant. In the more general case, however, the author shows that a more accurate rule would be to make the product $r\sqrt{\lambda}$ constant for alternating currents, and to make $\sqrt{\sigma}/r$ constant for continuous currents.

A Theory of Gravitation and of Electrons.—At the same meeting of the Physical Society, C. V. Burton read a Paper which endeavours to adapt the ether of electromagnetic theory so as to account for gravitation. Hicks and other writers have supposed that ordinary matter is a modified portion of ether possessing as one of its properties a perpetual pulsatory motion in respect of its volume. It is well known that any such pulsatory objects, placed in a fluid, will exhibit attractions towards one another. The chief outstanding difficulty has lain in providing for that agreement in phase which must be assumed to subsist among the centres of pulsatory disturbance. This difficulty is avoided by the author by supposing the pulsations all caused by primary waves of compressional-rarefactional type propagated through the ether with a velocity enormously transcending that of light. These primary waves may be travelling in directions indifferently distributed, or predominantly in one direction; but an essential point is that all effective wave-lengths should be very great, measured even by astronomical standards. Taking Lodge's estimates for the density of the ether (10^{12} grams per c.c.), and for the constitutive energy of the ether (10^{33} ergs per c.c.), the author finds as mathematically reasonable figures the following:—Velocity of the compressional waves of the ether = $7{\cdot}3\times10^{16}$ times the velocity of light; wave length = $1{\cdot}5\times10^{17}$ cm.; rate at which energy is being propagated through each square cm of surface taken parallel to the wave fronts = $3{\cdot}4\times10^{11}$ kilowatts.

Continuous Oscillations.—At the meeting of the Roentgen Society on May 7th, Dr. Horace Manders read a Paper on "Continuous Oscillations of Electricity, and their Application." After dealing with mechanical oscillations and electrical oscillations in a general way, he described his experiments with arcs between different metals in air in a Duddell circuit with a view to the simple production of sustained oscillations. He had been largely assisted by Mr. Sharman in this work, and had been able to obtain successful results in aerial telephonic transmission by means of these currents. He found that the combination of zinc and aluminium for the poles of the arc, with the zinc rod positive, give satisfactory results, and he demonstrated to the audience the production of sustained oscillations by this method. Frequencies much higher than those of the singing arc could thus be obtained, and the lecturer proceeded to consider the applications of high frequency currents produced in this way. They might be useful for telegraphic, telephonic, or medical purposes. The lecture closed with a demonstration of aerial telephony by use of the method. In the discussion which followed, the President (Mr. Duddell) mentioned that he had made many experiments with arcs between metallic electrodes, but that he had found that a general characteristic of such arcs in Duddell circuits was that they could only be maintained with small currents; indeed, for some combinations of metals the arc could only be sustained when the currents were of the order of a few milliamperes.

Leeds University.—The Marquis of Ripon, Chancellor of Leeds University, has received an intimation that the King has consented to open the new university buildings in July. The Queen will accompany the King on his visit.

Continental

High-Frequency Oscillations from Direct-Current Dynamo.—A new method of producing high-frequency continuous oscillations is described by R. C. Galletti in *L'Elettricista* for April 15th. A direct-current Thury dynamo giving 25,000 volts and 114 amperes, is connected with a triangular oscillating circuit *MNO*. One lead goes to *M*, and the other to *N* and *O*. Between *M* and *N* there is a capacity and an inductive resistance. Between *M* and *O* there is a similar capacity in parallel with a spark-gap *B*, and also an inductive resistance. Between *N* and *O* there is a third capacity in parallel with a spark-gap *A*, and (towards *O*) a fourth capacity. The arrangement of the four capacities has the effect that a spark across *A* produces a virtual reduction of the spark-gap *B*, and *vice versâ*. The circuit *MNO* is syntonised with the circuit *NOD* (*D* being one pole of the dynamo), so that a spark at *A* produces undamped oscillations in *MNO*, and *vice versa*. At all events, when the dynamo is worked at a certain load, a series of practically undamped high-tension and high-frequency oscillations is obtained from the two syntonised circuits. The experiments are to be repeated at Lyons with a dynamo giving 40,000 volts.

Electrolysis of Hydrochloric Acid.—A novel view concerning the migration of chlorine ions is advanced by E. Dcumer in the *Comptes Rendus* for April 27th. If the transport factors of H and Cl ions are calculated on taking account of the fact that only a part of the current serves for the electrolysis of HCl, and the rest for that of water, the results obtained are very different from those yielded by Hittorf's hypothesis. To decide between the rival hypotheses, it is necessary to measure the impoverishment at *both* poles. On Hittorf's hypothesis, the impoverishment will be very different at the two poles. But if the migration velocities of the H and Cl ions are nearly the same, there will be an equality of density of acid at both poles. To obtain correct results, it is necessary to avoid the disengagement of chlorine, and the production of hypochlorous acid. This is accomplished by operating with dilute solutions of 1 to 5 per cent., and currents not exceeding 20 milliamperes. When this is done, the impoverishment is the same at both poles, and the author concludes that H and Cl ions are transported with the same speeds, instead of the H ions moving five times faster. If the HO ions also moved with the same speed, a simple process would result, but the author has not been able to determine this.

Contact Rectifiers.—It is known that some contacts between carbon or silicon and certain metals may be used as detectors in wireless telegraphy. This was attributed to some thermo-electric effect, but that explanation does not seem to cover the ground. Most of the action is due to a rectifying action of the contact, a current being transmitted more easily across it in one direction than in the other. L. W. Austin goes into this question in the *Physikalische Zeitschrift* for April 15th. The most regular effects are obtained with combinations of carbon and steel; tellurium and aluminium; and silicon with almost any metal. The silicon is embedded in a bar of solder, and a steel or brass point is pressed against it by a spring. With a continuous current at 2·5 volts, and a galvanometer of 280 ohms resistance, the author obtained a current of 6 milliamperes in the direction silicon-steel, and 25 milliamperes in the opposite direction. The resistance fell on reversal from 420 to 100 ohms. An alternating current of 60 periods per second at 2 volts was rectified to 8·1 milliamperes in the direction steel-silicon. With a combination of an arc carbon and a steel needle the author obtained 5 milliamperes with 0·4 volt alternate. In a tellurium-aluminium combination, the current passed into the aluminium at the junction, which is opposite to the thermoelectric effect on heating that junction.

Small E.M.F.'s of Prescribed Form.—A universal method for obtaining E.M.F.'s of any desired curve-shape on a small scale is described in the *Physikalische Zeitschrift* for April 15th by L. Baumgardt. The conductors which serve as terminals are two wire curves, one of them a circle and the other a cardioid or other curve, traced in accordance with a proper formula. These two curves are mounted in the same plane, and a conducting bar moves in the same plane in contact with them. A magnetic field is provided, whose lines of force are at right angles to the plane. The E.M.F. in the circuit, which includes that portion of the bar which bridges the wire curves is at any time proportional to the rate at which the bar by its motion adds or subtracts lines of force from the area of the circuit. In one of the simplest contrivances of this kind the centre of the circle is also the pivot of the bar, and the origin of the polar curve $r=\sqrt{\phi}$. This gives a zigzag E.M.F. The equation $r=\sqrt{1-\cos\phi}$ would give a sine E.M.F. accurately. Two other arrangements are also suggested. In one of them, there are two bars in opposite directions, and only a single wire curve. The terminals are the insulated concentric pivots. In another there are two separate wire curves, and two bars with a right angle between them, and concentric pivots.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 7th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.
Names in brackets indicate communicators of inventions from abroad.

1907 Patents

8,623A. S. STONE AND L. W. MIGOTTI. In the "multiple unit" control system for electrically-driven trains, all the motor coaches are of equal power, and when a train enters a curve, owing to the greater tractive resistance offered to the leading coach, there is a tendency for the leading and middle coaches to be forced out of line by the trailing coaches; the effect of which is excessive rail and flange wear, and undue strains and stresses on the truck frames and axles. This invention provides a means of control whereby the leading coach always has the maximum tractive effort, and pulls the remaining coaches to a certain degree. The traction motors are controlled by means of a pilot motor on each motor coach, the pilot motors being governed by a master controller. One claim, three figures.

16,530, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). A method of manufacturing tungsten filaments for glow lamps, and means for rendering the filaments ductile during the process of bending and attachment to the supporting and leading-in wires. These processes are fully described on page 738 of this issue. Two claims, eleven figures.

16,736. C. O. BASTIAN, G. CALVERT, & J. H. SANDERS. The chief difficulties to be contended with, when cheaper metals are substituted for platinum for the leading-in wires of electric glow lamps, are: (1) the different coefficients of expansion, (2) the occlusion of gases by the metal, and (3) the oxidisation of the metal. According to the present invention these difficulties are overcome by making the conductor of a very thin ribbon (0 004 in. thick) of pure copper. This ribbon is provided with a surrounding tube of enamel, glass, or soft white "platinum flux" glass, which is fused round that portion of the conductor which is to be fused into the glass of the bulb. The tube is quickly fused on to the ribbon by the action of two oppositely directed blow-pipe flames. Not only are all gases excluded from the film between the copper and the soft glass covering, but oxidisation of the metal is prevented, and a gas-tight seal is obtained. Six claims, eight figures.

18,515. BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). In a lightning arrester of the electrolytic type, a number of cells with aluminium electrodes immersed in a suitable electrolyte are connected in series. The current leaking to earth is limited by the thin film of aluminium oxide which forms on the surface of the electrodes, and which, with the rise of pressure, is broken down, thus permitting the current to flow until the pressure is reduced. It has been found that the voltage across some cells is liable to become greater than that across others, thus causing the former cells to overheat, and eventually to break down. According to this invention, this local rise in voltage is prevented by connecting each cell as a shunt across an equal number of turns of the winding of an auto-transformer. If the pressure across any one cell tends to increase, the auto-transformer immediately effects a balance, and the pressure is again equally distributed. Two or more auto-transformers in series can be used instead of one. A resistance shunted across each cell may be substituted for the windings of the auto-transformer. The separate resistances are connected in series. The resistances are cheaper than an auto-transformer, but the leakage current is increased. Five claims, four figures.

21,476, A. G. BLOXAM (*Siemens & Halske Akt.-Ges.*). The manufacture of metallic filament lamps of various candle-powers may be facilitated by the employment of two or more filaments twisted together to form one filament of lower resistance and higher candle-power. Standard bulbs and supporting frames may be used for lamps of various candle-powers. A twisted filament has more surface than a single filament of equal section, and is thus shorter for a given candle-power. The twisted filament may be embedded in a ductile metal, and drawn out, if necessary, the outer metal being afterwards removed chemically or by fusion. With thick filaments, excessive heating of the supporting hooks is liable to occur. With twisted filaments, however, this can be avoided, as only one strand of the twisted filament need be passed over the hook. Five claims.

27,401, J. J. RAWLINGS & R. T. SMITH. Fuses for electric circuits when made of either thin hard wire or thick soft wire are liable to become reduced in section at the points where they are gripped by the screw or terminal. The fuse wire often breaks due to this, and also tends to fuse first at these points, instead of at the middle, as is desirable. According to the present invention, copper or other suitable metal is electrolytically deposited on the ends of the wire, thus ensuring good contacts with the terminals. The fuse will also blow at its centre. To cause the fuse to blow simultaneously in several parts of the same fuse wire, and thus distribute the arc, copper can be deposited on all parts of the wire, except where it is to fuse. One claim.

1908 Patent

401, THOMAS A. EDISON. In alkaline secondary batteries of the Edison type, the difficulties have been largely confined to the depolarising electrode in connection with which nickel hydroxide is used. The storage capacity of the nickel element has been less than that of the iron element, and the capacity of the nickel element cannot be maintained for so long a period as that of the iron electrode. The nickel hydroxide is also seriously affected by the presence of dissolved iron in the electrolyte. These defects are partially remedied by the addition to the alkaline electrolyte of about 2 per cent. by weight of lithium hydroxide. The alkaline electrolyte may be a solution of sodium or potassium hydrate. The increase in the capacity of an Edison cell in which lithium hydroxide is used is about 10 per cent., while the increase in the time over which the capacity is maintained is very much more. One claim.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.
Summaries of the more important of these patents will appear in our next issue.

1907 Patents

1,292, RUHMER. Converting direct into alternating currents by means of the electric arc.
8,742, OPPERMANN. Electrical controllers.
8,951, DAVY. Distribution of electricity.
9,576, THURSFIELD. Motor starting apparatus.
11,165, HIGHFIELD. Electrical distribution.
12,139, PLANCHON. Electric lamp filaments.
12,535, HAAR. Apparatus for telegraphing type printed messages.
12,712, MILLER. Means for obtaining unidirectional electric current from spark coils.
13,891, TATE. Apparatus for treating liquids electrolytically.
14,162, PLUMSTEAD, & NEWTON & LAWRENCE, LTD. Apparatus for igniting gas electrically.
14,368, LAKE (*Charles M. Thompson Co.*). Automatic telephone switches.
15,171, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Methods of insulating sheet metal.
16,166, HIGHFIELD. Supplying current to electric motors in series systems.
16,531, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Supports for the filaments of electric lamps.
17,046, NEWMAN & LODGE. Application of electricity for stimulating vegetable growth.
18,101, WUNNER'SCHE BITUMEN-WERKE GES. Process for the manufacture of electric insulating materials.
19,477, GAIFFE. Rotary mercury interrupters.
21,077, ALLISON (*Behan*). Electro-motors.
21,827, LATOUR. Single-phase series alternating-current commutator motors.
22,085, SCHWARZWALDER. Electric batteries.
23,199, TIMAR & VON DREGER. Arc lamps.
26,920, SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*). Electrical locking apparatus for railway signals.
26,937, EVANS. Coin-operated apparatus for controlling the supply of electricity.
27,783, DENNY (*Eastgate & Horn*). Means for making electrical connections.

1908 Patent

898, ROBERT BOSCH. Electromagnetic sparking machines.

Complete Specifications open to Public Inspection before Acceptance.

1907 Patents

1,253, GERARD. Apparatus for producing electrical effluvia.
4,947, NOODT. Insulating bodies.
5,859, TAYLOR. Alternating-current relays.
8,414, ALLGEMEINE ELEKTRICITÄTS-GES. Alternating-current commutator motors.
8,522, BERG. Turbo-electric generator systems.
8,547, RUTHARDT. Field magnets for magnetic inductors.
8,713, HENRIQUE. Electrical ignition apparatus.

LOCAL NOTES

ASTON: *Tramways.*—The negotiations between Aston Manor, Handsworth, and the British Electric Traction Co. have been concluded, and Handsworth has entered into an agreement to purchase and electrify the Villa Road tramway, and arrangements were made for through running from Perry Barr to Birmingham.

BATH: *The Sale of the Electricity Undertaking.*—An alternative arrangement to that originally proposed whereby a syndicate connected with Mr. Schenk was to purchase the electricity undertaking from the Bath Corporation, has been put forward by the Electric Lighting Committee. The syndicate originally agreed to pay £162,000, the total capital expended by the Corporation, and £20,000 bonus, but was unable to raise the necessary capital immediately. It was subsequently arranged that instead of the bonuses the Corporation was to receive annually a supply of £1,000 worth of electricity per annum free. According to the proposed new terms, the payment of the £152,000 is to be spread over 50 years, and certain recommendations for public lighting are to be made.

BELFAST: *Electricity and Tramway Statistics.*—At the weekly meeting of the Tramways and Electrical Committee on Monday, Mr. Eloxam, the Electrical Engineer, read his report on the working of the year ending March 31st last, from which it appeared that the total output was 10,885,658 units, or an increase of 12·7 per cent., the total revenue £57,094, or an increase of 11·5 per cent., and, owing to the rise in coals, the cost of production has risen from 0·654d. per unit to 0·755d. per unit. The net profit on the year's working was £8,198 16s. 4d. He recommended the allocation of various sums, amounting to about £6,500 for various purposes. The report was adopted. From the financial statement, afterwards submitted, it appeared that the tramway revenue amounted to £195,815 1s. 4d., and the expenditure was £119,823 1s. 4d., leaving a gross profit of £75,990.

BLACKBURN: *Light Railway Inquiry.*—On May 8th an inquiry was held by the Light Railway Commissioners as to the expediency of granting an application by the Blackburn, Whalley and Padiham Light Railway Co., for a revival and extension of time for the proposed construction of a light railway in those districts. The inquiry lasted eight hours. The sitting Commissioners were the Hon. H. E. Gathorne-Hardy (chairman), Col. G. F. O. Boughey, R.E., C.S.I., and Mr. Henry Allen, steward. The Chairman said the arguments of counsel had not succeeded in establishing that it would be *ultra vires* to consider the matter as presented. The Commissioners were satisfied no substantial inconvenience had arisen from the course followed by the promoters. It was clear this scheme could not have been carried out in the hands of the original promoters, but having heard the evidence of Mr. Cownie and Mr. Mountain, they thought if those gentlemen were constituted the directors of the company, there was a probability of the scheme being duly proceeded with. The Commissioners consequently granted the application, but, having heard all the objections of the Blackburn Corporation, the Lancashire County Council, and the Padiham District Council, they would insert clauses in the Order for their protection before submitting to the Board of Trade. They could not insist on a width of 27ft. as a minimum for all roads, as asked for.

BRAY: *Electricity Supply.*—In a recent report presented to the Electric Light Committee, the Engineer refers to the great disadvantages under which the undertaking is worked. It is pointed out that the Bray works were among the first electricity works opened for public supply; that the site and buildings are entirely unsuited for electricity works, and the system of supply (single-phase alternating) is not a very suitable system for a small town. Mr. Sowter draws attention to the fact that the coal consumption is unduly high, the cause being chiefly due to the uneconomical loads at which the plant is run for many hours per day. In order to economise under this head, he recommends the Council to instal a 50 b.h.p. gas engine and suction gas plant, which will be run during the hours of light load, and the steam plant entirely shut down at such times. The Engineer also recommends that the mains be extended and supplemented where necessary in order to obtain more consumers. The introduction of the Osram lamp is favourably referred to, and Mr. Sowter proposes to introduce a free wiring scheme, whereby small consumers, who only require two or three lights, and whom it would not be financially possible to supply at a profit by meter, may be charged at a fixed rate per lamp per annum, such rate to include supply of current and hire of wiring. The Engineer's report was discussed and adopted at a recent meeting of the Electric Light Committee, and the Council is recommended to apply to the Local Government Board for sanction to borrow £4,800 to carry out the recommendations embodied therein.

CARSHALTON: *Tramways.*—The Urban District Council has received from the Board of Trade a copy of the report of Colonel von Donop on a visit he paid to Carshalton to investigate complaints concerning the noise of the trams. He found that the noise was only slight, but the representatives of the Council contended that there was usually much more noise. The day was hot, and the rails were perfectly dry, except for lubrication, which the tramways company said they put down always twice a day. On that day the lubricant was put down a little later than usual. Colonel von Donop reported the promise of the company to take greater care in the future and provide for more frequent lubrications. It appeared to him that if care was taken to lubricate the rails, the noise could be reduced to within reasonable limits.

CITY OF LONDON: *Lighting of Markets.*—The annual report of the Clerk and Superintendent of the London City Central Markets (Mr. H. W. G. Millman), which has just been issued, states that the new "Orionamme" arc lamps have greatly improved the lighting of the fruit and vegetable section of the market, and that the introduction of similar lighting in the other sections would prove advantageous. The illumination from the arc lamps around the market, installed and lit during the past year, is giving general satisfaction.

COLCHESTER: *Electricity Supply.*—The report of Mr. A. R. Sillar gives some figures showing the increase in supply since last year. During March, 1908, 142,800 units have been generated against 123,916 for the corresponding month of last year. The total number of consumers is now 1,306, and the connections represent 47,370 8-cp. lamps. Some complaints regarding variation of pressure have been received during the year, but the report attributes these in some cases to the running during unexpected hours of some large motors, and to difficulties in obtaining a satisfactory balance of the three-wire system.

DARWEN: *Tramways.*—Figures relating to Darwen's electric tramways were placed before the Council last week. The gross receipts for the main line were £12,215 11s. 4½d., and working expenses, including £500 for depreciation, have been £8,145 6s. 4d., showing gross profit of £4,058 4s. 9½d., reduced after necessary reductions of the value of £242 10s. 9½d., compared with a net profit of £477 16s. 7½d., for 1907, or a reduced profit of £235 5s. The working expenses were an increase on the previous year, the gross receipts being £85 19s. 11d. less than the previous year. The total mileage was 213,699, compared with 208,935 for 1907, an increase of 3,765 miles. Last year power expenses were £2,308 15s. 10d. In 1907 they were only £2,280 17s. 5d., a saving of £27 18s. 7d. On the Hoddesdon section the gross receipts were £1,685 19s. 7½d., and the working expenses were £1,474 4s. 1d., leaving a gross profit of £211 15s. 6½d. After provisions amounting to £817, there was a net loss for the year of £605 9s. 1½d., compared with a net loss for the previous year of £594 6s. 1d., or an increased loss of £11 3s. 0½d. The total mileage on this section was 31,895, against 30,955 last year, an increase of 938 miles. Power expenses were only £449 14s. 5d., against £471 8s. 3d. the previous year.

In the electricity department there had been 10 per cent. increase in the consumption of electricity for lighting, but a decrease in the units supplied to the trams due to the introduction of demi-cars. The net profits on the electricity works this year was £104, as against £65 last year. Certain improvements were being introduced, by which it was hoped the cost of production would be reduced.

DUDLEY: *Electricity Accounts.*—The units sold during the year ended March 31st, 1908, numbered 2,022,207, an increase of 211,195 over the previous year's total. The costs have slightly increased, but the income has shown an increase of £1,087, so that the net profit has increased from £68 to £344. During the year £200 has been spent in converting boilers from hand to mechanical stoking.

DUMBARTON: *Tramways.*—The Board of Trade inspection of the new tramways between Dumbarton and Alexandria was made by Col. Yorke on Thursday last, and the line was subsequently opened for traffic. It is expected that the whole system will be completed early next month.

EAST BARNET: *Public Lighting.*—The District Council, at its last meeting, considered the question of a proposed agreement with the North Metropolitan Tramways Co. in regard to the fixing of lamp brackets on poles carrying electric wires. It was held that the company had no power to call upon the Council to sign the agreement, and that, on the sanction of the Herts County Council, the local Council could fix the brackets on the poles. The Council declined to enter into any agreement with the company with regard to the standards.

ERDINGTON: *Tramways and Electricity Accounts.*—The receipts of the Electric Light and Tramways Department for the year ended March 31st were £5,254, and the expenditure was £4,294. £600 has been placed to reserve.

ERITH: *Assessment of Supply Undertaking.*—At the last meeting of the Urban District Council, the Clerk reported that he had given notice of appeal against an assessment of the electric supply undertaking for income tax, amounting to £1,142. The question in dispute was the allowance which should be made for depreciation of the machinery and plant, and the Surveyor of Taxes stated that he felt this would be best determined by the Income Tax Commissioners. The Clerk was instructed to appear before the Commissioners in support of the

Digitized by Google

appeal, and a rating surveyor is to give evidence on behalf of the Council.

GLASGOW: *Power Signalling.*—The large new installation of electro-pneumatic signalling gear at the central station, which has been carried out by the McKenzie, Holland and Westinghouse Power Signal Co., was inaugurated last week. The main frame contains 340 levers. Shortly after the opening, however, a main fuse blew, and the whole traffic was stopped for a few minutes.

HAMPTON WICK: *Tramways.*—At the last meeting of the District Council it was reported that the Surveyor had examined the tramway track, and had found that from Normansfield Avenue to Kingston Bridge practically no repairs had been done, the track being in the same bad condition as mentioned in a police report. Although some repairs had been done in Hampton Court Road, the setts were generally in a bad condition. The Surveyor has been instructed to prepare a detailed report, which is to be sent to the tramways company, together with a request for the remedying of the defects.

HARTLEPOOL: *Street Lighting.*—The cost of street lighting for the last quarter has shown a decrease of £42, as against the corresponding quarter of last year.

LONDON: *London County Council: Metropolitan Electric Tramways Bill.*—The Highways Committee recommend that no opposition be offered to the Metropolitan Electric Tramways Bill, 1908, subject to the insertion therein of clauses providing (1) that the powers with respect to the proposed tramway extension along Harrow Road to Edgware Road shall not be exercised unless and until the Council gives its consent; (2) that in the event of the Council promoting a Bill hereafter for the construction of tramways along the same route, the company shall not oppose the proposal, except on details; and (3) for the protection of the Council's property and interests.

Tramways in the Metropolitan Area.—The Metropolitan Association of Electric Tramway Managers are suggesting to various Metropolitan Councils that representations should be made to Parliament with a view to securing a provision that contribution should be paid by motor-omnibus proprietors towards road maintenance in each local area in which such conveyances run, and that the tramways undertakings, failing such contribution being made, should not be responsible for making good repairs necessitated by the running of the vehicles. The association are of opinion that, under existing conditions, the greater part of the repairs necessitated by the running of motor-omnibuses falls upon tramways undertakings under the provisions of the Tramways Act, 1870, and considers it manifestly unjust that tramways should be held liable to construct, maintain, and repair roads damaged by competing vehicles which, in most instances, are not even rated in the district. The association is also requesting the support of the Metropolitan Councils to the effort being made to revise Metropolitan Public Carriage Act, 1869, in order to obviate the present unnecessary expense and inconvenience to the tramways undertakings in connection with the licensing of tramcars, motormen, and conductors.

Camberwell.—The Borough Council has been informed by the Board of Trade that the Board have consented to the electrification of the London County Council tramways (partly situated within the borough) from Brixton Road, via Gresham Road and Coldharbour Lane, to Denmark Hill, and have approved the rail, paving, and substructure proposed to be adopted in the re-construction.

Westminster: Supply to the City Council.—The contracts of the Metropolitan Electric Supply Corporation, the St. James's & Pall Mall Electric Light Co., Ltd., the London Electric Supply Corporation, and the Charing Cross, West End & City Electricity Supply Co., Ltd., to supply current to the premises in the occupation of the City Council at 2½d. per unit for lighting and 2d. per unit for all other purposes, expires on June 24th. The Westminster Electric Supply Corporation, whose contract expired last January, reduced their charge for power heating and cooking to 1d. per unit, as from January 1st, 1906. The other companies are to be asked at what reduced price they will be prepared to enter into fresh contracts for one or three years. In consequence of the inconvenience which results from the Post Office Telegraph Department carrying out work during the season, the Works Committee state that they will advise the Council to refuse their consent in future to any telegraph works proposed to be laid through an important main thoroughfare, unless the work be done at a period of the year when the execution of same will cause the least amount of inconvenience to the public.

MANCHESTER: *Hire Purchase Wiring Scheme Abandoned.*—On Wednesday last week the Electricity Committee asked the Council for leave to borrow £130,500. As stated in our last issue, the original sum was about £500 in excess of this, but, owing to opposition to the proposed "assisted" wiring scheme, this scheme has been abandoned, and the sum allocated for this purpose will therefore not be borrowed. The money is required for extensions at the Stuart Street and Dickinson Street works. Included in the estimates was a sum of £13,500 for "bore-holes, complete, with electrically-driven pumps, softening plant, cabling, and pipe work." At present the water supply at Stuart Street is taken from the town's mains, and it is proposed to sink an artesian well at a point half a mile distant from the station, which it is hoped will supply sufficient water both for make-up feed and the make-up of the circulating water for the condensers (circulating condensers with cooling towers are used). The committee estimate that they could save £2,000 a year by this expenditure, as the daily water consumption at Stuart Street amounts to 400,000 gallons, and costs the Electricity Committee about £3,400 a year. It is estimated that the well should be capable of delivering 1,200,000 gallons per day of eighteen hours, and thus be sufficient for the requirements of the station for the next few years. Mr. Bowie and Mr. Heggs argued that the money would be wasted, as the water was already there, and it was only a question of taking money from one department and putting it into another. Mr. Hynes said that he would oppose the application for the loan at the Local Government Board inquiry. He complained that the capital of the electricity works was £2,385,495, and that as there were 7,000 consumers, this represented a cost of £341 per consumer. Mr. Jackson pointed out that at present the water was not brought from Thirlmere for nothing, and Sir Bosdin Leech, the Chairman of the Waterworks Committee, expressed his approval of the new scheme. Mr. Hargreaves suggested that the river Medlock should be utilised. Mr. Kay, Deputy-Chairman of the Electricity Committee, replied to all the objections, and also pointed to the risk they would run if they were dependent on one source of supply only for their water. The proposal was then adopted.

NELSON: *Electricity Accounts.*—The net profit of the Electricity Department for the year has been £591. A steady increase is being maintained in the load the units sold during the year amounting to 872,534. There has been a small profit on the tramways of £22, instead of an estimated deficit of £159. The receipts per car mile have averaged 8·63d.

SUTTON COLDFIELD: *Electricity Accounts.*—During the year ended March 31st, the units sold have been 347,820, an increase of 24,919 since the previous year. The maximum load has decreased from 931 to 908 kw. A slight increase in the working costs is reported, due mainly to the rise in the price of coal and increased cost of repairs. Last year's deficiency of £99 has been turned into a profit of £100. The total capital expenditure stands at £41,308, including £1,204 spent during the year.

TORQUAY: *Supply to the Tramways.*—Attention was called at a recent meeting of the Town Council to the incorrectness of a statement, that at the end of five years the tramway company would be able to withdraw from their present arrangement with the Corporation and put down their own generating plant. This was not so, as under their act they were bound to take current for an unlimited period from the Corporation unless they failed to supply. The profit on the electricity undertaking during the past year had been over £2,000, and the whole amount required in connection with the proposed removal of the generating station could be met without approaching the Local Government Board for a loan.

WATFORD: *Appointment of New Engineer.*—The Urban District Council has received no fewer than 210 applications for the post of Electrical Engineer. Before the final selection is made, the Electric Lighting Committee is to visit some six electric lighting undertakings, where some of the candidates are engaged, in order to see the actual nature of their work, and obtain other information.

WEST HAM: *Tramways.*—The Tramways Committee of the Council has consented to variation of agreements with the Leyton Council, with a view to extension of the through-running arrangements. In addition to the through services between Bow Bridge, "Green Man," Leytonstone, and "Rising Sun," and between Stratford and the "Bakers' Arms," it is suggested that, during the summer, direct facilities should be given from the south of the borough to Epping Forest, and it is intended to experiment with certain other services, such as a circular route—Stratford, Romford Road, Wanstead Flats, Cann Hall Road, Leytonstone Road, and The Grove, and, possibly, Clapton, "Bakers' Arms," Cann Hall Road, Forest Gate, and Green Street. The East Ham Corporation, having come to an arrangement with the North Metropolitan Tramways Co. for the purchase of the tramways line between Green Street and High Street, East Ham (the electrification of which is to be proceeded with at once), the committee has decided to carry out the overhead equipment of 336 yards of the northern line belonging to West Ham. The Tramways Manager has been in conference with the managers of East Ham and Ilford, so that through-running may commence as soon as the electrification is carried out, and, having regard to the three interests involved, and the varying earning capacity of the route in the different areas, the committee has approved of the proposed appointment of Mr. J. B. Hamilton, Tramways Manager of Leeds, and ex-President of the Municipal Tramways Association, to act as arbitrator to settle the through-running basis, conditionally that the other two authorities agree to abide by his award for a period of seven years. The Tramways Manager reports that during the past year the consumption of current per car mile shows an increase, and no bonus was earned during the quarter ended March 31st, in connection with the scheme providing for a payment to the traffic staff on decrease of current used. It is

proposed that the Chairman of the Electric Lighting and Tramways Committee and the Tramways Manager represent the Borough Council at a conference of tramways authorities on "Mutual Insurance against Third-Party Risks," to be held in London this month. West Ham's experience has shown, says the Tramways Manager, that the risk in question may be borne by the undertaking at a cost below the premiums demanded by insurance companies, and there are other advantages derived from this matter not being placed in the hands of an outside company. A mutual scheme under which the individual risks of different tramways were carefully graded would, in the opinion of the Tramways Manager, prove useful in minimising undue risks in connection with claims amounting to, say, over £250.

TENDERS INVITED AND PROSPECTIVE BUSINESS

BEDFORD.—Tenders are invited for the supply of about 6,500 tons of Derbyshire and Nottinghamshire coal for the electricity works. Particulars from the Town Clerk, to whom tenders by May 15th.

BELGIUM.—Tenders are invited by the Société Nationale des Chemins de Fer Vicinaux, Rue de la Science 14, Brussels, for the supply and laying down of underground electric traction cables. Tenders to the Director General by May 27th.

CHRISTCHURCH.—A report is to be prepared as to the best method of lighting the workhouse and cottage homes.

CORK.—The Cork Joint Hospital Board have received permission from the Local Government Board for the erection of a sanatorium on a site at Stream Hill, near Doneraile, for which a loan of £12,000 had been asked. The plans for the erection of the sanatorium, which will be electrically lighted, are being drawn by Mr. W. H. Hill, architect, Cork.

DARTFORD.—The Engineer has been instructed to obtain tenders for condensing plant.

Tenders are invited for a supply of meters, house service cable, jointing material, and accessories for the electric lighting department. Full particulars from the Clerk to the Council, to whom tenders by June 9th.

DOVER.—The Corporation invite tenders for the supply of large and small Welsh coal, and 3,000 tons of North Country and Midland or small coal, for the electricity works. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by May 18th.

EAST HAM.—The Board of Trade have sanctioned the borrowing of £8,000 for the purchase of the North Metropolitan tramway track in Romford Road. Application has been made for sanction to the following loans:—£1,000 for roof coverings to tramcars, £1,620 for cooling plant for the electricity station, £2,000 for extension of mains.

EDINBURGH.—Tenders are invited for an electrical installation for lighting, heating, and power, at the College of Art, Edinburgh. Full particulars may be obtained from Mr. F. A. Newington, the Borough Electrical Engineer, and tenders to the Town Clerk by May 14th.

ELLAND.—An application is to be made to the Local Government Board for sanction to borrow £3,000 for extensions to the electricity works, in connection with the company which it is proposed to form to construct tramways in the district.

GRIMSBY.—Sanction has been given to the negotiation of a loan of £3,519 in connection with extensions of the plant at the electricity works.

HAMPSTEAD.—The Borough Council Finance Committee has passed an estimate, amounting to £278, for work on the low-tension network in order to improve the efficiency of the electric supply.

HANLEY.—The Corporation invite tenders for the supply and delivery of lamp columns and arc lamps. Particulars from the Borough Electrical Engineer.

HASLINGDEN.—The Local Government Board have approved plans for the erection of a new infirmary at a cost of over £32,000. The Guardians have instructed their architect (Mr. Ross, of Accrington) to prepare specifications.

ILFORD.—A Local Government Board inquiry was held last week into an application by the Council to borrow £27,000 for the purpose of the electric lighting undertaking.

LONDON: *Bermondsey.*—Tenders are invited for a boiler, steam dynamo, condenser and cooling tower. Particulars from the Borough Electrical Engineer (fee, £2 2s., returnable), and tenders to the Town Clerk by May 18th.

St. Marylebone.—The Finance Committee of the London County Council, in a report upon an application by the St. Marylebone Borough Council for a loan of £44,002 in connection with the Council's electric lighting undertaking, point out that it has been previously agreed to grant the application to the extent of £31,306. With regard to the balance of £12,696, this is made up as follows:—Engineering works consequent upon change of pressure, £5,963; and architectural works, £6,733. The committee recommend that sanction be granted to the reduced amount of £12,301, repayable as follows:—Buildings, £3,320, 50 years; change of pressure (miscellaneous items), £5,963; station lighting, £2,133; furniture, £885, 15 years.

London County Council.—The Highways Committee, in a report upon the tramways from Loughborough Junction to Norwood, recommend that these be converted to the overhead trolley system at a total cost of £45,335, made up as follows:—Track work, &c., excluding rails, £35,400; overhead equipment, £6,490; cable ducts and feeder pillars, £3,200; sub-station equipment, £240.

NEWCASTLE (STAFFS.).—Application is to be made to the Local Government Board for a loan of £700 for mains extensions.

NORWAY.—Tenders are invited by the 16th inst., by the Norwegian State Railways, for the erection of an electric lighting station at Kongsvenger Railway Station.

ROTHERHAM.—Application is to be made to the Local Government Board for sanction to borrow £5,300 for the erection of a turbo-generator condensing plant, switchboard, &c., at the generating station.

SOUTHEND.—The Corporation invite tenders for the supply and delivery of traction poles, brackets, overhead line material, and bonds in connection with the construction of 1,500 yards of single tramway track with loops, the rails and setts being supplied by the Corporation. Particulars from the Borough Electrical Engineer (fee £1 1s., returnable), and tenders to the Town Clerk by May 28th.

STOCKPORT.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £10,500 in connection with the electricity undertaking. It is proposed to put in an additional generator and to extend the mains.

WALSALL.—The Electric Lighting Committee invite tenders for the supply and erection of condensing plant, including surface condenser, air pumps, cooling tower, and water purifier. Specifications from the Borough Electrical Engineer (fee one guinea, returnable), and tenders to the Town Clerk by May 29th.

WEDNESBURY.—The Local Government Board have approved of a loan of £7,107 for new generating plant. The question of extension of supply in the King's Hill district has been held over, pending a decision as to the use of overhead wires by the Board of Trade.

WEST HAM.—The Local Government Board has sanctioned the borrowing of amounts totalling £64,317 in respect of the electricity undertaking, including the following items:—Additional plant, £17,076; extensions to Silvertown district, £17,212; prospective expenditure on mains, £14,300; prospective expenditure on transformers, £6,000; prospective expenditure on meters, £3,000; excess expenditure, Abbey Mills Station, £1,442; excess expenditure, Canning Town Station, £5,287. The Electric Lighting Committee has decided that the Electrical Engineer proceed with the erection of two of the five chain-grate stokers at the generating station included in his estimate of £51,600, for which an application for sanction to a loan has been authorised, at an estimated cost of £700.

TENDERS RECEIVED AND ACCEPTED

BRAY.—The following tenders have been accepted for electrical stores during the current year:—Fittings and accessories, General Electric Co. and British Insulated Helsby Cable Co.; carbons, Messrs. Johnson & Phillips; carbon lamps, the Cryselco Lamp Co.; Osram lamps, General Electric Co.; engine room stores, Messrs. Tuck & Co., Messrs. Tomey & Son, and General Electric Co.; cylinder oil, Vacuum Oil Co.; crank chamber oil, Wakefield Oil Co.

BRISTOL.—The following tenders have been accepted: a 150,000 gallon soft water storage tank at Avonmouth, Messrs. W. Cowlin & Son, £645; for the supply of coal to the Avonmouth Electricity Works, the Bedminster Collieries, Ltd., at an estimated value of £12,078.

DARLINGTON.—The tender of Messrs. Callender's Cable & Construction Co., Ltd., at £1,642 has been accepted for the erection of a sub-station with mains.

DERBY.—The tenders of Messrs. Johnson & Phillips, for L.T. cable, and of the British Insulated & Helsby Cables, Ltd., for high-tension cable have been accepted.

DURBAN.—The Corporation have placed an order with Messrs. Willans & Robinson for a condenser capable of dealing with 30,000 lb. of steam per hour.

GLASGOW.—Messrs. Willans and Robinson are supplying two condensers for dealing with 4,000 kw. each, to the Corporation.

JOHANNESBURG.—A condenser for dealing with 12,000 lbs. of steam per hour is being supplied by Messrs. Willans & Robinson for a mine near Johannesburg.

Digitized by Google

LEEK.—The tender of Messrs. Mather & Platt, Ltd., for a supply of a generating set at £2,650 has been accepted.

LONDON: *London County Council.*—In connection with the construction of the new tramways from Hammersmith to Harlesden, it is decided to construct a siding at the Franco-British Exhibition in Wood Lane at a cost of about £1,950. It is recommended that the contract already entered into with Hadfields Steel Foundry, Ltd., be extended to include the special track work required for this siding.

Battersea.—Mains are to be extended to the Châlet in Battersea Park Road at a cost of £32 11s., and in other roads at a cost of £54 19s. In order to obviate vibration in steam pipes, which is set up when the turbo-generator set is running, an additional anchor is to be fixed at the centre of the main steam range at £9 12s. Callender's Cable & Construction Co., Ltd., have agreed to purchase old scrap iron at the Central Station for 44s. per ton.

City of London Union.—The tender of Messrs. Rinchin & Walton for repairs to the lighting installation at the Poplar Infirmary; Mr. Adrian Collins is the consulting engineer.

Hornsey. The Education Committee has decided that electric light be installed in the hall and classrooms at the North Harringay School, at an estimated cost of £154 6s. (Tantalum lamps will be used).

Islington.—The Council has placed an order with Messrs. Willans & Robinson for a condenser to deal with a 1,500 kw. turbine.

Hammersmith.—The Borough Council has received the following tenders for the supply of main switchgear:—Johnson & Phillips: (*a*) switchboard, £1,401 5s.; (*b*) cubicle work, No. 1½ in. slates; (*c*) select switch in oil, £50; (*d*) total without feeders, £1,451 5s.; (*e*) 20 feeder panels, £500; (*f*) complete contract, £1,951 5s. Johnson & Phillips, alternative tender: (*a*) £1,401 5s.; (*b*) £29; (*c*) £50; (*d*) £1,480 5s.; (*e*) £500; (*f*) £1,980 5s. Switchgear, Ltd. (provisionally accepted): (*a*) £1,344 10s.; (*b*) £150; (*c*) £70; (*d*) £1,544 10s.; (*e*) £470; (*f*) £2,014 10s. Spagnoletti, Ltd.: (*a*) £1,330; (*b*) £70; (*c*) £100; (*d*) £1,500; (*e*) £560; (*f*) £2,060. British Westinghouse Co.: (*a*) £1,344 10s.; (*b*) included in total; (*c*) included in total; (*d*) £1,534; (*e*) £574; (*f*) £2,108. Cowan's, Ltd.: (*a*) £1,575; (*b*) £120; (*c*) £118; (*d*) £1,813; (*e*) £515; (*f*) £2,129. Ferranti, Ltd.: (*a*) £1,519; (*b*) £562; (*c*) £200; (*d*) £2,281; (*e*) £700; (*f*) £2,981. The Electricity and Lighting Committee, reporting on the tenders, stated that a letter received from Messrs. Johnson & Phillips, in effect, materially increased the total amount of their tender, and, although the company had since virtually agreed to adhere to their original tender, the committee did not think the Council would be justified in further considering their tender. A letter had also been received from Messrs Spagnoletti, Ltd., reducing the amount of their tender to £1,969 5s., but as this was not received until after a recommendation to the Council setting out particulars of the various tenders received, the committee decided that permission could not be given for the amending of the tender. The provisional acceptance of the tender of Messrs. Switchgear's, Ltd., is subject to their undertaking to deliver the plant not later than July 31st.

The following tenders have been received for the supply of steam piping required in connection with the scheme for the extension of electricity department plant: John Spencer, Ltd. (provisionally accepted), £230 (welded-on flanges); Aiton & Co., £247 (welded-on branches); John Spencer, Ltd. (alternative), £255 10s. (rivetted-on flanges); Rosser & Russell, £261 (rivetted-on flanges); Aiton & Co. (alternative), £263 (rivetted-on branches); Stewarts & Lloyds, £289 15s. (welded-on flanges); Edward Le Bas & Co., £303 (rivetted-on flanges); Babcock & Wilcox, £320 (weldless mild steel).

The following tenders have been received for battery boosters and switchboards:—Premier Accumulator Co. (provisionally accepted): (*a*) battery with lead-lined cells, £650; (*b*) hand reversing booster at 500 revs., £155 10s.; (*c*) milking booster, £18 15s.; (*d*) switchboards, £115; (*e*) totals, £959 5s. Electrical Power Storage: (*a*) £622; (*b*) £163 5s. 6d.; (*c*) £51 10s.; (*d*) £140; (*e*) £976 15s. 6d. Tudor Accumulator Co.: (*a*) £896; (*b*) £163; (*c*) £52; (*d*) £63; (*e*) £979. Electrical Power Power Storage: (*a*) £622; (*b*) £198 10s.; (*c*) £65 10s.; (*d*) £98 14s.; (*e*) £984 14s. D.P. Battery Co.: (*a*) £560; (*b*) £198; (*c*) £65; (*d*) £80 15s.; (*e*) £1,003 15s. Chloride Electric Storage: (*a*) £692; (*b*) £172; (*c*) £52 16s.; (*d*) £95 10s.; (*e*) £1,012 6s. Hart Accumulator Co.: (*a*) £809 10s.; (*b*) £180, appx.; (*c*) £56 7s.; (*d*) pp. £156; (*e*) £1,192 17s. Pritchetts & Gold: (*a*) £783. Accumulator Industries: (*a*) £946 10s. Haven Accumulator Works: (*a*) £1,010. W. C. Rooper & Co.: (*a*) £1,421 12s.

Marylebone.—The Borough Council has accepted the following tenders for the annual supply of stores, materials, and tools for the Electricity Department: W. H. Wilcox & Co., Ltd., vaseline, 2s. 3d. per 5 lb.; best white rags, 35s. per cwt. Naylor Bros., Ltd., orange shellac varnish, 7s. 6d. per gal.; enamel: white, black, blue, P.O. red, black anti-sulphuric, 10s. each per gal. respectively. Pryke & Palmer, common resin, 11s. 9d. per cwt.; white resin, 14s. 9d. per cwt.; Dexine manhole gaskets, 3s. 10d. per lb. F. Bird & Co., spirits of salt, 10½d. per gal.; asphalte cutters, 3d. per lb.; 5 in. pipe cutters, 35s. each; side cutting pliers, 4 in., 6 in., 8 in., 10d., 1s., and 1s. 6d. per pair respectively; clasp knives (heavy), 1s. each; picks, 18s. 6d. per cwt.; pick shafts, 3 ft. hickory, 5s. per doz.; London shovels, No. 2 strap, 17s. per doz.; shovel handles, 5s. 6d. per doz.; steel road wedges, 16s. 6d. per cwt.; enamel iron saucepans, 4s. each; tinned copper wires, 14, 16, 18, 20, 22, 24, 26, 30, 36, S.W.G., 10d., 10½d., 10¾d., 11d., 11¼d., 1s. 0½d., 1s. 1d., 1s. 3d. per lb. respectively; tinned copper sheet, 24 S.W.G., 1s. per lb. Witty & Wyatt, ⅜ in. and ½ in. asbestos tubing, 1s. per lb. J. F. & G. Harris, meter boards, 18 in. by 15 in. by 1 in., 18s. and 15s. per doz.; 18 in. by 15 in. by ¾ in., 17s. and 14s. per doz.; 11 in. by 15 in. by ¾ in., 11s. and 9s. per doz.; banjo boards, 21s. and 18s. per doz.; battens, 11 in. by 3 in. by 1 in., 10d. per doz. H. W. Gilbart, creosoted troughing, 4 in. by 4 in., 24s. 6d. per 100 ft.; saddles for same, 5s. per doz.; brackets, 11s. per doz. Wm. McGeoch & Co., Ltd., black adhesive tape, 1s. per lb. St. Helen's Cable Co., Ltd., rubber gloves, 6s. 3d. per pair; 2 ft. by 2 ft. by 1.15 in. rubber mats, 11d. per lb. British Insulated & Helsby Cable Co., Ltd., pure tin fuse wires, 14, 16, 18, 20, 22, 24, 26, 30, 36, S.W.G., 2s., 2s., 2s. 1d., 2s. 2d., 2s. 4d., 2s. 7d., 3s., 3s. 3d., and 6s. per lb. respectively. Tulley & Straker, mica, 6 in. by 5 in., 4s. 2d. per lb.; 5 in. by 4 in., 2s. 11d. per lb.; 4 in. by 3 in., 1s. 11d. per lb. Baxter & Caunter, ceiling roses, 2s. 3d. per doz. Pope Electric Lamp Co., radiator lamps, 120 v., 24s. per doz.; 240 v., 26s. per doz. General Electric Co., steel conduit, 45 per cent. discount off list.

Metropolitan Asylums Board.—The offer of the Magneta Co. to install 30 clock dials, synchronised by electricity, at the Head Office, at an annual cost of £19, has been accepted.

NEWCASTLE (STAFFS.).—The tender of Messrs. Baggaley & Wood for laying 1,000 yards of three-wire mains, at £579, has been accepted.

SLEAFORD.—Messrs. Pattinson's tender for coal at 16s. per ton has been accepted.

SOUTHAMPTON.—Messrs. Willans & Robinson have been given an order for a condenser capable of dealing with a 15,000 kw. turbine.

The tender of West's Gas Improvement Co., Ltd., Manchester, for the supply and erection at the Westshore Electricity Works of a coal conveyor at £558, has been accepted.

SYDNEY.—A condenser for dealing with 2,000 lb. of steam per hour is being supplied to the University by Messrs. Willans & Robinson.

WEST HAM.—The Town Council has provisionally accepted the following tenders for annual supplies for the Electricity Department:—India-rubber covered wires: Liverpool Electric Cable Co., Ltd.; Plutte, Scheele & Co.; Armorduct Manufacturing Co., Ltd. (flexible wires, single vulcanised). Electrical fittings: Evered & Co.; Electrical Co., Ltd.; Armorduct Manufacturing Co., Ltd.; G. Straus & Co., Ltd.; G. Braulik; British Insulated & Helsby Cables, Ltd.; Verity's, Ltd.; General Electric Co., Ltd. Engine-room stores: Geo. Angus & Co., Ltd.; James Gibb & Co., Ltd.; H. Edmunds & Co.; Manufacturers' Agency Co., Ltd.; Fredk. Bird & Co.; Middleton Bros.; Pryke & Palmer; Wiggins & Rihll. Chemicals: Only one tender was received for chemicals, and this is not to be accepted, but the various articles are to be obtained at the following agreed prices:—F. W. Berk & Co., Ltd., sulphate of alumina, £4 5s. per ton; Middleton Bros., carbonate of soda, £5 5s. per ton; caustic potash, £1 8s. per ton; glycerine, 6s. 9d. per gallon; calcium chloride, 10s. per cwt.

APPOINTMENTS AND PERSONAL NOTES

The salary of the Works Superintendent at the Derby electricity works has been increased from £180 to £200 per annum, and that of the Chief Clerk from £2 10s. per week to £140 per annum, with a further increase to £150 per annum next year.

The West Ham Electric Lighting and Tramways Committee has decided to increase the salary of Mr. G. Lloyd Jones, Resident Engineer, from £260 to £280 per annum, rising to £300 per annum at the expiration of twelve months, and the salary of Mr. W. McKenzie, station foreman, from £3 10s. to £3 15s. per week.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Gilpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net c.i.f port of arrival, quoted on Tuesday night, was £58 5s. to £58 15s. per ton. (Last week £59 to £59 10s. per ton.)

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The P.P.B. Syndicate is to be wound up voluntarily.

A meeting of the South Western Electrical Co., Ltd., will be held at the offices of Messrs. Elles, Salaman & Co., 1 Oxford Court, Cannon Street, London, E.C., on June 15th, at 12 noon, for the purpose of hearing the liquidator's account of the winding up.

A meeting of the Pioneer Gas, Electric Light & Power Co., of South Africa, Ltd., will be held at 35 New Broad Street, London, E.C., on June 12th, at 12 noon, to hear the liquidator's account of the winding-up.

PARLIAMENTARY INTELLIGENCE

LONDON POWER BILLS.—A full report of the proceedings in the House of Lords Committee appears on pp. 721 to 750.

BRISTOL TRAMWAYS.—All opposition to this Bill has now been withdrawn, and it has been referred to the Unopposed Committee of the House of Lords.

ELECTRICAL FIRMS AND RATES OF WAGES.—In the House of Commons on Monday, Mr. Tyson Wilson asked the Postmaster-General whether he was aware that the India Rubber, Gutta Percha & Telegraph Works Co., of Silvertown, and the Western Electric Co., of North Woolwich, who contract for work and supply articles to the Post Office, paid many of their workmen less than the standard rate of wage, the amount in some instances being 8s. per week less than the recognised rate of the district; and whether he would take steps to induce these firms to comply with the fair wages clause. Mr. Sydney Buxton, in reply, asked the particular class or classes of workmen referred to, giving the rate of wages received by them. He would then have full inquiry made.

Another question on the same subject was addressed by Mr. Tyson Wilson to the First Lord of the Admiralty; whether he was aware that the firms of Messrs. W. T. Henley's Telegraph Works Co., the Western Electric Co., of North Woolwich, the India Rubber, Gutta Percha, and Telegraph Works Co., of Silvertown, and Messrs. Johnson & Phillips, of Charlton, who contract for and supply goods to the Admiralty, pay from 2s. to 8s. per week less than the standard rate of wage to many of the workmen in their employ; and whether, seeing that this was unfair both to the workmen and to firms that compete with them who did pay the standard rate of wage, he would take steps to induce those firms to pay the standard rate, or otherwise strike them off the list of firms that are allowed to contract for Admiralty work. Mr. M'Kenna replied that the Admiralty was not aware that the firms in question were paying wages below the current rate of the district. All contracts with those firms contained the usual clause as to the payment of the current rate, and no complaint of any breach of that clause had reached the Admiralty. If specific details of any cases of underpayment were furnished in respect of Admiralty contracts, full inquiry into the matter would be made and suitable action taken according to the result of any such inquiry.

ELECTRIC LIGHTING PROVISIONAL ORDER CONFIRMATION BILLS.—The Electric Lighting Provisional Order Confirmation Bill No. 1 confirms Provisional Orders by the Board of Trade under the Electric Lighting Acts for Bispham-with-Norbreck, Caldy Manor (Caldy Manor Estate, Ltd.), Carnarvon (J. B. Saunders & Co.), Fleetwood, Halesowen (G. Balfour), Heswall, Lowestoft, Portsmouth (amendment), Lymington (extension), Southampton (amendment), Woking (extension).

No. 2 confirms Orders granted by the Board of Trade under the Electric Lighting Acts to Barrhead (Strathclyde Electric Supply Co.), Clyde Bank (Clyde Valley Electrical Power Co.), Dundee (extension), Rutherglen.

GREAT NORTHERN, PICCADILLY & BROMPTON RAILWAY.—All opposition to this Bill has now been withdrawn, and it has been referred to the Unopposed Committee of the House of Lords.

HIGHGATE HILL TRAMWAYS.—The promoters of this Bill have intimated their intention not to proceed with it. This decision has been come to as a result of the agreement by which the London County Council will purchase the undertaking.

POTTERIES FEDERATION.—The Local Government Provision Order Confirmation Bill No. 3 confirms Provisional Order of the Local Government Board, consolidated various townships in the Potteries district of Burslem, Hanley, Longton, Stoke-upon-Trent, and Fenton and Tunstall. Article xvi. stipulates that the several electric lighting undertakings of the districts in question shall be carried on by the new Corporation as one undertaking, and a schedule to the Order gives the following list of Electric Lighting Orders which will be so absorbed into one undertaking:—Burslem Electric Lighting Orders of 1898-99, and the one authorising the Council to supply in Tunstall, granted in 1905; the Hanley Order of 1891; Longton, 1899; Stoke-upon-Trent, 1898 and 1907; and Fenton, 1907.

PROGRESS OF ELECTRICAL BILLS.—The Rochdale Corporation Bill was read a second time in the House of Lords on Wednesday last week.

The Edinburgh Corporation Tramways Order Confirmation Bill was read a third time in the House of Commons on Monday.

The King's College (London) Transfer Bill was read a third time in the House of Lords on Monday.

TRAMWAYS PROVISIONAL ORDER CONFIRMATION BILL (No. 2).—This Bill confirms provision orders made by the Board of Trade under the Tramways Acts, authorising the Liverpool Corporation to construct some short lengths of line. It also confirms an order authorising the Potteries Electric Traction Co. and the North Staffordshire Tramways Co. to double the existing tramways in Burslem, Hanley, Longton, Newcastle-under-Lyme, Stoke-on-Trent, Fenton, and Wolstanton.

MISCELLANEOUS CITY NOTES

BUENOS AYRES TRAMWAYS.—The directors of the Buenos Ayres New Tramways Co., Ltd., have convened a meeting of the holders of the four per cent. debentures for £250,000 for to-morrow, for the purpose of considering the following resolutions:—(1) That the company be authorised to increase the amount of the conversion debenture stock from £500,000 to £400,000, with power to further increase the amount by the creation of such an amount as may be necessary for redeeming the £50,000 six per cent. prior lien bonds. Provided that the further £100,000 of stock shall only be issued for raising the money required for the electrification and extension of the company's line, and for the other purposes of the agreement of November 27th, 1902, and that the provisions contained in the agreement as to the proportions which the issues of conversion debenture stock by this company and the Buenos Ayres Grand National Tramways Co., Ltd., are to bear to one another shall continue to apply; and (2) that the terms of issue of the five per cent. conversion debenture stock be varied so that, in the event of voluntary liquidation for the purpose of reconstruction or amalgamation, such stock shall be repayable at 105 per cent. instead of at par. The directors of the Buenos Ayres Grand National Tramways Co., Ltd., have also, says the *Financial Times*, convened a meeting of shareholders to-morrow to consider resolutions to increase the amount of the five per cent. conversion debenture stock to £900,000 by the issue of an additional £200,000 of the stock ranking *pari passu* with the stock at present authorised, and to further increase the conversion debenture stock beyond £900,000 by such amount as may be necessary for the purpose of raising the money required for the redemption of the £150,000 five and a half per cent. preference debentures at present ranking in priority thereto or any part thereof. It is also proposed to make certain variations in the terms of issue of the five per cent. conversion debenture stock, and of the six per cent. debentures, which, so far as the conversion debenture stock is concerned, are required by the Stock Exchange authorities as a condition of granting an official quotation for the stock. The directors, in the course of a circular, state that the proposed increase of the conversion debenture stock by £200,000 is required for the purpose of raising the further money necessary to complete the electrification of and to extend the company's system. The further increase of the conversion debenture stock will only become operative if and when it be decided to redeem the existing £150,000 preference debentures.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Associate Members:* S. K. Broadfoot, W. Golding, C. W. Inggs, W. E. Kidner, M. B. Logan, A. R. Macdonald, Dr. M. de A. Ramos, H. Robertson, L. A. Smart. *Associate:* T. Pearson. *Students:* R. G. Barton, H. N. Cunliffe, P. Furness, A. E. D. Kennard, D. J. Leacock, F. Parkinson, A. Schmidt, W. A. Stephens.

Obituary.—We regret to have to record the death of Mr. Benjamin Hawarth Thwaite, which took place at Egham on May 2nd. Mr. Thwaite was born in the year 1854, the son of a quarry owner. In his young days Mr. Thwaite was engaged in municipal engineering, and later as pupil and assistant to the late Sir William Siemens in South Wales. Subsequently he opened an office in Liverpool, and later came to London, practising in furnace work, metallurgy, and gas plant. He will, however, be best remembered as a pioneer in the use of blast-furnace gas for motive power purposes, though he never reaped any substantial reward from his work in this direction. Years ago he advocated the electrical transmission of energy from the coalfields to London, and two years ago gave his cordial assistance to a revised scheme with gas as motive power. Lately he has carried on experiments in the electrical forcing of plant growth. Other matters which claimed his attention were cement burning, mine-dust removal, and safety appliances. For the last year or two he had associated himself in business with Mr. T. E. Thorpe, who, with Mr. Alwyn Thwaite, have carried on the business at 29 Great George Street, S.W., and will continue the same.

Telegraph Traffic.—By reason of the break of communication between Chio and Tenedos, a cable belonging to the Eastern Telegraph Co., messages for Turkey are subject to delay, as they have to be sent via Syra-Chiotchesme. The Ottoman have, in consequence of the delay occasioned by this change, requested that they be sent by other routes. But telegrams are still being directed by this route. The Via Fao route has again been broken between Bagdad and Bassorah, but the trouble did not last long. We are able to announce that the cable between Mole St. Nicholas and Cape Haiti, in the Island of Haiti, was repaired on the 8th instant. This cable was interrupted on the 15th ultimo, so that the break lasted twenty-five days. Simultaneously with the above repair, we find that the cable between Cayenne and Salinas gave out, so that messages for Brazil cannot be accepted "via Hayti." This does not end the misfortunes of the Compagnie Française des Cables Telegraphiques, for on the 9th instant their cable between Martinique and Guadeloupe became interrupted. This, however, being a branch cable, will not affect through communication to the Guianas.

Institution of Electrical Engineers: Council for 1908-9.—As no alternative nominations have been received, the gentlemen nominated to fill the vacancies on the Council of the Institution of Electrical Engineers have been duly elected. The Council will therefore be as follows:—*President:* W. M. Mordey. *Vice-Presidents:* Colonel H. C. L. Holden, F.R.S., Dr. G. Kapp, C. P. Sparks, and F. Gill. *Ordinary Members of Council:* S. Evershed, H. E. Harrison, Dr. E. Hopkinson, J. W. Jacomb-Hood, J. E. Kingsbury, M. O'Gorman, G. W. Partridge, W. H. Patchell, W. Rutherford, A. A. C. Swinton, T. Mather, F.R.S., Major W. A. J. O'Meara, C.M.G., Prof. Alfred Schwartz, J. F. C. Snell, and G. G. Stoney. *Associate Members of Council:* J. Hunter Gray, H. Human, and J. E. Taylor. *Honorary Treasurer:* Robert Hammond. *Chairmen of Local Sections:* Miles Walker (Manchester), W. W. Lackie (Glasgow), H. E. Yerbury (Leeds). The new Chairmen at the Newcastle, Dublin, Cape Town, and Calcutta Local Sections have not yet been announced. Dr. Kapp, who has been elected for a second year as Chairman of the Birmingham Local Section, is a Vice-President.

Birmingham Local Section of the Institution of Electrical Engineers.—The annual general meeting was held at the Grand Hotel, Birmingham, on May 6th. The chairman, Prof. Kapp, in moving the adoption of the committee's report, briefly reviewed the work of the session. He said that the new scheme of dealing with the Institution Papers was working very satisfactorily. Owing to the sad death of the President of the Institution, they had had to postpone the annual dinner of the Birmingham Local Section. It was hoped, however, that this function would be held next session sometime in November. There was a gratifying increase in the attendance at their meetings, the average attendance being 40 per cent. greater than the average of last session. Also their total membership had increased by 14 per cent. There was a proposal to include in the Birmingham Section the districts of Derby and Leicester, as well as Birmingham. He then made an appeal to members in connection with the Corps of Electrical Engineers now being raised in Birmingham in connection with the Territorial Army. The Institution of Electrical Engineers had taken this matter up, and he hoped that many members of the Local Section would offer their services in connection with the Birmingham companies. Mr. Jackson, in seconding the report, said that in looking at the attendance figures it was clear that Papers dealing with practical subjects were most popular.

COMPANIES' MEETINGS AND REPORTS

EASTERN TELEGRAPH.—At the half-yearly meeting on Tuesday, the report and accounts given in our last issue were adopted. Sir John Wolfe Barry, K.C.B., who presided, stated that the receipts from South Africa continued to decline, whilst those of India showed a slight improvement, but there was a steady increase in the traffic from South America. On the whole the revenue showed an increase of about £5,000 over that of the previous half-year. In view of the continued depression in South Africa, which was adversely affecting the company's receipts, the directors had decided to transfer the sum of £70,000 to the general reserve fund, which now amounts to £1,144,750. Very important renewals had been completed on one of their cables in the Indian Ocean, and the steamer "Duplex" had undergone extensive repairs in England.

KALGOORLIE ELECTRIC TRAMWAYS.—At the annual general meeting on Wednesday last week, the report and accounts given in our issue for April 30th were adopted. Mr. H. H. P. Stoneham, the chairman, who presided, said that the progress of the company was such that it was evident that the town had entered upon a period of commercial and economical prosperity.

NATIONAL ELECTRIC CONSTRUCTION.—Mr. L. B. Schlesinger presided at the meeting last Monday, and said that considering the general financial depression, the Board considered the year's results satisfactory. Although it was advisable to pass the dividend this year, there was a prospect of an interim dividend being declared later on. The result of the Musselburgh undertaking had been poor, but they looked for an increase in the value of the 20,000 ordinary shares, which they held, when certain extensions were completed. The receipts at Torquay had been excellent, averaging 12·18d. per car mile, but the weather had been against them. On the Mexborough and Swinton line there had been a great deal of trouble with the Dolter surface contact system, but the replacement of this by the overhead trolley system was in hand, and a portion of the reconstructed system would probably be ready at Whitsuntide. In spite of delays due to arbitration cases, &c., the large Rhondda system should be completed in about three months. He also referred to the Bill which had been obtained for the reconstruction of the Oxford tramway system, and the construction of the Dewsbury and Osset line, which was now in hand. In dealing with the accounts, he spoke of the difficulty in raising capital for schemes upon which they had to depend for earning dividends. The report and accounts were adopted.

POTTERIES ELECTRIC TRACTION.—Mr. G. F. M. Cornwallis West presided at the annual meeting in London, when the report and accounts given in our last issue were adopted. During the speech the chairman mentioned that the question of third party risk is now done entirely by a committee of the British Electrical Federation. With regard to the Federation of the majority of the towns and villages in the Potteries district, he stated that at present it was not known how far this would affect the company.

SOUTH METROPOLITAN ELECTRIC TRAMWAYS AND LIGHTING.—At the meeting on Monday, the report given on page 713 of our last issue was adopted. Mr. Tegetmeier, who presided, commented on the figures already given, and said that during the year nearly seven million passengers had been carried on their tramways.

UNDERGROUND ELECTRIC RAILWAYS OF LONDON.—At the meeting called on Monday, to consider the readjustment scheme prepared by the London Waterhouse Committee, Sir Edgar Speyer profoundly regretted the disappointing result of their labours, which he attributed mainly to the unfavourable state of the investment market, delays in completion, opposition from local authorities, and competition of motor-omnibuses and the rate-aided tramways of the London County Council. He also considered the scale on which the rates and taxes of the company had been assessed was unwarrantably severe, and this matter was further aggravated by the fact that their most serious competitors got off practically free in this respect. He considered their experts had been too sanguine in estimating the differences between English and American conditions. He spoke strongly in favour of the appointment of a Traffic Board on the lines recommended by the Royal Commission. The increases in the tube traffics were, however, satisfactory. The receipts for the first 12 weeks of 1908 on the Great Northern, Piccadilly, and Brompton Railway amounted to £584 per route mile per week, being an increase of about 37½ per cent. on £425, the figure for the corresponding weeks in 1907. Similarly, the Baker Street and Waterloo Railway showed traffic receipts of £728 per route mile per week in 1908, against £645 in the same weeks of 1907, or an increase of about 13 per cent. The Charing Cross, Euston and Hampstead Railway started with earnings at the rate of £335 per mile per week, and has already over £400 per mile per week. Sir Edgar Speyer then outlined the feature of the new scheme. The eighteen millions which had sufficed for their capital expenditure, &c., up to November last, has been raised as follows:—Share capital, £5,000,000, sale of notes, £7,000,000, sale of Tube and District debentures and shares, £3,000,000; sale of power house debentures, £800,000, and a loan of £1,000,000. In November last it became necessary to provide for the December coupon, and his own firm had advanced £175,000 for this purpose, and £300,000 of the issue of short notes. The new scheme provides for the issue of £1,000,000 of five per cent. prior lien bonds, due November 1st, 1920, which have been underwritten at 93 per cent. There are also created £3,000,000 four and a half per cent. bonds, due January 1st, 1933, and £5,200,000 six per cent. income bonds, due January 1st, 1948. The holders of the profit-sharing secured notes will be asked to exchange their notes as on the 1st December last, as to 40 per cent. of their nominal value into four and a half per cent. bonds at par, and as to 70 per cent. of their nominal value into income bonds at par. The shareholders would in future share the control with the note-holders, as the income bonds were given a vote. The future was not without promise, and he had no hesitation in recommending the acceptance of the scheme. Lord George Hamilton seconded the adoption of the scheme, which was carried.

CAPE TOWN TRAMWAYS.—The report for 1907 states that the company was formed to take over, and has taken over, the undertaking of the late Cape Town Consolidated Tramways and Land Company, Ltd., on the following basis:—The shareholders of the old company, in exchange for the 450,000 ordinary shares of £1 each held by them, have received 300,000 ordinary shares of £1 each in the new company credited as paid with 17s. 6d. per share, and with a liability of 2s. 6d. per share, which has since been called up and paid to the company in cash with the exception of £9 18s. still outstanding at the date of this report. The £400,000 five per cent. mortgage debentures of the old company have been exchanged for £400,000 five per cent. mortgage debentures of the new company in the same form as those of the old company, except that for the period ended June 30th, 1910, interest is only to be payable out of the profits of each year, so far as the same (if any) will extend. A further issue has been made of £50,000 debentures which were taken up at par by Messrs. Erlanger and Company, and Messrs. Wernher Beit and Company, making a total debenture issue of £450,000 redeemable at 105 per cent. in annual drawings commencing July 1st, 1911. The profit and loss account shows a debit balance of £711, which has been carried forward. The estate companies and the Camps Bay Tramway Company have declared no dividends since the reconstruction of this company. The Camps Bay Tramway Company, Ltd., has felt most severely the effects of the serious depression in Cape Colony, and their accounts show a loss of £2,954. During the past year the Parliament of the Cape Colony passed a Bill,

Digitized by Google

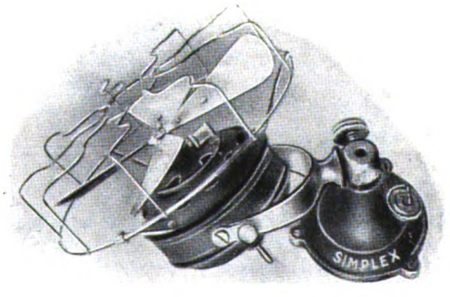
granting to the Camps Bay Tramway Company relief from operating the Kloof Nek route to Camps Bay during the winter months, from May 1st to September 30th, except on certain stated public holidays.

EDMUNDSON'S ELECTRICITY CORPORATION.—A meeting of the debenture holders was held on Thursday to discuss the trust deed in connection with the raising of new capital as prior lien stock. Mr. Tuckett, K.C., one of the directors, deplored the necessity which had compelled them to resort to the creation of prior lien debenture stock, but this was an expedient which offered the only practicable and satisfactory solution of a difficult position in which the company now was. There was no question of the interests of the debenture holders being sacrificed, and although the new issue was by no means a satisfactory method of procedure from the point of view of the debenture holders, he was himself satisfied that not only would their interest be safeguarded, but their position would be improved. New capital was not required for any new policy of expansion, but solely for the development of their undertaking in order to bring them to a profitable stage. The new stock proposed was £200,000 five per cent. prior lien debenture stock, and £50,000 to be provided out of revenue. The issue, of course, would take place gradually, and would not be all met at once. An amendment was moved limiting the new capital to £100,000, to be raised in two amounts of £50,000 each, but eventually the directors agreed to adjourn the meeting.

KALGOORLIE ELECTRIC POWER AND LIGHTING.—At the annual meeting in London on Thursday, the report and accounts given in our issue for April 13th were adopted. Mr. R. W. Wallace, K.C., who presided, called attention to the fact that reconstruction of the company had resulted in an increase of the amount of capital given to the shareholders, and not a reduction. The trading account for 1907 had been a record one. The company claimed that their load factor upon the works was better than that of any electric supply company in the world.

SOUTH STAFFORDSHIRE TRAMWAYS (LESSEE).—The report for the year ended December 31st, 1907, states that the total revenue, including a dividend at the rate of 3 per cent. on the preference shares of the South Staffordshire Tramways Company, amounted to £49,786, against £43,741 for the preceding year. The expenditure (including rental of lines and other payments to local authorities, repairs and maintenance of track, and interest on loans) amounted to £45,562. The profit for the year amounts to £4,223, add amount brought forward £611—£4,835. Deducting debenture interest £1,668, and amount placed to renewals account £500, there is a balance available for distribution of £2,667. The directors propose to place £700 to sinking fund, and recommend a dividend of 6 per cent. on the cumulative preference shares for the six months ended January 15, 1905; and to carry forward £467. The capital expenditure in respect of the reconstruction of the tramways in Tipton, Darlaston, and Wednesbury amounted to £34,088, of which £18,392 has been recovered from the South Staffordshire Tramways Company in accordance with the agreement of May 25th, 1905. The Birmingham and Midland Tramways advanced on loan against security a total amount of £32,000, which was expended in payment of the balance on reconstruction, in repaying the loan of £9,000 to the South Staffordshire Tramways, and reducing the bank overdraft and sundry creditors by £11,345. The amount advanced by the Birmingham and Midland Tramways has been reduced by £2,083 since the close of the year. There is an amount of £6,271 8s. 2d. to be received from the Dudley Corporation in respect of the cost of reconstruction and electrical equipment of the portion of tramway in Dudley, as mentioned in the last report, which will be credited to capital account when received. All the old steam tramways have now been reconstructed and are working by electric traction, except a small section of about a quarter of a mile in Wednesbury which is not worked. The expenditure includes an increase of over £1,700 for interest on loans from the Birmingham and Midland and South Staffordshire Tramways Companies, and arrangements will be made as soon as possible with the Birmingham and Midland Company for the conversion of the existing loan into debenture stock.

SUBMARINE CABLES TRUST.—The revenue for the year ended April 15th, 1908, amounted to £2,394, and the expenditure to £1,157. To the balance is added £453 brought forward, making a total of £23,237. The payment of coupons required £18,378, the sum of £4,810 has been transferred to redemption fund, and the balance of £49,000 carried forward. During the year 41 certificates have been redeemed by purchase in the open market at a cost of £4,810.



WESTERN TELEGRAPH.—The report and balance sheet for the half-year ended December 31st, 1907, shows a revenue of £353,815 and the working expenses £126,862. After providing £16,000 for debenture stock interest, and £4,464 10s. 11d. for income tax, there remains a balance of £206,488, to which is added the sum of £6,864 brought forward from June 30th last, making a total of £213,352. First and second interim dividends, amounting to £62,379, have been paid, and after transferring £120,000 to the general reserve fund, £5,000 to the maintenance ships' reserve fund, £10,000 to the marine insurance fund, and £10,000 to the land and buildings depreciation fund, there remains a balance of £5,972 18s. 2d., which is carried forward to the next account. The amount of £100,000 has been appropriated from the general reserve fund as a provision to meet the market fluctuations on investments, as shown on the balance sheet. The directors regret to report the death of their colleague, Mr. John Coppen, on November 20th, 1907. Mr. John Gordon has been appointed to the vacancy. The meeting is on the 13th inst.

CATALOGUES AND PAMPHLETS RECEIVED

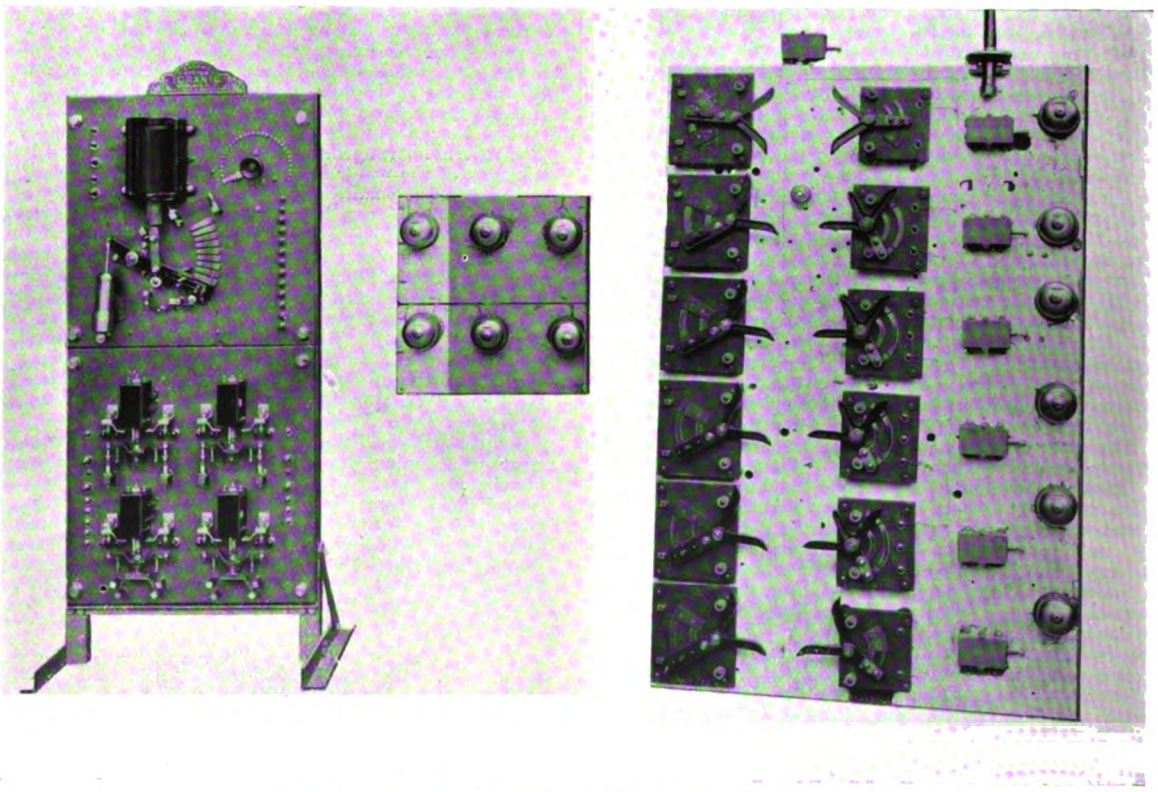
AUTOMATIC FIRE ALARMS.—A booklet from the Pearson Fire Alarm Co., Ltd., calls attention to the advantages of the company's automatic fire alarm system, based on the use of automatic heat detectors or thermostats. Illustrations are given of the principal parts of the equipment, together with views of a number of important buildings where the system has been adopted. The thermostat itself is built in the form of an oblong chamber approximately 5 inches by 2 inches by 2 inches. This box carries upon the underside, fixed rigidly to it, two expansion strips. In the centre of each strip is erected a metal pin having an insulated tip. This pin passes into the box through a packed chamber, thereby guarding against any accumulation of moisture, acids, fumes, dust, &c., but leaving the expansion blade free to move for the purpose of making contact under the influence of heat. The internal apparatus consists of two contacts and a limit stop built upon an insulating base and connected to a terminal at each end. One contact is adjustable for a rapid rise of temperature, and can be safely and accurately adjusted to notify a rise of 15° F. The other contact is built upon a flexible hard-drawn phosphor-bronze spring, and rests upon one of the insulated pins of the expansion strips. Any deflexion of this strip by means of heat at once affects the position of the flexible contact, and when the heat reaches the dangerous temperature, contact is made and the alarm is given. Means are provided on the indicator board in connection with apparatus for periodically testing the circuits.

COOLING TOWERS.—A very handsomely produced catalogue is being issued by Messrs. Balke & Co., of 27 Clement's Lane, Lombard Street, who are specialists in water cooling plants and pumping machinery. The firm claim to have been the pioneers in 1894 of natural draught cooling towers of the chimney type, and inform us that they have supplied 1,900 cooling towers of all types and sizes in every part of the world. The internal arrangement of troughs, gutters, and lathes, where the flow of the water is broken up into drops and films, offering a maximum of cooling surface to the air, is usually of wood, but the tower itself can be of wood, steel, ferroconcrete, or brick construction, as most suitable under the local conditions. Diagrams are given showing the arrangement of typical towers, and no less than 25 large full-page illustrations are given, reproduced from photographs of cooling towers in this country and abroad. These represent a variety of types, and include apparatus at the Cardiff, Oldham, Clyde Valley, Bermondsey, Hampstead, Sunderland, and Charing Cross and City electricity works, and the fine new brick tower at the generating station of the Central London Railway, which is described in some detail in another part of this issue.

ELECTRIC FANS.—Appropriately to the advent of warmer weather, Simplex Conduits, Ltd., have issued a new catalogue of electric fans. In the continuous-current fan motors, the round field frame is of cast iron, protected by a coat of enamel. The former wound field coils are wrapped with tape and are of silk-covered wire, protected by a heavy coat of shellac varnish. They are subjected to a test at 1,000 volts before leaving the works. The armature is drum wound, and

special care is taken in the construction of the commutators and brush gear to avoid all possibility of sparking. Automatic oil cups and self-aligning bearings are provided. Speed regulation is obtained by means of a switch and rheostat concealed in the base of the fan. The guards of all fans are of stout brass, and the blades, heavily nickel plated, carefully balanced to prevent the motor from vibrating. The alternating current fans

Digitized by Google



are of the induction type. The armatures are constructed of soft iron laminations assembled on brass spiders and held between copper discs at the ends of the cores. The air gap between stator and rotor is reduced to a minimum, which is essential if efficiency is to be obtained. The speed regulation on the fans generally covers about 300 revs. per minute; for example, on 12 in. fans it is 1,400, 1,300, 1,100, and so on. Most types are supplied with 10 in., 12 in., 16 in., diameter blades. The standard finish is of black enamel, relieved with gold lines. The accompanying illustration shows one of the many types listed.

ELECTRIC TRAVELLING HOISTS.—A leaflet has been issued by Kramos, Ltd., of Locksbrook Engineering Works, Bath, on which are depicted various types of electric hoists for foundries, shops, and warehouses. Among these are monorail trolley hoists arranged for hand travel and with remote control. Others are fitted with a pendant cord control, and some of the larger hoists are arranged for cab control. This firm also supplies lifting magnets up to 10 tons capacity for handling steel bars, plates, tubes, pig-iron, &c. Some spur-geared winches for both stationary and remote control are also illustrated. It is stated on the leaflet that a load of one ton can be lifted and lowered through a distance of 10 ft. fifty times with a total consumption of one B.O.T. unit, or for a total cost of 1d., assuming this to be the price per unit.

ELECTROSTATIC VOLTMETERS.—A new list which the Union Electric Co. are about to issue gives particulars of electrostatic voltmeters, having a range up to 120,000 volts. The design of these voltmeters is such that the capacity of the voltmeter remains constant at all degrees of deflection, the damping is by means of a disc working in a powerful magnetic field, and that the scales may be expanded at about that part which is most used. In addition to this the instruments are of the switchboard form, and therefore are easily mounted either on the face of the switchboard, or sunk so that the dial appears through a circular aperture in the same. For all instruments up to 13,000 volts the same rating is obtained with direct or alternating current of any frequency or current curve, while for higher voltages than this the instruments are only suitable for alternating currents and must be adjusted for the frequency while remaining independent of the current curve Owing to the very small energy taken by these instruments they are particularly suitable for measuring earth leakages on high-pressure circuits and for cable and other insulation tests. The instruments can all be supplied with two and three scale ranges, and in a portable form up to 13,000 volts.

A RECENT DESIGN OF LIFT CONTROLLER

THE accompanying illustration is reproduced from a photograph of a complete push-button controlling equipment for a six floor lift, which has recently been manufactured by the Adams Manufacturing Co., of London and Bedford. The apparatus is shown mounted all together roughly on a board for testing purposes, and will be seen to consist of a control panel, mounted in a convenient form so as to stand upon the floor, six patent magnetic push buttons, which are intended to be mounted inside the car, six patent magnetic push buttons which are intended to be mounted one upon each floor at each entrance to the lift, and also six tappet reversing switches, and six tappet switches to ensure accuracy of stopping.

SIX FLOOR PUSH BUTTON CONTROL LIFT EQUIPMENT.

There are also seven gate switches, one for each gate giving access to the lift, and one for the gate of the car itself, as well as a floor switch and a small emergency push button, which can be used by the passenger to stop the lift instantly at any position in case of emergency. The tappet reversing switches, as well as the tappet switches for accurate stopping, are operated by the travel of the car itself, so that the operation of this lift is entirely automatic and does not require the intervention of an attendant at all.

To call the car, the passenger presses a button just as if ringing a bell. If not already in use, this causes the car to come to the passenger, stop opposite to him, and unlock the gate for him to enter. Having entered and closed the gate behind him, he presses a button inside the car, which is labelled to correspond with the floor to which he wishes to travel. This causes the car to travel to that floor, where it stops and unlocks the gate for the passenger to alight. When he has alighted and closed the gate, the lift is at the disposal of any other passenger.

Among the advantages of the push-button method of control are the fact that the lift is always available, day or night; no attendant is required; the lift cannot be started while any gate is open; no gate can be opened unless the car is opposite to it; and the lift cannot be operated from outside while a passenger is in the car. In case of emergency the passenger can stop the lift instantly by pressing the emergency button, fixed inside the car, which works independently of the other push buttons. The lift can then only be restarted from the car, and the circuits are so arranged that the push buttons on the various floors will then have no effect.

SUMMARY

Mr. F. H. Webb, who was Secretary of the Institution of Electrical Engineers from 1878 to 1898, died last Thursday at the age of 84. (Page 762.)

Some notes are given on the Merz-Price system of automatic protection of high-tension circuits, in which the release of the circuit-breakers is effected when there is a lack of equality between the power flowing into and out of the ends of a feeder or inter-connector due to a fault on the section. It is claimed that this method avoids the isolation of healthy sections of the network, which is liable to occur when several overload circuit-breakers are used in series. The system is extensively used in the North of England. (Page 763.)

The Bournemouth tramway disaster inquest was resumed on Wednesday of last week, and further evidence was given as to the condition of the track and the efficiency of the brakes. The traffic manager, Mr. Barber, thought that the driver should have applied the hand-brake sooner than he did, and that he would have done so, had he known that the magnetic brake was not working. As the driver is still too unwell to attend, the inquest is adjourned until May 27th. (Page 764.)

The accounts of the Leeds Corporation Electricity Department show a considerable increase of business, especially in the power load. The working expenses per unit are 0·67d., and the total expenses (including capital charges) are 2·06d. per unit. An interesting item in the costs is "Wages incurred on extensions, but not chargeable to capital account, being paid to Corporation's permanent workmen, 0·02d. per unit." (Page 765.)

We give a few more particulars of the scheme relating to "Authorised Contractors" for wiring work in Birmingham. (Page 766.)

At the National Telephone Co.'s Staff Dinner last Thursday, the President and Secretary of the Company both gave assurances to the staff that their interests would be looked after when the system was transferred to the Post Office on January 1st, 1912, and that the Pension Fund would be not only equal to its obligations, but would show a handsome surplus in which all members would participate. From another note it will be seen that an announcement has been made by the Postmaster-General that, in some cases, the seniority of the present officers in the Post Office service may be affected by the transfer. (Pages 766 and 793.)

We are able to give this week the results of experience with metallic filament lamps for street lighting at Croydon and Exeter, which fully bear out the excellent figures of life and cost relating to a number of other places given in our last two issues. (Page 767.)

Digitized by Google

A FULL-SIZE illustration of an E.H.T. submarine cable for laying across Sydney Harbour is given on Page 767.

WE have received several more letters on the suggested use of the term "wire lamp." It is again pointed out that only one of the metallic filament lamps at present on the market has a wire-drawn filament. Some correspondents favour the term metal lamp, and other titles based on the high efficiency of the lamps are proposed. (Page 768.)

DR. C. C. GARRARD's Paper on Switchgear control apparatus and relays for alternating-current circuits, read at last Thursday's meeting of the Institution of Electrical Engineers, was devoted partly to pointing out some principles which had been applied in a number of systems, but were, in the author's opinion, erroneous, and partly to the description of a system of protecting interconnector cables by means of electrically interlocked reverse relays. The question of long and short time limits was also dealt with. An interesting discussion followed, in which several well-known designers of switchgear and engineers with experience of high-tension systems took part. Mr. H. W. CLOTHIER and Mr. B. WELBOURN both spoke of the advantages of the Merz-Price balanced system, especially for interconnected sub-stations and complicated networks. Mr. J. G. STATTER gave some curves of time-lag settings for his own apparatus, and Mr. WEDMORE, in a long speech, answered some of Dr. Garrard's criticisms of polyphase relays, fuse-shunted trip coils, and other apparatus, and put in a plea for simplicity in switchgear. Mr. LEONARD ANDREWS, whose pioneering work in the subject had been referred to by several speakers, examined one of Dr. Garrard's curves in detail, and referred to the question of protection against the effects on the system of loss of field of one of several generators running in parallel. He admitted the excellence of the Merz-Price system for the protection of interconnectors, but for most purposes preferred a simple discriminating device. Mr. K. EDGCUMBE and Mr. B. JENKIN also spoke. (Page 769.)

AT the annual meeting of the Iron and Steel Institute last week, two Papers of electrical interest were included in the programme. The first, by Prof. B. IGEWSKY, described a new form of electric furnace for smelting iron. The furnace-bricks are arranged radially and set in a frame so that the whole may be rotated. The electrodes are placed radially between the bricks, and are connected to a commutator. The metal is placed in the centre of the ring of bricks as soon as these have been raised to a sufficiently high temperature at the surface to conduct the current. The second Paper dealt with the pyrometric installation of the Ordnance Factories, Woolwich. The construction of the thermo-couples and the recording galvanometers was fully described, and the sources of possible error in measurements were discussed. (Page 777.)

MR. MANSBRIDGE'S Paper on the manufacture of electrical condensers for telegraphy and telephony, an abstract of which was given in our last week's issue, was read and discussed on Thursday, May 7th. Sir JOHN GAVEY, who opened the discussion, said that when condensers were introduced for telephone work, it was expected that the same troubles would be experienced as with the plate lightning arrester, but fortunately the capacity of the condenser absorbed the charge. Mr. J. E. KINGSBURY said that Mr. Mansbridge's process had been adopted at the London factory of the Western Electric Co. Mr. A. WHALLEY referred to the possible use of condensers in electric lighting circuits, in which small transformers were employed, for the purpose of increasing the power-factor. Some statistics relating to the condensers in use in the telegraphic and telephonic departments of the General Post Office were given by Major W. A. J. O'MEARA. Mr. B. S. COHEN gave figures showing enormously different results in some cases between measurements of the capacity of condensers with continuous and alternating current respectively. Mr. H. OPPENHEIMER spoke of the excellent results that had been reached in the commercial manufacture of condensers, the percentage of "wasters" having been reduced from 7 to 0·2 per cent. Some difficulties in the use of glass condensers in wireless telegraphy were mentioned by Mr. J. E. TAYLOR. Dr. S. P. THOMPSON referred to the possible coherer action of the unburnished metallised paper, and Mr. W. M. MORDEY emphasised the importance of the losses in the dielectric if condensers are to be used in heavy electrical engineering work. (Page 780.)

THE engineering evidence on behalf of the London and District Electric Power Bill, which is being considered by Lord CROMER'S Committee in the House of Lords, was completed on Tuesday. Mr. PARSHALL, who was re-examined on Wednesday last week, was followed by Mr. ROBERT HAMMOND, who gave his views on the proposal for linking up the existing generating stations in London, contained in the other two Bills. He said that the idea had long been given up as an absurdity, for it only perpetuated the existing evils. He did not say that linking up was an engineering impossibility, but the expense involved would be against cheap generation. In preparing the tables which showed the savings to the authorised distributors by taking a supply in bulk from the power company and in estimating the capital charges which would still have to be paid, Mr. Hammond said he had taken 60 years for buildings, 25 years for plant, 30 years for cables, and 10 years for meters, these terms being now generally agreed upon by the electrical engineering profession. He thought the protection given in the Bill to the authorised undertakers in regard to consumers up to 250 kw. was a very strong protection indeed, and secured them the small consumer, a class of business which they were particularly able to cope with because they were so well situated for distribution. Mr. Hammond's cross-examination was commenced on Friday, and continued until the committee rose on Tuesday. As in the case of the cross-examination of Mr. Parshall, the general tendency of the cross-examination was to show that the figures upon which the estimates of saving to the authorised distributors had been based by the promoters, were quite wrong, and that in consequence the success of the scheme foreshadowed was erroneous. Most of the opposition council had worked out that instead of making a profit by taking a supply in bulk, they would actually make a loss as compared with their present financial position. During the proceedings Lord CROMER enquired what would be the effect of passing all the three Bills before the Committee. Yesterday, Sir HUGH BELL said he would be responsible for raising £250,000 of the capital required, and that Lord FITZWILLIAM would also contribute a considerable sum. (Pages 762 and 783.)

THE French Bullier patents for the manufacture of calcium carbide expire at the beginning of next year. M. GIROD, who has been so successful in producing ferro-alloys in the electric furnace, is installing two eight-ton and two six-ton furnaces for the electric manufacture of steel at Ugines in Savoy. Under "Electrochemistry and Electrometallurgy" a note on a new method of rust prevention is also given. (Page 787.)

UNDER "Electrical Science," in the British and American Section, is a note on some of the principal exhibits of electrical interest at the Royal Society conversazione. An account of a new form of voltameter is also given, and some experiments which throw doubt on the supposed radioactivity of the alkali metals are referred to. In the Papers abstracted in the Continental Section, FERY describes a new form of automatic

Digitized by Google

photometer which is independent of eye observations; URBAIN finds that dysprosium is far more highly magnetic than iron; and VAILLANT proposes to employ Roentgen rays as a test for infant life. (Page 787.)

A PATENT specification by W. J. DAVY, published on Thursday last, describes an automatic switch for use with small house transformers. The primary of the transformer is connected to the mains only when one or more lamps in the secondary circuit are switched on. Another specification by F. J. PLANCHON deals with the manufacture of metallic filaments; and the BRITISH THOMSON-HOUSTON Co. have one relating to a new process for depositing a thin insulating film on armature or transformer laminations. The application of the flywheel machine for equalising the load on the generators of a direct-current series power system, when the motors are working on intermittent loads, is described in a specification by J. S. HIGHFIELD. A method of employing electricity for stimulating vegetable growth is patented by J. NEWMAN and L. LODGE; the method consists in maintaining a continuous discharge to earth from a wire network stretched on insulating supports above the surface of the ground, and dimensions and voltages are included in the specification. There are applications for amendments to three specifications, of which the first concerns switches, the second arc lamps, and the third incandescent lamps. A patent covering the use of electric lamps for the illumination of compass, clock, and other instrument dials expires during the current week. (Page 789.)

THE accounts of the Stepney Borough Council show a substantial increase of income, notwithstanding a 7 per cent. decrease in the price obtained per unit.—The revised terms of the North Metropolitan Electric Power Supply Co. for the bulk supply of Willesden have not been accepted.—The National Electric Construction Co. have offered to replace the arc lamps which have given trouble at Musselburgh.—The Borough Council are to purchase the plant in the Yardley power station of the City of Birmingham Tramways Co.—An arrangement has been arrived at for the through running of electric trams between Accrington and Haslingden.—The Provisional Order of the Llanelly and District Electric Light and Traction Co. has been transferred to the Llanelly Council.—At Burnley during last year £615 was spent in removing rail corrugations. The length of rail ground was 57,700 yards, and the proportion of rails corrugated 83 per cent. (Pages 791-793.)

TENDERS for condensing plant and switchboard extensions are required at Ilford, and for lead-covered cables at Handsworth.—A length of ⅜ of a mile of tramways now worked by horse traction by the Leyton Urban District Council, is to be converted to electric traction by the London County Council.—A large order for tantalum lamps for street lighting at Brighton has been received by Messrs. Siemens Brothers Dynamo Works.—The tender of Messrs. Hurst, Nelson & Co. for 175 car bodies, trucks, and equipments has been accepted by the London County Council. (Pages 794-5.)

AT the meeting of Callender's Cable & Construction Co. to-day, a 10 per cent. dividend will be recommended, with a bonus of 5s. per share; £10,000 is to be placed to suspense account, and £45,107 carried forward. The high price of copper and stringency of the money market has restricted business during the past year.—The Chairman of the Diesel Engine Co. reports the best year's working yet experienced. A new type of engine is to be produced.—The new issue of the Marconi Co. has been authorised at an extraordinary meeting.—Meetings have been held of several of the large cable companies during the week. (Page 795.)

WE publish some further letters this week with regard to Mr. MORDEY's proposal that the term "wire lamp" should be employed as the accepted designation of the new high-efficiency metallic filament lamp. Although the name would be undoubtedly convenient, and although it is, if considered as a description, sufficiently accurate for the purpose, it has not met with an enthusiastic reception; and, as a new conventional name for an article of common use, can only lead to confusion if it is not universally adopted, there is every probability that "metallic filament lamp," or its abbreviated form, "metal filament lamp," will remain. Several of our correspondents, it is true, have suggested "metal lamp" as a substitute, but we think that this name would tend to hinder rather than assist the conception of the lamp-user of the essential feature of this lamp. An arc lamp, a Nernst lamp, a mercury vapour lamp—and even a gas lamp or oil lamp—have all more metal about them than a metallic filament electric lamp. On the other hand, the public has been quick to accept the name tantalum lamp, which is more than a trade name for the Siemens metallic filament lamp, and the purely trade designation Osram for the lamp put on the market by the General Electric Co. has also become quite familiar. Names such as these, if sufficiently simple and pronounceable, are soon taken up by the retailers and the general public, and there is little danger of any article of real value being lost for want of a descriptive title. It will not be long, moreover, before the use of the new lamp is so widespread that the generic name "incandescent lamp" will be held to imply metallic filament lamp unless qualified by the words carbon filament or carbon.

WE are glad that Mr. HIRST'S Paper on the tungsten lamp is to be read this session, although it was received from the author at so late a date. It will be presented to the Institution to-night, and a good discussion may be expected, for it will afford an opportunity to the maker, seller, and user of lamps to give interesting and useful information. A second meeting has been allotted to the conclusion of the discussion, but nevertheless the time is none too long, and we trust that those speakers who usually express themselves only in generalisations and logical deductions will give way to others who are prepared to impart the results of tests and observations and real practical experience in connection with the new lamps. We have been fortunate enough to be able to collect some data of this character in our last few issues, especially as regards the life of the lamps under practical working conditions, but doubtless there is much more of a familiar character ripe for publication. To those who are unable to speak at the meeting and have useful data at their disposal our columns are open as usual.

THE Paper read by Dr. C. C. GARRARD at the last meeting of the Institution of Electrical Engineers was on a subject the importance of which is often underestimated. Some engineers are a little apt to look upon the relays and other protective appliances which form a feature of modern high-tension switchgear as the ingenious playthings of the instrument-maker, rather than integral and essential parts of the control equipment. When we reflect, however, that in large cable systems for power supply, working at high voltages, the

Digitized by Google

continued existence of the valuable plant, as well as the avoidance of interruption of supply, may be said practically to depend on the correct performance of these delicate protective devices, the importance of the subject becomes obvious. As shown in the discussion, engineers are by no means agreed on all points as to the best protective systems, although there were several mistakes commonly made which they united to condemn. There is always a tendency for those whose work has brought them in contact with any particular system being unduly carried away by their enthusiasm in attempting to press its application too far. But, speaking generally, we were very glad to notice, among the rival switchgear designers who took part in the discussion, a most open-minded attitude in recognising the good points of their competitors' designs. While showing praiseworthy loyalty to their own firms, they realised that what is suitable in some special cases is not necessarily of universal application.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 21ST.

Institution of Electrical Engineers.

8 p.m. Meeting at the Royal Society of Arts, John Street, Adelphi, W.C. Paper to be read:—"Recent Progress in Tungsten Metallic Filament Lamps," by H. Hirst.

FRIDAY, MAY 22ND.

Physical Society.

5 p.m. Meeting in the Physics Laboratory, Royal College of Science, South Kensington. Among the papers to be read is the following:—"On the Production of Small Alternating Currents of variable frequency suitable for Telephonic and other Measurements," by B. S. Cohen.

SATURDAY, MAY 23RD.

Junior Institution of Engineers.

Visit to the Avonmouth Docks Works and Electricity Works, Bristol.

TUESDAY, MAY 26TH.

Faraday Society.

8 p.m. Ordinary Meeting at the Institution of Electrical Engineers, 92 Victoria Street, Westminster, S.W. Sir Oliver Lodge, F.R.S., will deliver his Presidential Address on "Some Aspects of the Work of Lord Kelvin."

THURSDAY, MAY 28TH.

Institution of Civil Engineers.

8.30 to 11 p.m. Conversazione at the Royal Albert Hall.

London Electric Power Bills.—A full report of the fifth, sixth, seventh, and eighth day's proceedings is given on pp. 783–786 of this issue. Yesterday, the financial evidence on behalf of the Bill was commenced Sir Hugh Owen Bell, managing director of Bell Bros., Ltd., and a director of Messrs. Dorman, Long & Co., and of the North-Eastern Steel Co., who is the chief promoter of the Bill, said he would be prepared to be responsible for the raising of £250,000 of the capital, provided the Bill passed in substantially its present form, and he was also authorised by Lord Fitzwilliam to say that he also would be prepared to be responsible for a considerable sum. Sir Hugh impressed upon the Committee that the promoters were not coming for this Bill as a matter of amusement, but as a serious matter of business, and, therefore, any restrictions as to the time in which a portion of the capital must be raised, should be as lenient as possible. The promoters were willing to agree to the term within which a substantial commencement with the work must be made being reduced from five to two years. He would not agree with any substantial alteration of the proposed purchase clause, and expressed the opinion that if conditions were imposed which precluded the possibility of the promoters getting their money back, the capital would not be found, no set of promoters would undertake to find it, and London would remain in the same position, as regards electric power and supply, as it was at present.

OBITUARY

FRANCIS HUGHES WEBB.

WE regret to have to record the death of Mr. F. H. Webb, who was for twenty years Secretary of the Institution of Electrical Engineers. He retired from the Secretaryship in 1898 on account of his advancing years, and has lived on to the ripe age of 84.

Mr. Webb had his first experience of secretarial work in 1844, when he was appointed Resident Secretary and Librarian to the Royal Institute of British Architects; he had previously been in the audit department of the London Brighton and South Coast Railway. Resigning this position in 1850, however, he entered the service of the Electric Telegraph Co., and subsequently became Private Secretary to the then Chairman of that company, the late General Leon Ricardo. Fourteen years later he returned to the London Brighton and South Coast Railway as Assistant Secretary.

From the start of the Society of Telegraph Engineers, in 1872, until Mr. Webb's appointment as Secretary in 1878, there were a number of Honorary Secretaries, including Mr. W. E. Langdon, Mr. George Preece, a brother of Sir William Preece, and Sir James Sivewright. In fact, Mr. Webb in 1878 at first was Honorary Secretary, and until 1885 only gave a portion of his time to the duties, but in that year he was appointed the first paid Secretary. The membership then was 958. The progress of the Institution during Mr. Webb's twenty years' tenure of the secretarial office is shown by the fact that the membership in 1898, when he retired on a pension unanimously granted by the Council, was 2,930. Mr. Webb, it will be remembered, was succeeded by Mr. W. G. McMillan, who died in 1904, when Mr. G. C. Lloyd, the present Secretary, was appointed to the office.

Mr. Webb's kindly manner, his unfailing courtesy to all, his sympathy with the aspirations of the younger members and students, and last, but not least, his entire devotion to the interests and well-being of the Institution, secured to him many friends, who will deplore his loss.

Breach of Contract for Electricity Supply.—In the Court of Appeal on Wednesday, May 15th, the case of Bourne and Hollingsworth v. The Marylebone Borough Council came before Sir Gorell Barnes and Lords Justices Moulton and Farwell. This was an application by the defendants for judgment or a new trial in an action tried before Mr. Justice Ridley. (See ELECTRICAL ENGINEERING, February 6th, p. 204, and February 13th, p. 253.) In the lower Court it was decided that certain letters written by Mr. Wright (Consulting Engineer) and by Mr. Wilkinson (Resident Engineer), and promising a supply of electricity at a certain date, were of the nature of contracts, and that, owing to failure to supply, the plaintiffs were entitled to £500 damages. Sir Gorell Barnes said that Mr. Wright's letter was not capable of being construed as a contract, and that although Mr. Wilkinson's letter might be looked upon as such, the latter had no authority to make a contract. The Electric Light Committee only could make an authorised contract. Judgment was accordingly entered for the defendants.

Telegraph Traffic.—The cable between Chio and Tenedos owned by the Eastern Telegraph Co., which was interrupted on 7th instant, was again put into working order on the 12th instant. This repair was followed by a breakdown on the 16th inst of the cable between Constantinople and Dardanelles, belonging to the same company, and a repair was effected on the 18th inst. On the same day traffic was stopped owing to a breakdown of the cable between Las Palmas (Grand Canary) and Arecife (Lonzarote). The *viâ* Fao route was, as usual, down and repaired within a short time, the trouble again occurring between Bagdad and Bassorah. The cables of the Compagnie Française des Cables Télégraphiques between Cayenne and Salinas and Martinique and Guadeloupe still remain interrupted. Owing to the break in the cable between Cadiz and Teneriffe, the Canary Islands can only be reached *viâ* the Cape Verde Islands, from whence there is a cable to Bathwest, which again is joined by cable to St. Louis. From the latter place there is a cable to Teneriffe.

THE MERZ-PRICE SYSTEM OF AUTOMATIC PROTECTION OF HIGH-TENSION CIRCUITS

IN the discussion on Dr. Garrard's Paper at the last meeting of the Institution of Electrical Engineers, a good deal was said respecting the protective system of relays, &c., upon which Mr. C. H. Merz and Mr. B. Price have been working for some years, and which, we understand, is applied with considerable success on some of the high-tension cable systems of the large power companies in the north. Although this system is in somewhat extensive use, very little has hitherto

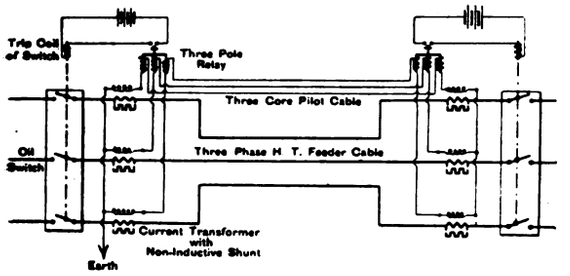

FIG. 1.—PROTECTION OF SINGLE FEEDER (E.M.F. BALANCING).

been published as to its working; and in connection with the discussion already referred to a few notes as to its aims and objects will be of interest. An idea as to the extent to which the system has been adopted may be gathered from the fact that something like 70 feeder-cables, covering a route length of about 200 miles, working at 6,000, 12,000, and 20,000 volts, together with 50 sub-stations with an aggregate capacity of 50,000 kw. of installed plant, are protected by apparatus of this nature, and it has been found that under ordinary working conditions a shock on the system at the moment of breakdown has been scarcely noticeable at the power station, and in no case has the synchronising plant in the sub-station been upset.

The general principle of the system is that a balance is created under normal conditions between the power which is flowing at the points of entry to and exit from the cable or apparatus to be protected, and means are taken whereby this balance is disturbed only when leakage takes place between the points of entry and exit due to breakdown. One way in which this system of balance is employed to control the relays may be seen by the aid of Fig. 1, which is a diagram of connections for a simple case of a three-phase feeder cable. A three-core low-tension pilot cable is laid in the same trough, and is connected up at each end to three-phase relays or to three single-phase relays and to the secondary windings of current transformers, the primaries of which are in series with the cores of the main feeder cable. These relays are of the simplest possible character. They only act as contact-makers, and are designed not only to instantaneously close the local battery circuit, but also to release a falling weight, which in turn short-circuits the contact just made. Since the current at both ends of the main cable (neglecting the inappreciable capacity current) must be the same at every instant, it will be evident that unless there is a leakage between the two sets of current transformers the inductive effects which this current will produce in the pilot wire circuits will be equal and opposite, so that no appreciable current will flow through the relays. As soon as there is a leakage, however, the balance will be upset, and a current capable of operating the relays will flow. In considering the advantages and disadvantages of this system as compared with others, the requirements which should be fulfilled may be classified as follows:—

(1) The system must discriminate with certainty, *i.e.*, it must be certain of action on faulty cables or apparatus, but must be inoperative with equal certainty on healthy sections.

(2) The system must be suitable for use on all possible arrangement of cables, whether these comprise separate feeders or form interconnectors on complicated networks, or consist of branch cables without switchgear at the points of junction.

(3) The system must be as instantaneous as possible in isolating a faulty piece of apparatus.

(4) The system must entail the simplest possible apparatus, as, although it only operates occasionally, it has to be capable of being absolutely relied on.

With regard to the certainty of discrimination, it is well known that with the ordinary systems of protection, when a fault occurs at some distance from the power station, the heavy rush of current has to flow through several overload relays in series. It is extremely difficult to prevent these from operating almost simultaneously and isolating the healthy sections of the system as well as those upon which the fault has occurred. The principle underlying the action of the balance system is such that this difficulty is avoided, as the action is the result of the combined effect of the current at both ends of the cable, whereas in the case of ordinary overload and reverse current system each end is controlled separately. It is thus seen that the operating system is independent of the magnitude of the current flowing, of the voltage on the network, and of the direction of flow of the power in any of the phases. Even if it were found possible in practice to discriminate satisfactorily between several overload and reverse current relays in series, it would still be impossible to apply this system to any great extent on extensive or interconnected systems. Take, for instance, a simple loop consisting of a number of sub-stations strung together, so to speak, by single cable links, power may flow in any direction around this loop under normal conditions, the direction depending on the relative loading of the sub-station at each particular instant, so that it is quite impossible to use reverse current relays. It is particularly for overcoming difficulties of this kind that the balance system has been devised. It should be pointed out that in order to obtain any discrimination at all between overload cut-outs in series, it is necessary to introduce an adjustable time element, with the result that excessive overloads have time to cause considerable disturbance before the circuit is broken. In the system we are considering it is not only possible for all the apparatus to be designed especially with a view to avoid time-lag, but in the majority of cases currents at both ends of the cable combine to operate the relay on the overload sections, and the apparatus is rendered doubly sensitive and rapid in action, besides being very considerably simplified in design.

This balancing may be obtained in several different ways; in some cases equal electromotive forces may be opposed to one another, and in others a form of magnetic balancing may be employed in which equal magneto-motive forces are opposed to one another in the same magnetic circuit. Experience has shown that the E.M.F. method is most readily applicable to the protection of feeder cables, whilst magnetic balancing is best suited to the protection of transformers and other

D

Digitized by Google

station plant. When magnetic balancing is employed it is possible to combine the protective gear with measuring apparatus by using the same current transformers. The way in which these applications are arranged can be seen from the accompanying diagrams. The simplest case is that in Fig. 1, which represents the protection of a simple case by E.M.F. balancing with star-connected current transformers. In this connection it may be pointed out that it is advantageous to combine the armatures of the contact-makers for each phase into a three-pole instrument. The non-inductive shunts shown across the primary windings of the current transformers are not always necessary, but are usually employed. It is important that the pilot-wire circuits should be earthed at one end only, as otherwise there is a risk that current flowing in the earth at the moment when the breakdown occurs on some other part of the system may tend to flow through

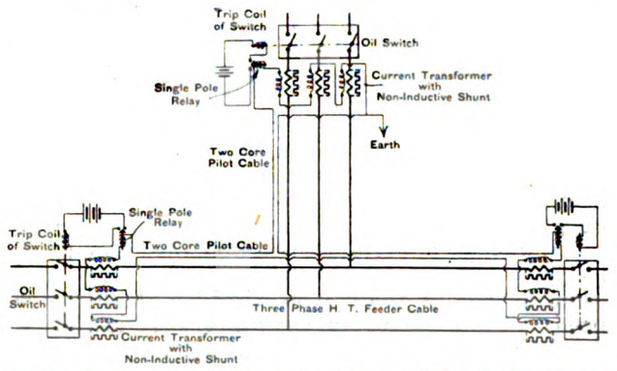

Fig. 2.—Protection of Branched Feeder (E.M.F. Balancing).

pilot wires and affect other parts of the system. In Fig. 2 is shown the method of protection of branched feeders by means of E.M.F. balancing with an open reverse delta connected current transformers. The protection of a transformer by means of magnetic balancing is shown in Fig. 3. As under normal conditions

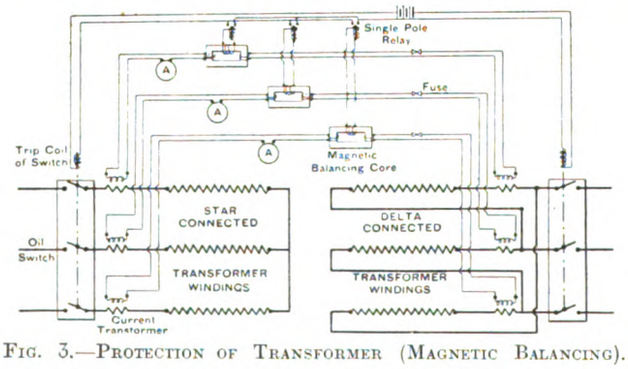

Fig. 3.—Protection of Transformer (Magnetic Balancing).

the magneto-motive forces in the magnetic balance cores are equal and opposite, the flux is practically zero, and the windings, therefore, are practically non-inductive; measuring instruments may, however, be connected as shown. Generators and other plant may be protected in a similar manner. Several further methods of applying the principle have been worked out and tried in practice with satisfactory results. Connections may be arranged in a variety of ways, but the principle is the same in all. A balance is created in effects due in same way or other to the current entering and leaving the system to be protected.

In the preparation of these notes upon the Merz-Price system we wish to acknowledge the assistance of the British Insulated & Helsby Cables, Ltd., to which firm the inventors have granted the sole patent rights on condition that they shall sub-let the licence to manufacturers of cables and switchgear on agreed terms.

BOURNEMOUTH TRAMWAY DISASTER

THE inquest on the death of seven persons, as a result of the tramway accident at Bournemouth on May 1st, was resumed on May 13th and continued on May 14th. The driver, who is still too unwell to attend, was represented by Mr. J. O'Connor, M.P. Details of the accident, and a report of the first two days' inquest, were given on page 713 of our issue of May 7th. It will be remembered that the car left the rails on a curve after descending a steep hill at a high speed. The hand brakes were found to be fixed tightly on the wheels after the accident, but the rear controller was found to be not in the off position, under which condition the magnetic brakes could not operate. It was admitted during the first day's inquest that three only of the four magnetic brake-shoes were in working condition, and also that on the day of the accident the controller had been found defective and had been repaired.

On Wednesday, May 13th, evidence was given by persons who had seen the accident to show that the car went down the hill at a high speed, and also that the driver was applying the brakes. Mr. F. W. Lacey, borough engineer, stated that the line on which the accident took place was relaid about two years ago, and would have been relaid again in six months or so. The rails were much worn, but there was a guard rail on the inner side at the curve. A car could go round safely at 10 or 12 miles per hour, but even with new rails a car would not get round safely at a speed of 15 or 20 miles per hour.

Mr. J. Bulfin, the borough electrical engineer, said that he inspected the rails an hour after the accident, and found both inner and outer rails in good condition for the proper speed, round the curve, of six miles per hour. He also confirmed the statement that, owing to the position of the controller handles, the magnetic brakes could not have been working, and that the only brake available was the hand brake. The latter, however, was sufficient if the speed was not allowed to get too high. With regard to the one defective magnetic brake-shoe, Mr. Bulfin said that of course four shoes would be more effective than three, but he would not have hesitated to allow a car to go down the hill with three instead of four shoes. Mr. C. Barber, traffic manager, said that the controllers and the brakes were examined twice a week. The hand brakes of the car in question were examined on the night previous to the accident and the controller on the previous Wednesday, but no report as to any defect was made. No car was allowed to go out with less than three shoes operative. He was perfectly satisfied that the magnetic brake of the car in question was working on the day of the accident.

On Thursday, May 14th, the examination of Mr. C. Barber was continued. He stated, in reply to Major Pringle, the Board of Trade inspector, that he had made the experiment of sending a car (similar to that which met with the accident), with 32 men upon it, down a gradient of 1 in 12, at a speed of 15 to 20 miles per hour. Full power was kept on up to a certain spot, and then, on shutting off the power and applying the four magnetic brake-shoes, the car was stopped after running an average distance of 80 ft. Three tests were made with three magnetic brake-shoes only, and the average distance in which the car was stopped was 84 ft. 3 in. The accident was, in his opinion, due to the failure of the magnetic brake, although, if the hand-brake had been applied in time, it should have been sufficient. He thought that the condition of the hand-brake indicated that it was not applied until the speed of the car had got too great. The failure of the magnetic brake was, he thought, due to the fact that the rear controller had become deranged unknown to the driver, in which case there would be no effect when he tried to put on the brake. There was also the possibility that the driver had accidentally left the controller in the wrong position when changing over at the terminus. Probably the driver did not apply the hand-brake soon enough because he was unaware that the magnetic brake was not working. If applied in time the hand-brake would have been sufficient, as for six months the cars had gone down this hill without magnetic brakes. W. Rushton, divisional inspector, stated that the car came in to be seen to on the afternoon of the accident. He made some adjustments to the controller, and satisfied himself that it was in good working condition, and the car went out on service again. W. Lait, depôt superintendent, who examined the controller after the accident, stated that he found the rear controller set one notch backwards, whereas it should have been in the neutral position. He did not think that the fall of the car could have caused that; it was more likely that it was in that position when the car left the terminus. This concluded the evidence on Thursday, and the inquest was adjourned until May 27th.

LEEDS CORPORATION ELECTRICITY ACCOUNTS

WE have received from the Electric Lighting Department of the City of Leeds a comparative statement of the results of the past year's working with those of the preceding year, which was submitted to the Electricity Committee with the revenue accounts on Monday. The following table summarises the chief figures of interest, and shows the marked improvement in the business of the undertaking:—

	1906-7.	1907-8.
	£	£
Receipts from sales for private lighting	79,251	80,928
,, ,, street lighting	4,536	4,661
,, ,, power	24,472	27,847
Total receipts	108,260	113,436

Revenue per lamp installed ...	5/6·22	5/5·47

POWER AND HEATING.

Aggregate horse-power of motors installed at 31st March, 1908	8,379
Aggregate horse-power of motors installed at 31st March, 1907	6,880
Increase during the year (in horse-power)...	1,499 (21·8%)

	1906-7.	1907-8.
Units sold	4,870,942	5,746,255
Revenue	£24,472	£27,846
Average price per unit	1·21*d.*	1·16*d.*
Units sold per horse-power installed	796	754
Revenue per horse-power installed	£4	£3 13 2

The revenue from sales of current for lighting purposes has been somewhat severely affected in the final quarter of the year by the introduction and rapidly increasing use of metallic filament lamps, by means of which a large reduction is effected in the quantity of current consumed in the production of a given amount of illumination. It is anticipated, however, that the temporary loss of income by this cause may be ultimately recouped by a large influx of additional consumers, induced by the lower cost at which electric light can be obtained. The use of electricity as motive power again shows a satisfactory extension, the aggregate capacity of the motors installed on consumers' premises having increased by 21·8 per cent. during the year, and the sales of current for this purpose are also much higher than during any preceding year, although the consumption in proportion to the horse-power installed shows a decrease, no doubt due to reduced activity in some of the principal industries of the city. The recent reductions in the scale of charges for electricity used for power and heating purposes are estimated to affect the ensuing year's income to the extent of about £5,000, without allowing for the increase of business which is likely to result. It will be seen that the revenue has again had to bear a considerable charge under the heading of extraordinary renewals, the bulk of this representing the cost of replacing plant of a capacity of 700 kilowatts, which was only suitable for the now obsolete system of supply at a frequency of 83 periods per second. It is satisfactory to know that the replacement of the whole of the 83-period plant has now been provided for, and the charges for extraordinary renewals are therefore likely in the immediate future to be much smaller than in the past two years. Notwithstanding the favourable effect of contracts made during the period of lower prices, the expenditure has also been increased by an advance in the price of coal, the fuller effect of which will be felt in the ensuing year. The increased cost due to this cause during the past year is calculated to have been £1,336. The weight of coal used per unit sold has been reduced by about 5 per cent.

The following statement shows the cost per unit in detail for the past and the preceding year:—

	Year ended 31st March, 1907.	Year ended 31st March, 1908.
	d.	*d.*
Coal	0·19	0·21
Oil, water and stores	0·02	0·02
Wages	0·13	0·12
Repairs, maintenance and renewals ...	0·15	0·12
Rates, taxes, and insurance	0·07	0·08
Engineers' salaries	0·08	0·08
Office salaries and general expenses ...	0·05	0·04
Total ordinary working expenses per unit	**0·69**	**0·67**
Wages incurred on extensions, but not chargeable to capital account, being paid to Corporation's permanent workmen	0·00	0·02
Extraordinary renewals	0·30	0·26
Interest	0·60	0·54
Redemption fund charges	0·62	0·57
Total charges per unit	2·21	2·06
Surplus profit per unit	0·07	0·13
Average price obtained	2·28	2·19

A 3,000-kilowatt steam turbo-alternator has been installed at the generating station during the year, and after deducting the 83-period plant discarded, as before mentioned, the capacity of the plant is 12,740 kilowatts. An additional turbine set of the same capacity (3,000 kilowatts) is on order, and expected to be available for use before next winter. The maximum load upon the plant has been 8,300 kilowatts, compared with 7,470 kilowatts in the preceding year, and therefore the load factor (being the proportion between the units sold and the quantity which would have been generated if the load had been continuous and uniform throughout the year) has been 17 per cent. During the previous year it was 18 per cent., and the decrease is due to the two facts already mentioned, viz., the reduced consumption per horse-power of motors installed on consumers' premises, and the saving of current used for lighting purposes, during the last quarter of the year, by the introduction of more economical lamps.

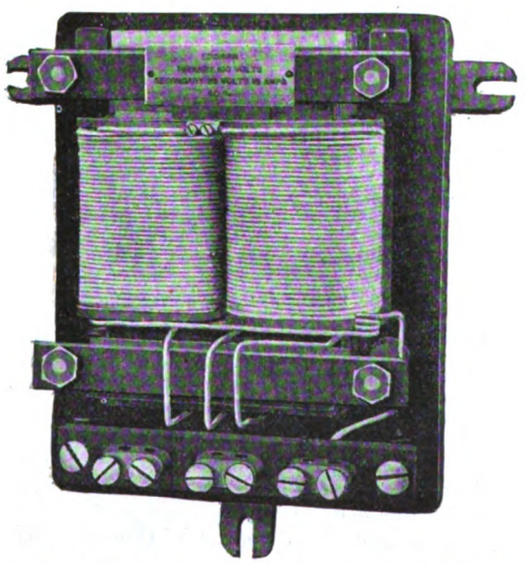
"AUTHORISED" CONTRACTORS



As announced in our issue of May 7th, the Birmingham Corporation has given notice that on and after June 30th next all installations intended to be connected to the Corporation's mains should be carried out by "authorised" contractors. A printed list will be drawn up of these firms, and will be available to any consumer in the Birmingham City area who may apply for it.

On further inquiry we learn that, while on the whole the quality of the wiring work done in Birmingham is good, there are, as always, some cases of shoddy work being done. It is partly with a view to lessening this, and partly for the convenience of having a list of good firms to recommend to prospective consumers, that this step has been taken. The Corporation electricity department are constantly being asked to advise as to what firms consumers should go to for their installation work, and the practice has hitherto been to recommend certain high-class firms, strictly in rotation, from a list kept at the offices. The present plan of having a printed list is regarded as preferable. Every firm desiring to be placed on the list of "authorised" contractors will be asked to give six recent installations as a reference; the department will examine some of these, and will decide from this examination whether the firm shall be "authorised." Doubtless, in the case of firms in other towns applying, information will be obtained from the supply authority in the town in question.

We understand that the scheme is not meeting with any opposition on the part of the contractors; in fact, the National Electrical Contractors' Association has applied to have all its Birmingham members placed on the list.

SMALL TRANSFORMERS FOR METALLIC FILAMENT LAMPS

THE Edison Swan United Electric Light Co. have sent us some particulars of a series of small transformers for metallic filament lamps, which they are now manufacturing at their works at Ponder's End. We have on more than one occasion pointed out the advantages to be obtained by this class of apparatus.

Ediswan Transformer for Metallic Filament Lamps.

The construction of these transformers is seen from the accompanying illustration, which represents one of these with the cast-iron cover removed. The whole construction appears thoroughly mechanical, and we are assured that only the best selected transformer plate is used for the cores, with the result that the no-load losses are very small. The design is such that the voltage regulation is within one or two per cent., and the power factor is given as 0·98 at half and 0·99 at three-quarter and full load. The arrangement of the cover allows of good ventilation, and as regards the insulation it should be said that every transformer is tested with 1,500 volts alternating before being sent out.

They are listed in sizes ranging from 300 to 1,000 watts, both as plain auto-transformers for secondary voltages of 100, 50, and 25 volts, and also as balancing transformers for half the primary voltage. The following particulars of a medium size transformer for 450 watts, 200/25 volts, 50 cycles, will give a general idea of the sizes, weights, efficiencies, &c.:—No-load loss, 9 watts; efficiency at half to full load, from 96 to 98 per cent.; overall dimensions, 10¼ in. by 9½ in. by 5⅛ in.; weight, 34 lb.

NATIONAL TELEPHONE CO.'S STAFF DINNER

ON Thursday last, the National Telephone Co.'s annual staff dinner was held. The guests this year included Mr. George Franklin (the President of the company), Lord Harris, Sir Albert Rollitt, Mr. G. H. Robertson, and Mr. C. S. Agnew (Directors of the company), Sir John Gavey, C.B. (Consulting Engineer to the Post Office), Sir Robert Hunter (Solicitor to the Post Office), Major W. A. J. O'Meara, C.M.G. (Engineer-in-Chief to the Post Office), and Mr. G. F. Preston (General Manager of the London Post Office Telephones). The chief officials of the company were also present, including Mr. Albert Anns (secretary), who occupied the chair, Mr. Frank Gill (Engineer-in-Chief), Mr. S. J. Goddard (General Superintendent), and Mr. C. B. Clay (Metropolitan Superintendent). In several of the speeches, feeling reference was made to the loss which the company had suffered by the death of Mr. W. E. L. Gaine, the late General Manager.

As usual, interesting statistics were given of the growth of the company during the year. Not including replacements, such as at Gerrard Street, 176 new exchanges had been established at an expenditure of over £150,000. The total number of exchanges up to date is 1,480. On April 30th last there were 457,564 telephone stations, an increase of 36,085 over last year. No less than 1,313,511,576 messages were sent over the wires during last year (on the usual basis of an assumption of two messages per conversation), an increase of 136,204,744. These figures apply to the National Telephone Co. only, and do not include the Post Office system. The number of stations represents one to every 96 of the population;—including the Post Office figures there would be a large reduction in this figure of 96. Excluding Germany, Mr. Franklin said, we have more telephones in Great Britain than any five other European countries put together. During the twenty-eight years of the company's licence, 2½ millions sterling, he said, had been paid to the Post Office as royalty.

Both Mr. Anns (who received an enthusiastic reception) and Mr. Franklin reassured the staff as to their positions when the Post Office takes over the business of the company on Jan. 1st, 1912. It was absolutely erroneous, Mr. Anns said, to think that the Pension Fund would not be equal to its engagements, and when it was wound up he was confident that there would be a handsome surplus, in which all members would participate. As to the actual status of the staff when the transfer takes place, Mr. Franklin said that it was quite clear that they were properly protected by the agreement of 1905 between the company and the Post Office, and also by the subsequent statement in the House of Commons by Lord Stanley (then Postmaster-General). Moreover, the Board of the company would take every opportunity of seeing that no member of the staff suffered by the transfer.

Other speakers were Mr. Goddard, who proposed "The Guests," and Sir A. K. Rollitt and Major W. A. J. O'Meara, who responded to this toast.

Electrical Association of Victoria.—The report of the Council for the past session states that a gradual improvement in the progress of the association has been distinctly noticeable. Mention is made, says the *Australian Mining Standard*, of the useful work done by the special tariff committee which was appointed for the purpose of modifying the new Australian tariff. The rules of the association have been redrafted in order to make them as far as possible uniform with the Association of New South Wales. The officers for the ensuing year are as follows:—President, Mr. Noel Murray; past presidents, Mr. H. Noyes and Mr. Alcock; vice-presidents, Mr. Harper and Mr. Jackson; hon. secretary, Mr. Brearley; hon. treasurer, Mr. Mountain; auditors, Mr. R. O. Moore, Mr. Cresswell; council, Mr. J. L. Newbigin, Mr. Walker Fowler, Mr. W. Cumming, Mr. Woodward, Mr. Morrison.

METALLIC FILAMENT LAMPS FOR STREET LIGHTING

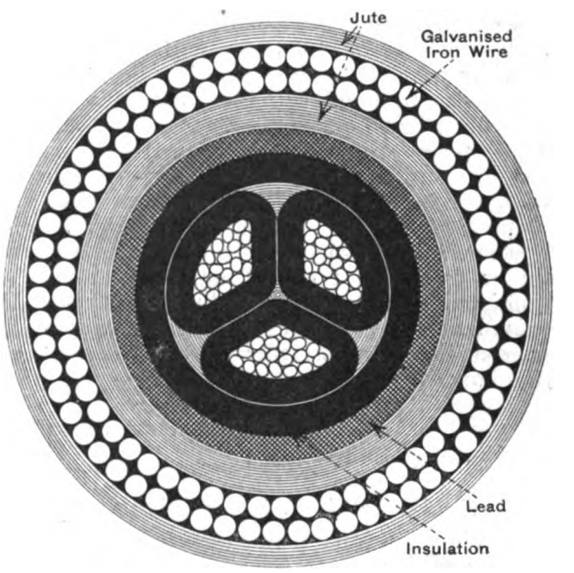
IN our last two issues (pages 703 and 740) we gave some interesting letters containing results of experiences in the use of metallic filament lamps for street lighting at a number of places, including Derby, Harrogate, Horsham, Bray, Kettering, Sutton Coldfield, Cambuslang, and Yarmouth, from which it was seen that excellent results of life tests had been obtained, pointing in the case of Osram lamps to an average of about 1,500 hours. In those undertakings where the lamps had been in use long enough to enable accurate figures of costs to be arrived at, it was evident that the street lighting by metallic filament lamps is generally cheaper than gas. In some cases it has been found necessary to adopt some care in pairing the lamps suitably, and some difference of opinion was expressed as to the effect on the life of the lamps of enclosing them in outer globes and the desirability of permitting a certain amount of play in the holders to allow of movement in windy weather. In connection with the figures of life and cost, the following letter from Mr. A. C. Cramb, Borough Electrical Engineer, Croydon, who has devoted a great deal of attention to the subject, is of interest:—

We commenced experimenting with these lamps for street lighting about 18 months ago, and we have had 44 posts running since February, 1907, and 38 since September, 1907. Each post has two 104-volt 35-watt lamps in series on 200-208-volt A.C. circuit. The average number of burning hours obtained per pair of Osram lamps has been nearly 1,300, but this is without taking account of lamps still running, which will bring the average well over 1,500. There is no appreciable diminution of candle-power throughout the life of these lamps. We have been running "Metalik" lamps since the end of January this year, and so far the results have been satisfactory; but there has not yet been a sufficient lapse of time for us to form a just comparison between the two lamps.

Perhaps you will permit us to observe that the figures of running cost whch you publish in your article of May 7th issue appear to be somewhat biased. A 35-watt Osram lamp gives about 28 candle-power, which is not equal to a gas mantle, if these are renewed with reasonable frequency, as they are in Croydon. We have been running several 200-volt 60-watt Osram lamps for the past two months, and we consider that nothing less than these could compete with the gas mantle, nor do we think that a longer average than 1,500 hours can be reckoned upon, at least with any of the lamps which are now upon the market.

Our running cost meantime with one pair of 35-watt lamps per post is as follows:—

	£	s.	d.
70 watts, 3,800 hours, 270 units at 1¼d. per unit ...	1	8	2
Lamp renewals (average 1,500 hours per pair), 2½ pairs per annum	0	9	6
	£1	17	8



We obtain the same price per annum for electric incandescent street lighting as the Gas Company. Our aim in Croydon is to instal one 75 candle-power lamp per post, and so give a much better light than the ordinary gas mantle, and to charge the same price. This lamp, however, has not yet made its appearance.

The following notes sent us by Mr. H. D. Munro, City Electrical Engineer, Exeter, are of interest. It should be pointed out that Exeter was practically the first place where Osram lamps were adopted to any great extent for street lighting. In addition to the lighting referred to below, some of the main streets are lighted by Osram lamps after midnight, when the flame arcs are extinguished. Mr. Munro writes:—

We have had an unusually extensive experience in this matter in Exeter, as we took over the lighting of some twelve miles of streets, in which our mains were laid, in the autumn and winter of 1906, with Osram lamps on our 100-volt supply, as soon as they were obtainable for that pressure. There are now some 500 lamps in all, of which 135 are 110-watt lamps, mostly on tramway standards, and the rest 55-watt lamps on brackets on the old gas-lamp posts. We had at the time to make a somewhat conservative estimate, as there was little information to be had as to the life of these lamps, or even as to their being obtainable in sufficient quantities, and the estimate (including cost of conversion) came out some 10 per cent. to 12 per cent. above that of the local gas company, which tendered with single and double low-pressure incandescent mantles. The electric lighting is at least equal to the incandescent gas lighting in other streets, and on the tramway routes is far superior, and I think the lighting generally is well worth the extra cost. The life of the lamps, however, has considerably exceeded the estimate, with a consequent reduction in cost of renewals and attendance, and as a result we have obtained over 1¾d. a unit for the supply, which I consider a very satisfactory figure. Some of the lamps have shown exceedingly long life, ranging to above 4,000 hours, but the average of some 1,400 of them so far is about 1,200 hours. A good deal depends on making sure that they are not seriously overrun, and I hope to get the average considerably higher if the present quality of the lamps is maintained. Other metallic lamps than the Osram have also shown good results, but I have not enough data for definite statements as to their average life. Now that metallic lamps for the higher voltages are obtainable, I believe, from my experience, that any electricity department in the country should be able to compete on even terms with the incandescent gas mantle for street lighting, and make a profit on the transaction, in view of the high load-factor of this class of supply.

A LARGE SUBMARINE E.H.T. CABLE

THE illustration below is a drawing of the section of a heavy cable recently supplied by the British Insulated & Helsby Cables, Ltd., for laying across Sydney Harbour. It is an extra high-tension cable, and each core has a section of 0·062 sq. in. The cores are insulated with paper and lead-covered in the usual way. Above the lead is a layer of jute to serve

as a bedding for the armouring, which consists of two layers of No. 10 S.W.G. galvanised iron wire. Over the armouring is a protective layer of jute. The heavy armouring is to prevent damage by ships' anchors and from other causes. To obviate the necessity of making joints in the cable, it has been supplied in one length of 2,400 ft., and it weighs no less than 15 tons. The cable is to be used as a feeder on the Sydney tramways.

Wireless Telegraphy.—Twenty-four new wireless stations are to be installed for the Spanish Government by the Compagnie Française de Télégraphie Sans Fil. Of these, fifteen will be along the Spanish coast, seven will be on the Canary Islands, and nine will be on the Balearic Islands in the Mediterranean. It is stated that one of the new stations will also communicate with the Marconi station at Clifden, and the station at Teneriffe will probably soon be in communication with Pernambuco in Brazil.

CORRESPONDENCE

"WIRE LAMPS."

To the Editor of ELECTRICAL ENGINEERING.

SIR,—If the term "wire lamp" is to be used simply for the sake of a shorter "fancy name," it is as good as any other invented name, and I, personally, have no objection to raise against it. It should, however, be well understood that "wire lamp" is a failure from a descriptive point of view when applied to the tungsten lamp, as no tungsten lamp at present in the market has a wire as its filament. Might I suggest "metal lamp" as being distinctive from "carbon lamp"?

Yours faithfully,

Queen Victoria Street. H. HIRST.
May 7th, 1908. (General Electric Co., Ltd.)

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Referring to our letter of May 5th, we beg to say that in the closing sentence a slip of the pen has occurred. It should read as follows: "We have used the term 'metal lamps' for a considerable time, and our customers are quite used to it."

Yours faithfully,

Charing Cross Road. J. STOTTNER.
May 8th, 1908. (The Electrical Co., Ltd.)

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I am inclined to agree with your correspondent, "E. C. L.," that, although the term "wire lamp," suggested by Mr. Mordey, is more convenient, it is, nevertheless, somewhat of a misnomer. It seems to me, moreover, that to the non-technical public, who form the bulk of the users, the term "wire lamp" would express no new idea, because to them the carbon filament lamp has always been a "wire lamp." Again, the pre-carbon platinum lamp actually was a "wire lamp," and a "metallic filament" lamp too, but such a lamp, giving only one-sixth of a candle or less per watt, is not one that the term which is being sought for should be capable of including. It seems to me that what is really wanted is a term which will convey the idea of high efficiency or economy. The word "economic" might be used, but I rather fancy that it is already appropriated as a trade name by some firm. As all the new lamps have an efficiency in the neighbourhood of one candle per watt, why not call them "candle-watt" lamps?

Yours faithfully,

GILBERT SCOTT RAM.

London, May 12th, 1908.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—We think the point that has been raised is interesting, as these metallic lamps are now making such headway with the certainty of coming more widely into use, and if a better name can be found than is at present employed, this is the time for it. The term "wire lamp," however, we think is not suitable, and a word seems to be needed which covers the fact that the filament is composed of something more than metal. There is, in fact, something introduced with the metal under special chemical process, making distinction between one metallic lamp and another, and which many people might like to know of, but which at present cannot be divulged. The most appropriate name we can think of is that at present in use, viz., metallic lamp, which is what we had in view when we went into the matter and named ours with phonetic spelling.

Yours faithfully,

G. M. BODDY.

Newington Works, Liverpool,
May 13th, 1908.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—While we agree that the term "Wire Lamp" is more concise than the term "Metallic Filament Lamp," it is quite evident that the term "Wire" should only be applied to a filament which has been drawn through a die. It is apparent that the "Tantalum" is the only lamp now on the market that really possesses a filament which may correctly be described by the word "Wire," as it would be quite a misnomer to apply this term to filaments which are squirted in the process of manufacture. It is, of course, recognised on all sides that the wire lamp, viz., the "Tantalum" lamp, is at least as strong as any carbon filament lamp, and this lamp has now been widely adopted for ship and train lighting, as it withstands an amount of vibration and unfavourable usage which would be too great for any other type of metallic lamp.

We are, dear Sir,

London, Yours faithfully,
May 12th, 1908. E. P. BARFIELD.
(Siemens Bros. Dynamo Works, Ltd., Supplies Department.)

METALLIC FILAMENT LAMPS FOR STREET LIGHTING.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—You state in your issue of 14th inst. that I could have avoided trouble by pairing Tantalum lamps. Before making this remark I think you should have found out our practice in regard to this. For the past two years every lamp we have put into the streets has been *carefully* paired. Not only this, but when a lamp gives out a new pair is put up and the odd lamp brought in. After this all odd lamps are paired again in the same manner. Nobody has taken greater care nor been more particular in pairing Tantalum lamps than we have, so that your remark seems rather hard. I should be glad if you would be so good as to publish this letter. My trouble in 1907 was neither due to want of pairing nor bad voltage, but to the lamps themselves. This is proved by our 1906 results, using Tantalum lamps of 125 volts as against 130 volts in 1907. During 1906 we had not a battery, and our volts were steadier in 1907 with a battery.

Yours faithfully,

A. J. ABRAHAM.

Cambuslang, May 16th, 1908.

Swiss Electricity Supply Statistics.—According to the Year-book of the Schweizerischer Elektrotechnischer Verein there were at the close of 1906, in Switzerland, 539 electricity works. Of these 240 were generating stations, 50 partly sub-stations, and the remaining 249 purely sub-stations. Of the generating stations 51 per cent. were water-power stations. In 36 per cent. mixed water and heat engines, in only 3·5 per cent. steam engines, and in 9 per cent. explosion engines were the prime movers. The water-power stations delivered 37·5 per cent of the total output, and the mixed stations 60 per cent. The capacity of the largest station was 16,000 kw. Of the 240 generating stations 60 generated continuous-current, 25 single-phase alternating, 75 three-phase alternating, and the remainder generated on two or all three systems. The usual transmission voltages employed were 1,000 and 5,000 volts, but in four cases the voltage was 25,000 volts. One high-tension direct-current transmission system operated at this pressure also. The distribution pressures were between 100 and 120 volts in over 50 per cent., and between 200 and 240 volts in 30 per cent. of the cases considered. The usual frequency was 50 cycles per second. The total kilowatts connected for all generating stations were 161,000, of which 67,500 kw. was for lighting purposes, 11,000 kw. for heating purposes, and the remainder for power. The following are given as average installation costs per kilowatt installed:—(1) For a water-power station: Electrical part £22, remainder £26, total £48 per kw. (2) Mixed water-power and steam station: Electrical part £26, remainder £28, total £54 per kw. (3) Explosion engine station: Electrical part £62, remainder £38, total £100 per kw. The above figures are taken from an abstract in *Elektrotechnik und Maschinenbau*.

ALTERNATING-CURRENT SWITCHGEAR RELAYS

IN the introductory portion of his Paper, read last Thursday before the Institution of Electrical Engineers, Dr. C. C. Garrard remarked that the installation of control relays on high-tension alternating-current circuits had become standard practice, and was likely so to continue, but it was somewhat remarkable that many systems were in operation designed on what seemed to him to be erroneous lines. The object of the Paper was to deal with a number of such instances which had come under his notice, and to examine some other systems of control working at present in use or proposed to be put into application.

Polyphase Relays.—A considerable number of polyphase maximum time-element relays have been installed in various supply stations. They consist of a polyphase-wound relay having a single moving element which moves under the action of the currents in two or three of the phases. We will consider such a relay in use on a three-phase four-wire circuit, in which case it would have three windings energised by each of the three phases. Let us suppose it to be set to operate after, say, 30 seconds continued overload at 150 per cent. of full load. This means that after 150 per cent. of full load has flowed in *each phase* for 30 seconds the relay operates. Suppose now that instead of the overload occurring on each of the three phases simultaneously, it only took place in one phase. It is clear that in order to operate the relay the overload on the single overloaded phase must be much greater than before; in fact, the current in the single overloaded phase will have to rise to two and a half times the normal full-load current before the relay will operate. For this reason polyphase relays should never be used, but always single-phase relays connected separately on two or three of the phases on three or four wire systems respectively. The same objection applies to the use of polyphase reverse relays. In fact, under some conditions with a reversal in one phase only the tendency towards operation in the relay due to this reversal is neutralised by the increased forces in the opposite direction due to the unreversed phases, and the relay quite fails in its action.

Solenoid Relays.—These consist of a solenoid having a movable iron plunger, which is sucked up when the current in the solenoid exceeds a certain value. The iron plunger is attached to a dashpot or air-bellows, which retards the travel of the plunger, the amount of the retardation being varied by means of a small valve which controls the clearance in the dashpot, or the rate at which air can pass in or out of the bellows, &c. Thus the plunger is caused to take a certain time to travel to its top position. When the top position is reached, contact is made in the trip-coil circuit and the controlled circuit is opened. As the plunger goes up the magnetic reluctance goes down. Now, with a constant magnetising force in the relay the attractive force on the plunger varies inversely as the square of the reluctance. It follows that if, due to the passage of a certain current through the relay, the plunger is caused to travel upwards, the higher the plunger goes the less the current necessary to keep it in its new position. Thus the current in the controlled circuit can fall again to its normal value, but the plunger will not fall, but remain "floating" for an indefinitely long period near its top position. If, now, the current again increases, the plunger will complete its upward journey, but without any time element whatever, this being due to the fact that the first small movement in a dashpot is unretarded, no matter from what position in its travel the plunger starts. Translated into practical conditions, these results mean as follows :—At time of full load a short comes on the system which is intermittent in nature. The current increases sufficiently to pull up the plunger of the solenoid relay, but not for a sufficient time to close the trip contacts. The short goes off, but the full load remains flowing in the circuit. Consequently the plunger does not fall, but remains floating near its top position, and the next time the short comes on the relay operates without any time element whatever, and the whole object of the apparatus is vitiated. These results show pretty conclusively that the dashpot solenoid type of maximum relay is not to be relied upon for dealing with intermittent overloads or shorts.

Fuse-shunted Trip Coils.—A method sometimes adopted to impart a time element characteristic to an ordinary circuit breaker is to shunt the trip coil with a fuse. Normally, the secondary current of the current transformer flows through the fuse and not through the trip coil, until the fuse blows and the current is diverted through the coil. The time taken for the fuse to blow gives the time element. It is only possible to use this scheme for alternating currents, as with continuous currents the whole of the current passes through the trip coil, and a sufficient volt-drop to blow the fuse cannot be obtained. The chief advantage of this scheme is cheapness. Its efficiency may be judged from the following considerations. The two essential functions of a time-element device are that the time lag should prevent the circuit breaker opening with every momentarily abnormal rush of current, and that if two time-element circuit breakers are in series, it should be possibe to adjust one to open before the other. The point to be ascertained is how far this discriminating action can be attained. The following experiments were made to elucidate this. The trip coil used was a standard 10-ampere one, having a volt-drop of 2·8 volts at 50 cycles, the plunger being set so that it was pulled up with 10 amperes through the coil. In order to approximate to working conditions, the current through the coil and fuse in parallel was kept constant at 8 amperes, and then suddenly increased by definite amounts, and the time noted which elapsed before the trip coil operated. Curves (Fig. 1) give the results obtained by varying the thickness of the copper fuse wire. It will be seen that altering the thickness of the wire not only alters the current at which the combination works, but also affects the time element enormously. Thus independent adjustments of the time and the current calibrations are not feasible—at least, if fuse wires of constant length and of the same material are used. A characteristic of all the curves is that on large overloads the times taken all become practically zero. That is to say, on heavy overloads any time discrimination disappears altogether. The fuse-shunted trip coil may,

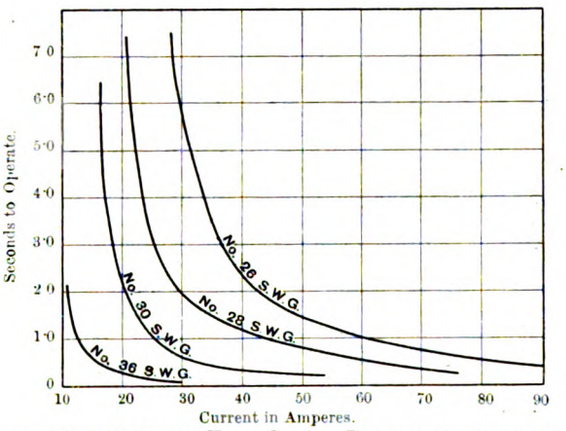

FIG. 1.—FUSE SHUNTED TRIP COILS. LENGTH OF COPPER FUSE =2. 50 CYCLES. VOLTS ACROSS TRIP COIL AT 10 AND 50 CYCLES = 2·8.

however, find useful application on motor-control panels where ordinary fuses are not desired, and where a discriminating action, apart from the prevention of the machine being cut off due to every temporary overload is not wanted.

Maximum Relays Connected on the "Resultant Principle."—For three-phase three-wire systems two separate single-pole relays are theoretically necessary to afford complete protection. When what may be designated the "resultant" scheme of connections has been used a single one-phase relay only has been installed, but in conjunction with two current transformers, so connected that the current in the relay is the vectorial resultant of the current in each of the phases in which the current transformers are situated. A superficial examination would lead one to think that as the relay current is the resultant of the currents in the two phases, an overload in either will cause the relay to operate and thus afford complete protection. In three-phase four-wire systems three current transformers are necessary, but only two relays are used, the idea being to save the cost of the third relay. Exactly the same consideration, however, can be applied to this case as above, as it is quite possible for one phase to be overloaded, since it has a return path through the fourth wire. If this overload has a large phase displacement relative to the currents in the other phases, then the condition may arise of very big overloads in the one phase and the circuit breaker not operating. The only safe arrangement is to have the same number of relays as current transformers. If the circuit be a four-wire one, then three relays are necessary; if three-wire, then only two relays are essential.

Reverse Relays on Generators.—These should only come into operation when a serious fault has developed on the generator or prime mover of the nature of an insulation breakdown in the winding, or a total failure of steam power. A short consideration will show several cases of accident to the prime

Digitized by Google

mover, in which an automatic disconnection from the busbars would only be an aggravation of the trouble. For example, consider two or three large compound Corliss engines, with three-phase generators running in parallel. A not uncommon fault is the failure of one of the admission valves to open, with the result that steam is admitted to only one side of the piston. Under these circumstances a large surging current passes backwards and forwards from the faulty to the good machines. The fault with the valve is but a small matter, and the driver attends to it immediately, the surging current ceases, and everything goes on as before. If, however, this set had been cut off the busbars, the other generators would have become seriously overloaded, with probable variation in volts, and all the trouble of synchronising would have had to be gone through.

With the diminution or total failure of the field current of a generator, the current in the windings increases greatly and leads considerably on the machine volts. Provided the set remains in synchronism, and the steam supply is in order, the alternator continues to supply energy to the system, and there is no reason why it should be disconnected from the busbars. The large increase of current is noticed by the switchman, who immediately seeks for and remedies the fault without any serious disturbance of the supply. If when the field circuit fails the set drops out of step, then it should rightly be disconnected.

It will be understood that any form of relay, one of whose constituent parts is a shunt coil, will be affected by variation in the voltage applied to the same. The shunt coil of the generator reverse relay is excited (through the intermediary of potential transformers) directly from the busbars. On the occasion of an accident to one of the generators, the busbar volts will tend to go down. The trouble is intensified by the fact

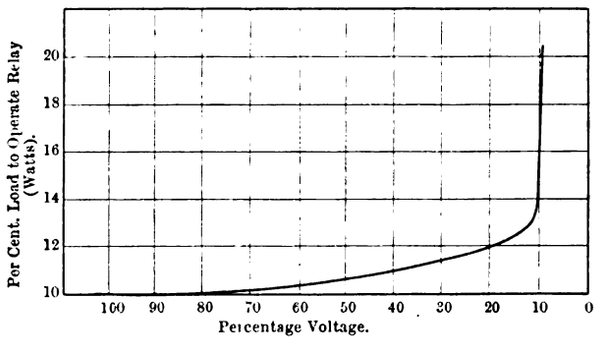

FIG. 2.—A.C. REVERSE RELAY. VARIATION OF CALIBRATION WITH VOLTAGE.

that, as has been shown, an instantaneous relay cannot be used, therefore there is more time for the voltage to fall. It must be remembered, however, that a failing generator in parallel with one or more good ones is not likely to pull the volts down to any very alarming extent. Probably a 50 per cent. reduction is the maximum to be expected. It is clear, however, that the calibration of the relay should be as little affected by variation in the busbar voltage as possible. Fig. 2 shows the effect of reduction of the shunt voltage on the calibration of a reverse-power relay of the wattmeter type.

The most suitable value to which a generator reverse relay should be set is such that it will operate, after the requisite time element, with an energy reversal of 10 per cent. of the full rating of the machine. With this setting the current which can flow in the generator windings is never very excessive.

Reverse Relays at the Ends of Feeders.—The function of such relays is to prevent a fault on the feeder being fed back from the sub-station or distribution network. The currents which flow into such a fault will have passed through long lengths of feeder, the C R and inductive drop in which will cause the voltage applied to the shunt of the relay to fall. Thus reverse relays, situated at the ends of feeders, are far more likely to be affected by drop in volts than are those on generators. For this reason it is desirable for the relay to operate as quickly as possible after the occurrence of the reversal. The objection to instantaneous reverse relays on generators does not apply here, as a similar action to the slow surging of current, or cross-current, from one generator to another cannot take place. Temporary reversals of energy in a feeder may happen, however, due to hunting of the sub-station machinery. The hunting may be set up by a temporary disturbance in the system, such as a short circuit with consequent lowering of voltage. With an instantaneously operating relay the first reversal, provided it be of sufficient amplitude, will cause the relay to operate, and thus the circuit may be opened when there is not any need for it. As the time-limit relay is inadmissible, this action must be obviated by other means. The determining factor is obviously, to what degree may hunting occur in the sub-station machinery without the same falling out of step? Naturally, if it be going to fall out of step the opening of the circuit is an advantage. On the other hand, a moderate temporary swing might be set up between the sub-station and the generating station, which will be damped out immediately and not do any harm. The instantaneous reverse relay at the far end of the

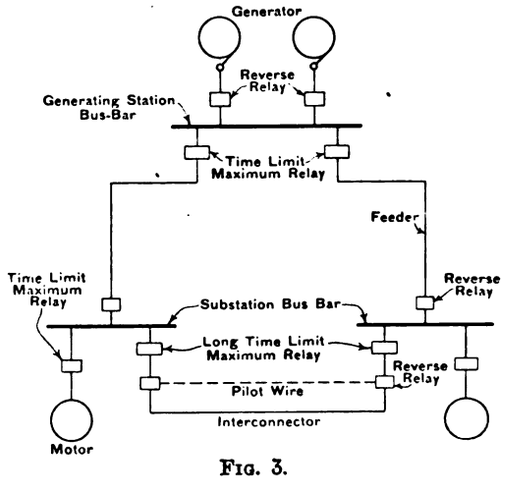

FIG. 3.

feeder should be set, therefore, so that the minimum power required to operate it should be above that likely to flow back, owing to such a harmless hunting of the sub-station machinery. It follows that the feeder-end relay should be set proportionately higher than the reverse relay on the generator; probably if it were set to operate at 25 per cent. of the normal full-load capacity of the feeder it would form the most suitable arrangement. Other considerations also indicate that a higher power setting of the feeder-end relay than the generator relay is admissible. With the latter the motoring current may be of very low power factor, and in order to keep the current within moderate limits the power setting of the relay must be kept relatively low. The feeder-end reverse relay is intended, however, to prevent a feeding back into an earth or short circuit. Such current would be of high-power factor, and, if not interrupted, of considerable magnitude. Thus the high watt setting of the relay is justified.

Protection of Interconnector Cables.—Interconnector alternating-current cables are used generally to connect up one sub-station with another. The standard method of protection for ordinary feeders is by means of an inverse time-limit maximum circuit breaker at the generating station end and a reverse circuit breaker at the sub-station end. It is obvious that this system is not applicable to the interconnector, as power may flow in either direction from one sub-station to the other. A diagrammatic representation of a generating station feeding two sub-stations connected together by an interconnector is given in Fig. 3. It is obvious that the interconnector should be protected against excessive loads going through it of such a magnitude that the cable itself is likely to be damaged. It is conceivable that owing to faulty superintendence the current in the interconnector may mount up to such an extent that damage

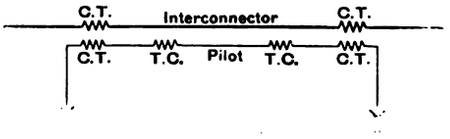

FIG. 4.—MERZ AND PRICE'S SYSTEM OF PROTECTION OF INTERCONNECTIONS.

to it may result. Some kind of maximum circuit-breaking device is desirable therefore, and as the only object of this is to prevent thermal damage, the time element should be very long—longer than any of the other maximum circuit breakers on the system, whose function it is to deal with shorts and accidental temporary overloads. For shorts and overloads on the system, other than those caused by the failure of the interconnector itself, the circuit breakers on the feeders, motors, and generators must be relied upon. The interconnector, from the point of view of control, virtually makes two sub-stations into one—that is, it is a prolongation of the sub-station busbars. So long, therefore, as the interconnector is in good condition, and not permanently overloaded sufficiently to be

Digitized by Google

burned, overloads and shorts on the system should never cut it out of circuit. The occasion when it should be cut off is when it goes wrong itself either by grounding or shorting. It is obvious that to attain this end something more is needed than simply maximum or reverse relays at either end of the inter-connector, as these cannot discriminate between shorts or grounds in the interconnector, or in other parts of the system. To solve the problem it is only necessary to consider that the function of the interconnector is to pass energy from one sub-station to the other in either direction. So long as it is doing this it may be said to be performing its function. It is, however, not doing so when it takes energy from one sub-station and does not deliver it to the other—that is, when energy flows into the cable at both ends at the same time. It follows that a circuit-breaking apparatus must be installed at either end, and that these must be interconnected together. This is done generally by means of one or more pilot wires.

Merz and Price's Systems.—The principle on which this method depends is illustrated in Fig. 4. A current transformer (C.T.) is included in the interconnector at either end, the secondaries of which are connected together through the trip coils (T.C.) and the pilot, the return circuit being *viâ* earth. So long as the current flows through both current transformers in the same direction, it is immaterial in which direction; the E.M.F.'s induced in the secondaries of the C.T.'s balance, and current does not flow through the pilot and trip coils. So soon,

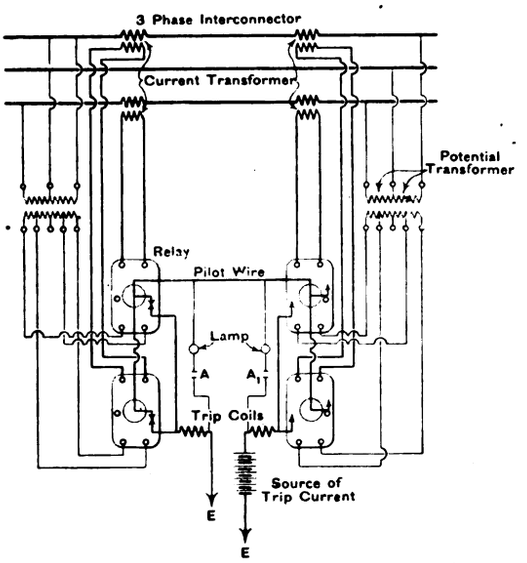

FIG. 5.—PROTECTION OF THREE-PHASE INTERCONNECTOR BY MEANS OF ELECTRICALLY INTERLOCKED REVERSE RELAYS.

however, as the currents at either end become unequal, or a reversal at the one end relatively to the other takes place, current begins to flow in the trip coils, and when this has reached sufficient value the switches are opened. It may be mentioned that differential relays are used usually, in addition, for operating the tripping mechanism of the switches as the arrangement of Fig. 4, although quite right theoretically, cannot be applied practically in the simple form shown. The advantage of Merz and Price's arrangement is that potential transformers are done away with altogether. In order to secure full protection, however, more than one pilot wire has to be run for each three-phase interconnector.

Protection of Interconnector Cables by means of Electrically Interlocked Reverse Relays.—As the criterion of failure of an interconnector is simultaneous flow of power into it at either end, such a circuit can be protected by the installation of reverse power relays at both ends, both relays being connected in a common tripping circuit arranged so that only when energy is flowing into the cable at both ends is the trip-coil circuit closed at both relays and the main switches caused to open circuit (see Fig. 5). Normally, the trip circuit is broken at one relay and made at the other, or *vice-versâ*, according to the direction of flow of power in the circuit. The relays close circuit with a slight time-element, so that, on the flow of current reversing, one of the contacts is opened at the one relay before the other one is closed. On reference to Fig. 4 it will be seen that only when power is flowing into the cable at both ends at the same time is the trip-coil circuit complete through each trip coil and the circuit ruptured at both ends. A and A_1 are each a pair of contacts which are closed automatically when the main circuit breaker at the corresponding end opens. Thus, if the switch at the left end of the interconnector opened slightly before the one at the right-hand end, the trip-coil circuit would be closed at A and by the relay at the right-hand end. Thus the circuit breaker at the right-hand end would also operate. The object of this arrangement is to ensure that both ends of the interconnector will be disconnected, even if the two switches do not act quite as quickly as each other. Each trip coil is also

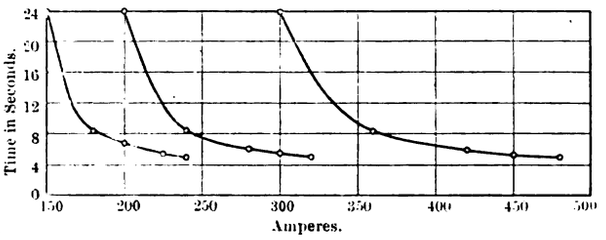

FIG. 6.—STANDARD 10-AMPERE RELAY, 25 CYCLES, SET TO OPERATE AT 60 PER CENT., 80 PER CENT., AND 120 PER CENT. OF FULL LOAD—THAT IS, 150 AMPERES, 200 AMPERES, AND 300 AMPERES, IN CONJUNCTION WITH A 25/1 RATIO CURRENT TRANSFORMER.

arranged so that it is cut out of circuit when its main switch has opened circuit, after, however, A (respectively A_1) has been closed. The trip coils, therefore, experience no danger of burning out. The state of affairs might, however, arise that the left-hand switch was open and the right-hand switch was closed, there being a short or earth on the interconnector. By the act of closing the right-hand switch the trip coil of this switch will be put into circuit ready for operation, and the circuit through the same will be complete through the right-hand relay, which operates due to the flow of current into the fault, and through A. Thus the right-hand circuit breaker will be opened, while at the same time cutting out its own trip coil. Thus it is impossible to connect up the interconnector at either end while there is a fault on the same. The arrangement as set forth above, of course, necessitates that there should be some voltage in order to operate the relays. If the voltage absolutely disappears, the reverse relay will not work, and it may be thought that in the case of a very bad short circuit this will happen. Considerable experience has shown, however, that even under the worst conditions the voltage does not entirely disappear, and that if the calibration of the apparatus is unaffected by fall of potential down to 10 per cent. of the normal working voltage, all working conditions will be met. As the pilot wire only carries the tripping current, it will be seen that only one pilot is necessary whether the relays are single-, two-, or three-pole. On a three-phase system the relays will be two- or three-pole, according as to whether the system be three-wire or four-wire. Messrs. Merz & Price suggest that the pilot wire, or wires, can be made up in the same multicore cable as the main conductors, there being generally sufficient space for this in the filling, which is used to make up the cable to a cylindrical cross-section. This, however, is open to the serious objection that if a serious fault or burn-out occurs the

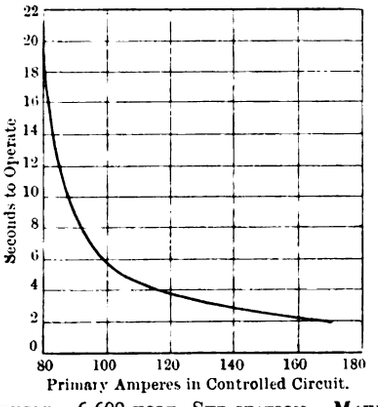

FIG. 7.—25 CYCLE, 6,600-VOLT SUB-STATION, MAXIMUM TIME-LIMIT RELAY WITH INDUCTION MOTOR GENERATORS IN SUB-STATIONS.

pilot wire will be broken most probably. It would be much better to keep the pilot wire quite distinct from the main cable, preferably laying it in a different duct. A system, therefore, which, under all conditions, only requires one pilot wire is of advantage in this direction.

Time-limit Maximum Circuit Breakers.—At the present time

Digitized by Google

it is general practice to instal time-element maximum circuit-breaking devices, in various positions, on all large systems. There have been a variety of forms used. Some have had a constant time-element independent of the degree of the overload. These are but rarely required, and we will only consider inverse time-element circuit breakers. Of course, apart altogether from the difficulty of arranging two fuses in series with the certainty of one operating before the other, high-tension fuses cannot now compete with automatic circuit breakers either in cost or efficiency.

If it has been decided that a time-element circuit breaker is necessary on the outgoing feeder, the next point to determine is what this time-element should be. If it were only a question of arranging the various switches so that they opened in a predetermined order the feeder time lag would be made as long as possible, as, naturally, the longer it is the more chance have the distant circuit breakers of operating before the feeder. Fig. 6 shows the calibration of outgoing feeder relays installed on the 6,600-volt 25-cycle three-phase feeders in a large generating station in Scotland. I am indebted to the chief engineer for the curve in Fig. 7, which shows the curve of the switches which are installed on the machines in the sub-stations. The curves of Fig. 6 were arranged so that, under all conditions, the machine breaker should operate before the feeder breaker had time to do so. These settings have proved to be satisfactory on the system in question. The sub-station machinery in this case consisted almost exclusively of induction motor-generators. Relays having time-elements, as in Fig. 1, were subsequently installed on the outgoing feeders in a similar English 6,600-volt system, except that in this case the sub-station machinery consisted almost exclusively of 50-cycle synchronous motor-generators. The difficulty was at once experienced that with the comparatively long time-elements whenever a severe high tension short came on the system, the shock was so great that a great deal of the synchronous sub-station machinery fell out of step.

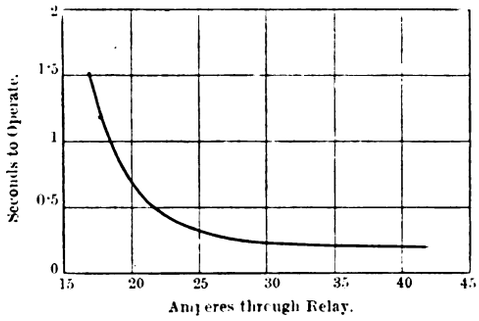

FIG. 8.—CALIBRATION CURVE OF OUTGOING FEEDER RELAYS FEEDING SUB-STATIONS CONTAINING 50 CYCLE SYNCHRONOUS MACHINERY.

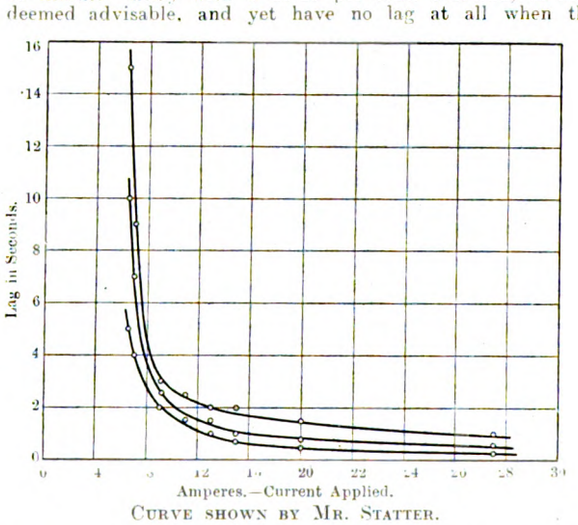
Generally a swinging of the current to and from the sub-stations was set up which increased until the motors fell out of step. To get over this the time-elements were shortened several times until the calibration curve as given in Fig. 8 was obtained on the outgoing feeders. It is considered that with such settings the system will be able to clear itself of high-tension short circuits without any danger of affecting the synchronous machinery other than that fed by the faulty feeder.

It will be seen that in order to prevent the falling out of step of the synchronous machines the advantage of the long time-element circuit breakers has (in this case) to be dispensed with. On examining Fig. 8 the thought arises, Is this very short time element worth keeping? Would it not be just as good to abolish the time lag altogether? This may seem a plausible thing to do, as it might be considered that the difference between Fig. 8 and an instantaneous action is inappreciable. Really, however, this is not so, and there is more difference between curve No. 8 and an instantaneous action than there is between curves Nos. 6 and 7. In order to get an idea as to what time a so-called instantaneous release mechanism took to work, an ordinary alternate-current trip coil was investigated. An examination showed that the time taken for the plunger to rise from the bottom to the top position did not exceed $\frac{1}{10}$th of a second. It follows that the time element of an instantaneous release is less than $\frac{1}{15}$th of the time-element shown in the curve No. 8, and to go from this curve to the instantaneous release is a larger step than the sum total of the previous steps taken in arriving at curve No. 8. There is no doubt that instantaneous releases have been tried and found unsatisfactory by reason of too often and unnecessary operation. If now it should be found that the transitory currents that have given trouble with the instantaneous release are of shorter durations than the times of the curve in Fig. 8, then the retention of the time-element, even if shortened to the extent of Fig. 8, is desirable. The general conclusion to be drawn from these notes is that the necessary and desirable time-elements of the circuit-breakers on each system must be determined experimentally. When installing maximum relays, therefore, they should be such that their time-elements may be varied within wide limits independently of the currents at which they operate. It is not desirable to have the time-element too easily adjustable by means of a screw or some such arrangement outside the relay, as this provides grave danger of the time settings being altered by unauthorised persons. The time-elements of all the circuit-breakers on the system must be considered as a whole, and after the correct values have been found the settings need never be altered. The curve in Fig. 5 gives a time-element which need not be exceeded on the outgoing feeders on the 50-cycle synchronous sub-station system considered. Relays set with longer times than this resulted in the synchronous motors falling out of step when a high-tension short came on the system, and to get over this difficulty very short time settings had to be resorted to. This entailed a sacrifice of a great deal of the possibility of arranging a selective action of the circuit-breakers in series one with another. It would, however, be inadvisable to resort to absolutely instantaneous-action circuit-breakers on this system. Much longer time-elements can be used on a system consisting of induction motor-generator sub-stations, and therefore a better grading of the circuit-breakers can be obtained.

DISCUSSION.

H. W. CLOTHIER (Messrs. Reyrolle & Co., Ltd.) said he generally agreed with the contents of the Paper. When a bad fault occurred on a system it was generally the practice to look round and see what things had been isolated which ought not to have been isolated; in fact, it became a sort of second nature with electrical engineers to expect to find these discrepancies in the operation of their gear. One of the worst offenders in this respect had been the reverse current relay. He had discussed the matter of protecting gear with a very large number of engineers, but he had seldom found a man who was in sympathy with the use of reverse current relays, or reverse power relays, as the author called them. Mr. Andrews had from the earliest stages been the great instigator of them, and the work that he had done with them had been very great. But apart from that, there still seemed to be the danger of reverse current relays tripping when they should not trip, particularly when there were surging currents and low voltages. He could state as an absolute matter of fact that on the supply systems in Northumberland and Durham, when they had reverse power relays installed, they had experienced so much trouble with them tripping at the wrong time that they had been taken out from the generators and from the feeder system. With regard to time-limit relays, he thought these were almost as undesirable, the trouble being that they allowed a fault to maintain on the system and so caused surging, with the result that their synchronous machines were thrown out of step and the whole system disorganised. The author was rather advocating the time-limit attachment to his reverse power relays. He admitted that this might avoid a good deal of trouble due to relays dropping out on momentary surges. At the same time, by putting the time element on the reverse current relay the same objection occurred as was the case with the use of time-limit overload apparatus, *i.e.*, the faults were not cut out instantaneously enough. The successful features of a feeder-protection system on any high-tension network were these:—(1) The gear must part absolutely instantaneously; the fault must be brought out before it had risen to any dangerous dimensions, and before there was a chance of serious surging. (2) The gear must be as simple as it could be made. (3) It must be applicable to all systems of network. (4) It must not bring out a healthy section for a bad fault developed in another section. This brought him to the question of the Merz-Price protection. His company had been privileged to manufacture and carry out a good deal of the early development work, and, therefore, the subject was of particular interest to him. The Merz-Price system was explained clearly enough in the Paper, but there were one or two details which were not quite correct. It was the only system he knew of which complied with the conditions he had just enumerated. The author's proposal of interlocked reverse current relays was certainly ingenious, but it did not cover all the points. In the first place, it had a serious objection. Supposing they had a generating station feeding two sub-stations, but an interconnector between them, with time-limit overload relays in the main feeders and interlocked reverse-current relays at both ends of the interconnector, this was all right in the event of a fault occurring on the interconnector cable, provided the first relays did not trip out when they should not trip. Supposing, however, that the incoming feeder



Digitized by Google

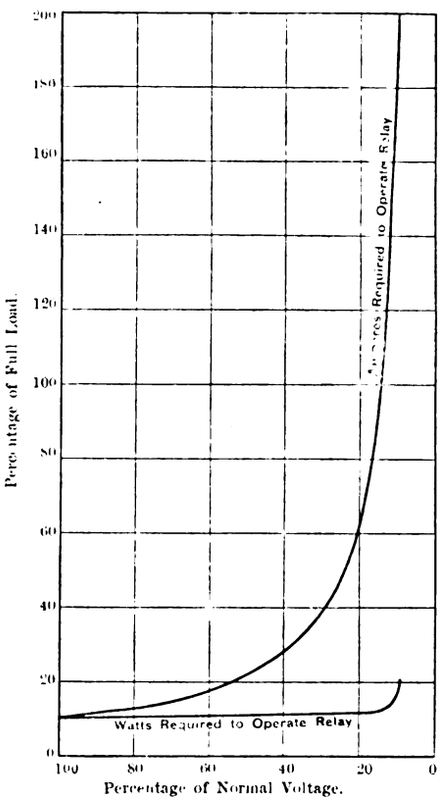
switch to one of the sub-stations was opened and a fault developed on the interconnector, there was no current being fed through that feeder, and therefore the gear became inoperative. It also had the objection that there were time-limit overload relays, and therefore faults on the interconnector did not come off the system instantaneously enough. Supposing they wanted to put a T at some point on the interconnector leading to another sub-station, that could not be done on Dr. Garrard's system, because it was obvious they would get reverse currents through the ends which would trip the circuit breaker, so that, in these circumstances, Dr. Garrard's system had its limitations as compared with the Merz-Price gear. One of the great features of the Merz-Price gear was that they could have complicated networks, such as ring mains, loops, tees, and in every case absolutely instantaneous isolation of a faulty section without interruption of supply to the sound sections was assured. He had had a demonstration of this which was not a test-room development. Only recently a 20,000-volt joint box developed a fault and was simply scattered to pieces. The section was instantaneously isolated without interruption to a single consumer. In this connection he would like to say what a large capital saving in the cable network could be obtained by the use of this system. Assuming a power station and a row of sub-stations, the ordinary system, carrying duplicate cables from the sub-station to the power station, called for five sets of cables each with its overload and reverse-current relay, and, provided the reverse-current relays worked and the overload relays did not run the synchronous machines out of step, then that system applied. But with the Merz-Price system it was possible to take the five sub-stations and join them to the power station in a complete loop. Roughly, the saving on capital expenditure in cable was 25 per cent., a saving which more than compensated for the extra cost of the pilot cable, but not only that, they could use bigger cables for the two main cables, which in a small system would be found more mechanical and reliable than the small cables used in the other system. The use of the Merz-Price system enabled the supply undertaking to connect consumers in a manner which was impossible under the old system, and he thought it would surprise many people to know what a very large system had been developed on this gear.

Mr. B. WELBOURN (British Insulated and Helsby Cables, Ltd.) said that on reading the Paper he had found that the references to the Merz-Price protective gear were rather short, and he thought that they hardly give an adequate idea of what had been done with it, so he would like to make a few supplementary remarks on the subject. First of all, he wished to point out that Fig. 4 was incorrect, and that in practice a complete metallic circuit, and not an earth return, was used, and for this reason it was important that the pilot-wire circuit should be earthed at one end only, because when a breakdown occurred on any part of the network there was a risk that the earth current caused thereby might tend to flow through the pilot cores and operate the relays on a healthy cable, if there was an intentional earth on each end of the pilot circuit. With reference to the statement about multicore cables, Merz and Price did not use, and had never tried to use in practice, a system of pilot wires laid up in one cable with the main conductors. In all cases they had laid a separate three-core pilot cable with each three-core feeder, and had been gradually installing this system on this plan since 1904. The author's two objections to the Merz and Price proposals seemed to him, therefore, to disappear. It might be well to state that Merz and Price began their experiments in 1902, and by 1904 were so assured of the results they could obtain, that they commenced systematically laying pilot cables with all new feeders. A large amount of money had been spent in the development of the system, and now practical experience had shown its unfailing reliability, with the result that there are at present 70 individual feeders totalling about two hundred miles of cable, and about fifty sub-stations containing some 50,000 kw. of plant protected on the networks, controlled by Mr. Merz, and there had been no case of faulty operation to date. A very extensive experience on the large networks under Mr. Merz's control had shown that all the old systems for the protection of any interconnected network were the cause of endless trouble, and even on a small system where there was no interconnection, but where duplicate cables were used and where more than one supply was given in series, it was extremely difficult and very often impossible to get the old style gear to discriminate properly. In the earliest stages of development in Newcastle, down to about 1905, Mr. Merz tried nearly every make of overload and reverse-current relay then in existence, and soon was forced to the conclusion that it was impossible to discriminate with more than two, or at the most three, overloads in series under the conditions which exist on the high-tension network at the moment of short circuit, and that reverse-current relays were very erratic in action when surges took place, that is, they tripped just when they were not required to. With such complicated networks as those of the Newcastle and County of Durham Companies, it would be hopeless to attempt discrimination by any other principle than that of balanced gear. The feeder cables were of every possible description, those fed from one end, those fed from both ends as interconnectors, and those with branches taken off feeders by direct Tee joints. The Newcastle engineers had worked very hard at this problem, and could now claim that they had the only large installations of well-tried and perfected protective gear, and that they could not do any automatic control worthy of the name unless they had this balanced gear.

On the northern systems there have been a number (about twenty in all) of breakdowns on cables and transformers due to known causes, and the faults had in every case been isolated without dislocating the supply on the healthy sections, and without shock being noticeable at the power station. It was fair to claim that this highly satisfactory result could only be obtained with this balanced gear, which operated instantaneously and was especially valuable on circuits involving synchronous plants. It was of the utmost importance to note, when failures occurred, that the only sections which were isolated were those containing the faults, and the balanced protective gear on adjacent healthy feeders was quite unaffected. The whole point was that there never could be any question of the gear failing to operate on a faulty section, there is no disturbance of healthy sections, and at the same time it operates instantaneously. Unless he misunderstood Dr. Garrard's proposals, the electrically interlocked reverse relay proposed in the Paper necessitated a time-limit element, and he did not gather that instantaneous isolation of a faulty interconnector cable was claimed. This seemed to be a decided disadvantage on any system containing synchronous machinery which might be thrown out of step. To sum up the case for the Merz-Price system, first, it discriminated with absolute certainty, and was certain in its action in isolating faulty cables, transformers, or other plant, and was inoperative with equal certainty on healthy sections. Secondly, it was suitable for use on all possible arrangements of cables, whether these comprised separate feeders or formed interconnectors, or consisted of branch cables without switchgear at the points of junction. Thirdly, it was as instantaneous in action as it was physically possible for any cut-out to be. Fourthly, the apparatus is of the simplest possible character, and needed only very slight occasional attention to keep it in perfect working order.

Mr. J. G. STATTER, as a maker of, and experimenter with, relays, agreed with the author that the solenoid dash-pot form of time lag was more or less useless for the reason that it climbed up the setting. With regard to the proper definition of time lag apparatus, specifications for time lags should state the number of seconds required at a given overload, and also the requirements under conditions of short circuit. All breakers in series with one another, and which are desired to come out in some definite order, should have their time lag so arranged that there still remained a small fraction of time lag even under short-circuit conditions. On the other hand, circuit-breakers for some purposes, such, for example, as the protection of motors, were better arranged to act instantly at a predetermined overload, say, two or three times the normal working load of the motor. A circuit-breaker provided with time lag of this description could easily be arranged to give as much as 10 minutes' delay with a 10-20 per cent. overload, as may be deemed advisable, and yet have no lag at all when the

CURVE SHOWN BY MR. STATTER.



overload reaches 100 per cent. An arrangement of this sort was obviously preferable to the use of time lags giving some lag with six or seven times the full load. His own device could be arranged for either conditions. Referring to the curves shown in the diagram, it would be seen that there was an appreciable lag with six times the full load. The curves shown correspond to those shown by Dr. Garrard in Fig. 6, but whereas in Dr. Garrard's figure the settings for each relay were different, that is, one is set for 150, the next for 200, and the last one for 300 amperes, the curves shown in his diagram were all taken with the relay set at 6 amperes. It would have been interesting to know what would have been the result of increasing the overloads in Dr. Garrard's experiments, and continuing the curves to much higher readings. It would seem, from the direction taken by the first two curves, that there was some

Digitized by Google

possibility of their meeting, in which case selective action would be at an end. Referring to Fig. 2 it was unfortunate that the author had plotted the percentage of load required to operate the relay in watts. This was not what we wish to know; it was value in current that an engineer was concerned with in the case of a reverse-current relay. If current values were plotted instead of watts, the results were quite different, and appeared to show that the particular wattmeter movement described by the author was not desirable in cases where a reduction exceeding 50 per cent. of the volts might occur. In fact, taking into consideration phase displacement, the reverse-current might reach considerable dimensions on a reduction in bus-bar voltage of less than 50 per cent.

Mr. A. E. Wedmore (British Thomson-Houston Co.) remarked that considerable advance had been made in the art since the Paper on the subject was read by Mr. L. Andrews, than whom no one had done more to create a demand and to fill it. He held no brief for the defence of the polyphase relays referred to in the beginning of the paper, but he would like to point out one feature in their favour, a fault which occurred on all three phases was generally so serious that as soon as it was cut out the better. A fault on one phase might be only momentary, and it might be argued that there was an advantage in a device set to go at a higher current on such a fault. Turning to the solenoid relay of the bellows type mentioned in the Paper, this, he believed, had been the standard for the purpose of one of the largest manufacturing concerns in the world for seven years. He had had an opportunity of checking the test results given in the Paper, applied to this device, and found that they were substantially correct. The rating given to this device was an altogether spurious rating, viz., 3½ amperes continuous rating. If the device were applied to a number of generators, of the normal standard guarantee, it would be set at a materially lower setting than this. It would recover itself at a current which was above the lowest current which the generator ought to be allowed to carry. Referring to the use of a fuse shunting the trip coil, he had a particular interest in this device. It was suggested in the Paper that it was possible to obtain a discriminating action with this device, and that small changes in the current setting affected the time limit enormously. It seemed to him that that was exactly what was required. In other words, material control of the time element could be obtained without making material changes in the current setting. Another way of doing this was suggested in the Paper, viz., by using fuses of different materials. He at one time developed quite a number of fuses of different materials. One material had been found to answer all the requirements of service. The author stated that they improved distribution, and therefore the fuse shunted trip coil was not suitable. Several of the largest London electric supply companies were employing this device extensively. Turning to the author's remarks relative to cross-connected transformers, the same arguments might be used in their protection as he had applied to the polyphase relays. It was quite a question whether it was not an advantage to have a somewhat higher setting against faulty conditions than against conditions of overload. At any rate, he had never received any complaints of faulty action due to low power factor where this device had been installed under his supervision, of any such action, and, as was shown by the Paper, the device had been very extensively used. To the faulty relay connections on three-phase four-wire circuits, a very similar argument applied. There was an objection, however, which limited its use in a manner well known to the makers. He had spoken of simplicity in the evolution of switchgear. Whenever a simpler service replaced a more complicated one, it nearly always came to stay. The cross-connected transformer was not a simple device, although it appeared to be more simple than that of employing two transformers or relays where one could do the work. Personally he had actually advocated in some cases the employment of two or three, as the case may be, trip coils or relays where expense had not been the primary consideration, solely on account of the simplicity of the connections that it led to. He would like to raise a point with regard to the suggested setting of the reverse-current device on a generator. Dr. Garrard suggested a setting of 10 per cent. of the full rating of the machinery for the time element. He thought the time element all right. He had had an opportunity of testing generators under very special emergency conditions, using the solenoid type of relay, which filled all the conditions laid down by Dr. Garrard, and previously by Mr. Andrews, and he found it quite easy, owing to the slight hunting action of the governors, to obtain cross current during good parallelling amounting to 40 per cent. of the normal load current. The conditions laid down by Dr. Garrard were accompanied by cross currents of very much higher values than that due to setting the relay at such a low value as 10 per cent. He believed in setting the reverse relay at very much nearer the value assigned to the cross currents which were likely to occur, and then put in only just sufficient time element to prevent the cross currents doing damage.

Mr. Leonard Andrews (Key Engineering Co.) said that some of the speakers had very kindly referred to the work which he had carried out in this connection, but he would like to go back still further, and give credit where credit was due, viz., to Mr. J. S. Raworth. It was he who first drew attention to the mistake of using excess current circuit-breakers between generators, feeders, and transformers, and the bus-bars they were supplying. Generally, he agreed almost entirely with Dr. Garrard's remarks. There was a point that Dr. Garrard would expect him to disagree upon, and that was on the question of dealing with the failure of the field current. That was a matter which Dr. Garrard, Mr. Field, and himself had considerable discussion after his Paper at Manchester. Mr. Field had, however, pointed out subsequently that relays of the reverse power factor type, which Dr. Garrard had referred to, would operate with any reverse power down to 10 per cent. of the full load current. In reply to that, he pointed out to Mr. Field that when the field circuit of a generator was open, there was no reverse power, and Dr. Garrard had admitted this to be a fact. But Dr. Garrard stated, "Provided the set remains in synchronism, and the steam supply is in order, the alternator continues to supply energy to the system, and there is no reason why it should be disconnected from the bus-bars." This, however, was where he disagreed with Dr. Garrard. In effect, the author stated that if the machines were still running in synchronism, there was nothing to worry about, but he could not help thinking that in making that statement Dr. Garrard could not have tried the experiment of opening the field of a generator when there were two or three machines running in parallel. There was a leading current in the one machine which gave an artificial field which kept the generator in step. What became of this heavy leading current? If there was only one other generator going, it was bound to go into the other machine, and it became a leading current 180 degrees out of phase in the one machine and a lagging current in the other

Curve Exhibited by Mr. L. Andrews.

machine. There were thus two machines in parallel, one with a direct current field and the other artificially produced by the leading current; the direct current field was soon wiped out by the enormous reactance of the lagging current in the other machine, and in a very short time the volts dropped down to something like zero, and if there were synchronous machinery running, it was almost bound to drop out of step. All this was theory, but he would like to add that there were numbers of cases of breakdown and of entire shutdowns due to a field circuit being open, and he thought that a discriminating device that did not deal with the open field difficulty gave a sense of false security. He was grateful to Dr. Garrard for having given the curve of variation of calibration with voltage for an alternating current reverse relay, which Mr. Statter had also referred to, because it enabled him to run to earth a rumour which had given him some trouble for a long time. He had been told time after time that Dr. Garrard's instrument would operate on a reverse current of less than 20 per cent. when the potential fell to 10 per cent. But that was not Dr. Garrard's meaning, as he now made quite clear. Engineers had been accustomed to specify the reverse current in amperes, and he had often seen specifications in which it was stated the device was to cut out with a current of 20 per cent. at normal potent[illegible]

Digitized by Google

and perhaps cent. per cent. at 10 per cent. full load. If they took this in current, they got a totally different shaped curve, as Mr. Statter had shown. In the curve, given below, he had reproduced this. The bottom curve was Dr. Garrard's curve expressed in watts, and it was drawn to a similar scale. The other curve showed the reverse power in amperes. It would be seen that when they got down to about 20 per cent., the reverse current in amperes was about 16 per cent. of the full load current. This, he thought, explained why Dr. Garrard had always advocated a 10 per cent. setting. He entirely agreed with Mr. Wedmore that this was a great mistake; he would like to see 30 per cent., for then nothing would be heard of these discriminating devices coming out when they should not. Imagine the curve starting on normal potential with a 25 per cent. setting, and it would be seen where the curve would go to when 20 per cent. or 30 per cent. of the normal pressure was reached. Those who had been working with him had aimed at—and it was a very difficult thing to get—arriving at a curve that would give some such condition as this, viz., that the reverse current necessary to operate the device at normal potential should be something like 30 per cent., and that the current required to operate it at, say, 10 per cent. of the normal potential, about as low, perhaps, as they would get, should be cent. per cent., and that still left a chance of the device coming out with something like 5 per cent. of the normal, which was quite possible to obtain. He hoped Dr. Garrard in future would speak of the behaviour of his device in amperes instead of watts. (Dr. Garrard: No.) Reference had been made to the Merz-Price system. This, he thought, was a most ingenious system, and enabled them to deal with the ring main problem. He was quite sorry to see Dr. Garrard was trying to make reverse relays work on the ring main principle. He thought the Merz-Price system was certainly the best way of dealing with a ring main system. On the other hand, he did not agree with Mr. Clothier, who apparently would have them believe that the Merz-Price system was the best for all conditions. His view was that switchgear designers should aim at supplying devices to meet conditions as they were laid down. The Merz-Price system was not applicable to the majority of systems laid down because they had no pilot wire, and there were other reasons. For many purposes a simple discriminating device was the best. Mr. Welbourn, who spoke after Mr. Clothier, also referred to the Merz-Price system, and talked a great deal about the reasons why Messrs. Merz and Price went in for this system, and the difficulties they had experienced with discriminating cut-outs. According to this speaker, Messrs. Merz and Price had tried *nearly* every discriminating cut-out which had been brought out. Some years ago Mr. Merz read a Paper in which he said he had not been able to get a reverse-current device that would work satisfactorily, and referred to his own experiments on different types of apparatus. After that Paper he had told Mr. Merz that he could guarantee to supply him with a device that would do what he wanted, but so far as he knew Mr. Merz never tried one then, and he knew he had never tried one of his devices since. The speakers who had advocated the Merz-Price system had referred to various cases in which they worked satisfactorily, but he himself had had numbers of cases of devices which were working satisfactorily and never failed, years before Messrs. Merz and Price began on their system. Some of them might remember that a few years ago he invited a number of engineers to Hastings to see a nail driven into a 2,000-volt feeder. He should not have done that if he had not felt pretty certain what he could do with it, and that system had never failed; there was no earthly reason why it should any more than the Merz-Price system.

Mr. KENELM EDGCUMBE (Messrs. Everett, Edgcumbe & Co.) said that all Dr. Garrard's curves of time lag stopped at about three times the full load, but it should be remembered that a short circuit might be anything over ten times the ordinary full load. In one well-known type of induction relay, which was made by a firm not 100 miles from Manchester, a damping magnet was used for getting the time lag, and the time setting was arranged by altering the position of the magnet on the damping disc, with the result that first-rate curves could be obtained, as shown in the Paper, but, unfortunately, when the overload was fairly large the disc reached synchronous speed, and consequently all the time lags were about the same independently of the setting of the magnet. They might, of course, alter the setting current rating, but with large overloads that was not of much use. It appeared to him that it was important that the time lag should be independent of any protecting force, *i.e.*, that the movement should be set in motion and be moved through a definite distance depending on the setting. He felt it was very essential that reverse-current relays should be reverse-current relays and not reverse-power relays; it was not the current but the power that did the damage.

Mr. B. JENKIN (Messrs. Kennedy & Jenkin) said one very important point had not been touched upon in the Paper or during the discussion. Dr. Garrard mentioned that it was necessary to set the cut-outs to deal with synchronising the currents between the sub-stations, motors, and the generators. He thought they would have to go a great deal further than that. Where there were a number of motor generators their power of generating current from their flywheel effect was so great that it was necessary to treat the sub-stations as if they were as much generators as the power station. That accounted for so many of these troubles with reverse-current relays. People did not take into effect the power from the sub-station coming back to the generating station. A simple instance of this was where he had four generators running in a power station, there being no interconnector between the two sub-stations. It was wanted to separate the four generators, putting two on each sub-station. They cut the busbars, and the cut-outs opened, and two of the generators simply dropped out. In another case, with a Highfield booster and a motor generator, the man opened the exciter switch and two of the main engines promptly dropped their reverse-current cut-outs. It was the power coming from the sub-station which upset things. In Fig. 5 this had not been taken into account, as the interconnector with pilot wire was only shown between the two sub-stations. The feeders between the power house and sub-stations should be protected in the same way, otherwise the reverse-current relays at the sub-station end of the feeders would open at once on any interruption or short circuit on the system. He had constantly found that not only would reverse cut-outs open in that way when one sub-station was feeding back to the power house and into another sub-station, but the motors would open their maximum cut-outs, the feeder maximum cut-outs at both ends would come out, and if there were separate busbars at the power house these would be disconnected. This was a very important matter and must be taken into consideration. With the time-element one might possibly find what was wanted by going a step further than Mr. Statter, viz., by the use of an inverse time-element until a point was reached where they opened at short circuit; this could be a fixed time-limit, which could be set with absolute certainty. It should be a very small fraction of a second, but only in that way would they be able to make certain that maximum cut-outs in series would open in the order they were wanted to. At present they almost invariably did not.

Dr. GARRARD replied shortly to the discussion, and will reply more fully in the *Journal*. With regard to the Merz and Price system, this was a very excellent one, and he had nothing to say against it. The only thing was that it was complicated, and it certainly appeared that the makers found it more complicated than had been originally thought. If they took the original patents of Merz and Price and saw the very simple arrangements there, and then saw the price list now issued, there was a very great difference. The difficulty was the pilot wire. With an interconnector the pilot wire was essential, and could not be done away with, but it was an evil. There was an extra cable and tremendous expense and complication. The sub-station attendant did not know what was happening at the other end of the pilot wire, and it was an evil which should be kept down to the very minimum. With regard to Mr. Clothier's remarks, it was quite true that the system in Fig. 5 was a system for the protection of an interconnector, but if the switch was open the thing was not an interconnector any more, and it did not protect it, and, as Mr. Clothier rightly said, it did not apply then. His ring main system was very good, but he thought if they were going to work five sub-stations on this principle this was going a bit too far. If the two main cables happened to break down at once, which was not unheard of, the whole system would break down. Of course, if they had pilot wires between every sub-station and in parallel with every feeder, and had pilot wires running round every corner and between secondary and primary of all transformers and on generators, they would get a very good system of protection, but it would be an extremely complicated system and not a bit in advance of the ordinary system of maximum time-circuit breakers and reverse-current breakers. Of course, the maximum system had its limitations, every system had, but still he thought it preferable. Messrs. Merz and Price had carried it to the very extreme extent. Their system for the protection of interconnectors was very good, and he had said so in the Paper, but he thought it was rather a large statement that, because it had operated with success twenty times, this was proof that it was a good system. He had made thousands of relays, and had had excellent results. He agreed with Mr. Andrews that Mr. Merz had not tried all maximum devices; he certainly did not try his. On the question of solenoid relays he was glad Mr. Statter agreed with him. As to his remarks upon Fig. 6, the relays themselves were identical, but the transformers were different. All the relays were 10 ampere; in the first instance, they had a 10–1 current transformer, in the second instance a 20–1, and in the third instance a 30–1, and, therefore, it was that the various curves differed. Therefore, there was not much in the point raised by Mr. Statter on this matter. Mr. Statter also made some remarks about direct-current time-limit relays, but the Paper was headed "Alternating Current," and he had not dealt with direct current at all. He had not wished to discredit the apparatus made by Mr. Wedmore's firm, all he had done was to describe his own mental evolution. He had tried all these things, and it was very unfortunate that it had come out in this way; he could not help it. On the question of different materials for fuses, he did not think this possible. The Paper by Messrs. Schwarz and James gave curves for fuses of different materials, aluminium, copper, and so forth, and in a contribution to the discussion on this Paper he

Digitized by Google

showed that it was impossible to do that which Mr. Wedmore suggested. The curves invariably crossed. If they kept the same normal fusing current the curves crossed one another, and the order in which they would fall would depend on the overload. With regard to the failure of the field current, that was a question of opinion; the opinion he had stated in the Paper did not agree with that of Mr. Andrews. If they wanted to guard against this they should put a very simple device in the field-current circuit, so that when the field broke it cut the main switch out. This could be done for a few shillings, and they need not rely on the reverse relay doing it. He did not think that when the field broke the reverse relay should operate unless the flow of power into the faulty generator exceeded 10 per cent. Mr. Andrews' curve was no news to him at all; in fact, he did not quite see the point of the curve at all. The machine would easily carry 60 per cent. overload; under conditions of breakdown, they got 10, 20, or 30 times the full-load current. As a matter of fact, he had made parallel tests on 6,000-volt generators with Mr. Andrews' arrangement, and the results were favourable to his own. (Mr. ANDREWS: I also have made tests.) Dealing with Mr. Edgcumbe's remarks, Dr. Garrard said he understood him to say that on a dead short circuit with an induction type relay, the time might become zero, because of the synchronous speed. But in all the figures the lower curve was practically asymptotic and would give a time excess.

Mr. EDGCUMBE said he did not suggest they would go to zero, but, if they all coincided, the times would be the same irrespective of the setting.

Dr. GARRARD said there were two methods of adjustment, one by the magnet and the other by altering the travel, and if they got over this, the minimum value of the time, was the time which determined the order in which they operated; and this was met in the different relays by different lengths of travel. He was interested in Mr. Jenkin's remarks as to the very large flow of power that can come back from the sub-station. It was suggested in the Paper that the sub-station relay should be set for 20 per cent. He would be willing to put this at 100 per cent., or even higher, but the correct value could only be found by actual experiments on the system.

Several written contributions to the discussion have already been received.

Mr. H. BEVIS (General Electric Co.) wished to comment on Dr. Garrard's remark that a detrimental feature of the solenoid relays he tested, was the variation in the magnetic reluctance of the circuit due to the different positions of the plunger. It might be that the relay tested had a return iron circuit, whilst if the circuit was mostly air, the flux was rendered proportionate to the current. Relays could be made with the return circuit of air, in which case the defects mentioned would be greatly minimised. He did not agree with all Dr. Garrard's criticisms on the solenoid relay. He had found them reliable owing to their simplicity, and pointed out that the overload and time adjustments could be made quite independent just as readily as any other types, whilst the cost of manufacture is very much less. A reverse-current relay with a wattmeter movement lacked all provision for differences in power factor. He did not consider it good practice to have a time limit on a reverse-current relay. The small reversals that took place during synchronising were negligible. A device was required to take care of a big reversal, and when this occurred the action should be instantaneous. The present tendency inclined towards too many automatic devices: whilst, taken in moderation, they were essential for central station work, multiplication of such devices was not to be desired, and the object should be only to install the smallest number really necessary.

Mr. W. J. P. ORTON and Mr. G. NORTH (British Westinghouse Co.) did not think the author's remarks on solenoid relays were altogether correct. No doubt there were relays of this type which could be made to float in the manner described, but if the movable iron plunger and the pole-piece to which it is attracted were properly designed, they could be made to work with practically no danger of floating. It was obvious that in both the solenoid and disc types of relay, if the overload came on again in such a short space of time that the mechanism could not reset itself, then the relay would operate with a very short time limit in the second case. This, however, was in their opinion rather an advantage, as an intermittent short of this description should be disconnected from the circuit with the least possible delay. Referring to Fig. 2, from the author's description it would appear that the A.C. reverse relay in question acted on a drop in voltage without a corresponding increase in current, but on referring to the curve it would be noted that the ordinates were represented in watts, and, since the relay acted at 10 per cent. of full load watts with full voltage, it would act about 10·5 per cent. of full load watts when the volts had dropped 40 per cent. This meant that the current would be practically doubled, and is the result which would naturally be expected with a wattmeter relay. The author's method of protecting interconnector cables had the advantage over the Merz-Price system of employing only one pilot wire, but since, according to Fig. 2, the reverse relays proposed were dependent solely on the actual power in watts passing through them, it would be possible, when the sub-station voltage fell to a very low value, that the current required to actuate the relay would be so great that the inverse time element maximum relays in series with the fault would act before the relays in question, thus shutting down the whole or part of the supply without isolating the faulty interconnector. The author recommended time element maximum relays with varying time element in series, whilst they agreed that this was the best method of protecting distribution in sub-station systems, they believed that it was the subject of Mr. Stillwell's patent 25,422 of 1899.

CATALOGUES AND PAMPHLETS RECEIVED

ARC LAMPS.—A handsome brochure from the Union Electrical Company gives nearly forty reproductions of the photographs of applications of the company's Excello and other arc lamps, both at home and abroad, for a very large variety of purposes.

CONDUIT TUBES AND FITTINGS.—A comprehensive catalogue from the Sun Electrical Co., Ltd., of 118 and 120 Charing Cross Road, gives full particulars of the component parts of the "Kalkos" system of tinned tube conduit wiring, which was described in ELECTRICAL ENGINEERING, Vol. II., page 533. In brief, the system consists of specially drawn tinned brass tubes, tinned inside and out and socketed together with slip sockets and soldered. All fittings, such as switch-boxes, elbows, tees, ceiling rose boxes, &c., are also tinned, so that the matter of soldering and making the circuit continuously metallic is an easy one. The material is not liable to corrode, and absolute electrical continuity is attained by simply slipping a socket piece over a butt joint, and applying a blow lamp, no screwing being required. Useful features of the catalogue are the hints on estimating these equipments, and instructions for erecting.

DRAWING OFFICE SUPPLIES.—A folding card from Messrs. A. E. Mallandain, of 51 Cheapside, contains samples of drawing and tracing cloths and papers, and particulars of instruments, pencils, calculating rules, &c., and a useful ink-erasing liquid.

ELECTRIC CLOCKS.—A catalogue from Mr. G. B. Bornell, of Terminus Chambers, Holborn Viaduct, gives particulars of a series of silent electric clocks on his patented system, which comprises any number of electrically propelled dials, the hands of which are moved periodically by the operation of a contact in a "master pendulum," fixed in any convenient place in the circuit. The dials rely for their action upon the effects of electro-magnetism and gravity alone, there are no springs or ratchet teeth, the movement is definite, and the period of time cannot be exceeded or missed. The master pendulum is self-winding, and, once regulated, requires no further attention. The contacts are absolutely sparkless, means being provided for obviating the effect of self-induction both in the master pendulum and in the dials. The system can be driven from batteries or from direct-current lighting circuits. A number of forms of dial are listed, including a pattern used throughout in the Piccadilly Hotel.

ELECTRICAL PLANT.—A pamphlet from the Schorch Electrical Co., whose works are at Rheydt (Germany), describes and illustrates a number of varieties of motor-generators, &c., which this firm manufacture. The English branch has just been established, but the works in Rheydt have been established since 1881, and we understand that, during the past few years, about 6,000 installations, totalling 250,000 h.p., have been supplied. Among the special features to be introduced are complete electrical equipments for mines and collieries, loom motors, and high voltage switchgear.

MACHINE TOOLS.—A booklet entitled "Equipment Buyers' Finance," by Mr. Arthur Winder, of Leeds, points out the economy of high-speed machine tools; illustrations are given of various machine tools by Leeds and Sheffield manufacturers, including Messrs. J. & P. Hill, E. Dennison & Sons, Bateman's Machine Tool Co., and Peter Pilkington, Ltd.

The Corps of Electrical Engineers.—The movement in connection with the electrical engineers required for the Territorial Army is making considerable progress in Birmingham. As we have already announced, three companies are being raised in Birmingham by Mr. J. F. Lister, who will be in command with the rank of Lieutenant-Colonel. The three companies being raised are to be known as the Southern Wireless Company, the Southern Cable Company, and the Southern Airline Company. The Wireless Company will be commanded by a captain, and the Cable and Airline Companies each by a major. These officers will be responsible for their own companies on mobilisation. The companies will be what are known as "Army Troops," and on mobilisation they may not necessarily be attached to the Birmingham Regimental District. The period of annual training is from eight to fifteen days, the August Bank Holiday week being included. The place of training has not yet been fixed, but in all probability it will be Salisbury Plain. We hear that about 150 men have already been attested, and no difficulty is anticipated in raising the required number, namely, 500. Several well-known members of the local section of the Institution of Electrical Engineers have been offered, and have accepted, commissions in this new unit.

THE IRON AND STEEL INSTITUTE

THE thirty-ninth annual meeting of the Iron and Steel Institute was held on Thursday and Friday last at the Institution of Civil Engineers, under the presidency of Sir Hugh Bell. As previously announced in these columns, two Papers of electrical interest were down for reading. The first of these, by Prof. B. Igewsky, described a new form of electric furnace for the smelting of iron, and was included in the programme for Thursday. There was, however, no discussion to this Paper.

A New Electric Furnace for Smelting Iron

Professor B. Igewsky points out that a supply of electrical energy equal to 500 kilowatts is usually sufficient for the smelting of one ton of steel. Under modern conditions the electric furnace should be capable of producing steel more cheaply than by the open-hearth process; the crucible steel process may be excluded as a method for the production of steel on a commercial scale. Many works already employ electric furnaces, of the Stassano, Kjellin, and Heroult types. These furnaces work very successfully, but they all either employ low pressures (not exceeding 100 volts), or they themselves act as transformers. The author describes a method of working with high-pressure electric current, of which he has had seven years' experience. The furnace is one of a type employing what may be called second-class conductors, such as magnesia, lime, silicates, or their colloids, such as Al_2O_3, $2SiO_2$, which, on being greatly heated, become conductors. It is absolutely necessary that the current should pass in the thinnest possible layer over the lower surface of the bricks. The pressure should be 1,000 volts for each metre space between the electrodes. By bringing the electrodes nearer together, or placing them further apart, or by providing the furnace with a number of electrodes, and only charging those which are immediately needed, it is possible to obtain a furnace which will work with all pressures in ordinary use. Such a furnace should work as steadily as an incandescent lamp, and should develop the highest temperature that the bricks can support. The problem is, however, not entirely solved. Difficulties are presented owing to a phenomenon analogous to that which the author has found to occur in the blast-furnace, and to which he gave the name of differentiation.* The electric current only flows over the whole surface of the brick during the earlier stages. In a very short space of time it concentrates itself along the lines of least resistance. Little by little the path selected becomes the only zone affected, and the remaining surface remains quite cool. Differentiation can be obviated by dividing each electrode into a number of smaller electrodes furnished with regulators. Such a system could be employed for the firing of porcelain, for example.

The application of the principle to the manufacture of steel and to the fusion of other smelted materials is more easily solved by the furnace being made to revolve, and supplied with a sufficient number of electrodes, so that the current does not suffer interruption. In such an arrangement the bricks will at one time form the vault and at another the bottom of the furnace. By this means the variations in temperature can be avoided, and each brick passing beneath the metal will have the same conductivity over the whole of its surface as any other brick. In addition to this the bricks will be automatically moistened with slag, so that their surfaces become better conductors than their interiors. If the principle of a revolving furnace be adopted, it is necessary that it should be furnished with a commutator, otherwise the current will short circuit through the metal. Fig. 1 shows a plan for a rotating furnace using three-phase current. Such a furnace should be rotated about twenty times per minute. It is possible to construct a free commutator connected with the furnace by a cable. In the section shown in Fig. 2, the rollers can be seen, as well as the pivot which allows of the furnace being tilted in order to empty it completely. All the plates are of cast iron; *a*, *a*, are bricks, *b*, *b*, are electrodes placed between the bricks, and *c*, *c*, parts of the commutator; *e*, *e*, are the brush holders. The inside diameter of the furnace is 175 millimetres, and the depth 215 millimetres. The cubic capacity is 5·17 litres. The space that can be occupied by metal is, however, only about 2 litres, and at the commencement little more than 10 kilogrammes can be charged. In the course of time the interior bricks wear, and the capacity of the furnace becomes greater. The author prefers a three-phase electric current, but usually employs a continuous current of 250 volts and 56-60 amperes, *i.e.*, 12-15 kilowatts. When cold the furnace is a non-conductor.

The process of smelting is conducted in the following sequence of operations: The flame of a gas or Bunsen burner is made to impinge through the working opening, and when the furnace has been slightly warmed a little damp potassium hydrate is charged and the furnace is rotated. It will now be found that the furnace acts as a conductor, and the electric current begins to warm it. After a short time sodium hydrate is added, and

when the interior of the furnace is red hot sodium carbonate is charged. The corrosive alkalies which evaporate within the furnace do not cause as much harm as might be expected. Rapid heating is, however, a danger to the bricks, which begin to crack. The best plan is to warm the furnace with gas during the night preceding the experiment. When the temperature of the furnace reaches a light red heat, cast-iron may be put in, and then scrap, or the order can be reversed. In the first case the author is in the habit of adding the new material gradually as the charge melts. In the latter case, when the iron becomes sufficiently hot, the smelting takes place at once on the addition of cast iron. If a quantity of cold metal be suddenly introduced at one time, it is easy to reduce the temperature to such an extent that short circuiting occurs. The same thing occurs if the furnace becomes cool with the metal inside; small furnaces cool down in an exceedingly short time. In a large furnace where there is a considerable margin of heat, such an accident is hardly likely to occur. Indeed, in order to bring them into working condition, it would suffice to charge some hot slag from some other furnace and to avoid having recourse to soda, which could not be other than injurious to the bricks. The outer bricks of the author's furnace are of fireclay,

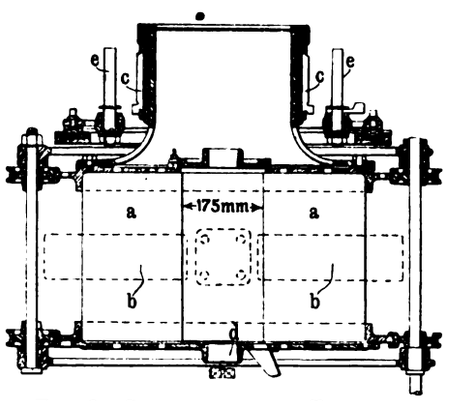

FIG. 2.—SECTION THROUGH FURNACE.

and the inner of fireclay or dinas. The fireclay bricks are fairly good conductors, but the dinas bricks are exceedingly poor conductors. The author has, however, used both for years with successful results. With fireclay bricks care should be taken that less slag should be used. With dinas bricks it is his custom purposely to add fluorspar, cryolite, magnesia, and similar substances, in order to increase conductivity. Magnesite bricks appear to be ill adapted to the purpose, because they conduct too easily, while the current of 250 volts would, with the existing dimensions of the furnace, be too great for these bricks. Ex-

* *Revue de Métallurgie*, vol. ii, p. 842.

periments with dolomite and other bricks have not yet been carried out by the author.

The electrodes in the furnaces illustrated are of iron. At first sight it seems astonishing that they could be made to work in a furnace in which steel is being smelted. As a matter of fact, the electrodes melt and become slightly absorbed in the interstices of the bricks. But as the heat is developed on the surfaces of the bricks lining the inner side of the furnace, the crevices around the electrodes remain at a moderate temperature, because they retain the slag and even drops of metal, which act as conductors. The author at first employed electrodes of 3 to 4 millimetres in thickness, so as to drive them into the furnace from time to time by means of a hammer, but as that appears to be unnecessary he now employs thin sheet-iron electrodes. There are in the furnace twenty-four electrodes placed at intervals of 23 millimetres from each other. As in the furnace filled with liquid steel only, the fourteen upper bricks constitute the working surface, a difference in potential of $\frac{24}{25}$", or nearly 35 volts, is obtained between adjoining electrodes. As a result sparks are emitted on the collector on replacing each electrode, and frequently the spark is transformed into an arc. The path of the voltaic arc to the collector is shorter than that through the conducting brick. On the distance between these electrodes being reduced to 12 millimetres, the difference of potential falls to 17½ volts, and the formation of the arc becomes impossible. The author has, however, adopted an alternative. Each flat piece of the collector is divided into three parts, connected to each other with rheostat wires. By these means each electrode becomes gradually shut off whenever the difference of potential reaches the vicinity of 12 volts, and the formation of an arc is impossible. Besides that, he has fixed an additional brush on the electrodes, joined to the rheostats. This brush similarly serves to lessen sparking The method employed to obviate sparking is the only complicated part of the furnace, the remaining principles being quite of an elementary nature. The manipulation of the furnace is likewise exceedingly simple, although with its present very small dimensions it requires constant attention. As a rule the author smelts a small quantity of cast-iron and afterwards adds scrap. The softest steel produced possesses an ultimate strength of 56·8 kilogrammes per square millimetre, with an elongation of 20 per cent.

On smelting iron turnings with charcoal (1 per cent.) steel was produced with an ultimate strength of 85·6 kilogrammes per square millimetre, and an elongation of 3 per cent. Experiments for the production of steel from cast-iron by the ore process were also successful, and the fireclay bricks suffered less than might have been anticipated. The advantages claimed for a furnace of the construction indicated above are as follows:—High voltage and low expenditure of current; the possibility of using any form of current ordinarily employed; compactness and high efficiency; homogeneity of the metal produced; minimum amount of surface contact with air or with the walls of the furnace; slag at a high temperature, favourable to the reactions needed for the refining of the metal; minimum superheating of the furnace; avoidance of carbon electrodes; and the possibility of using the furnace for the production at a high temperature of any material in a fluid state.

The other Paper, by Mr. W. Lambert, discussed on Friday, described the pyrometric installation of the Ordnance Factories, Woolwich. At this meeting, previous to the reading of the Paper, the Carnegie Gold Medal for research was presented to Dr. Carl A. Benedicks, of the University of Upsala, Sweden, for work in connection with electro-metallurgy.

The Pyrometric Installation in the Royal Gun Factory, Woolwich

After reviewing the circumstances which led to the adoption of pyrometrical methods in the factory, Mr. W. Lambert describes the simplest form of pyrometer, which consists of the thermo-junction and an indicating galvanometer. The thermo-junction simply consists of a pair of wires of dissimilar metals, one end of each wire being twisted together, thus forming a junction which, to all intents and purposes, is regarded as a battery, since such a junction when heated is the seat of an electro-motive force which is a function of the temperature. The wires forming the hot-junction must necessarily withstand fairly high temperatures, seeing that the couple has to be introduced into furnaces, the heat of which sometimes exceeds 2,000° F. A suitable couple consists of a pure platinum wire, together with a wire of 10 per cent. iridio-platinum alloy, and thermo-couples of these two metals are used exclusively throughout the present installation. The free ends of the two wires are available for the copper leads joining up to the indicating galvanometer. The wires of the couple for furnace work are preferably threaded through double-drilled fireclay tubes, which serve to keep them apart throughout their length, and the whole inserted in a covering sheath of gas or steam barrel, the junction end of which is closed by a thin iron disc welded securely into the end. To the open end of the sheathing is fixed a head which serves to carry two terminals, on the under side of which the ends of the wires forming the couple are connected, thus ensuring a clean contact. The copper leads to the galvanometer being attached to the exposed portion of the terminals, care is necessary to secure a clean contact whenever connection is made. The galvanometer is a modification, devised by Colonel Holden over twenty years ago, of the D'Arsonval galvanometer, and consists of a built-up, laminated horseshoe magnet, between the poles of which an adjustable frame holds a circular iron core round which a light silver "former" wound with a coil of wire partially revolves. This coil is held suspended between the top and bottom of the frame by a fine metallic strip of flattened phosphor-bronze wire. Fixed to the upper portion of the moving coil is a small, circular, silvered mirror. This form of galvanometer is practically dead-beat. Its internal resistance is about 80 ohms. The galvanometer, together with a suitable illuminating lamp and transparent centimetre scale, are erected upon a rigid though light frame of cast iron.

An instrument of this type was the first contribution to the present-day installation, and was used for ascertaining the temperature of the lead bath for heating test-specimens. A second instrument was ordered for use at the big furnaces of the oil-hardening and annealing section. Here, on account of the close proximity of the heavy hammers and other ponderous machinery, some difficulty was experienced as the result of vibration, even though the instrument was placed on a solid pedestal of concrete, the footings of which were several feet below the ground level. Closely following this second instrument, a further addition was introduced, an instrument of the recording pattern. With this instrument also some slight trouble was experienced through vibration; but this, after a few experiments, was successfully overcome by suspending the galvanometer from a tripod in such a manner that the vibration was absorbed by three small spiral springs so arranged as to be in partial compression. This method of suspension has proved an admirable one, and has been adopted throughout the system. Several interesting thermo-metallurgical observations having been made concurrently with the calibration experiments upon this instrument, it was finally decided that it should be permanently retained in the metallurgical laboratory as a standard instrument available for comparison and for such experimental work as might arise, and that the oil-hardening section should be wired up to the laboratory in order that photographic records of thermal treatment in the mass might be obtained for permanent record as occasion might demand. These three instruments formed the nucleus of what is now regarded by experts as one of the most complete pyrometric installations in the kingdom.

The recording pyrometer consists of two light-tight mahogany cases, the larger of which contains a Holden-d'Arsonval dead-beat galvanometer. The other case contains a drum which is made to revolve by contained clockwork. The surface of this drum is covered with sensitised photographic paper. A ray of light, from either a gas jet or a lamp, is thrown by means of a mirror, at an angle of 45°, on to the mirror of the galvanometer, and is projected thence to the surface of the drum, and acts photographically on the sensitised paper. The galvanometer is then connected by copper leads to a thermo-junction inserted in the place, the temperature of which it is wished to record.

The heating of the thermo-junction causes a very small current to pass through the coil of the galvanometer which is deflected, and the mirror attached to it projects a spot of light on the surface of the drum. The amplitude of this deflection indicates the temperature, and a continuous curve is traced on the photographic paper, which at once indicates what temperature had been attained at any particular period. A scale is also provided on which the temperatures can be read from time to time without interfering in any way with the record. Two recording instruments of this type are in constant use day and night, and constitute the laboratory end of the system. These two recorders are also regarded as the standard instruments of the department. They are mounted on simple iron pedestals, the galvanometers being suspended inside the cameras from their respective tripods. The following branches are now wired up to and are under pyrometric control from the metallurgical laboratory—the heavy forges, the oil-hardening and tempering branches, the case-hardening shop, the drop-forging plant, the

Digitized by Google

lead bath (specimen treatment plant), and the gas muffles throughout the department used by the tool-smiths and other craftsmen. The various sections of the gun department are also in direct telephonic communication with the metallurgical laboratory through a small local exchange board. Each of the larger sections previously named has an independent instrument room fitted with a simple indicating instrument. An attendant is always present in each room whose duties are: (1) To connect up the respective furnaces, take observations, and communicate temperatures from time to time to the furnace-men, and also to record all such temperatures in a book. (2) To test repeatedly the zero of the instrument in his charge, and confirm the readings by telephonic reference at frequent intervals to the standard instruments in the metallurgical laboratory. (3) To report periodically the condition of the couples under his charge, and to keep clean all terminals, connections, &c. (4) To annotate and file the photographic records received from the metallurgical department.

The temperature of boiling water is taken as a common zero for the temperature scale of the whole of the instruments comprising the installation. The standard instruments are calibrated by the arrest representing the boiling point of water as zero and the freezing points of the following substances:—

Substance used for calibrations.	Solidification Temperature in degrees Fahrenheit.
Tin	450
Lead	621
Zinc	786
Aluminium	1,215
Sodium sulphate	1,580
Copper	1,983

The metals are ordered from the trade as "especially pure for pyrometer calibration," the purity of each parcel being ascertained before use by chemical analysis. A small crucible charged with about 8 ounces of a metal is placed in a Fletcher injector furnace until the contents are molten, a thermo-couple protected by a small porcelain tube sealed at one end is then placed in the molten metal and the gas and blast turned off. Observations are taken of the cooling of the metal, the temperature of solidification being indicated by the arrest in the downward movement of the beam of light upon the glass scale. In the construction of the recording instrument the glass observation scale is fixed, as is also the drum; but the adjustment of the zero of the instrument is provided for by means of a tangent screw actuating a pivoted plate, upon which is mounted the tripod from which the galvanometer is hung.

The sensitised bromide sheet after a twenty-four hours' run on the drum is removed, carefully excluding actinic light, placed in a printing-out frame containing a sheet of plate glass, the inner side of which is painter black, and upon which surface longitudinal and vertical lines are scratched, in such a manner that upon exposing the frame to active light lines representing both periods of time and temperature are printed. Common flashed ruby-red glass may be substituted for the painted glass, the lines being etched upon the ruby surface by exposure to the action of hydrofluoric acid. The exposed paper is then developed, fixed, washed, and dried, dated and forwarded to the responsible foreman of the particular section for whom the record is intended. Each sheet represents a day's record in the form of curves of the temperatures of the various forgings treated in the furnaces of the section during the preceding twenty-four hours.

A simple plug board of a double-pole pattern is employed, to the back of which the respective leads from each furnace are conducted. These leads are of standard wire, gauge No. 18, of high-conductivity tinned-copper, insulated with pure and vulcanised india-rubber, taped and braided. Each pair of leads is enclosed in common gas or steam barrel, which is maintained throughout the whole circuit from the furnaces to the pyrometric cabin of each branch, thus insuring freedom from injury by the corrosive action of any escaping furnace gas or damage by abrasion from ladders, scaffolding, &c., during furnace repairs. The short flexible portion of the leads at each furnace, by which connection is made to the pyrometers in the furnaces, is protected by an asbestos covering, thus preventing any liability of faulty insulation by the scorching of the ordinary coverings. Two plugs suspended on short flexible leads serve either for connection to the pyrometer cabin, or to transmit the thermo-electric current to the recording instrument in the metallurgical laboratory—according to whichever of the two plugs is inserted in the plug holes of the particular leads of the furnace under observation. The metallurgical laboratory being situated at some distance from the sections previously named, the resistance of the conducting leads is carefully measured, and in calibrating the respective instruments due allowance is made for this. Moreover, with each galvanometer a considerable predetermined series resistance is used, approximating some 500 to 600 ohms, and with such a resistance the slight differences in the lengths of the leads from one furnace to another is not sufficient to impair the accuracy of the readings.

The method of insuring that, as far as possible, the actual temperature of the article heated is ascertained as distinct from the temperature of the furnace itself, is by sheathing the pyrometer tube in a circular muffle of non-conducting material in such a manner that the extreme end of the pyrometer, which is in close proximity to the couple itself, shall be in actual contact with the article. The muffle ensures the absence of any false reading due to the temperature of the gaseous atmosphere of the furnace being conducted down to the thermo-couple. As many as five and six thermo-couples are sometimes inserted in the long vertical furnaces of the oil-hardening section employed in heating the larger forgings forming the inner tubes of the heavier guns. These gun tubes in the larger nature of ordnance sometimes exceed 60 ft. in length. The furnaces are gas heated, and by means of air ports combustion may be regulated with great uniformity, especially when controlled by a number of thermo-junctions placed at regular ascending intervals in the walls of the furnace. The cold-junction of each couple with the pyrometer leads is maintained at an equable temperature by having sufficiently long pyrometers. The further precaution is taken of calibrating the whole system with an allowance for the average cold-junction temperature of the various pyrometers.

The details of the construction of the pyrometers in use are as follows:—The ends of the couples are twisted together for a length of $\frac{3}{10}$ of an inch; the twisted junction is then "autogene" soldered by holding the ends in the oxyhydrogen flame until they become fused to a small globule. Merely twisting the ends results, after repeated heatings of the same couple, in loose contacts, and leads to false readings. The unsecured ends of the wires of the couple are then threaded through the double-drilled porcelain tube of highly refractory clay. This refractory covering, together with the couple wires, are maintained throughout the whole length of a pyrometer, even should this approximate 15 or 16 ft. in length, as is actually the case in the longer forms. The wires in the head are wound into two spirals, which are insulated from each other by short lengths of rubber tubing. This affords a few inches of spare wire, use of which is made from time to time as necessitated by the re-making of a new junction, &c. The double-drilled fireclay tube, immediately at the junction end of the couple, is sawn through longitudinally for a short distance, just sufficient to little more than cover the end of the junction, and thereby preventing liability of any contact between the couple and the welded end of the iron sheath. The head is of cast metal, bored and tapped to fit the iron sheathing. The cover of the head carries the two terminals to which the wires of the couple are connected to the galvanometer leads. It is made of ebonite, and simply fastened by three screws. The iron sheathing is ordinary $\frac{3}{8}$-in. gas barrel. For use at the lead bath the sheathing is a solid-ended tube bored from mild steel rod. Welded tubes have not proved satisfactory in use at these baths on account of the lead finding its way through after being in use but a short time.

Upon exposure at long-sustained high temperatures, more or less crystallinity of the platinum and iridio-platinum wires takes place. Neither the thermo-electric value nor the conductivity is materially affected by slight changes of this nature, but excessive crystallinity, however, renders the wire brittle. The malleability of the wire may be restored by momentarily glowing to incandescence by passing a current through the wire. If this is not convenient, the brittle portion of the wire may be cut off and the wires pulled down from the head, for which purpose the spirally coiled length at the end of the wire is provided, or, failing sufficient length to allow of shortening the wire, the whole couple may be transferred end for end. The gauge of the platinum and the iridio-platinum wires employed throughout the installation in making up the couples is of a uniform size, viz., 25 standard wire gauge. The advantage in securing a single coil of each of the wires is evident. It favours the chances of the metals being of the same composition throughout and of the same thermo-electric value. Too much care, however, cannot be expended in satisfying oneself that each couple made up is practically of the same thermo-electric value, as otherwise the calibration of the instruments does not hold good for the whole of the pyrometers throughout the system. The variableness of the coil of wire may be tested on its receipt by cutting off portions from each end of a coil.

Digitized by Google

twisting the ends of the *similar* metals together, and connecting the free ends to the galvanometer. On applying heat to the junction no appreciable movement on the galvanometer scale should be observable, thus demonstrating the purity or uniform composition of the wire.

There still remains a form of pyrometer which is in daily use for ascertaining shrinkage temperatures in the building up of ordnance, &c., and also for ascertaining the given temperature below which it is not deemed desirable to put further work upon a forging. This couple is similar in most respects to those previously described, but differs in one important feature. The fire end of the couple terminates in a small exposed platinum plate made up of two small circular discs, $\frac{1}{10}$ of an inch in diameter, of sheet platinum, between which the wires of the couple are lead, and the two discs secured by riveting each to the other. This small plate or disc standing proud of the end of the pyrometer is supported some distance from the end of the tube by a small spiral spring, thus ensuring a good contact when the couple is pressed to the face or side of the heated body. The platinum plate serves as a collecting disc, and, being very light and small, almost instantly acquires the temperature of the heated mass, and, being itself the actual hot-junction, proves a most efficient thermo-couple.

A short discussion followed the Paper, but owing to the absence of the author the reply will be given in the *Proceedings*.

The discussion was opened by Sir Thomas Wrightson, who referred to the successful use of the pyrometer in the experiments which he had made in connection with the decrease of temperature when blocks of iron or steel were pressed together in the same way as when two pieces of ice were pressed together and were frozen together on account of the lowering of temperature. The results of these experiments were embodied in a Paper before the Royal Society.

Mr. W. Rosenhain (National Physical Laboratory) thought that the potentiometer method was far preferable to the deflection method of measuring the thermo-electric effects on account of the possibility of a change of zero of the galvanometer. He suggested the use of bifilar suspension galvanometers as a further precaution against zero errors. He remarked on the importance of protecting the leads from the furnace gases, as mentioned in the Paper, but did not agree with the author that annealing the couple by means of the electric current was sufficient to bring the couple back to its original condition.

Mr. J. M. Gledhill (Manchester) emphasised the importance of temperature in the treatment of alloy steels, particularly in the case of large forgings. The records of the temperatures during the treatment of forgings were most valuable, as in the case of any forging being found faulty its history could be traced back.

Dr. C. A. Benedicks (Upsala, Sweden) was surprised that the author did not attach more importance to the control of the cold junctions, and wished to know whether any arrangements were made for this purpose.

Mr. W. H. Hatfield (Sheffield) referred to the different results that were obtained with the couples in silica and iron tubes respectively owing to the travel of the heat along the iron.

Prof. T. Turner (Birmingham) recommended the employment of deflection readings and calibration curves in preference to direct-reading instruments. The calibration should be made frequently and under working conditions.

THE MANUFACTURE OF ELECTRICAL CONDENSERS FOR TELEGRAPHY AND TELEPHONY

IN the Paper read before the Institution on Thursday, May 7th, and reported fully in our last week's issue, Mr. G. F. Mansbridge described the methods employed in the manufacture of electrical condensers for telephony and telegraphy. In the author's process, used by the Post Office for manufacturing condensers for telegraph and telephone work, metallic tin, precipitated chemically or electrically from a solution of tin in nitrohydrochloric acid, is mixed with an adhesive and pasted on the paper; after drying, the metallised surface is burnished, and forms a coherent thin metallic film. The paper is then subjected to a high voltage, which fuses away the film of metal surrounding the weak spots in the dielectric. The drying, impregnation, and compression of the rolled condensers were dealt with at length in the Paper. In an appendix the Post Office and National Telephone Co.'s specifications for condensers for telegraphic and telephonic use were given. A long discussion followed the reading of the Paper:—

Sir John Gavey, K.C.B., said that he would like to make one remark with reference to the introduction of the rolled method at Mount Pleasant. This method was not of his design, as might be gathered from the Paper; but a hint had been given him by his friends, the Western Electric Co., of New York and Chicago. The manner in which Mr. Mansbridge overcame the difficulties of obtaining the well-conducting foil paper seemed to him like a stroke of genius. The fact also that this new method involved a self-sealing condition which eliminated accidental faults was also one of very great value. Many of them would remember the old days, when the plate lightning arrester was first introduced. These arresters certainly protected the instruments they were intended to protect, but they generally put the line to earth and caused an interruption of considerable duration. This earthing of the line was due either to the carbonisation of the paraffined paper separating the earth and the line plate, or to the fusing of small particles of metal, which made the necessary contact. He must confess, personally, that when these condensers were first introduced on a large scale in telegraph circuits for quadruplex and other methods of working, he rather anticipated that they would get a good deal of similar trouble; but he was glad to find that in that he had made an error, because, although in theory the condenser would be a huge lightning arrester, in practice it absorbed the charge without causing a disruptive discharge to earth.

It must be borne in mind, of course, that an ordinary lightning discharge from a telegraph circuit was rather an inductive than a direct charge; in other words, when the pressure from a lightning cloud was reduced by a stroke of lightning, the static stress in the telegraph wire was released, a discharge took place, and when the end of the wire was connected with a condenser of about the same capacity the discharge harmlessly divided itself between the wire and the condenser. The use of condensers had increased marvellously in the telegraph and telephone services. He would not like to say how many millions of condensers were now in use. Every modern telephone circuit had a condenser in it. They had also been largely used for telegraph purposes, and that use was increasing day by day, so that he did not think it was a very far-fetched idea if he were to say we were within measurable distance of having a condenser on every telegraph circuit, as was the case on every telephone circuit. The use of condensers had led to the introduction of the universal battery system on many circuits which had previously been supplied with separate batteries at every small station. This involved an enormous improvement in telegraph working. From this point of view, therefore, anything which tended to facilitate their manufacture, to reduce their price, or to render them more suitable, was a very great advantage to both services.

Mr. J. E. Kingsbury (Western Electric Co.) dealt with one or two historical facts in connection with the use of condensers on telephone circuits. One of the earliest indications of the use of condensers on telephone circuits that he had been able to find was in a patent which was deposited in the United States Patent Office in 1878, and which was for the use of a condenser in place of a type of apparatus mentioned in a previous specification of Roseburgh, and it was interesting to note that the type of apparatus which this patent displaced was practically the same thing as the tube which Mr. Mansbridge had explained in connection with the Moscicki high-tension condenser. The following was the fourth claim of the Roseburgh patent:—"In telephony, a glass tube filled with glycerine and water or other suitable liquid, and provided with air-tight fitting caps connected with platinum points forming a high resistance medium capable of offering a high resistance to the galvanic current, and comparatively little resistance to the induced current, applied substantially as and for the purposes specified." This patent was No. 212,510 of February, 1879, and was filed on May 25, 1878. A few days later, however, Roseburgh had apparently found that a condenser was far more suitable for the purpose he had in view than glycerine and water and the first claim of his second specification was as follows:—"At any station on a telegraph or telephone line and on a derived line of the same, the combination of a telephone with or without secondary current apparatus and a condenser, so that the secondary current apparatus may be used without interfering with the action of the galvanic circuit, and so that the galvanic circuit may be broken between the two points where the two ends of the derived line are attached without breaking the secondary current circuit substantially as set forth." Until

Digitized by Google

about 1896 condensers were only used in a small degree in telephony and for very special purposes. But in 1896 the central battery system was being actively developed. This system eliminated the magneto, and hence provided, other things being equal, a cheaper sub-station outfit. The condenser of the period, however, was a costly apparatus, difficult to make, unobtainable in large quantities, and generally he thought it might be said the invention of a cheap and practical condenser was as much an invention of necessity as was any other invention with which they had had to deal. There were three engineers in the employ of the American Bell Telephone Co., Lea, Westcott, and Robes, who developed a condenser manufactured from rolls of paper and rolls of tin foil, very much in the manner which Mr. Mansbridge had shown, and this having been brought to a practical conclusion, condensers were supplied for shillings instead of guineas, and in millions instead of tens. This was the position of the art when Mr. Mansbridge took a further step forward. It seemed obvious that if one single sheet of paper could carry with it the metal there must be economy; and there ought to be greater certainty than in the case of running two separate metals. In their London factory, the Western Electric Co. were adopting Mr. Mansbridge's process. If they had not been able to convince other factories of its superiority, perhaps it was only a question of time before this would be done.

Mr. A. WHALLEY (British Insulated and Helsby Cables, Ltd.) thought that condensers of the type dealt with in the Paper might also be of some slight interest at the present time to electric light engineers, especially after the manner in which it was brought out in the discussion upon Messrs. Handcock and Dykes' Paper on metallic filament lamps that the use on lamp circuits of transformers or auto-transformers had seriously lowered the power factor of the special lighting circuits. These condensers with only a single interleaving paper could quite suitably be used up to 10, 20, or 30 microfarads capacity, and worked on circuits up to 250 volts without any serious or scarcely noticeable rise of temperature; no doubt they could be made to stand 450 to 500 volts, and if they could be made cheaply they should be worthy of consideration, as a means of increasing the power factor. As regards the break-down point mentioned in the Paper, namely, 150,000 volts per centimetre for the metal foil condensers, the practice at Helsby was to strain these condensers with a direct current of 500 to 600 volts sent through a commutator so as to give a flat top curve alternatively positive and negative, and they tested and sorted out the weak condensers at that pressure. It was found th they stood it for quite a long time. The degree of electrification mentioned in the Paper as falling seriously with temperature was the *percentage* fall of electrification. It was not quite clearly stated whether the temperature coefficients given at the end of the Paper were to be used for correcting both the megohms and the percentage fall of electrification. Frequently the condenser shops were at high temperature about 85° F., and it would be interesting to know whether temperature had also a like serious effect on the difference in the National Telephone Co.'s specification between the absolute capacity measurement with direct current and that with alternating current. The formulæ given in the Paper for measuring megohms per microfarad of the condenser were interesting, and he presumed they were maximum possible figures and not specification figures. Apparently they were based on figures something like 1,750 megohms per microfarad at 60° F. at a pressure of 300 volts. The Post Office telegraph condenser specification admitted 1,000 megohms per microfarad, and the telephone condensers about 300, so that slightly different constants would be needed to get specification figures. He believed artificial cables (which had been referred to in the Paper) would be of very great use in technical colleges if they were used to cultivate the spread of knowledge in the telephonic art. As a matter of fact, such cables would soon be on the market at a reasonable price up to 60 or more miles.

Major W. A. J. O'MEARA (Engineer-in-Chief to the General Post Office) gave a few statistics as to the use of condensers in the Post Office. During 1906 there were issued for telephonic use 14,130 condensers, representing 32,200 microfarads. Last year there were issued 14,800 condensers, representing 33,550 microfarads and it was rather interesting to note that at the present time the Post Office had in use on their telephone circuits some 80,000 condensers, representing 0·182 farad. Sir John Gavey had referred to the increasing use of condensers for telegraphic purposes, and he was able to give a few figures in relation to that matter also. In 1906 the Post Office issued 2,130 condensers, representing 15,270 microfarads. Last year they issued 2,470 condensers, representing 12,130 microfarads. He had not the exact figures relating to the total number of condensers in use on telegraphic circuits, but he understood that in this country there were at least 6,000 condensers used in this way. All these figures referred to the paper condensers as described by Mr. Mansbridge. The Post Office had had these condensers in use for over seven years, and he could support the author in his claim that they were satisfactory from every point of view. They had not found them to fail from loss of insulation or in any other way.

Mr. B. S. COHEN (National Telephone Co.) said there was one very important point which Mr. Mansbridge had not referred to, and that was the effect of alternating current upon capacity. In the specification of the National Telephone Co. for condensers, reference was made in the first clause to a test with both alternating current and with the ordinary discharge method. Many forms of commercial condensers possessed considerable dielectric losses, which in some cases had resulted in a reduction in capacity when measured by alternating current to such an extent as to cause serious trouble. The necessity for testing condensers in practice with alternating current was, he thought, first pointed out by the engineering staff of the Western Electric Co. A few years ago an investigation was carried out by the National Telephone Co. to determine the capacity of various types of commercial condensers at telephonic speech frequencies, and perhaps a few of the results might prove of interest. A batch of 21 condensers of one pattern with a mean discharge capacity of 2·09 microfarads when tested by alternating current had a mean capacity of 1·76 microfarads, or a decrease of 18·8 per cent. That was with a current frequency of 800. Another batch had a percentage decrease in capacity which amounted to just under 1 per cent. A further batch with a discharge capacity of 2·43 m.f. had an alternating capacity of 1·81, or 34·2 per cent. decrease. One condenser, which actually passed the insulation and breakdown tests, had an actual discharge capacity of 1·88 m.f., and an alternating capacity of 0·6 m f., or 21·3 per cent. decrease. This implied a very important source of trouble, and the condensers referred to might have been accepted under a specification which only covered a discharge, capacity, insulation, and breakdown tests, although many of them would give trouble in telephone instruments or currents. He might mention that, given an alternating current of about 800 frequency, the workshop capacity test of a condenser with this current was, if anything, simpler than the corresponding direct current test, as all that was required was a standard condenser, slide wire bridge, and telephone receiver; and this was a method which could be used in practice by men of not very high grade. The question of the insulation resistance variation of commercial condensers with alternating current did not appear to have been studied to any great extent. Could Mr. Mansbridge give any information on this subject? Tests for this, involving as they did small phase angle measurements, were more difficult to make than the corresponding capacity tests, which in all probability covered the effect. In this connection he would like to refer to the artificial cable for telephone work mentioned by Mr. Mansbridge; and Mr. Whalley had also mentioned them as being shortly on the market. Whilst probably of very great use for educational work, he thought it very possible that such cables might introduce some dangers in use. The general artificial cables manufactured for actual cable work had the capacity and resistance lumped to such an extent that the result was the same as if they were evenly distributed within a very small percentage. Such artificial cables were also manufactured with silvered mica condensers and almost in the same manner as a telephone dry core cable. The tests of telephone dry core cable showed very little variation with alternating current; on the other hand, there was a very considerable variation in insulation resistance, viz., a very considerable decrease with alternating current. If artificial cables were manufactured with capacities made up with paraffined paper, it appeared very possible that trouble would be caused by variations in capacity.

Mr. H. OPPENHEIMER (International Electric Co.) said that two years ago his firm took up the manufacture of condensers under Mr. Mansbridge's patents. The manufacture of commercial condensers was mostly a matter of practice, and those firms who had taken the matter up had been initiated in the elementary stages, so that even from the start the relative results were very satisfactory. In the first batch of condensers his firm made there was about 7 per cent. "wasters"; in the second lot this came down to 3·8 per cent.; the fourth lot showed 1·6 per cent.; the next 0·36 per cent.; and to-day he had arrived at 0·2 per cent. It was remarkable, when comparing the various specifications, to notice how the various departments had come practically to the same conclusion and fixed the tests almost alike. So far as the pressure to be applied was concerned, the Post ffice specification prescribed 300 volts, the National Telephone Co. 400 volts, the Colonies 1,000 volts, and the Continent 350 volts. The time for applying the test was two minutes in the Post Office specification, half a minute in the National Telephone Co.'s, five minutes by the Colonies, and one minute on the Continent. The insulation resistance was as follows:—G.P.O., 300 megohms; National Telephone Co., 200 megohms; Colonies, 1,000 megohms; Continent, 400 megohms. the Colonial specification was, he thought, detrimental to progress; to ask that an ordinary telephonic condenser should withstand 1,000 volts pressure for five minutes, and that its insulation resistance should be 1,000 megohms was practically nullifying the efforts at progress made by the author.

Mr. J. E. TAYLOR (Assistant Superintending Engineer, General Post Office) said he was interested in the question of high-tension condensers, more especially with the silvered Leyden jar type for wireless telegraphy purposes, to which Mr. Mansbridge had referred. These had not been altogether successful. In the first place, he might explain that the silvered Leyden jars to which he referred were made before the Moscicki condensers were put on the market, and were not of the same pattern.

Digitized by Google

but they had some disadvantages. For instance, they had the self-sealing effect which Mr. Mansbridge referred to, but when this effect came into play in connection with wireless telegraphy it was a considerable disadvantage. One was tempted very often in using Leyden jars for wireless telegraphy purposes, to make temporary connections, such as standing the Leyden jar on tin foil sheets to effect a connection between several jars or between a jar and another part of the circuit. If the silver was unprotected, sparking occurred, which rapidly burnt away the silver coating. There were objections to the backing of these coatings also. If they were backed with a copper coating of any thickness, the contraction and expansion due to temperature quickly loosened the coating. If they were backed with insulating varnish, then the first objection again came in, because if the outer portion of the jar came against any part of the circuit or a loose wire, or was stood on a conducting material, sparking again occurred, and the silvering was eaten off underneath the backing. Another trouble which it was a little difficult to overcome arose from the brush discharges, which were a source of so much trouble in wireless telegraphy. These caused a certain amount of erosion or eating away of the silvering, which gradually increased and ultimately rendered the jar useless. These brush discharges were a source of serious loss in Leyden jars for wireless telegraphy, and he had considered to some extent what was the real explanation of these brush discharges. He had not been satisfied with the explanations which had been based on the surging of the charges round the circuit or the decrease of specific inductive capacity of the glass due to high frequency oscillations, as the effect was too large to be explained completely in that way. The view which seemed to explain the formation of these brush discharges better to him was that the successive oscillations of the condenser circuit built up an ionisation or conductivity of the air at the edges of the foil, so that the longer the oscillations lasted the more conducting did the air become, and the same effect was very often noticed in sparking. Some of the sparking troubles between knobs of the wireless telegraph transmitter, were very often due to a similar cause in that the spark gap was set so that the first rush did not cause a spark, but perhaps caused spitting; the air was then ionised, and the major portion of the electrical energy was dissipated. Referring to Mr. Mansbridge's form of condenser, he could support some of the advantages claimed for the self-sealing properties of these condensers. He had found that they could be used for shunting electro-magnets energised to a very considerable extent, *i.e.*, for shunting electro-magnets to prevent sparking when the circuit was broken. On 100-volt circuits, an ordinary condenser of one or two microfarads capacity would not stand for a moment the discharge effect from such an electro-magnet. When the circuit was broken in the ordinary way, the dielectric would be perforated, but although in this case perforation might take place, the dielectric had the property of sealing itself, so that it would withstand a large number of perforations before it would be incapacitated, or, as he might put it, decapacitated. These condensers had stood for some little time past a test of this sort, and they might ultimately be pushed to the extreme loss of their capacity, but they were becoming so cheap that it paid one to use them for apparatus of this kind when it was important that sparking troubles should be eliminated. Mr. Mansbridge had referred to the advantage in some circumstances of using leaky condensers for spark suppression; although this might have an advantage, he was of the opinion that, on the whole, it was better to have a good condenser and not a bad one, and that if any leaks were required, these should be obtained by the use of artificial resistances.

Prof. Silvanus P. Thompson, F.R.S., said he should like to ask two questions. They had seen a strip exposed to the test, flashing with sparks, as all the faults in the paper and its edges were discovered by the machine and burnt out. He wanted to know what would happen if this paper were sent through the machine a second time. Would it flash at all, much or little? Did it really successfully burn out all the faults, or would it find some more a second time? The other question was this. It was an exceedingly interesting physical fact to be told that the metal-deposited paper before being callendered was almost a perfect non-conductor, and he wanted to know whether, in common with other metallic filings, it became a better conductor in the presence of electrical oscillations; in fact, would a strip of that uncallendered paper act as a coherer? He had been making enquiries as to how much a microfarad cost nowadays. He was the possessor of several of them, and had paid two and a half guineas for a third of a microfarad. At this rate a farad would cost £9,600,000, but he thought that a farad could be bought to-day for £50,000.

Mr. W. M. Mordey thought the Paper was illustrative of the close connection between telegraphy and telephony and heavy electrical engineering. He wished to ask some questions concerning the value of the dielectric hysteresis in these condensers. It might be remembered that seven or eight years ago he read a Paper on this subject entitled "Dielectric Losses in Cables," and he had been unfortunate in making his experiments on a cable which had an exceptionally high power factor of something like 0·1, and he was led to draw certain general conclusions as to the losses which occurred in cables due to the dielectric capacity, which were much too high when applied to cables of the sort that were now generally used. On going into it later he found that although he was laughed at a good deal, the dielectric hysteresis losses in even the best cables that could be obtained were very often so high that with alternating current these losses wasted more energy than the copper. It would be very interesting if the author, who evidently had exceptional facilities, could go into the question of what was the power factor and the dielectric losses in condensers of various types. With regard to the Moscicki condenser, which was intended for high-tension work, it would be particularly easy to make such calculations by a simple calorimeter method, as the condenser was provided with water circulation, and one had nothing much more to do than to treat the whole thing as a calorimeter, put the various volts on, and take the temperature ingoing and outcoming, and they would get a close approximation to the actual losses. He would be very surprised to find that the loss in this or in any other condenser was less than would be represented by a power factor of 0·03. If that were the case, then he thought the matter ought to be considered from the point of view of the energy wasted. There was every possibility now of getting what they had all been trying for for many years, viz., condensers that would be of actual use in power distribution work. They would all remember that, at the Crystal Palace Exhibition many years ago, Mr. Swinburne, who was then a manufacturer, had a tempting exhibit of condensers intended for such work. They had cast-iron boxes outside, but what there was inside he did not know. Anyway he knew that Mr. Swinburne fully recognised at that time the very great importance of having practical condensers for power distribution work. If they were going to have them now, they should look at them from the very beginning, viz., from the energy point of view. If he was right, and it was impossible to get a power factor of less than 0·05, it might be found that the losses in condensers might be more than double the magnetising losses. Some years ago he had tried to get some idea how heating was caused in alternating current cables at light load, and he then arrived at a conclusion that was worth consideration. The mere static attraction between electrified surfaces was very great indeed, and being oft repeated, as it was in alternating current work, it was in itself sufficient to cause a considerable amount of heat merely by making a number of blows upon the dielectric. These blows being often repeated might be sufficient to account for what they called the dielectric hysteresis losses. It might be somewhat of a mechanical loss. He would like to give an example. If his arithmetic was correct, with a 20,000 volt condenser and a dielectric of 0·2 inch thick, then the static attraction was about 2 lb. per square foot. Imagine a blow of 2 lb. per square foot being given 100 times per second on any dielectric: this might easily account for a good deal of the heat. Applying that figure to the interesting example which the author gave in Fig. 5 of breakdown of a condenser at 1,100 or 1,200 volts, and assuming that the dielectric thickness was about 0·001, and taking 1,000 volts as the voltage, the actual pressure between the actual metallic films of the condenser was about 13 lb. per square foot at the time of breakdown—quite an appreciable thing—and he would like to see experiments carried out to ascertain whether dielectrics would stand that kind of pressure or whether his estimate was a correct one.

The President (Col. Crompton) said that he had, during the South African War, a very interesting experience with condensers in the portable telephones which were carried by the Electrical Engineer Volunteers. These telephones were of a Swedish pattern and they enabled them to do good service by signalling through broken circuits laid on the bare veldt. Sometimes they could get speech through several feet of gap in the thin lines laid on the ground, and they could buzz through many yards of broken circuit. This was of great importance, for it enabled communications to be maintained at a time when all telegraphic service had been destroyed by the enemy, and no doubt prevented a good deal of anxiety to those at home because they got news which they otherwise would not have done, and this was entirely due to the combined Swedish pattern telephones each having a condenser.

Mr. Mansbridge, referring in his reply to Mr. Whalley's suggestion that these cheap condensers might be used for the improvement of power factor of the lines feeding small house transformers, presumed that Mr. Whalley intended that the customer who paid for the transformer would also pay for the condenser. If this could be arranged he thought it was a very happy suggestion. Mr. Whalley had also raised the point as to whether the formula in the Paper was applicable to the electrification. No; it dealt with the megohms only. The variation of the electrification with temperature was a problem which, up to the present, he would not like to be responsible for the solution of. With regard to Mr. Cohen's remarks, he had intended to deal with the alternating current problem in the Paper, but he had purposely cut out what he had put in because he had hoped to hear Mr. Cohen's answer to the question he had put. At the Post Office they had tried alternating current tests, and although it sounded something like an advertisement,

Digitized by Google

their condensers were so good that they did not get very much difference—scarcely a measurable difference—between the alternating current and the continuous current. The conditions at the Post Office were rather different from those of Mr. Cohen, inasmuch as the former made practically all their own condensers, and Mr. Cohen had to deal with a number of manufactured condensers. In reply to Dr. Thompson's inquiry, he did not find that any advantage was obtained by running the paper through the breaking down machine two, three, four, or five times. If it was taken through a dozen times there would probably be some places which would give way. The dielectric strength of the material was a function of the time, and this was a point to be taken into consideration in that connection. With regard to the coherer capacity of the uncallendered paper, he could not say; he had never tried it. But a strip of the callendered paper which had been so creased that it had become a non-conductor had answered as a coherer. Mr. Mordey had remarked that there were facilities at the Post Office for carrying out tests with regard to dielectric hysteresis, but as a matter of fact the only tests that could be carried out at the Post Office were those which were carried out in the regular course of the work. He would, however, check Mr. Mordey's figures and reply more fully in the *Journal*.

Written communications to the Discussion have been received from G. L. Addenbrooke, A. W. Ashton, J. W. Record, Mr. Alex. Russell, and Dr. W. E. Sumpner.

LONDON ELECTRIC POWER BILLS

LORD CROMER'S Committee of the House of Lords has continued its consideration of the London Electric Power Bills since our last issue. On Wednesday Mr. Parshall was re-examined, and was followed by Mr. Hammond. The Committee did not sit on Thursday owing to several members desiring to be present at the opening of the Franco-British Exhibition, and on Friday the Committee adjourned at one o'clock.

WEDNESDAY, MAY 13TH. (FIFTH DAY.)

Mr. PARSHALL, re-examined by Mr. Fitzgerald, first referred to the suggestion that the power company might quote a ridiculously low price in order to get into a district and compete with the authorised distributor, and pointed out that the opponents to the Bill had apparently overlooked the fact that under Clause 52 the company must supply authorised distributors substantially at the same price at which they themselves would supply a consumer. On the point that no power company had been successful, Mr. Parshall referred to the Newcastle Company, which, he said, had paid 8 per cent. for many years, and further had reconstructed their system out of revenue. The Committee would also hear from the Chairman of the Yorkshire Electric Power Co. that, although they were quite in the initial stages, very satisfactory progress was being made. If the company were to adopt a policy of buying up electric lighting companies, as had been suggested by Mr. Bushe (for some of the London companies), in view of the very satisfactory financial position of some of the companies, it was clear that the power company's capital would be totally absorbed in making such purchase before a start was made upon their generating station. It might be in the power company's interest to purchase some of the smaller municipal undertakings; for instance, in the case of Barking they knew that that undertaking was to be had at a very moderate price. With regard to the position in Chicago and New York, he pointed out that in both these places the original condition of affairs of a large number of small generating stations had given way to one bulk station, the smaller stations being retained only for the purposes of the peak load.

Mr. R. HAMMOND was then called, and gave his views on the proposal for linking up the existing generating stations which was contained in the other two Bills. The general idea, he said, that London could be benefited by putting all the existing mains into one great network, was quite impossible on account of the variation in the class of supply given in the different districts. The idea that the network of mains could be linked up in this way had long been given up as an absurdity. It only perpetuated the existing evils, and what was wanted was a perfectly new and model generating station. The promoters could do for London what Niagara had done in America. The mere fact that generation was by the use of coal did not alter the problem at all. At the same time he did not say linking up was an engineering impossibility; it was a question of expense, and the extent of this was illustrated by an example. At Hackney, generation took place at 480 volts direct current, and Islington, which adjoined Hackney, generated at 2,000 volts alternating current. If Islington asked Hackney for a supply, it would be necessary to put down transforming plant to transform from 480 volts direct current to 2,000 volts alternating current. This sort of thing would have to take place at a very great many of the stations, and the expense would be enormous. In addition, the existing authorities could not generate as cheaply as a bulk station on the lines of the present proposal; although they might link up, they were only exchanging current which was being manufactured at a high price. Mr. Hammond then went into the details of the various tables which had been placed before the Committee. The figures upon which the estimates were based had all, he said, been taken from the last published accounts of each undertaking, and the results given in the tables had been arrived at by analysis. With regard to management, in order to get a figure which was as correct as possible, he had debited to the cost of generation only 25 per cent. of the charges appearing under the head of "management," presuming that the heaviest cost of management was that connected with distribution. In order to arrive at the absolute cost of generation it was necessary not only to add the money spent in coal and wages, but also something for depreciation of plant, and interest. In the case of local authorities outside London, the Local Government Board compelled them to repay their capital expenditure in 25 years. Inside the county of London, some of the authorities had obtained their loans for 42 years; but as 42 years was quite beyond the equated period for the wearing out of the plant, he had put them all upon the Local Government Board basis of 25 years. He had in this way arrived at capital charges of 6¼ per cent., on the basis of 2¾ per cent. sinking fund, and 3½ per cent. interest. The mistake that had been made in London was decentralisation; the same mistake as was made by the gas companies many years ago. Then there was a little gas works in every little district, but a gradual amalgamation took place until there were at present only two gas works for London, one for the South and one for the North. Dealing with the power companies around London whose area the present Bill overlapped, Mr. Hammond said that the prices both of the North Metropolitan Electric Power Co. and the Kent Electric Power Co. were considerably higher than those now being proposed. On the question of diversity factor, the promoters only estimated upon 1·5, but he was inclined to believe it would be more. When the station was completed he ventured to put it at 1·66. His estimates for the renewal of plant were 60 years for buildings, 25 years for plant, 30 years for cables, and 10 years for meters. These were terms which he thought now were generally agreed upon by the electrical engineering profession. He read a Paper before the Institution of Electrical Engineers a few months ago, and these figures were debated, and it was agreed it was a proper provision to make. (ELECTRICAL ENGINEERING, Vol I., p. 759.) The estimate of the amount of horse-power available in London for conversion to electric driving was next dealt with, and Mr. Hammond pointed out that there were numerous cases of isolated generating plants which it was quite possible would be discontinued in favour of a supply from the power company if suitable rates were quoted. For instance, the Savoy Hotel was lighted with its own plant originally, but they later took supply from a company. The Hotel Cecil at present had its own plant, but there was every likelihood of the power company being able to offer sufficient inducement for it to discontinue its use. His own opinion was that the amount of machinery which the power company might hope to supply was nearer 600,000 h.p. than the 300,000 h.p. already mentioned by Mr. Parshall. He thought the protection given in the Bill to the authorised undertakers in regard to consumers up to 250 kw. was a very strong protection indeed, and secured them the small consumer, a class of business which they were particularly able to do because they were so well situated for distribution.

FRIDAY, MAY 15TH. (SIXTH DAY.)

Mr. HAMMOND'S evidence-in-chief was continued. He said the estimate of h.p. in factories in the area was based upon a Home Office return for 1904, since when no census of this character has been made. He thought it was reasonable to assume that there had been an increase in the number of factories since then. A list was then read of the companies and local authorities who made agreements or agreed clauses with the Administrative County of London in 1905. This is as follows:—Barking, Bexley, Stepney, and Beckenham Councils, Croydon and Gravesend Corporations, and the following companies:—County of London Electric Supply Co., Charing Cross and City Co., City and London Electric Lighting Co., Chelsea Electricity Supply Co., Westminster Electric Supply Corporation, St. James and Pall Mall Company, London Electric Supply Corporation, South London Electric Supply Corporation, South Metropolitan Electric Light and Power Co., Kent Electric Power Co., Empire Electric Light and Power Co., and Kensington and Knightsbridge Co.

Mr. SEYMOUR BUSHE, K.C., pointed out that no agreement

Digitized by Google

with regard to supply was made with the Kensington and Knightsbridge Co., in fact, a clause was agreed by which the Kensington and Knightsbridge Co. was excluded from the operations of the Administrative Co.

THE CHAIRMAN: Do you want us to draw the inference, Mr. Hammond, that these companies and local authorities would make similar arrangements with you?—Some of them most certainly.

In answer to Lord Saunderson, Mr. Hammond gave some particulars of the distributing system, for which he said he was responsible. In dealing with this, he said that he had kept in mind a criticism of the committee of 1906 as to means of providing for continuity of supply. In consequence, they had provided 25 trunk cables from Barking, of which 15, each having a section of ·10 sq. in., would belong to the first stage.

LORD CROMER: You say you do not see any hostility between your company and the rival schemes, and referred to the fact that you merely want to use the companies as distributors. What I want to arrive at is whether, looking at the principles of the rival schemes, do you consider them, either from a financial or from an engineering standpoint, mutually destructive to each other?—I think it would be a calamity for both schemes to be sanctioned.

Do you think the two schemes would be impossible if they were both passed, and do you think your scheme is preferable?—It is certain that there is going to be a growth of electricity in London; for instance, the promoters are certain that the railways will want 60,000 kw. We see that annually there is a growth, and that this growth will be largely developed in consequence of lower prices. This growth will have to be provided for by new generating plant, and the amount of margin of generating plant at present available includes a certain amount of obsolete plant. Money has to be spent on this new plant, and we consider that if the burden of dealing with generation was put into the hands of a solid company, and that all the new generating plant, instead of being dotted about, was put under one roof, and dealt with by the most economical methods, then a bulk company would be able to supply to the authorised distributors that amount of extra electricity which they will require from time to time, and that therefrom the authorised distributors would be great gainers in two ways. First, they would not have to spend their money in the form of capital expenditure on a wasteful basis, and secondly, they would have the advantage of obtaining a supply at a much cheaper price than if they made it themselves; and I say there is no antagonism whatever, they should welcome this Bill. The only thing they object to is the clause about the 250-kw. consumer. We have been told more than once that there are very few consumers of this size, and what I urge is that these consumers should be properly left to the bulk company.

Let us assume that all three Bills were passed, would there still then remain the possibility of your doing business?—The only objection that strikes me is that mutual destruction would come in the way of raising capital. I take it if we were all going to the public at the same time there might be some hesitation on the part of investors as to whether their capital would be secure; but as far as the actual business part of it is concerned, I think the companies would see, if they got their Bill also, that it would be to their interests to take a supply rather than carry out their scheme.

Supposing all three Bills were passed, do you think you would still have the possibility of conducting a profitable business?—I do not think that this would tend to the best development of the capital, and eventually there would be amalgamation in the same way as the gas companies amalgamated and divided London between them.

In answer to other questions from the Committee on this point, Mr. Hammond said he thought the real issue lay between the bulk scheme and the scheme of the eight companies, and if both of these were passed there would be a great waste of capital, but he was convinced, from an engineering point of view, that the bulk scheme would be carried out, even if the other Bill were passed. Assuming the bulk scheme were passed by itself, the question of giving a cheap supply to London would depend upon the promoters getting the money.

LORD CROMER next pointed out that the capital required for the first stage was £2,600,000, and he presumed that, in addition to this, which included interest during construction, a further sum would have to be added for expenses in connection with raising the money.

Mr. HAMMOND pointed out that this was already provided for, as the interest during construction would amount to £86,000, and they had allowed £100,000.

Continuing, Mr. Hammond said that some contracts would have to be made before they went to the public for their money, but they did not think there was the slightest doubt that, as soon as the Bill became law and there was a company to deal with, a good many contracts would be entered into. Acting as he did for some of the local authorities, he could speak with confidence that many of them would prefer to take a supply in bulk rather than spend capital in putting down new machinery themselves. Further, the London County Council had been in the past, and he thought certainly would be in the future, inclined not to sanction any more money for electric lighting purposes if there was a certainty of getting energy in bulk.

Lord WELBY pointed out that £100,000 for interest during construction was rather a small sum, considering that the constructional work would be carried over a number of years.

Mr. HAMMOND pointed out that under the Bill they were only allowed to pay interest out of capital during the first four years, and the amount in the estimates had been reckoned on that basis.

Replying to Lord Welby on the question of competing schemes, Mr. Hammond mentioned the case of Newcastle, where two Provisional Orders had been granted, but the town was split up into two districts, and competition was not allowed. With regard to raising the capital, he did not think the promoters could have any objection to a clause stipulating that a certain amount must be raised within a certain time.

Lord WELBY next referred to a statement in a recent prospectus of the Newcastle Electric Supply Co., that the whole of the original system of that company had been replaced out of revenue between 1890 and 1908. Would such a rapid replacement be necessary in the future?

Mr. HAMMOND replied that the Newcastle Company started in the very early days of the electric supply business, and it was in consequence of the rapid strides made since then that their system generally had needed renewal. This contingency would not arise to anything like the same degree in the present state of electrical engineering.

Mr. FITZGERALD, at the close of these questions, stated that with regard to the other Bills, Mr. Hammond had given his personal opinion, but he wanted to make it quite clear, on behalf of the promoters—as he did in opening the Bill—that their position was that the three Bills were not inconsistent Bills. The other two Bills were not, in their opinion, in any way substitutes for this Bill; they were not, strictly speaking, competing Bills, and it was quite open to the committee to pass all three Bills.

Mr. HAMMOND'S cross-examination was then opened by Sir Ralph Littler, K.C., on behalf of the City Corporation. Mr. Hammond said the cost of the main trunk cables through the City, which would be 0·35 sq. in., was estimated at £2,000 per mile.

Mr. FREEMAN, K.C., for the London County Council, took up the question of the purchase clause, and suggested that as Mr. Hammond had taken in his estimates an equated period of twenty-five years for the life of plant, it would be only fair if the purchase of the power company's undertaking was to be the capital expenditure, less a proper amount for depreciation, as between the 25 years and the 42 years proposed in the purchase clause. He pointed out that there was no obligation upon the company to keep the plant in good repair.

Mr. HAMMOND admitted this, but said that the Bill would prevent the company from making any profit until they had made such provision. He did not agree that it would be to the interests of the company to go on with old plant rather than renew it, but was quite agreeable to there being a distinct understanding in the Bill that the plant must be maintained.

Further questioned by Mr. Freeman as to an obligation to raise a certain amount of capital in a certain time, Mr. Freeman suggested £1,000,000 in twelve months, and that a substantial commencement should be made in two years. Mr. Hammond agreed with the suggestion in principle, but would not commit himself as to the amount. He said he should not want £1,000,000 during the first twelve months.

Mr. FREEMAN then dealt with the consumer of 250 kw. and over, and suggested that provision should be made for securing the sanction of an independent authority, such as the Board of Trade, for consent to supply any such consumer.

Mr. HAMMOND retorted that he was already before the independent tribunal, and it would be inconvenient, having got powers from Parliament to supply the 250 kw. consumer, to have to ask the Board of Trade for permission to do it.

Mr. BLENNERHASSETT, K.C., also cross-examined on behalf of the Westminster City Council.

MONDAY, MAY 18TH. (SEVENTH DAY.)

Mr. HAMMOND'S cross-examination was continued by

Mr. C. A. CRIPPS, K.C., who appears for the London companies with Mr. Balfour Browne, K.C., put questions relating to the tables of capital expenditure upon the undertakings of the London companies, and took as an example the Charing Cross Co., the capital expenditure of which compared with the figure taken by Mr. Hammond in his tables was £300,000 less. Mr. Hammond said he had taken his figures from the balance-sheet of the company, and agreed that if he were wrong this alteration would vitiate all his subsequent calculations. On the question of the voltage drop in the cables, Mr. Hammond had taken 10 per cent., which Mr. Cripps said should be 20 per cent. Mr. Hammond's reply was that the 20 per cent. drop in transmission, which engineers were now used to, was because the cables were overloaded. The cables in this scheme had been calculated upon a basis of a 4 per cent. loss, and they could be arranged to work at 1 per cent. loss. If he had assumed 20 per cent. he could have used very much cheaper cables. On the question

Digitized by Google

of load factor, Mr. Cripps argued that the estimates of the promoters had been based upon the assumption that the authorised distributors took the peak load from the power company, and consequently they got a works load factor twice as good as the existing companies. If, however, the distributors only took the day load from the power company, the result would only be half as good. Mr. Hammond agreed that the load factor would only be about half, but there would be no material difference in the profits, as the distributors would have to pay the £5 10s. per kw. whether they took a small or a large quantity of units, and if they were foolish enough to take only a small quantity it did not matter to the power company. Mr. Cripps next went to the savings to the London companies, as shown in Mr. Hammond's tables, and dealt with the following five companies, viz., Charing Cross Co., County of London Co., City of London Co., London Electric Supply Corporation, and the South Metropolitan Electric Power Co. The saving estimated to these companies by taking a supply in bulk from the power company was shown as £29,999, but Mr. Cripps said the companies had calculated that if they took their supply in the manner suggested they would make a loss of £63,110. If this were so they would not take a supply, and the power scheme would not be much good. Mr. Hammond's reply was that the fact they did not supply to a few authorised distributors made no difference at all to the prospects of the scheme; he was after the 66 authorised distributors in the area. It would take 25 years' growth, said Mr. Cripps, to reach the figures in the tables. Mr. Hammond said he was very pleased to hear this, because it showed how greatly the present companies had underestimated the power load in their area and neglected the power user. The tables of future growth were based upon the maximum plant at the disposal of the authorised distributors, which Mr. Hammond thought was the only basis of estimating the future demand, whereas Mr. Cripps held the view that this had no reference whatever in this connection. Also, said counsel, the increasing adoption of metallic filament lamps would decrease the estimates in as much as greatly decreased demand was to be anticipated. Mr. Hammond, however, held the contrary view, and said that the feeling in the industry at the present time was that the more efficient metallic filament lamps were going to create a greatly increased demand. Another point touched upon was as to the cost of generation in future, and here again Mr. Cripps said the figures of the promoters as regard the London companies were much lower than those assumed by the power company. As neither witness nor counsel could agree as to the correctness of the other's assumption, the cross-examination developed itself into Mr. Cripps putting his view of what Mr. Hammond's figures should be, and Mr. Hammond dissenting.

After this Mr. Cripps dealt with a few general matters. On the promoters' modification of the Kitson clause, it was suggested to Mr. Hammond that this allowed of competition, whereas under the original Kitson clause there was no competition without the machinery of the Board of Trade. As the Bill stood, the obligation to supply could not be enforced against the power company, yet if they did come in and compete against the authorised distributor there was still the complication of the Kitson clause, in that if the power company and the power user did not come to terms there would have to be an arbitration at the hands of the Board of Trade. Mr. Hammond said personally he saw no objection to the insertion of a clause making it obligatory upon the power company to supply all those small power consumers which the authorised distributors neglected. Such supply should be on the basis of the charges which the power company would offer the authorised distributor. Mr. Cripps next emphasised the pioneer work which had been carried out by the existing companies, with all of which Mr. Hammond agreed, but he said that if the companies would not take advantage of an offer of a cheap supply they should suffer. Asked as to why the present companies should not be permitted to carry out the larger scheme proposed in their Bill, Mr. Hammond said they were proposing to go dead against the one thing that would save London, viz., centralisation. He agreed that the main difference between the two schemes was that whereas the new company would have only one station, the existing companies had several; but this was a material difference. If the promoters of the other Bill could prove that the idea of the promoters of this one as to centralisation was wrong, then his scheme did not compare very favourably. Mr. Cripps suggested that four stations would be better than one or two, for the reason that there would be greater security of supply and that the stations would be nearer the consumers. As to the probable demand in the area of the Bill, Mr. Cripps said the companies had made a canvass, and found they were supplying about 46 per cent. of the total power installed. Mr. Hammond said he entirely disagreed with this. Mr. Cripps said the total h.p. in the County of London was 208,000 h.p., of which about half was within the companies' area. The companies supplied 47,299 h.p., which was 47 per cent. of this moiety.

The Hon. SYDNEY HOLLAND, for the Westminster and Kensington companies, first directed his cross-examination to the fact that turbines of the size proposed in this scheme had not been used in this country hitherto. He also pointed out that the Kensington Co. agreed a clause with the Administrative Co. that the area of that company should be omitted from the operations of the company. Would Mr. Hammond give them such a clause now? Mr. Hammond suggested that a clause should be submitted. Mr. Holland then went to the point that if the power company came into existence, all the local authorities and companies would find a difficulty of getting new capital during the two years which the promoters said it would take to get their scheme in working order. What would they do if the company did not get going? Mr. Hammond pointed out that in the meantime the companies had plenty of spare plant to carry them over, and they would not need new plant during the next two years. On the point of the saving to the London companies Mr. Holland argued that the only thing they would save on management, even if they took their whole supply from the power company, would be something on the salary of their engineer, owing to their undertakings being established in the way they were.

Mr. POLLOCK, K.C., for the Middlesex County Council, took the point that the competition should not be allowed between power companies, and, in view of the fact that both the North Metropolitan Electric Power Supply Co. and the Metropolitan Electric Supply Co. were both already supplying in Middlesex, that county should be cut out.

LORD LYTTON: Would you object to the new company supplying in the County of Middlesex by agreement with the existing companies.

Mr. POLLOCK: I do not know that that would be a matter for us, so far as supply is concerned, but the question of the purchase of the new company would come in and complicate the arrangements between the County Council and the existing power companies.

Mr. WEDDERBURN, for the Croydon Corporation, pointed out that in 1905, the Administrative County of London Co. agreed not to supply in Croydon without the consent of the Corporation. Would Mr. Hammond give the same clause? Mr. Hammond said to give such clauses would defeat the whole object of the Bill. He agreed there were not many factories in Croydon, but it was one of those districts where factories would undoubtedly be built if a cheap supply of electric power was available. Another point of Mr. Wedderburn's was that, assuming Croydon took the whole of its supply from the power company, instead of making a profit of over £400 per annum, they would lose £329 per annum compared with their present result. During the discussion on this, Mr. Hammond said that in the event of the whole supply at Croydon being taken from the power company, the latter would have their own men in the transforming station, and the Corporation would only require a switchboard attendant in their own station, and a man at 30s. a week would do this work quite satisfactorily.

Mr. WILLIAMS, for the Stepney Borough Council, dealt with the question of linking-up, and suggested that Stepney, Hackney, and Islington, should link up, but Mr. Hammond characterised this as a great waste of capital. Mr. Williams next attempted to bring Mr. Hammond to accept the Stepney Council's agreement with the Administrative County of London Co., but Mr. Talbot, K.C., intervened that it was not a question for Mr. Hammond to decide. The legal advisers to the promoters would consider the suggestion with every anxiety to come to terms with Stepney.

TUESDAY, MAY 19TH. (EIGHTH DAY.)

Before Mr. Hammond's cross-examination was continued, the Chairman gave a hint to Counsel for the opposition that the proceedings were being a little drawn out by the needless repetition of questions that had already been answered.

Mr. WILLIAMS then put some further questions on behalf of the Stepney Borough Council. Having gathered from Mr. Hammond that the cost of distribution as a general rule varied from 50 per cent. to 60 per cent. over the cost of generation, assuming a 75 kw. consumer, Mr. Williams put it that, under the clause in the Bill, the authorised distributor could only charge an extra 18 per cent. over the charge by the power company, and that consequently there would be a considerable loss. But Mr. Hammond replied that the cost of distribution he had mentioned related to a purely lighting undertaking. Mr. Williams was debiting one consumer with a proportion of the total cost of distribution without taking into account the diversity factor. It would be possible for the authorised distributor, by only charging the profit (one per cent. for every 10 kw. below 250 kw.) set out in the Bill, to make a profit of as much as 100 per cent. by reason of the diversity factor.

Mr. MORTEN, for West Ham Corporation, placed the 1908 figures of the Corporation electrical undertaking against those given in the tables, which are for 1907, and endeavoured to show that the basis of all the calculations was wrong. Mr. Morten also dealt with the question of carrying mains through West Ham, and pointed out that there were only two routes, viz., one over Bow Bridge and the other over the iron bridge in the Barking Road. Both these routes were already filled with mains in respect of the tramways and electric supply undertaking already in West Ham.

Mr. CAINE, for the Marylebone Borough Council, compared

Digitized by Google

the capital cost of generation in the Marylebone works and the capital cost to the power company of generating and transmitting to the authorised distributor. Mr. Hammond admitted it might be less by the former method, but he did not consider this material, as the cost of generation was the factor to be taken into account by the authorised distributors. The question of load factor was then dealt with, and Mr. Caine's argument was that it was vital to the prospects of the power company to get high load factors, and that Mr. Hammond's assumption as to the load factor in Marylebone was much too high. The next point brought out was that the Marylebone Council had paid a considerable sum to the Metropolitan Electric Supply Co. for the prospective power demand, and yet the promoters of this Bill proposed to compete. Coming back to the diversity factor of 1·5 which had been mentioned, Mr. Hammond said he did not think this was too high, in view of the fact that the London County Council, upon its tramway system, had a diversity factor of 1·25; he thought the 1·5 taken in the estimates was not high enough, seeing what was being done in Chicago.

The Hon. EVAN CHARTERIS, for the Hampstead Borough Council, pointed out that this area was placed in the area of the Metropolitan Electric Supply Co., having been struck out of the Administrative Bill by Lord Camperdown's committee. If this Bill passed, there would be three authorities with powers to supply electric power in Hampstead. Mr. Hammond, however, refused to agree that Hampstead should be cut out of the area; he thought a wrong policy had been pursued in the past in cutting areas out of power schemes. From the position of Hampstead he thought this was the district which the power company could do the least harm to. A fact brought out in this cross-examination was that Hampstead was the first borough to initiate a period of 25 years for the repayment of loans instead of 42 years, and in the L.C.C. report for 1907 upon electricity supply in London, this was pointed to as accounting for the very favourable position of the undertaking. Mr. Charteris also dealt with the point that, as the proportion for power and heating of the total consumption in Hampstead was only 4 per cent., there was no advantage in taking a supply in bulk from the power company, in consequence of the clause limiting the price to be charged to the authorised distributor. The diversity factor in Hampstead was practically unity.

In answer to Mr. Courthope Munroe, for the St. Pancras Borough Council, Mr. Hammond said, in adopting the area scheduled and refusing to cut any authority out of the operations of the Bill, he was adopting the policy of the Select Committee of 1906, which approved the area. It was pointed out in cross-examination that the St. Pancras Council supplied 85 per cent. of the total power in the district, and that the load factors of all the power users were extremely low; also that there were only three consumers taking 250 kw.

Mr. MUNROE also appears for the Shoreditch Council, and in the course of his questions mentioned that here there was only one consumer of 250 kw. Also, that some new extensions had been carried out at £12 10s. per kw., but Mr. Hammond elicited that this did not include land, and asked Mr. Munroe to compare upon a proper basis.

Mr. LYNDEN MACASSEY, for the South Essex Water Co., asked some questions with regard to the laying of mains, and asked for all the protection which has been given to the Metropolitan Water Board under a special clause, which states that no electric main shall be laid within 6 ft. of a water main. Mr. Hammond thought this reasonable. It having been suggested by the Chairman that these matters would best be discussed on clauses, Mr. Macassey dealt with the supply of water to the generating station, and wished to know if the promoters intended to sink wells. Mr. Hammond said yes, whereupon Mr. Macassey pointed out that the total water-bearing strata for the whole of the area of the South Essex Water Co. was one square mile round the site of the Barking generating station, but Mr. Hammond would not agree to come under an obligation not to sink wells on the site of the generating station.

Mr. SNOWDEN, for the Hammersmith Borough Council, gave a few general facts with regard to the undertaking, and mentioned the Franco-British Exhibition, where the lighting was carried out by co-operation between the Borough Council and the Notting Hill Co., whereas if the whole supply was to be taken from Barking, in the event of a breakdown, the supply would be cut off. In other words, under present conditions, continuity of supply was ensured, whereas under Mr. Hammond's ideal conditions continuity would not be ensured. Mr. Hammond's comment upon a few remarks by counsel as to what is being done at Hammersmith was that the sooner Hammersmith was done away with the better.

In answer to Mr. Sanders, for the Islington Borough Council, on the question of price, Mr. Hammond said no system of charging would help Islington to make a profit on power at 1d. per unit. He contended that Islington was losing money, and that it was this undertaking more than any other in London which would be benefited by taking a supply in bulk from the power company.

In re-examination by Mr. Talbot, Mr. Hammond dealt first with the question of purchase of electrical undertakings raised by the City of Westminster, and pointed out that no purchase could take place without the consent of the Board of Trade. With regard to the high load factor which had been assumed by the promoters, he stated that this good result would be attained by aggregation. Dealing with Mr. Cripps's criticism that the capital expenditure taken in relation to certain of the London companies was too high, he maintained that as this reduction would have to be made in all his tables, the ultimate saving shown would not be affected. He could not understand the criticism of the Middlesex County Council that the proposed company wished to take the best portions of that county and leave the poorer part to the County Council, as the County Council was not the electric supply authority.

Speaking generally, Mr. Hammond said he was convinced that a great many of the authorised distributors in the County of London, who were met with the difficulty of being unable to find land for extensions, would be glad to make use of the power company for all supply after their present plant was exhausted. The Marylebone Council had complained that, having purchased the prospective power load in the district, they should be allowed to supply it; but all the power company proposed to do was to help the borough council do this, and not to compete for it. He failed to see how Hampstead could be injured by the power company, for they stated there were no power consumers there. Consequently, the power company could only supply to the authorised distributor if they desired a supply, and not otherwise.

In answer to Lord Saunderson, Mr. Hammond said that no account had been taken in their estimates for supply to tramways in the County of London, as they did not expect to do this.

Mr. HAMMOND next referred to a point that had been brought to his notice, and which had not been foreseen. It had been stated that, in the case of an authority distributing direct current only, and not wishing to lay special mains for giving an alternating current supply taken from the power company, the latter might attempt to induce the power user to take a supply of alternating current direct, on the ground that alternating current was better for power supply, and so compete with the local authority. This contingency had been quite unforeseen by the promoters, and he thought steps should be taken to remedy it.

Mr. TALBOT, K.C., for the promoters, agreed with this, and said he would venture to submit a suggestion as a way out of the difficulty.

WEDNESDAY, MAY 20TH. (NINTH DAY.)

Financial evidence was called. Sir Thomas Hugh Bell, Bart., one of the promoters, was the principal witness called. The other promoters are Mr. R. W. Blackwell, Mr. R. S. Guinness, M.P., Mr. R. Miller, Mr. G. D. Rowe, Mr. Owen Hugh Smith, Mr. W. D. Ward, Mr. V. W. Yorke, and Mr. John Young.

A full report will appear in our next issue.

Messrs. Mather & Platt's Exhibit at the Franco-British Exhibition.—We have received from Messrs. Mather & Platt, of Manchester and London, some details of the extensive exhibits which they have erected in the Machinery Hall of the Franco-British Exhibition. One of the most important of these exhibits is a twin-cylinder two-cycle gas engine, with three-phase generator, mounted on the crankshaft between the two cylinders. The speed of this set is 107 revolutions per minute, and it is rated at 800 b.h.p. output continuously, with gas supply of about 140 British thermal units per cubic foot; or, in other words, ¾-lb. of coal per h.p. hour. This design of gas engine is the most similar to a steam engine of any made; it is claimed to be equal to a steam engine in reliability, evenness of turning and certainty of starting. There are no side shafts, cams, or gear wheels, and no exhaust valves. The three-phase generator is for an output of 2,200 volts, 170 amperes, at 25 cycles per second, which, with a power factor of 0·8, is equivalent to 520 kilowatts. The firm also show a Zoelly patent steam turbine, coupled direct to a patent high-lift turbine pump. This set is designed to run at 3,000 revolutions per minute, and the turbine will develop 210 b.h.p. when supplied with steam at a pressure of 160-lbs. per square inch, and condensing. The pump will lift 1,200 gallons per minute against a total head of 400 ft. Another exhibit is a pair of patent high-lift turbine pumps direct-coupled to a direct-current steel-clad motor, placed between the two pumps. The motor runs at 1,060 revolutions per minute, and is capable of giving out 150 b.h.p. The two pumps which have each six successive chambers, through which the water passes, are connected in series, and are capable of pumping 400 gallons per minute against a total head of 720 ft., that is, each of the twelve chambers in series furnishes pressure sufficient to overcome 60 ft. This is at 1,060 revolutions per minute; at 1,450 revolutions the output would be 500 gallons per minute against 1,300 ft., and at 1,850 revolutions 600 gallons per minute against 2,000 ft. head. In addition to this plant the firm also show a large tank constructed of standard-sized cast-iron plates, with accurately-machined external or internal flanges, and several steam-driven pumps. We hope to deal more fully with these and other engineering exhibits in the Franco-British Exhibition more fully at a later date.

ELECTROCHEMISTRY AND ELECTROMETALLURGY

ACCORDING to the *Times Engineering Supplement* there are in France a large number of factories engaged in the production of calcium carbide which are worked by hydro-electric agency, a considerable number of them being situated in the Alpine territory and some of them in the Pyrenees. The whole of the factories are worked under license from the Bullier patents, as these have been shown to be the only valid ones, consequently all the works pay royalties to the proprietors of these patents. Likewise, foreign carbide imported into France also has to pay a license. These patents expire in February, 1909, and after this the French electro-chemical product will no longer be protected against that of foreign producers, which can be manufactured at a much lower rate in certain countries, for example, Norway, where hydro-electric energy is relatively much cheaper; consequently French manufacturers will have to meet with very serious competition, which it will require all their ingenuity to counteract. It is also stated that Mr. Girod, who is well known for his success in the production of ferro-alloys by electric agency, is concerned in the putting down of a very important electric steel plant at Ugines, in Savoy. Mr. Girod intends to make steel directly in an electric furnace specially constructed from designs of his own, and in which the intermediate process of producing cast-iron will be avoided. Furthermore, he will not employ the Martin furnace which has always been used in connection with the electric furnace in steel manufacture, in order to start the reaction, which is finally completed at the higher temperature rendered possible by the use of the electric arc. Advantage will thus be gained by it being no longer needed to use gas-producers in the first stages, and the expense and trouble attendant to this part of the manufacture will be avoided. The works will comprise two 8-ton furnaces and also two 6-ton furnaces.

In the steel factory of Jacob Holzer at Unieux a 2,000-h.p. electric furnace is in course of erection, from which it is intended to produce fine qualities of steel.

Another article in the same number deals with the electrolytic copper industry. We notice from this that the opening up of new copper mining districts in Russia and Australasia has led to a demand for the erection of central electrolytic refineries, to which it is intended to send the raw copper from the various centres in these two countries. Both in Sydney, N.S.W., and also in Moscow schemes are being discussed for meeting this demand in a practical manner. In Australasia a company has been formed and named "The Electrolytic Refining & Smelting Co., Ltd." As soon as a suitable locality and site for these works has been selected building operations will begin. The company has a capital of £150,000, and the offices are situated in Sydney. The Mt. Morgan Gold Mining Co., of Queensland, has a financial interest in the new undertaking. This latter company is now producing large amounts of copper-ore, but it is relinquishing its plans for the erection of a local refinery in favour of the larger scheme. A similar scheme is being pushed forward in Russia, a company having been floated by a group of financiers interested in the industry. According to H. R. Merton the output of raw copper by the Russian mines in 1907 was 15,000 tons, as compared with 10,490 in 1906, while Australasia increased her output from 36,250 in 1906 to 41,250 tons in 1907. The rest of the article deals with subjects familiar to readers of this column.

The Rusting of Iron and Steel.—In a Paper before the Birmingham University Metallurgical Society, Mr. M. Thornton-Murray dealt with the various methods of protecting iron and steel surfaces from the corrosive action of the atmosphere and of moisture. The purely chemical theory of Calvert states that the essentials for the formation of rust are iron, oxygen, carbon dioxide and water, the latter two taking part in a preliminary reaction in which bicarbonate of iron is formed. The bicarbonate interacts with the oxygen of the air to form rust (hydrated ferric oxide), carbon dioxide, and water. The new theory of Dr. Cushman states that the action is electrolytic, and is promoted by irregularities in the metallic surface. The fact that underground pipes under the influence of earth currents tend to corrode more rapidly than others, the greater liability to corrosion of magnetised steel, and of iron or steel in contact with metals electro-negative to iron, such as lead, tin, or copper, point to a very close connection between corrosion and electrical phenomena. The presence of the magnetic oxide of iron or of particles of slag in steel lessens the resistivity to corrosion, but, on the other hand, phosphorus and silicon tend to reduce corrosion. Nickel and other steel alloying metals seem to increase the resistivity. In general, however, it is usual to coat the iron or steel with some protecting material. Tin is an excellent material for this purpose, but directly an opening is made, the corrosion is rapid, as tin is electro-negative to iron. Zinc is better, as it is, electro-positive to iron and thus tends to redeposit on the iron. It is, however, brittle and scales off easily. Electro-plating with copper, nickel, or silver is open to the same objection as was given for tin. For heavy engineering work special anti-rust paints are largely used, and for light engineering work a recently introduced process, known as the Cosbett process, is particularly suitable. In this process the iron or steel article is immersed in a hot phosphorised solution which contains an iron compound. The solution is kept at the boiling point by suitable means. The articles are immersed for three to four hours and then dried and oiled. The surface of the metal after this treatment is converted into a mixture of ferrous and ferric phosphates which has a high resistivity to corrosion and a pleasing dull black appearance.

ELECTRICAL SCIENCE

British and American

Royal Society Conversazione.—Among the exhibits of electrical interest at the conversazione of the Royal Society, held at Burlington House last week, was an interesting collection of recent apparatus shown by Prof. J. A. Fleming. This included the latest forms of his well-known cymometer and oscillation values as used for wireless telegraph receivers, and a laboratory apparatus for exhibiting certain photoelectric effects of potassium-sodium alloys. Other wireless telegraph apparatus included Mr. L. H. Walter's tantalum wave detector. In this instrument a tantalum wire point dipping into mercury forms a detector, which is comparable with the electrolytic detector at 450 miles for all but very faint signals. The sound is several times louder than with the electrolytic when the signals are not too weak, and the tone is very good in wireless telephonic transmission. The same exhibitor also showed a new signalling key for high powers, in which the difficulty of breaking the large currents is overcome by making the break (in the primary circuit of the transformer) take place beneath an aqueous electrolyte between two valve electrodes, normally separated, and actuated by a local key circuit. A model of an early form of magnetic detector was also shown. Mr. S. Cowper Coles showed samples of his new bimetallic projector reflectors (see ELECTRICAL ENGINEERING, April 9th, page 550) and some specimens of pure electrolytic iron. The Rev. F. J. Jervis Smith had on view an apparatus for generating a luminous glow in an exhausted vessel, moving in an electrostatic field and exhibiting the action of a magnetic field on the glow so produced. Other exhibits included a mercury vapour lamp for microscope work shown by Mr. J. E. Barnard, Mr. J. T. Irwin's hot wire oscillographs, and a display of various measuring instruments from the National Physical Laboratory.

New Form of Voltameter.—In the May number of the *Philosophical Magazine*, R. A. Lehfeldt gives an account of his attempts to design a gas "coulometer," or instrument for measuring coulombs by electrolysis. The usual trouble with gas voltameters is that they cannot be used accurately with high current densities. In the instrument described by the present author the two electrodes are held in a cork, which can be inserted into a sort of inverted test-tube. The test-tube has a side limb for pouring in electrolyte till the platinum electrodes are well covered, and a small-bore gas tube runs from the top of the test-tube to a manometer and a gas-measuring apparatus. The manometer is a U-tube containing olive oil, one limb being open to the atmosphere. The gas-measuring apparatus is a vessel out of which mercury can be run from a tap at the bottom. In making a measurement of a quantity of electricity the mercury was adjusted till the oil manometer showed that atmospheric pressure existed inside the apparatus, the current was passed, and mercury was run out to keep the oil manometer level. By weighing the mercury the volume of gas evolved could be estimated accurately. Of course, the temperature was kept as steady as possible by a water-jacket. The author used currents about 0·6 of an ampere, and passed quantities of the order of a thousand coulombs through the apparatus. The mercury that was run out during an experiment averaged between two and three thousand grams. The author tried a great many electrolytes at this current density, using a potentiometer and standard cell method of measuring the current passing. He found that many electrolytes give volumes of gas varying from 33 per cent. to 99 per cent. of the theoretical yield; but if solutions of sodium sulphate, of strength ten to thirty per cent., or solutions of potassium bichromate, of strength five to ten per cent., be electrolysed, almost theoretical yields are obtained. With these solutions the apparatus is reliable and rapid, the error being within one-tenth per cent.

Radioactivity of the Alkali Metals.—The so-called non-radioactive elements were carefully examined by Campbell and Wood, who found that the element potassium possesses the greatest

Digitized by Google

radioactivity. These authors convinced themselves that the faint radioactivity they discovered was an atomic property which was carried through all the salts of potassium (see ELECTRICAL ENGINEERING, Vol. I., p. 564). Later experiments of Campbell led to the opinion that the radiation consisted of β-rays with an average velocity less than the β-rays of uranium. In a letter to *Nature* last week, J. C. McLennan and W. T. Kennedy state that they have made a close examination of the radioactivity of a large number of potassium and other salts, and find themselves unable to support Campbell's conclusions. On the contrary they have found, in the first place, that samples of potassium salts obtained from different sources exhibited widely differing degrees of radioactivity. For instance, two samples of potassium chloride which they examined differed by more than 40 per cent. in ionising power. Similar results were found with samples of potassium hydroxide, and especially with potassium cyanide. In the second place, while metallic sodium and several sodium salts did not, in their experiments, exhibit radioactivity, yet a sample of sodium chloride obtained from rock salt showed an activity comparable with that of many potassium salts. In the third place, none of the samples of lithium salts obtained and examined by the authors showed the slightest trace of radioactivity, while samples of rubidium alum and of cæsium chloride were very slightly active. Thus we have to conclude that great doubt exists as to the possession of radioactivity by the alkali metals.

Continental

An Automatic Photometer.—Most photometers are "ocular," meaning that comparisons of brightness are made by the eye. To eliminate this necessity, it has been proposed to employ a selenium cell, a bolometer, or other instrument sensitive to radiant energy. But all such instruments suffer from the drawback that their colour-sensitiveness is not the same as that of the human eye. This might be rectified by analysing the light spectroscopically and stopping down the various radiations in the requisite proportions. But, fortunately, the same result may be obtained in a much simpler manner by a screen consisting of a solution of acetate of copper. In Bulletin No. 278 of the French Physical Society, C. Fery proposes to employ such a screen for the automatic recording of luminosities. The maximum sensitiveness of the eye is at wave-length 540 mm., which is therefore the brightest region of the spectrum. It is only necessary to graduate the strength and thickness of the solution in such a manner that the recording instrument shows the maximum reading at that wave-length. Then the colour-curve is the same as that of the human eye. As a recording instrument, Boys' radiomicrometer is most suitable. It is sensitive enough to record to 0·1 to 0·4 per cent. of light transmitted by the solution, and gives a deflection of 60 mm. per candle at 1 metre.

Dysprosium more Paramagnetic than Iron.—G. Urbain claims to have proved that the first place among the paramagnetic elements belongs, not to iron, but to an element called dysprosium. This is one of the yttrium group of rare earths, and was discovered by Lecoq in 1886. Crookes only found one band in its spectrum ($\lambda=451$), but the author has succeeded in locating no less than 90 lines in the ultra-violet, of which he gives a list in the *Comptes Rendus* for May 4th. In fact, he maintains that this element is richer in lines than any element of the rare earths. He has obtained the element in a "pure" state, from which nothing else can be extracted by further fractionisation. He determined the magnetisation of its oxide, $Dy\,O_3$, by means of Curie's magnetic balance, and compared it with that of cobalt sulphate. The magnetic susceptibility of the latter is $39{\cdot}7\times10^{-6}$. That of dysprosium oxide is 290×10^{-6}. It is 12·8 times more magnetic than the magnetic iron oxide Fe_3O_4. Meyer obtained some susceptibilities almost as high with a substance called "holmium," but Urbain regards this substance not as an element, but as a mixture of yttrium, erbium, dysprosium, and some doubtful metals of the rare earths.

X-ray Test for Infant Life.—In the *Comptes Rendus* for May 4th, C. Vaillant proposes to use Roentgen rays for testing whether alleged still-born infants have lived even for a few hours after birth. From a large number of radiographs he draws the conclusion that no details of internal organs can be obtained from any still-born infants whatever, no matter how the exposure is graduated. The most pronounced effect of respiration is to bring the stomach within the range of radiography. It is the first of the internal organs to appear, and ranges in size from a pea to a large bean. The respiration of the next ten hours makes the stomach larger and more transparent. At the end of that time the large intestine begins to appear on the radiographs. When life continues for several days, but without food, the liver appears clearly, and the heart in a blurred outline. The lungs also become transparent, but that is not so certain. When the infant has been fed for several days, all the organs become more or less visible. The gases in the intestine enlarge it and favour a clear image. In all these observations the meconium plays no part. The new test should be of considerable importance for purposes of medical jurisprudence.

This year's meeting of the French Association for the Advancement of Science will take place at Clermond-Ferrand about the beginning of August. Sir William Ramsay has promised to lecture on his recent discoveries. The association's office is at 28 rue Serpente, Paris.

The First International Congress of Refrigerating Industries (*Congrès des Industries Frigorifiques*) will take place at the Grand Palais, Paris, towards the end of September. For both these meetings the French railways issue tickets at half the ordinary fares.

Institution Conversazione and Dinner.—It was announced at the Institution of Electrical Engineers on Thursday that the annual conversazione will take place on Thursday, June 25th, and the annual dinner on Thursday, October 22nd.

Central London Railway.—In our article on the extension of this station last week, we should have made it quite clear that Messrs. Balcke & Co., not only supplied the interior of the cooling tower, but that the whole tower was Messrs. Balcke & Co.'s original design.

Institution of Electrical Engineers.—The following is the result of the ballot of new members at the meeting on Thursday:—Associate Members: W. N. Cochrane, P. Cordiner, P. L. Davis, H. W. Edwards, H. A. Fleet, J. A. Fraser E. H. Rhodes, W. V. Waite. Students: H. R. Climie, I. K. Kaul, W. T. Magrath, W. Pate.

The Association of Teachers in Technical Institutions.—The second annual conference of this Association will be held in London at Whitsuntide. Papers will be read on various educational subjects on the Saturday, Monday, and Tuesday, and Wednesday, June 10th, will be devoted to an excursion.

Obituary.—At the meeting of the Institution of Electrical Engineers on Thursday Mr. W. H. Patchell, who was in the chair, announced the death of the Very Rev. Father Lafont, Professor of Physics at the St. Xavier's College, Calcutta. Mr. Patchell stated that Father Lafont was better known to them in connection with the Calcutta Local Section of the Institution of Electrical Engineers, of which he had been chairman for many years.

Telephone Charges.—An action was brought by the National Telephone Co. against G. H. Openshaw & Co., of Old Trafford, at the Salford County Court last week. The claim was for £4 for rent of apparatus, and £1 10s. for calls for this year, and 5s. 6d. for excess calls last year. Under the agreement the rent was payable in advance, and as the defendant had not paid he was cut off on February 27th. The judge decided that the company was entitled to the £4 for rent and the 5s. 6d. for excess calls last year, but not to the £1 10s., which, although generally paid as a deposit in advance, was not mentioned in the agreement as having to be paid in advance.

Damage to City Electric Light Standard.—In the Court of Appeal on Friday last the case of the City of London Electric Lighting Co. *v.* the Vanguard Motor 'Bus Co. was heard before Sir Gorell Barnes and Lord Justices Moulton and Farrell. Both parties appealed against the judgment of Mr. Justice Ridley in the King's Bench Division of the High Court. (See ELECTRICAL ENGINEERING, April 2nd, p. 507.) The jury found that there was negligence on the part of the driver on the occasion of the first accident, but that the vehicle was not a legal nuisance. Judgment was entered for the plaintiffs for £43 3s. 4d., being the amount attributable to the accident. Their lordships held that this verdict was unsatisfactory, and ordered that there should be a new trial.

Electrical Engineering in India.—A report to the Bengal Chamber of Commerce by Mr. C. E. Low, of the Industrial Survey, extracts from which are reproduced in the *Journal of the Society of Arts*, reviews the industrial situation in the Central Provinces in connection with an exhibition of the products and manufactures of the Central Provinces and Berar, which it is proposed to hold at Nagpur in November next. The question of electrical driving of cotton mills is alluded to, and it is remarked that there are four or five spinning and weaving mills of fair size in or near Nagpur, as well as the Empress Mills of Messrs. Tata. Messrs. Petit are just taking over and re-starting on a large scale another mill. The Empress Mills are already partly run by electricity. A scheme for electric lighting in Nagpur city is on foot, and, in any case, electric lighting for the Government offices cannot be long delayed.

Wireless Telegraphy.—According to an American Consular report two wireless telegraph stations have been established in the vicinity of Vancouver. One station is situated at North Vancouver, just across Burrard Inlet. The other is at Point Gray, some seven miles distant. These stations promise to be of great service to the trade between Vancouver, Puget Sound ports, and Alaska.

Experiments are being made by the United States Government to determine the possibility of installing wireless telegraphy apparatus in balloons. Balloons with receiving apparatus have already been used successfully, but owing to the risk of an ignition of gas experiments have not yet been made with transmitting apparatus on board.

The amendment to the law of 1892 relating to the telegraph system in Germany has been published. By this amendment wireless telegraphy is included, and in future no wireless telegraph installations can be erected without the consent of the Government. The law applies also to German vessels on the high seas, and regulations governing the use of installations on foreign vessels within German waters are to be framed.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 14th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.
Names in brackets indicate communicators of inventions from abroad.

1907 Patents

8,951, W. J. DAVY. An automatic switch to use in connection with small transformers for metallic filament lamps. A solenoid acting on an iron plunger is connected to one of the house mains, and also to one of the supply mains. The remaining house main is connected to the other supply main through a resistance. On closing any one lamp circuit, a current flows through the solenoid, and the plunger descends, closing a switch in the primary circuit of the transformer. The solenoid circuit is at the same time broken. An auxiliary solenoid in series with the secondary circuit keeps the plunger from rising. If all lamps are switched off, the auxiliary solenoid ceases to act, and the plunger rises, breaking the primary circuit of the transformer. Six claims, two figures.

12,139, F. J. PLANCHON. The preparation of metallic filaments for electric lamps. An alkaline solution of tungstic or molybdic acid is mixed with an aqueous or alkaline solution of an albuminoid substance, as gelatine or casein. The mixture is poured into dilute hydrochloric acid and a precipitate appears which is a compound of the tungstic or molybdic acid and the albuminoid substance. The precipitate is mixed with water to form a plastic mass, which is squirted into filaments. The filaments are reduced to purely metallic filaments in a vacuum or inert gas by raising to a high temperature by means of an electric current. Filaments prepared in this way are stated to be very regular as regards dimensions and resistance. Three claims.

15,171, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). A method of coating armature or transformer laminations with an insulating film. Gum copal is ground in water until a colloidal solution is formed. The solution should contain about 20 per cent. by weight of copal. The air-bubbles in the solution may be dispersed by adding a few drops of 10 per cent. solution of barium hydrate or chloride. This causes a precipitation of the copal, but by stirring a uniform and practically permanent suspension is again obtained. The addition of a little sodium hydrate will prevent any precipitation. The solution is then applied to the laminations by spraying, rolling, or dipping, the last-named having been found best. After draining, the plates are heated in an oven to between 100°C. and 200°C. The water is driven off, and the gum melts, forming a thin adherent coating, which does not crack if the iron is bent, and which does not easily flake off. Three claims, no figures.

16,166, J. S. HIGHFIELD. The application of the fly-wheel storage principle to the direct-current series system of power transmission, for the purpose of equalising the load on the generators when the motors are working intermittently. A control motor consisting of a series motor coupled to a heavy fly-wheel is connected in series with the main circuit. The brushes of this control motor are rocked by a series solenoid device, so arranged that on an increase of the current, the brushes are rocked into the working position, so that the motor and fly-wheel speeds up, and generates a back E.M.F. in opposition to the generator E.M.F. If the back E.M.F. of the motor at full speed is made just a little below the generator E.M.F., the speed will rise until normal line current flows. If this is impracticable, the generator E.M.F. can be reduced by the action of a governor on the control machine, which may operate a lever connected so as to increase the resistance in the generator shunt field at high speeds. If a motor on the system is suddenly started up, the line current is reduced, due to the back E.M.F. of this motor, and the brushes of the control machine are rocked round by the solenoid device to the non-working position, reducing the back E.M.F. of the control machine. If the line current is further reduced, the brushes are rocked further, so that the control machine becomes a generator and delivers energy to the system so long as the fly-wheel rotates. If the load is so prolonged that the control machine stops altogether with its brushes in the full generating position, the machine would start up in the wrong direction on an increase of line current. This result is avoided by the addition of a device to instantly rock the brushes to the non-working position on a reversal. A single control machine, with a suitable flywheel and situated in the station, will keep the current constant in the system so long as the variations are within the limits permitted by its range of speed. Five claims, one figure.

17,046, J. E. NEWMAN and L. LODGE. A method of employing electricity for stimulating vegetable growth. Rows of galvanised iron wires (about No. 20, S.W.G.) are arranged on insulators about 12 to 16 feet above the ground, and about nine yards apart. A continuous discharge to earth is obtained by connecting this network to one terminal (preferably the positive) of an induction coil, giving a pressure of 100,000 volts. Valves or rectifiers (of the Lodge type, for instance) are inserted in series, and to prevent surgings of current a choking coil also. The other terminal of the coil is connected to earth. The apparatus should be protected from lightning by a spark-gap between the network and earth. An increase in the amount of available nitrogen in the soil, and a marked increase in the crops, is obtained. Three claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.
Summaries of the more important of these patents will appear in our next issue.

1906 Patent

21,347, FELTEN & GUILLEAUME LAHMEYERWERKE AKT.-GES. Electric signalling apparatus.

1907 Patents

9,390, SIMPSON. Electric-vehicle or locomotive brakes.
9,434, MAINPRIZE. Combination fuse and switch.
10,367, COWPER-COLES. Electro-deposition of iron.
10,636, BLACK & BLACK. Electric traction installations using contact boxes.
10,650, DAWSON & BUCKHAM. Electrical apparatus for transmitting and receiving signals.
13,882, LOWDEN & WESTINGHOUSE METAL FILAMENT LAMP CO. Electric lamps.
16,051, SIEMENS BROS. DYNAMO WORKS & W. PARKER. Dynamo-electric machines.
19,378, WHITTAKER. Sanding apparatus for use with tramcars.
19,758, POOLE. Means for controlling mechanism operating rheostats.
19,855, BOYDEN. Electrical switches.
22,224, ZANDER (*Held*). Case for electric indicators.
25,961, HOSKEN. Automatic sand-valve opener for tramcars.
28,142, SIMMS MANUFACTURING CO. & ALTREE. Sparking plugs for internal-combustion engines.

1908 Patent

1,427, DE FOREST. Space telegraphy.

Complete Specifications open to Public Inspection before Acceptance.

1908 Patents

4,948, HOWARD. Alternating current transformers.
8,287, FELTEN & GUILLEAUME LAHMEYERWERKE AKT.-GES. Transporting apparatus.
8,415, NOBGGERATH. Dynamo-electric machines.
8,416, WOLFRAM-LAMPEN AKT.-GES. Incandescent filaments for electric incandescent lamps.
8,904, BOUNEAU. Electrical furnaces.
9,146, AKT.-GES BROWN, BOVERI, ET CIE. Electric transformers.
9,257, ALLGEMEINE ELEKTRICITÄTS-GES. Devices for protecting transformers, cables, and other electrical apparatus.

Applications for Amendment

Further particulars and instructions as to procedure in opposition to amendment will be found in the Official Journal of the Patent Office of May 13th.

23,942 of 1896. THE BRITISH WESTINGHOUSE ELECTRIC AND MANUFACTURING CO., LTD. seek leave to amend the specification numbered as above, granted to R. BELFIELD, for "Improvements in electric switches and circuit breakers," in order to limit and to define more clearly the scope of the invention. The proposed amendment consists in striking out much of the specification, including Claims 1 to 4 and 6.

21,892 of 1904. F. M. LEWIS seeks leave to amend the specification numbered as above, for "Improvements in electric arc lamps," in order to define more clearly the scope of the invention. The proposed amendment consists in striking out Claims 3 and 5 to 8, also Figs. 1 and 3 to 6.

4,922 of 1908. C. H. STEARN and C. F. TOPHAM seek leave to amend this specification, for "Improvements in connection with electric lamps and their circuits," by including H. W. HANDCOCK and A. H. DYKES as applicants for a patent.

Expiring Patent

The following patent expires during the current week after a life of fourteen years :—

10,292 of May 28th, 1894. J. MANGER and E. MOJON. The use of an electric lamp, fitted in the case of a watch, clock, barometer, compass or similar instrument, to illuminate the dial.

LOCAL NOTES

ACCRINGTON: *Lighting and Tramways.*—In his yearly budget last week, Mr. J. C. Lupton, Chairman of the Accrington Finance Committee, remarked that during the year the energies of the Council had been devoted mainly to the conversion of tramways to electric traction. That had meant that some work had been deferred, particularly highway repairs. In such cases the money had been ear-marked and placed in reserve for subsequent years. Provision had also been made for rearranging the street lighting on the main roads, consequent upon the erection of the tramway standards, and it was intended to improve the lighting greatly by fixing lights to standards and taking out a considerable number of street lamp pillars.

ALLOA: *The Electricity Undertaking.*—It was reported, at a meeting of the Town Council, that the loss on the electricity undertaking for the last five years had been £2,576. In 1907 the amount paid to the British Electric Plant Co., Alloa, for current was £1,081, and this was retailed to consumers at £1,159, showing a gross profit of £78. Deducting sinking fund and mortgage interest, the loss for the year was £573.

ARGENTINE: *Cordoba.*—The Cordoba Electric Tramway Construction Co. have, says the *Review of the River Plate*, applied to the municipality for an extension of six months in which to comply with some of the terms of their concession. They state that as soon as the concession was obtained, they took the necessary steps to float the company, but the crisis in the European Money Markets made this temporarily impossible. The company has purchased the Argentine tramway system, and has also acquired land for generating stations, having spent about $500,000. There is some local opposition to the application.

AUSTRALIA: *Water Power Plant.*—A scheme is under consideration for the lighting of Coburg and other municipalities by electricity from a water power plant on the Yarra River, near Warrandyte. According to the *Melbourne Argus*, it is estimated that, by the construction of a weir 80 ft. long and a tunnel 600 ft. long, over 1,500 h.p. would be available.

AYR: *Extension to Alloway and Prestwick.*—In view of the conditions imposed by the various local authorities, the Electric Light Committee has recommended the Council not to proceed with the scheme.

BARNES: *Tramways.*—The District Council at its last meeting discussed an offer by the promoters of the West London, Barnes & Richmond Tramways Bill with regard to street widenings. The promoters offered (*a*) to make the Council an immediate payment of £45,000 in respect of street widenings, or (*b*) that the Barnes Council should raise £75,000 for the purpose by loan, the company to guarantee the repayment of principal and interest, the Council's security to be a first charge on the entire undertaking, including the part outside their area. This proposal would provide for a road 45 ft. wide throughout the route of the tramways in the town. In reply to this offer, a resolution was moved that it be referred to the Tramways Committee to consider as to the best means of developing a service of electric trams, but the motion was rejected by 13 votes to 7.

BELFAST: *Tramways.*—At the meeting of the Tramways and Electrical Committee, on the 18th inst.—Sir Robert Anderson, Lord Mayor, presiding—a letter was read from Mr. Rodden, of the Whitewell and Cavehill Tramway Co., stating that, having considered the Council's resolution relative to the establishment of a through service between Castle Junction and Glengormely, and also the terms of the Manchester-Oldham agreement *re* the distribution of fares, they were prepared to accept in principle the Corporation's proposal. The question of details, it was suggested, could be left between the manager and a representative of the company, and this was finally decided upon.

BIRMINGHAM: *Tramway Accounts.*—The gross profits for the first complete year's working of the Corporation Tramways were announced on Tuesday to be £121,000, of which a balance of £72,000 remains after meeting capital charges, &c.

BLACKBURN: *M.E.A. Meeting.*—The Town Council have deputed Mr. Higham, Vice-Chairman of the Electricity and Tramways Committee, and Mr. P. P. Wheelwright, Electrical Engineer, to represent the Blackburn Corporation at the Nottingham Convention of the Incorporated Municipal Electrical Associations at the end of June.

BURNLEY: *Tramways.*—Mr. Harry Mozley, tramway manager, issued his annual report last week-end, in which he mentioned that the proportionate increase in receipts of previous years had not been maintained, but there was the substantial increase of 388,460 passengers, and £1,562 2s. 11½d. receipts. Parcel receipts showed a satisfactory increase of £58, and now amounted to £680 per annum. The growth in traffic had necessitated additional rolling stock, and during the year an experimental car had been constructed, and was still undergoing trials, the object being to obtain a more economical car for working special lines than the four motor equipments now in use. During the year the whole system had been cleared of corrugations, at a total cost of £615 2s. The length of rail ground was 57,700 yards, and percentage of rails corrugated 83 per cent. The cost of energy was less, owing to the reduction in the charges of the Electricity Committee from 1⅜d. to 1¼d. per unit. Double helical gears and pinions were being experimented with to lessen the noise. The depreciation fund amounted to £32,608 9s. 3d., bringing the fund up to the full annual average (£6,000 per annum) required. If profits were maintained as hoped, a substantial sum should be available for the purpose of the Corporation in future years. The question of covering the tops of the cars was receiving attention.

BURY: *Electricity Accounts.*—The units sold for lighting and power during the year ended March 31st, 1908, amounted to 1,440,659, an increase of 37·7 per cent. over the previous year. The amount supplied to the tramways has shown an increase of 27 per cent., and totalled 1,230,799 units. The profit on the year's working is expected to be £3,950, as against £2,947 for the previous year. The engineer has been instructed to prepare plans for further testing rooms, and office accommodation at the electricity works.

CHESHUNT: *Light Railway.*—The construction of the light railway at Cheshunt from the Herts county boundary to a point about 80 yards south of Queen Eleanor's Cross, Waltham Cross, is now in progress, and will shortly be completed.

CHISLEHURST: *Extension of Mains.*—The Chislehurst Electric Lighting Co. have extended their mains from Heatherbank to Summer Hill.

CLACTON: *Appointment of Electrical Inspector.*—Mr. H. E. Harrison has been appointed Electrical Inspector under the Clacton Electric Lighting Order.

DARLINGTON: *Supply to the Tramways.*—It has been decided to reduce the charge for electricity supplied to the tramway department from 1¼d. to 1⅛d. per unit.

DOVER: *Archcliffe Fort.*—The new generating station in the trenches behind Archcliffe Fort is now approaching completion.

EDINBURGH: *Leith Tramways.*—At a meeting last week of the Tramways Committee it was stated that the difficulties regarding certain clauses in the Bill relating to tramway extensions at Leith had been adjusted, and that the Bill would very shortly come before Parliament.

FOLESHILL: *Power Supply.*—The Council has approved of an agreement for the supply of power to the Newdigate Colliery Co., at 4d. per unit, with a minimum payment of £40 per annum, the contract to be binding for ten years, after which it is to be terminable at six months' notice from either side.

GLASGOW: *Tramway Undertakings.*—A report has been prepared by the Town Clerk and the tramways manager, in which is considered the relation of the tramway department to the "Common Good," the financial position of the department, and the position of the sinking fund. The report states that, as the undertaking is a part of the Common Good estate, an abstract of the revenue and expenditure is given in the balance sheet of the Common Good. The report, however, does not consider that this serves any useful purpose, and recommends its discontinuance. The total amount of borrowing powers on May 31st, 1907, was £3,100,000, since which the sum of £41,862 has been sanctioned. Additional borrowing powers will be necessary, however, as the Tramways Committee have decided to increase the number of cars and install additional machinery at the Pinkston power station. The sum borrowed from the Common Good to March 31st last year was £2,246,114, but by the operation of the sinking fund the amount outstanding is £1,679,997, which will be entirely wiped off by 1930. The capital expenditure for the same period is £3,104,060, thus showing an excess of expenditure over borrowing powers, but it does not include any portion of the expenditure of the old horse tramways, the cost of which has been entirely written off. The revenue per car mile in 1907 was 10·47d., and for the current year to date 10·46d., and it is the aim of the department to keep as near 10·5d. as possible. The depreciation and renewals fund stands at £1,079,253, which in the light of the capital of expenditure is considered about correct. On the question of sinking fund, the report recommends that the wishes of the Scotch Office in regard to sinking fund on capital temporarily borrowed from renewal and depreciation fund be acceded to, this taking effect as from June 1st, 1907.

GRIMSBY: *Electricity Accounts.*—The Borough Electrical Engineer submitted his annual report on Monday. A profit of £2,442 has been made, in spite of a temporary set-back to the revenue due to the increasing use of metallic filament lamps and the high price of coal.

HARROW: *Church Lighting.*—Electric lighting has been installed at the new Baptist Church at Harrow. The nave is lighted by 12 Osram lamps of 50 c.p. each, and in the side aisles beneath the galleries, as well as for the galleries themselves, 16 c.p. Tantalum lamps are used.

HASLINGDEN: *Tramways.*—A deputation from the Haslingden Corporation on May 15th met representatives from the Accrington Municipality with a view to arrangements being made for the running of electric cars to and from Haslingden. The Haslingden Councillors inquired whether Accrington would be willing to run its cars over the length of the line now

Digitized by Google

being made in Haslingden borough, and, if so, on what terms for the cars and the current necessary for motive power. Accrington offered the service at 7½d. per car-mile for three months; for six months, 7¼d.; and for twelve months, 7d.; Haslingden to find its own inspectors and take the responsibility for risks to third parties. Haslingden asked if Accrington would accept for nine months the price quoted for twelve. Accrington agreed, and the deputation decided to recommend their Corporation to accept the terms.

IPSWICH: *Electricity and Tramway Accounts.*—The report of Mr. Frank Ayton, Borough Electrical Engineer, states that there has been an increase of revenue in the Electricity Department of 2½ per cent. for the year ended March 31st, as compared with the previous year, although the average price obtained per unit had declined from 4·181d. to 3·755d. The lighting connections had increased 30 per cent. and the power connections 56 per cent. The increased cost of coal is commented on, and it is mentioned that capital expenditure amounting to £1,315, mostly for extensions to mains and services, had been incurred during the year. The traffic expenses of the tramways have been reduced from 2·305d. to 2·699d. per car mile.

LLANELLY: *Provisional Order Transfer.*—The Council has decided to affix its seal to an agreement with the Llanelly and District Electric Light & Traction Co., which transfers the Council's electric lighting order to the company. A generating station is to be erected within two years.

LONDON: *Bermondsey.*—The monthly report of the units generated and sold continues to show large increases. During April, 255,163 units were generated, showing an increase of 50 per cent. over the corresponding period in 1907. The Engineer has been authorised to arrange special terms for the supply of current to the Motor Radiator Co., Tanner Street.

G.B. Surface Contact Tramways.—At the Tuesday meeting of the L.C.C., Sir John McDougall asked the Chairman of the Highways Committee whether he would present a full report on the G.B. system of traction in Whitechapel Road, before the Whitsun recess. Mr. Gordon asked whether any accident had occurred resulting in injuries to horses in the Mile End Road, and whether there had been any damage to the surface of the road by explosions. Mr. W. W. Thompson, Chairman of the Highways Committee, in reply, said that the section on the G.B. system was still in the experimental stage, and had not yet been passed by the Board of Trade, so that he could give no report before Whitsun. A horse had come into contact with a live stud, and the animal had got staggers, but without fatal result. There had also been a large escape of gas in the Mile End Road, which was the fault of the Gas Company, and the soil was impregnated with gas. Until this was overcome, it would be impossible to run any cars.

Hackney.—Twelve of the twenty-four sections of tubes on the inlet side of the Green's fuel economiser have lately been replaced at a cost of £100, but when the annual inspection and hydraulic pressure test were made it was found that it would be advisable to replace at once the remaining twelve. The inlet side will then be as good as new, and the best of the sections taken out will be used to replace sections on the outlet side at some future date. While the economiser is out of commission the coal consumption is increased by about £10 per week, and as the matter is one of urgency the Electric Lighting Committee have instructed the Engineer to proceed with the work, ordering such material from Messrs. Green & Son as is necessary. The cost of the additional work is £98.

Stepney: Electricity Accounts.—The accounts of the Borough Council's electricity undertaking for the twelve months ended March 31st show the capital outlay on the undertaking to that date to have been £287,960 10s. 1d., and that of this amount £22,888 4s. was spent during the year under review. The capital account shows the intention of the Electricity Supply Committee to write off the account the sum of £547 4s. 11d. out of last year's profits. This amount, added to that already written off, will reduce the value of the capital expenditure in the balance-sheet to £279,614 1s. 7d. The net result of the trading account shows a balance of income for the year over expenditure of £17,102 8s. 3d., and an increase in the number of units sold from 4,751,182 to 5,712,684, producing an income of £38,655 6s. 3d. This income includes the sum of £5,768 15s. 3d., in respect of public street lighting, and a further £848 1s. 8d. in respect of the sale of current to other departments of the Council. The units sold were made up as follows:—Private consumers, for lighting, ordinary charges: 274,755 units at 8d., 746,518 units at 1d.; charge to consumers with minimum annual bill of £120, 305,667 units at 6d., 1,199,782 units at 0·9d.; private consumers for power and heating, flat rate: 1,034,237 units at 1d.: alternative charges to consumers with minimum annual bill of £120, 811,168 units at ½d., and 5s. per h.p. per month demanded: private consumers in bulk for lighting, power, and heating: 22,564 units at 5d., 231,465 units at ¾d.: Council for public street lighting: 79,731 units at 6d., 1,006,797 units at 0·9d. The total income derived from all sources, minus bad debts, was £41,449 5s. The trading account shows that, compared with the previous year, the income has increased by £4,457 2s. 10d., and the expenditure by £3,280 16s. 5d. Although the expenditure has increased in total, per unit sold it has actually decreased, being 0·924d. per unit, as against 0·965d. the previous year. To the balance of income for the year over expenditure has to be added minimum guarantees, and the interest from bankers and investments, making a total of £17,480 9s. Deducting from this amount the interest paid and accrued during the year on mortgage debt, amounting to £10,075 1s. 5d., or £1,676 4s. 9d. over that of the previous year; instalments of loans, amounting to £5,207 11s., or £271 5s. 6d. over that of the previous year; and the cost of executing temporary work, amounting to £269 17s. 8d., there remains £1,927 18s. 11d. Of this last-named sum, which represents the actual surplus made during the year, the Electricity Supply Committee has decided to place £1,000 to reserve account, £200 to another reserve account for bad and doubtful debts, and to carry forward an unappropriated balance of £180 18s. 11d. The average income per unit sold for all purposes has decreased from 1·746d. to 1·624d.—a decrease of 7 per cent. The average charge made by all the companies and local authorities of London is 2·86d. per unit.

Willesden: Bulk Supply.—The Electricity Committee, after considering the report of their Chairman, the Clerk, and the Electrical Engineer upon an interview with the officials of the North Metropolitan Electric Power Supply Co., have come to the conclusion that revised terms submitted by the Company for current supplied in bulk should not be accepted. Further negotiations are proceeding.

Woolwich.—The Borough Council having informally approached the L.C.C. for sanction to a loan for the acquisition of the freehold of the Globe Lane works and adjoining property at Roff's Wharf for the purposes of the electricity undertaking, have been informed that the Finance Committee of the London County Council are prepared to recommend the Council in due course to sanction a loan for the purpose.

MANCHESTER: *Cable Box Fire.*—On Monday there was considerable excitement at the bottom of Market Street, occasioned by a short circuit in a service box in front of Cromwell Buildings. Flames and smoke were observed, and it is said that there was a slight explosion. No damage was done however; the fire brigade were in prompt attendance, but it was unnecessary to start the hose.

MUSSELBURGH: *Public Lighting.*—The National Electric Construction Co. have offered to replace the arc lamps now in use, which have given some trouble, with new lamps of a make to be approved by the Council. The Cleaning and Lighting Committee have been empowered to take advice as to a satisfactory form of lamp. The matter arose through a refusal of the Council to pay the quarterly lighting account in consequence of complaints as to the lighting.

NELSON: *Profits on Electricity Department.*—It was resolved by the Nelson Town Council on May 14th that the profits of the Electricity Department for last year, £590 0s. 8½d., be disposed of as follows:—£250 in aid of general district rate and £341 0s. 8½d. in reduction of capital indebtedness on old works.

NEWCASTLE: *Tramways.*—Mr. E. Hatton's report for the year ended March 31st records a net profit of £19,477. The total working expenses have increased from £107,318 in the previous year to £116,852. The total receipts amounted to £205,322, or an average of 11·17d. per car mile, as compared with 11·56d. for the previous year. The total car miles run were 4,411,745, as against 4,263,174.

The new line from Trafalgar Street to Market Street, described in an illustrated article in ELECTRICAL ENGINEERING, April 9th, page 552, has been inspected by Colonel von Donop, of the Board of Trade, and will be opened for traffic in a day or two.

SOUTHEND: *Electricity Accounts.*—The profit on the electricity undertaking for the past year has been £2,200, as against £946 for the previous year.

TOTTENHAM: *New Sub-station.*—The North Metropolitan Electric Power Supply Co. propose to use the "pound" in Tottenham Hale as an electricity sub-station.

YARDLEY: *Supply to the Tramways.*—An agreement has been drawn up with the City of Birmingham Tramways Co. for the purchase of the plant of the power station in the Coventry Road, Yardley, and the supply of electric energy for the working of the tramways. The Council agreed to purchase the plant at the power station at Yardley for £12,500, and to pay for any additional plant that might become necessary between the signing of the agreement and taking possession.

Dublin Local Section of the Institution of Electrical Engineers.—The following officers and committee have been elected for the ensuing session:—*Chairman:* Mr. G. F. Pilditch (Resident Engineer, Electricity Works, Rathmines). *Vice-Chairman:* Mr. W. Brown (Royal College of Science, Dublin). *Committee:* Mr. N. Hosgood (Electricity Works, Pembroke), Mr. S. T. Land, Mr. A. Moir (Post Office Telegraph, Dublin), Mr. M. Ruddle (City Electrical Engineer, Dublin), Mr. P. S. Sheardown (Electrical Engineer, Dublin United Tramways Co.), Mr. W. J. U. Sowter (Borough Electrical Engineer, Bray), Mr. W. Tatlow, Mr. R. M. Tweedy (Messrs. W. Coates & Son), Mr. A. W. Wheildon (Chief Electrical Engineer, Great Northern Railway of Ireland). *Hon. Sec.:* Mr. T. Tomlinson.

TENDERS INVITED AND PROSPECTIVE BUSINESS

CHELTENHAM.—There was no opposition at a Local Government Board inquiry last week into an application by the Corporation for sanction to borrow £660 for the construction of a railway siding at the electricity works. At present coal has to be carted a distance of about a mile.

CROYDON.—The tramways manager has reported the necessity of replacing a tramways feeder cable, the insulation of which is in a bad conditions, with one of larger dimensions (2,450 yards of 0·5 cable), at an estimated total cost of £1,076 18s. 7d. When put in, the feeder cables were provided for a maximum service of 40 cars, but the normal service is in excess of this, and at week-ends there is a service of 60 or more. It is proposed to transfer the present positive cable to the negative side, so that this, together with the present negative cable, shall equal the new feeder in carrying capacity. At its last meeting, the Town Council adopted the recommendations of the tramways manager, which were previously endorsed by the tramways committee. Plans, specification, and estimate are to be prepared for the doubling of the single track between the Whitgift loop and the new loop recently constructed in North End. According to a report of the Borough road surveyor, the work would necessitate new track to the extent of 120 yards, which, at £4 10s. per yard, would cost £540. A surplus portion of the land required for a new electricity sub-station, which has now been erected, is to be sold, subject to protective conditions.

DARTFORD.—Tenders are invited for a surface condensing plant. Particulars from the Borough Electrical Engineer, fee £1 1s. returnable, and tenders to the Town Clerk by June 3rd.

EXETER.—An application is to be made for sanction to borrow £8,000 for extensions of mains.

FINCHLEY.—Mains are to be extended in Dudley Road and Westbury Road at a cost of £162.

GLASGOW.—A report by Mr. James Dalrymple, manager of the tramway system, deals with the question of extensions. The report recommends the construction of new lines to the extent of over 35 miles, at an estimated cost of £557,225. This will involve an annual expenditure on capital account of £55,722. A sub-committee of the tramways committee which has dealt with the report specifies a certain number of lines, which it thinks should be put in hand immediately.

GREAT NORTHERN RAILWAY CO.—Tenders are invited for stores during the twelve months from July 1st, 1908. Particulars from the Stores Superintendent, Doncaster, and tenders to the Stores Committee, King's Cross, by May 25th.

HANDSWORTH.—Tenders are invited for low-tension, lead-covered paper-insulated distributing cables. Particulars from the Electrical Engineer, and tenders to the Town Clerk by May 25th.

HORNSEY.—The Local Government Board has sanctioned the borrowing of £10,000 for the Council's electricity undertaking.

ILFORD.—Tenders are invited for surface condensing plant and cooling tower, steam and feed pipes, boiler feed pump, &c., and extensions and alterations to main switchboard. Full particulars from Mr. A. Shaw, Electrical Engineer to the Council, Electricity Works, Lea Street, Ilford, and tenders to the Chairman of the Urban District Council by June 10th. (See an advertisement this week.)

JAPAN.—A company has been formed, with a capital of £206,500, for the purpose of constructing an electric railway, 26 kilometres long, from Moji, through Kokura and Yawata to Kurosaki, as well as a branch 9 kilometres long from Kokura through Tobata to Yawata.

KILMARNOCK.—Tenders are invited for a Lancashire boiler in connection with the electricity undertaking. Full particulars from the Borough Engineer, to whom tenders by May 25th.

LONDON: *London County Council.*—The Highways Committee of the Council recommend an expenditure on capital account of £45,330 in respect of:—(1) The reconstruction on the overhead trolley system of the existing tramways from Wanless Road, via Hinton Road, Milkwood Road, Half Moon Lane, and Norwood Road, and to the existing terminus at Norwood; and (2) the construction on the same system of traction of the authorised diversion or loop lines along Herne Hill Road, Wanless Road, Poplar Walk Road, and Lowden Road. The estimate is made up as follows:—Track work, excluding rails, £35,400; overhead equipment, £6,490; cable duct and feeder pillars, £3,200; sub-station equipment, £240. The total length of tramways proposed to be dealt with is equivalent to about five miles of single track.

The Highways Committee have reported upon the purchase of the Lea Bridge, Leyton, and Walthamstow Tramways Co., within the County of London, to the extent of about three-eighths of a mile. At present the Leyton Urban District Council is working this section by horse traction, but it is now proposed that it should be converted to overhead traction, and that it should be leased to the Leyton Urban District Council until August, 1911. The terms of the lease are that the District Council shall pay to the County Council an annual rent made up as follows:—(*a*) One fifty-ninth part of the total cost of the acquisition; (*b*) one twenty-fifth part of the total cost of the reconstruction; (*c*) 3¾ per cent. on the total cost of acquisition and reconstruction for a time being unpaid by the District Council; and (*d*) one per cent. on the total cost of acquisition and reconstruction. It is therefore recommended that the sum of £6,270 be expended upon this work, excluding cars, which will be provided by the Leyton Council, as follows:—Track work, excluding rails, £5,100; overhead equipment, £1,100; cable ducts, feeder pillars, &c., £70.

Fulham.—The Electricity and Lighting Committee of the Borough Council has decided to extend mains and provide transformers, &c., at a cost of £350, in order to give an electricity supply to the Wall Papers Manufacturers, Ltd. (Osborn & Shearman Branch). The company propose, in the first place, to install two motors, aggregating from 70 to 80 h.p., at their works, and in due course they intend to install further plant. It has also been decided that cables be extended from Stevenage Road to Kenyon Street, at an estimated cost of £31 7s. 6d., and five new public lamps are to be provided, at an additional estimated cost of £15.

Stepney.—The Finance Committee of the London County Council recommend that the Council be authorised to borrow a sum of £9,500 in connection with the Blythe's Wharf generating station, repayable in 50 years. In June the Council sanctioned the borrowing of £22,000 on account of the sum of £42,150, then applied for, for the equipment of the generating station, it being estimated that the cost of the building would be £14,850. It has now been ascertained that the total expenditure will probably exceed the original sum by the amount now asked for.

Mains are to be laid in four streets in order to meet applications for supplies of electricity. The Finance Committee has decided that application be made for the borrowing of £15,375 in respect of extensions of mains.

Woolwich.—The Borough Council is to invite tenders for the supply of about 6,000 tons of coal for the year commencing June 25th. Of this amount 3,000 tons of washed nuts are required for the Plumstead Electricity Works, and 1,500 tons of rough coal for the Electricity Works at Woolwich.

NORWICH.—It is proposed to make some modifications in the boiler plant, &c., for which a loan of £25,000 was authorised last February, and apply to the Local Government Board for the additional £1,450 that will be required.

RAWTENSTALL.—Tenders are invited for the supply, delivery, and erection of a two-track booster, low-tension, direct-current, and high-tension alternating current switchboards. Full particulars from Messrs. Lacey, Sillar & Leigh, 2 Queen Anne's Gate, Westminster, S.W., and 78 King Street, Manchester; fee, £3 3s., returnable; and tenders to the Town Clerk by May 29th.

SALFORD.—The Electricity Committee invite tenders for the supply, delivery, and erection at the Frederick Road generating station of cooling towers, tanks, pumps, and pipe-work. Full particulars from Mr. V. A. H. McCowen, Borough Electrical Engineer (fee, £2 2s., returnable), and tenders to the Town Clerk by May 25th. (See an advertisement last week.)

SOFIA (BULGARIA).—Tenders are invited for the construction of an electric power station for the supply of light and power required by the Government coal mines at Pernik. Tenders will be received up to 3 p.m., on June 19th. A copy of the specification (in German), with drawings, may be examined by British contractors on application at the Commercial Intelligence Branch of the Board of Trade.

STOCKPORT.—The Tramways Committee invite tenders for automatic point controllers. Particulars from, and tenders to, the Borough Electrical Engineer.

TORQUAY.—The scheme for the erection of a new generating station at a cost of £16,000 has been rejected, and it has been decided to make alterations costing £5,000 or £6,000 to the existing station.

WALSALL.—A Local Government Board inquiry was held last Friday by Mr. W. O. Meade-King respecting an application for a loan of £4,000 for the electricity undertaking; £1,400 is required for new mains, services, and meters, and the remainder for new condensing plant, including oil separating plant and a cooling tower.

WORTHING.—Tenders are invited for the erection of an elevated barometric counter-current jet condensing plant, air and circulating pumps, and piping. Full particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by May 25th.

Post Office Employees and the Telephone Transfer.—The following general notice has been addressed to the Post Office staff:—"As the staff of the Post Office is aware, the staff of the National Telephone Co. will, with a few exceptions, be transferred to the Post Office on January 1st, 1912, and the Postmaster-General thinks it well to warn officers of all grades of the Post Office Service who may be promoted hereafter that, while every care will be taken to prevent hardship, their seniority may possibly be affected by officers transferred from the service of the National Telephone Co."

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

ABERDEEN.—The tender of the Brush Electrical Engineering Co. for the supply of extra high tension plant for the Dee village and Cults stations, at £2,485, has been accepted.

AUSTRALIA.—With reference to the tenders for telephone material called for by the Australian Commonwealth, of which notice was given in ELECTRICAL ENGINEERING, April 23rd, page 641, and subsequent issue, the following addition has been made to the list of materials to be supplied, viz. :—One common battery switchboard of nine sections in all, together with all associated frames, racks, power plant, and parts.

BELFAST.—The tender of Messrs. Watson, Gow & Co., of Glasgow, for 880 yards of cast-iron piping has been accepted by the tramway department.

BRIGHTON.—An order for 15.000 16-c.p. Tantalum lamps has been placed with Messrs. Siemens Bros.' Dynamo Works, Ltd., by the Corporation. These will be used for series burning in the majority of side streets in lieu of the carbon filament lamps.

CROYDON.—The Town Council has had under consideration a report by the Tramways Manager relative to the Quin cut-out system installed on the tramways. The report stated that the present cut-out switches were of a size adapted to the capacity of the feeder cables, which were laid down for a forty-car service. Now that an increased tractive effort is required, owing to heavier traffic loads and more frequent stops and starts, largely augmented by increased vehicular conditions, the amount of current passing through these switches is at times much greater than their capacity, and consequently they act far too frequently. The Tramways Manager recommended the acceptance of the quotation of the makers of the apparatus, the British Insulated and Helsby Cables, Ltd., at £16 per panel, for strengthening and reconstructing the various parts, the total cost per box being £69 (including labour and material), and £483, therefore, for the seven boxes.

DARTFORD.—The offer of the London Electron Co. for old tins, at the price of 15s. per ton, collected at the electricity works by the company's vans, has been recommended for acceptance.

FOLESHILL.—The tender of the Electric Trades Supply Co., Ltd., of Birmingham, for the electric installation at the Infectious Diseases Hospital, at £268 has been accepted.

GILLINGHAM.—The following tenders for coal have been recommended for acceptance :—The tender of John Hudson & Co., Ltd., for Class A (No. 2) Bowhill Single Nuts, at 15s. 9d. per ton. The tender of Messrs. Myers, Rose & Co., Ltd., for Class B best Derbyshire house screenings, at 10s. 10d. per ton, delivered in lighter alongside the borough wharves, subject to the contractors supplying the necessary trial quantity, and failing this, the tender of Messrs. F. K. Parker & Co., for Class B, at 15s. 6d. per ton delivered into the bunkers at the electric light works.

HORNSEY.—The Council received thirteen tenders for supplying and laying feeder cable from the works to Muswell Hill. The lowest price for the complete work was £5,651 9s. 2d., while an estimate submitted by the Borough Electrical Engineer for carrying out the work departmentally was £4.986 10s. It was decided to accept the tender of the Western Electric Co. for the supply of the cable at £3,322 18s. 4d., the Electrical Engineer to complete the work.

LONDON: *London County Council.*—The following tenders have been received for the manufacture, supply, and delivery of car-bodies, trucks, and electrical equipments for 175 electric cars :—Hurst, Nelson & Co., £72.450: United Electric Car Company, £79.275: Metropolitan Amalgamated Railway Carriage & Wagon Co., £80,500: Cravens, Ltd., £82.687 10s.: Gloucester Railway Carriage & Wagon Co., £83.825: Brush Electrical Engineering Co., £84.525; G. C. Milnes Voss and Co., £96.250. The tender of Hurst, Nelson & Co., Ltd., is recommended for acceptance.

Four tenders have been received for the electrical equipment and assembly of cars :—British Westinghouse Electric & Manufacturing Co., £55.587 10s., do., alternative tender (not to specification) £54.950; Dick, Kerr & Co., £59,062 10s.; Siemens Brothers Dynamo Works, £63.000: British Thomson-Houston Co., £64.750. The tender of the British Westinghouse Electric & Manufacturing Co. is recommended for acceptance.

Bermondsey.—The Borough Council has accepted the following tenders for annual supplies of coal to the Electricity Department by G. J. Cockerell & Co., for Bwllfa coal, 23s. per ton; Myers, Rose & Co., Ltd., for Exhall, Ansley Hall, Griff, Ibstock, and for Bugsworth, and for Kingsbury and Baddeley Beans, at 14s. per ton, subject to the coal being found on testing to be equal to Kingsbury Ryder Beans. There were 20 tenders for Welsh coal and 92 for Midland or Scotch coal.

Hammersmith.—In reference to the tenders for main switchgear for the Hammersmith undertaking, it was announced in our last issue that the tender of Switchgears, Ltd., had been provisionally accepted by the Electricity Committee at £2,014 10s. However, on the matter being further considered by the Borough Council, it was finally decided to accept the tender of Spagnoletti, Ltd., for the switchboard, &c., at £1,500, and the tender of Cowans, Ltd., at £316 for twenty feeder panels.

For the supply of iron flues, air heaters, and hot-air ducts required in connection with the plant extension scheme, the appended tenders have been received :—Mechan & Sons (provisionally accepted), £710; John Fraser & Sons, £969; Rosser & Russell, £1,050; Thames Ironworks, £1,350. For boiler mountings the tenders received were :—Hopkinson & Co. (provisionally accepted) : (*a*) two stop valves angles, £30; (*b*) two isolating valves, £31; (*c*) two safety valves with high and low water alarm, double dead weight, £58; (*d*) two superheater blow-down cocks, £5 6s.; (*e*) four water gauges, £18; (*f*) two steam gauges, £6 5s.; (*g*) four check valves, £13 4s.; (*h*) four feed-regulating valves, £11 12s.; (*i*) four blown-down cocks, £16 4s.; (*j*) total, £189 11s.; (*k*) fitting above to two boilers, £4. Dewrance & Co. : (*a*) £34; (*b*) £36; (*c*) £48 10s.; (*d*) £10 10s.; (*e*) £24 18s.; (*f*) £6 6s.; (*g*) £24 10s.; (*h*) £12 16s.; (*i*) £15; (*j*) £212 4s.; (*k*) no quotation. Templer & Ranoe : (*a*) £27; (*b*) £39 10s.; (*c*) £45; (*d*) £5; (*e*) £6 10s.; (*f*) £5; (*g*) £9; (*h*) £14; (*i*) £30 10s.; (*j*) £181 10s.; (*k*) no quotation.

The following tenders were received for the supply of free burning coal :—Spenser Whatley, Ltd. : Selston main seam small, (*a*) three months' contract, 11s. 5d.; (*b*) 12 months' contract, 11s. 5d. Kaye, Son & Co. : Pinxton nutty slack, (*a*) 12s. 4d., (*b*) 12s. 4d.; ditto, Pinxton pea nuts, (*a*) 14s. 1d., (*b*) 14s. 1d. Spenser Whatley, Ltd. : Selston main seam peas, (*a*) 15s. 2d., (*b*) 15s. 2d. Cory Bros. & Co. : Pewei Pyber unwashed, (*a*) 15s. 4d., (*b*) 14s. 10d. E. Foster & Co. : Mardy, (*a*) 15s. 9d., (*b*) 15s. 9d. Main Colliery Co. (accepted for *a*) : Graigola & Victoria, (*a*) 15s. 10d., (*b*) 15s. 10d. H. B. Pring : Primrose, (*a*) 15s. 11d., (*b*) 15s. 11d. Cory Bros. & Co. : Pentre, Rhondda Valley, (*a*) 16s 4d., (*b*) 15s. 10d. Speakman & Son : Corrwg Vale, (*a*) 16s. 6d., (*b*) 16s. 3d. Dinham, Fawcus & Co. : Dynnevor Duffryn, (*a*) 16s. 6d., (*b*) 16s. 6d. Hinchliffe & Co. : Sgwborwen, (*a*) 16s. 8d., (*b*) 16s. 9d. Lindsay, Blee & Co. : Moontown, (*a*) 16s. 11d., (*b*) 16s. 11d. T. A. King : Grovesend Longerwich, (*a*) 17s. 3d., (*b*) 17s.; ditto, Fernhill, (*a*) 17s., (*b*) 17s. Hinchliffe & Co. : Ynisfair, (*a*) 17s. 4d., (*b*) 17s. 4d. Waddell & Co. : Phœnix Glyncorrwg, (*a*) 18s., (*b*) 18s.

Poplar.—At the meeting of the Borough Council on the 14th inst. the following tenders were received for a 1,000-kw. turbine generating set, to replace a 200-kw. set in connection with the extension scheme provisionally approved by the Council on March 5th last : C. A. Parsons & Co., (*a*) alternator manufactured by General Electric Co., £6.283; (*b*) alternator manufactured by Bruce Peebles & Co. (accepted at £5.907 10s. without rotor), £6.365; (*c*) alternator manufactured by Siemens Bros., £6,420; (*d*) alternator manufactured by Electric Construction Co., £6.593; (*e*) alternator manufactured by Dick Kerr & Co., £6,648; (*f*) alternator manufactured by Parsons & Co., £6,901; Willans & Robinson, (*a*) £6.443 15s., (*b*) £6.498, (*c*) £6.525 10s., (*d*) £6,731, (*e*) £6.785; Richardsons Westgarth & Co., (*a*) £6,390, (*b*) £6,475, (*c*) £6.500, (*d*) £6,725, (*e*) £6.805. The Electricity Committee reported that Messrs. C. A. Parsons & Co., whose tender was the lowest, guaranteed the most economical plant, and they would make the spindle, bearings, and couplings of the new turbine interchangeable with existing plant. They also stated that various improvements had been effected in their governor gear since their turbines were installed at the Council's works, and the firm offered to bring the governor gear of the existing turbines up to the standard of their latest practice without extra charge. The Engineer advised that the order for the turbine should be placed with Messrs. Parsons & Co., having regard to saving in revenue, the lower capital cost, and the engine being practically a duplicate of existing plant. With regard to the alternator, the Engineer pointed out that if a Bruce Peebles alternator was accepted, a saving on capital expenditure of £457 10s. could be effected by utilising the spare rotor purchased by the Council for use in case of emergency. The installation of a third set of similar manufacture to the existing sets will diminish the necessity for retaining this rotor as a stand-by. The adoption of this proposal would reduce the tender of Messrs. Parsons & Co. to £5.907 10s. The Engineer reported that the turbine generator plant proposed would be capable of giving a continuous load of 1.330 kw., and an overload of 25 per cent. for three hours, and 50 per cent. for thirty minutes, and the price was a decided improvement on that paid for the last extension, when the contract price for the two sets was £13.521, and the capacity of each set was only 1,000 kw. continuous and overload of 20 per cent. The tender of Messrs. Parsons was accepted subject to the consent of the L.C.C. being obtained for the necessary loan. The following tenders were received for switchgear at the generating and sub-stations : A. W. Penrose and Co. : (*a*) generating station, £150, (*b*) south sub-station, £175, (*c*) new sub-station, £520; Ferranti, Ltd. : (*a*) £123 1s., (*b*) £181 9s., (*c*) £593 6s. 6d. (revised tender); Siemens Bros. : (*a*) £94 17s., (*b*) £115 10s., (*c*) £633 16s.; Johnson & Phillips : (*a*) £117 15s., (*b*) £166 15s.; (*c*) (accepted) £593 15s.; British Westinghouse Co. (accepted for *a* and *b*) : (*a*) £124 10s., (*b*) £213, (*c*) £706 6s.; Whipp and

Digitized by Google

Bourne : (*a*) £125, (*b*) £215, (*c*) £730; Electric Construction Co. : (*a*) £155, (*b*) £194, (*c*) £750; Union Electric Co. : (*a*) £177, (*b*) £172, (*c*) £752 10s.; Cox Walkers : (*a*) £179, (*b*) £223, (*c*) £780; General Electric Co. : (*a*) £180, (*b*) £285, (*c*) £925. The engineer pointed out that the British Westinghouse Co. recently carried out similar work at Glengall Road sub-station in an entirely satisfactory manner, and as it was not desirable to complicate existing switchboards, he recommended that the company should be given the present contract for the Glengall Road and central stations. With regard to the switchgear to be provided at the new sub-station, the committee were informed that Messrs. Penrose and Co., whose tender was lowest, were not manufacturers of the plant to be supplied, and the engineer reported that Messrs. Johnson & Phillips, whose tender was next lowest, with the exception of an amended tender of Messrs. Ferranti, had carried out work of a high order for the L.C.C. The committee added that it was desirable that the converters to be provided at the new sub-station should be similar to those already installed for the council by Messrs. Bruce Peebles and Co. Some time ago the council agreed with the Western Electric Co. for them to supply all cables required for two years at a scheduled rate of prices. In accordance with this agreement orders are to be placed with the company for cable for High Street (Wade's Place) feeder and cable for extra high-tension feeder at £1,059 and £847 4s. respectively.

In connection with the extension scheme provisionally approved by the Council on March 5th last, the Electricity Committee have received tenders for the erection of a proposed new sub-station. These, together with the matter of the selection of a site for the sub-station, are the subject of negotiations, and a report is to be presented at an early date. Prices have also been received for the provision of a new boiler, and the committee have directed tests to be carried out with regard to the efficiency of certain types. The total estimated capital cost in respect of boiler, mains, and machinery, as revised on receipt of tenders, amounts to £20,793, as against the estimates for these items provisionally approved by the Council of £22,112. The applications for supply during the quarter ending April 30th totalled 34·128 kilowatts for lighting and 332·700 for power. Amongst the applications received were the following :—Rev. G. R. P. Preston, St. Michael's Church Hall, Bromley, 170 16-c.p. lamps and 1 15-amp. arc lamp; Venesta, Ltd., 242 Westferry Road, additional motors, 234·400 kilowatts; Spratts Patent, Ltd., Morris Road, 42·400 kilowatts; J. Stewart and Sons, Ltd., Blackwall, 24·000 kilowatts; United Asbestos Co., Ltd., Westferry Road, 20·000 kilowatts; Glengall Ironworks, Ltd., Glengall Road, 8·800 kilowatts.

Southwark.—The Electric Light Committee has received quotations from the following firms for the supply of cable : British Insulated & Helsby Cables, Ltd., (*a*) 1 mile 0·05, £260, (*b*) 1 mile 0·1, £404; Callenders Cable & Construction Co., (*a*) £305, (*b*) £450; Glover & Co., Ltd., (*a*) £245 10s., (*b*) £368 10s.; Henley's Telegraph Works Co., Ltd., (*a*) £253 10s., (*b*) £381; Johnson & Phillips, Ltd., (*a*) £242, (*b*) £365 10s.; Siemens Bros. & Co., Ltd., (*a*) £248 10s., (*b*) £369 15s.; Western Electric Co. (provisionally accepted), (*a*) £240, (*b*) £360.

Woolwich.—The Borough Council received the following tenders for 750 yards of three-core cable and 170 yards of four-core cable :—Western Electric Co. (accepted), £285; Callender's Cable and Construction Co., Ltd., £289 17s. 7d.; Johnson & Phillips, Ltd., £290 6s.; W. T. Glover & Co., Ltd., £295; British Insulated & Helsby Cables, Ltd., £294 13s.; Siemens Bros. & Co., Ltd., £295 2s. 6d.; W. T. Henley's Telegraph Works Co., Ltd., £298 2s. 6d.; St. Helens Cable & Rubber Co., £305.

NEWCASTLE-ON-TYNE.—The British Westinghouse Co. have received an order from the Newcastle-on-Tyne Electric Supply Co. for a 300 h.p. electric locomotive for hauling coal traffic from the North-Eastern Railway Co.'s sidings at Dunston to the bunkers at the power station.

The tender of the Tudor Battery Co. for storage batteries for the Manors tramway station, at £3,594, has been accepted.

RAWTENSTALL.—The Corporation Electricity Works (through Messrs. Yates & Thom, of Blackburn) have placed an order with Ed. Bennis & Co., Ltd., of Little Hulton, Bolton, for six stokers and self-cleaning compressed air furnaces for Lancashire boilers.

STOCKWELL.—The tender of Messrs. Fryer & Co., of Paddington, for electric lighting at the South-Western Hospital Ambulance Station, at £3,434. Twenty-two other tenders were received, varying from £3,700 to £5,995.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON.—Messrs. Siemens Bros. have recently fitted up two trains of the Underground Electric Railways Co. of London with tantalum lamps, the result being highly satisfactory.

WINDSOR.—The Windsor Town Council, at its last meeting, considered tenders for the public lighting of the borough, submitted by the Windsor Royal Gaslight Co. and the Windsor Electrical Installation Co., Ltd. The former firm quoted £1,193 15s. 6d. per year for lighting the town with gas for five years, 280 single burners (for ordinary standards), to be lighted from one hour after sunset to one hour before sunrise, and 58 triple burners (for large standards), to be lighted from one hour after sunset until midnight, when two burners would be extinguished, leaving one burner alight until one hour before sunrise. If the Corporation would wish to retain the existing arc lamps, the gas company would be willing to provide the 280 single lights for £931 per annum. The Windsor Electrical Installation Co. quoted £18 per annum per 8-ampere flame arc lamp, each of a nominal 2,400 c.p. of the type at present erected in the High Street, &c.; the lamps to be lighted one hour after sunset and extinguished at 11.30 p.m., after which time two lamps of 22 nominal c.p., each to burn until one hour before sunrise. For the side street lighting, £4 4s. per annum per twin 22 nominal c.p. lamp was quoted, and, if preferred, £2 5s. per standard per annum for a single 22 nominal c.p. lamp on each standard. As an alternative, current was offered at a flat rate of 2d. per unit, the Corporation to provide standards, lamps, renewals, and be responsible for maintenance. On these terms, using an 8-ampere flame arc lamp, the Corporation would obtain 2,400 nominal c.p. for 1d. per hour, and using "Tantalum" lamps, 275 nominal c.p. for 1d. per hour. The light would be distributed as follows :—29 arc lamps in main streets of 2,400 nominal c.p. each; 1 arc lamp of 500 nominal c.p.; one lamp of 400 nominal c.p.; and 284 pairs of glow lamps in side streets, each pair of 44 nominal c.p. The Town Council Lighting Committee recommended that on the expiration of the present lighting contract, the arc lamps in the main streets be maintained, at £558 per annum, and the lamps in the side streets be lighted by gas, at £931 per annum. After some discussion the Committee's recommendation for electric light in the main streets, and gas in the side streets, was adopted.

COMPANIES' MEETINGS AND REPORTS

AUCKLAND ELECTRIC TRAMWAYS.—The report for the year 1907 shows a total revenue of £140,452, compared with £132,365 for the previous year. The traffic receipts, which amounted to £137,718, show an increase of £7,381 over the previous year. After deducting all expenses chargeable to revenue, including £14,255 for interest on the debenture stock of the company, and providing for the rental and percentage of profits payable to the Auckland City Council, amounting to £3,567, and setting aside £10,000 to meet depreciation, there remains a surplus of £29,722. The expenses include expenditure on repairs and maintenance, amounting to £20,350, as compared with £16,915 during 1906. In addition the sum of £18,726 has been expended on renewals and charged to depreciation account. A large portion of the latter amount was in connection with the reconstruction of the track in Queen Street, which has now been completed. Including the amount brought forward from last account, there is an available balance of £32,824, and the directors recommend the allocation to reserve fund of £10,000, and dividends of 6 per cent. on the preference shares and the ordinary shares of £18,000, carrying forward £2,165. The sum of £2,658 is payable out of the profits of the past year as dividend on £50,000 six per cent. preference shares of £1 each, which were issued early in the year for the purpose of providing capital for additional plant and rolling stock. Nearly the whole of these shares were taken up in Auckland. The total capital expenditure during the year amounted to £71,398 6s., making the total amount expended on the tramways £664,390 14s., but only to a very slight extent did the increased expenditure become remunerative during the year. The directors therefore consider it prudent to reduce the dividend on the ordinary shares by 1 per cent., representing £3,000. The expenditure during the year included the acquisition of the necessary material for the Mount Eden, Mount Roskill, and Grey Lynn extensions, the construction of which is now in progress, the cost of a new generating set of 600 kilowatt capacity and two new boilers, which have been installed, and the purchase of large additions to the rolling stock. At the end of the year the company had 71 cars in stock, being an increase of 11 during the year. Since then the number has been further increased by the delivery of 10 cars shipped from this country, and the construction of six in Auckland, bringing the total number to 87. The company has joined the British Electrical Federation. The following statistics represent the state of affairs at December 31st, 1906 and 1907, respectively :—Miles open : route miles, 19·2 and 19·2; single line, 6·99 and 6·99; double line, 12·21 and 12·21. Number of passengers carried, 21,104,651 and 22,474,537; average receipts per passenger, 1·48d. and 1·47d.; average expenditure per passenger, 0·81d. and 0·88d.; proportion of expenses to receipts, 55 per cent. and 60 per cent.; number of cars in working, 60 and 71.

BUENOS AYRES GRAND NATIONAL TRAMWAYS.—An extraordinary meeting was held on Friday, when resolutions were passed authorising the creation of £200,000 additional five per cent. conversion debenture stock, and such further amount as

Digitized by Google

might be necessary to provide for the redemption of £150,000 5½ per cent. preference debentures; providing for the variation of the trust deeds so as to make the 6 per cent. debentures redeemable at £105 per cent. in the event of voluntary liquidation for the purpose of reconstruction or amalgamation; and authorising the directors to vary the agreements with the Buenos Ayres New Tramway Company, Ltd., and other companies relating to the distribution of the receipts of the joint working of the tramway systems.

CALCUTTA ELECTRIC SUPPLY.—The report for the year 1907 shows that 5,487,885 units were sold during the year, an increase of nearly 20 per cent. over the sales for 1906. The gross revenue amounted to £103,360, compared with £89,242 in 1906. The working costs were £46,084, compared with £39,065 in the preceding year. This increase in working costs is due chiefly to the large increase in the cost of coal. The capital expenditure at December 31st last amounted to £604,348, an increase of £59,994 during the year. In order to meet the constantly increasing demand for electricity, the directors recently offered to the shareholders for subscription 20,000 5 per cent. preference shares of £5 each. These have all been subscribed and allotted. During the year the sum of £19,016 has been expended in the renewal of mains, and has been charged to the depreciation and renewals account. The directors being of opinion that the time had arrived when the company should manage its own business, they determined the agreement of the managing agents as at December 31st last. Offices have been opened at No. 8 Dalhousie Square, Calcutta, and Frank Rawson, Esq., C.M.G., has been appointed agent and manager of the company. Since the close of the financial year the number of applications from new consumers has largely increased. The new comprehensive license, referred to by the directors in their report of April 19th, 1905, was granted by the Government on July 31st, 1907, and by the terms of this license the company's statutory powers are continued until determined by purchase of the undertaking either by the Government or the local authority, which purchase can be effected on October 20th, 1918, or at any recurring period of ten years thereafter. The net profits for the year amount to £57,276, to which has to be added the balance brought forward from last year £4,230, and after deducting the interim dividend at the rate of 6½ per cent. per annum paid in November, 1907, and other items set out in the net revenue account, there remains an available surplus of £44,851. The directors recommend that a sum of £17,000 be placed out of the profits to the credit of the depreciation and renewals account, and that a final dividend at the rate of 9½ per cent. for the half year be declared and paid on the ordinary share capital, making, with the interim dividend, 8 per cent. for the year, the balance, £5,305, being carried forward. The meeting is to-morrow.

CALLENDER'S CABLE & CONSTRUCTION.—The report for the year ending December 31st, 1907, shows a balance (after providing for income tax) of £60,454. The balance carried forward at the end of 1906 was £56,722, and from this the extra remuneration voted to the directors in respect of 1906 has to be deducted, leaving £55,522, making a balance of £115,976. From this has to be deducted interest on debenture stock, dividend on preference shares, and appropriation for depreciation of buildings, plant, and machinery, £34,618, leaving £81,357. The directors recommend a dividend on the ordinary shares of ten per cent. per annum, free of income tax, together with a bonus of 5s. per share. The sum of £10,000 is placed to suspense account, and £45,107 carried forward. The directors are of opinion that this result, although not so favourable as that of the previous year, must, in view of the conditions which prevailed in 1907, be considered as highly satisfactory. Various causes have rendered the operations of the company difficult and less remunerative than in previous years. The almost prohibitive price of metals and the stringency of the money market are too well known to need more than casual reference. The most pronounced factor in restricting business in heavy mains has been the abnormal price of copper which prevailed in the first eight months of last year, leading to the temporary abandonment of nearly all new enterprise in electrical supply, and to the curtailment of extensions of existing networks in every direction. This was not confined to the home trade, as diminished orders were observed in almost every area throughout the world in which the company carries on its business. The continuing downward trend of the market offered no inducement to consumers to undertake new work or to fill up their deplenished cable stocks. The recent return of copper to its average price came after the season was at an end, and it may, therefore, be said that practically the whole of the company's business during the past year consisted of extensions which were absolutely necessary in connection with electrical supply stations already in existence. The subsequent stringency in the money market has delayed that improvement in business which might otherwise have been expected, and has caused difficulties in other directions, one large firm with which this company has had dealings for some years past having been forced into liquidation. Their business is in course of reorganisation, but, in order to provide against any possible loss, the directors have placed a sum of £10,000 to suspense account. The business in Germany has been consolidated, and the company has been registered under German laws, with its headquarters in Hamburg. Excellent results have already attended this step. In spite of the continued depression in every branch of engineering, the factories both at Erith and at Leigh are fairly well employed. The appliances at Erith and at the Anchor Works at Leigh have been thoroughly overhauled, with the result that the plant and machinery at both factories are in first-class order in every respect. A great improvement has been made in the working of the Anchor Company's business. The rubber trade has been much increased, and a satisfactory profit has been made on that company's operations. The directors refer with deep regret to the loss which the company has sustained, two of the members of the Board, Sir David Evans having died on August 14th, and Mr. W. O. Callender on March 14th last. The meeting is on the 21st inst.

DIESEL ENGINE.—The eighth ordinary general meeting was held last Thursday in London. Mr. C. C. Ellis, who presided, said that the past year was the best they had had. The net profit had been £20,721, as against £11,212 for the previous year. A 10 per cent. dividend was recommended, with £7,000 carried to reserve. A satisfactory feature was the varied sources from which they were receiving orders. Permission had been given to the Mirrlees Watson Co. to erect works for the manufacture of Diesel engines, and they had acquired £800 worth of shares in the Mirrlees Watson Co. He announced that they were negotiating with one of their other manufacturers for a new type of engine, which might for some purposes be more satisfactory than the existing engine.

EASTERN EXTENSION, AUSTRALASIA, & CHINA TELEGRAPH.—The sixty-ninth half-yearly ordinary general meeting was held last Wednesday. Sir John Wolfe Barry, who presided, stated that the gross revenue for the half-year under review amounted to £304,000, against £296,000 for the corresponding period of 1906, an increase of £8,000. In spite of general depression of trade in the Far East, the working expenses amounted to £154,000, against £139,000 for the corresponding period of 1906, showing an increase of £15,000. Of this increase, over £13,000 was due to cable repairs having been far more numerous during the past half-year than in 1906. They had also been obliged to spend £1,000 in respect of a claim for damages arising out of the loss of the anchor of the s.s. *Agincourt* when she fouled one of the company's cables in the Yang-tsze-Kiang. The net profit for the half-year amounted to £130,000, and, after adding £75,000 brought forward from the previous half-year, there remained an available balance of £205,000. The usual quarterly interim dividends of 2s. 6d. per share were paid during the past year, and it is now proposed to distribute a final dividend for the year of like amount, making a total dividend of 5 per cent. It is also proposed to pay a bonus of 4s. per share, or 2 per cent., making a total distribution for the year 1907 of 7 per cent. 330 nautical miles of cable, mostly consisting of renewals, had been laid during the year at a cost of £28,848, and the new cable between Java and the Cocos Islands had been opened for traffic. The State-aided competition of the Pacific route was alluded to. The report and accounts were adopted.

EDMUNDSONS' ELECTRICITY.—At the adjourned meeting of first mortgage debenture holders held last Thursday to consider the authorisation of the creation of £200,000 prior lien 5 per cent. debenture stock, it was decided to issue £100,000, but the second £100,000 was not to be issued without the consent of a special committee of debenture holders, which was appointed at the meeting.

LISBON ELECTRIC TRAMWAYS.—Col. Sir Charles Euan-Smith presided at the tenth ordinary meeting last Thursday. In his speech, after referring to the assassination of the late King of Portugal, he stated that the figures remained practically the same as last year, in spite of several disadvantageous factors, including a poor harvest and political unrest. Regarding the general progress, he mentioned that during the last seven years they had converted a working loss of £14,000 to an annual profit of about £120,000. He also refuted some statements which had appeared in a circular from a Mr. Parrish. A five per cent. dividend on the ordinary shares was declared, and the retiring directors were re-elected.

MARCONI'S WIRELESS TELEGRAPH.—At an extraordinary meeting on Monday, a resolution providing for the increase of the capital by the creation of £250,000 seven per cent. cumulative participating preference shares at £1 each was unanimously adopted. It was stated that if the new capital was forthcoming the four transatlantic stations alluded to in the report would be completed by the end of the year.

PERTH ELECTRIC TRAMWAYS.—The report for 1907 shows gross receipts of £75,042, as compared with £78,543 for the previous year, while the net profit amounted to £31,177 against £35,261. The traffics for the year 1906 were favourably affected by an exhibition which was held at Perth. After payment of interest and sinking fund on the first and second debenture issues and trustees' fees for the year, there is a balance of £15,656, which is carried to profit allocation account. To this is added the balance brought forward from last year, viz., £790, making £14,446, from which has to be deducted £6,000, dividend paid on preference shares for the year, leaving a balance of £8,446. Out of this a sum of £1,500 has been

Digitized by Google

expended on capital account in respect of new car barn, new machine shop, &c., and will be carried to reserve account of undivided profits as in former years. It is proposed to apportion the total sum of £8,446 as follows:—Reserve account—expended in extensions, &c., £1,500; cash reserve fund, £1,000; dividend on ordinary shares at 5 per cent., £5,000; carry forward, £946. Including the above-mentioned sum of £1,500, a total of £23,625 has been expended out of profits on capital account. The sum of £4,276 shown in the balance sheet as cash in the hands of the trustees has since been utilised in the redemption of £4,130 of first mortgage debenture stock, reducing the debenture debt accordingly. A contract has been entered into with the owners of the Nedlands Park Estate to operate a tramway now being built to connect with the company's system. The conditions of the contract are that the service be run at an agreed rate per car mile, and that the company participate in the profits of the land scheme if that proves to be a success. The Nedlands Park scheme embraces not only development of Nedlands Park as a building estate but provides for the establishment of a bathing station and jetty which it is believed will be largely taken advantage of by pleasure-seekers, and so increase the general traffics. The whole of the money required for the Nedlands Park tramway has been subscribed by prominent citizens of Perth. In order to fulfil the promise made to the shareholders, the directors have induced some of the large holders of preference shares to offer for sale a portion of their holding, with a view to increasing the number of preference shareholders, and thus enable an application for an official quotation to be made for the shares. The time allowed for payment for the shares expires on June 30th next, and immediately thereafter an application will be made to the Stock Exchange Committee for the quotation. The directors deeply regret to record the death of their colleague, Mr. R. C. Ogilvie, A.M.I.C.E., whose technical knowledge has been of great service to the company. The Engineer's report states that during the year the trams travelled 1,178,716 car miles, as against 1,167,763 car miles in 1906; and carried 7,790,934 passengers, as against £8,083,315 passengers in 1906. The earnings per car mile were 15·17d. in 1907, as against 15·97d. in 1906; while the expenses were 8·29d., as against 8·3d. in 1906. The expenses per cent. of earnings in 1907 were 54·7 per cent., as against 51·94 per cent. in 1906. The receipts show a decrease as compared with last year. This is due to a slight depression that has been, and is, prevailing in Perth. The meeting is to-morrow.

SOUTH STAFFORDSHIRE TRAMWAYS.—The tenth ordinary general meeting was held last Thursday under the chairmanship of Sir Ernest Spencer, when the report and accounts referred to in our last issue were adopted. The chairman referred to the improvement in the receipts, and anticipated a further increase during the present year. The final portion of the reconstructed tramways was opened in October last.

WEST AFRICAN TELEGRAPH.—The annual report states that the receipts have declined from £66,100 in the previous year to £59,200, and that the expenses have risen from £24,700 to £25,800; the dividend remains at 4 per cent., but a smaller amount is carried to reserve. The falling-off is attributable partly to diminution of Stock Exchange business in connection with West African mines.

WESTERN TELEGRAPH.—At the meeting on Wednesday last week, the report and accounts given in our last issue were adopted. Sir John Wolfe Barry, F.R.S., K.C.B., who presided, stated that whereas the receipts increased during the year by about £2,500, the total expenses decreased by £1,232. On the question of wireless telegraphy, the chairman stated that nothing had occurred to induce him to alter or modify his views as expressed on previous occasions.

Automatic Sewage Pumping Stations.—The town of Dayton, Ohio, is situated on a river which in the early spring frequently rises to a high level. At such times it is necessary to close the sewer-gates at the outfalls to prevent the river rising up into the streets and houses. The sewage is then raised and discharged above the flood-level. For this purpose three pumping stations have been constructed. According to the *Western Electrician* (Chicago), the first is equipped with two vertical Brooks submerged centrifugal pumps capable of pumping 2,500 gallons per hour, and each coupled to a three-phase 20 h.p. motor. The motors are started and stopped by oil-switch compensators, which are operated by hydraulic pistons controlled by float switches. The lift averages about 20 ft. The operation of these pumps is entirely automatic, it being only necessary to inspect them occasionally and keep the oil receptacles filled. The second station has three units, and the third station two, each consisting of a 4,500-gallon centrifugal pump coupled to a 40 h.p. three-phase motor. The operation of the plant has proved entirely satisfactory, the motors starting and stopping automatically with the rise or fall of the sewage in the pits with great regularity and smoothness. During a heavy rain recently one pump in the third station did all the work for that district, running about three minutes with idle intervals of about seven minutes. The power is taken from a public supply main at 2,000-volt 60 cycles. Upon notice of a rise in the river, the gates are closed and the current turned on to the stations.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net c.i.f. port of arrival, quoted on Tuesday night, was £60 to £60 10s. per ton (last week £58 5s. to £58 15s. per ton).

MESSRS. ROGER DAWSON, LTD.—This firm of electrical engineers have taken extensive new showrooms in Berners Street, adjoining Oxford Street, W., which will be opened when the buildings are completed.

THE SCHORCH ELECTRICAL CO.—We are informed that Messrs. Max Scorch & Co., Ltd., Rheydt, have opened a branch which is carried on in the name of The Schorch Electrical Co., 35 Basinghall Street, London, E.C., Mr. Walter R. Rothenberg having been appointed as general manager for the business in England and Colonies.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A. W. Bennett, electrical engineer, of Leeds, lately carrying on business under the style of Bennett & Co., has been adjudicated bankrupt. The first meeting is to be held at the Official Receiver's office, Leeds, on May 25th, and the public examination will be held on June 16th at the County Court House.

Meldrum Brothers, Ltd., patent furnace manufacturers, of Timperley, near Manchester, is to be wound up voluntarily. Mr. T. Gregory, of Manchester, is appointed liquidator.

A petition has been presented for the winding up of the Helis Cell & Accumulator Co.

The Gardner Electric Drill & Hammer Co. is to be wound up voluntarily.

Messrs. Stephen Sellon and E. M. Sellon, carrying on business as Stephen Sellon and Partners, consulting engineers, 36 Victoria Street, have dissolved partnership. Debts by Stephen Sellon, who continues under the present title.

MISCELLANEOUS CITY NOTES

ROSARIO ELECTRIC CO.—A prospectus has been published relating to a new issue of 5,000 six per cent. cumulative second preference shares of £5 each.

WALSALL ELECTRICAL CO.—Notice has been given of a petition for confirming the resolution of the company to reduce its capital from £25,000 to £20,620.

APPOINTMENTS AND PERSONAL NOTES

Applications to the number of 190 were received for the position of canvasser in the Fulham Electricity Department, and the Electricity and Lighting Committee has decided that the appointment be given to Mr. S. A. Lovick (Hither Green), who is at present employed as canvasser in the Electricity Department of the Stoke Newington Borough Council, and who has held several similar positions under other local authorities and electric supply companies.

NEW COMPANIES

ELECTRIC CONTROL.—This company was registered in Edinburgh on April 30th, with a capital of £6,000 in £1 shares, to carry on the business of electrical and mechanical engineers, and manufacturers of, and dealers in, appliances and apparatus for the generation, supply, and control of electrical power, including electric motors and breaks, &c. The subscribers are:—J. R. S. Maxwell, C. Macmillan, J. Craig, Mrs. R. Scott, Miss L. Scott, Miss R. M. Scott, H. M. Macmillan. The number of directors is not to be less than two nor more than six; the first are:—J. M. S. Maxwell, C. Macmillan, and J. Craig. Qualification, 100 shares. Remuneration as fixed by the company. Registered office, 177 Reid Street, Bridgton, Glasgow.

GLASS TELEGRAPH POLES.—H.M. Representative at Darmstadt (Mr. F. D. Harford) reports that a company has been formed at Cassel for the purpose of manufacturing glass telegraph poles. The capital is to be £90,000, which is said to be sufficient for an annual output of 60,000 poles. The patent rights cost £15,000, with a royalty of 2s. per post sold. It is stated by the company that poles of 28 ft. in length can be manufactured at a cost of 15s. (including the royalty). An experimental line of glass telegraph poles, with eleven wires, on a much frequented public highway stood the test most satisfactorily, and it is pointed out that such poles do not rot like wooden ones, nor rust and need painting like iron ones. It is further stated that broken or damaged poles can be repaired satisfactorily. Particulars of the construction, also dimensions and weights of these poles, were given in ELECTRICAL ENGINEERING, Vol. II., pp. 900 and 978.

GREYSTONES ELECTRIC LIGHT & POWER.—This company was registered in Dublin on May 8th, with a capital of £3,500 in £1 shares, to carry on the business of electrical engineers, electricians, practical engineers, contractors, &c. The subscribers are:—C. L. Matheson, A. Macaulay Fitzgibbon, A. M. Archer, A. L. Figgis, F. Batchelor, E. S. Dashwood, R. N. Tweedy. The number of directors is not to be less than three nor more than seven; the first are C. L. Matheson, H. M.

Digitized by Google

Fitzgibbon, A. L. Figgis, F. Batchelor, A. M. Archer, E. S. Dashwood, and R. N. Tweedy. Qualification, 100 shares. Remuneration as fixed by the company. Registered office, 5 Leinster Street, Dublin.

LANGBEIN-PFANHAUSER WORKS.—This company was registered on April 25th, with a capital of £3,000 in £50 shares, to carry on in the United Kingdom and the Colonies the business of electro-metallurgists, electro-platers, electrotypers, manufacturers of and dealers in dynamo machines, electric motors, switches, and other electrical apparatus and instruments, makers, grinding and polishing machines, chemicals and electrolytic solutions, &c. The subscribers are :—W. Pfanhauser, Dr. G. Langbein, Dr. W. Pfanhauser, Dr. R. Jay, Dr. H. Kissel, O. Pfanhauser, Dr. W. Wurker. No initial public issue. The number of directors is not to be less than two nor more than three; the first are Dr. R. Jay and Dr. H. Kissell. If Dr. R. Jay ceases to be a director, the Langbein-Pfanhauser Werke Actien Gesellschaft may, so long as they are shareholders, appoint one of their own directors to fill the vacancy. Qualification (except Dr. R. Jay and such nominee), £100. Remuneration as fixed by the company.

RICHARD PAPE.—This company was registered on May 8th, with a capital of £10,000 in £1 shares, to acquire the benefit of a contract relating to an electric storage battery known as the "Fors Accumulator," together with the business of manufacturing and selling the same, carried on at 110 Strand, W.C., and Dyott Street, Oxford Street, W., to adopt an agreement with R. Pape, and to carry on the business of electrical engineers, manufacturers of, and dealers in, accumulators, storage batteries, and electrical appliances of all kinds, &c. The subscribers are :—F. J. Wood, R. Pape, W. Simpson, Miss E. M. Smith, F. Pape, T. E. Ind, G. W. Watson. No initial public issue. Table "A" mainly applies.

Tramway Strike in America.—On Friday last, over two thousand employees on the tramway system of Cleveland, Ohio, struck for higher pay. The lines have only recently been taken over by the city from private ownership. Nearly a thousand men were obtained to fill the places of the strikers and the trams were run. Several riots took place, and strikers, passengers, and police were injured.

Kent Collieries Electrical Plant.—The hearing of the case between Messrs. E. Scott & Mountain, Ltd., and the Kent Collieries Co. was resumed on Wednesday, May 6th, before Mr. Muir Mackenzie, in the Official Referee's Court, and continued on the following days. A report of the proceedings of the previous days was given on page 684 of our issue of May 7th. The following is a *résumé* of the proceedings of the last few days :—On the conclusion of the opening address for the defence, Mr. Lancaster, a director of the Kent Collieries Co., was examined by Mr. Bousfield. He stated that, previous to the breakdown, it was never suggested that more than one pump would be necessary. The water was erosive in character, and contained mineral salts, but this should not have caused breakdown. Mr. W. Thomas gave evidence to show that the tackle supplied by the defendant company was sufficient for raising and lowering the pumps. Mr. H. M. Sayers, consulting engineer to the defendant company, said that in his opinion the motors supplied were not capable of carrying the full guaranteed load. The temperatures had risen to nearly twice the usual limit. He attributed the breakdown to faulty construction and overheating. The defects in motors Nos. 1 and 2 had been overcome in motor No. 3. The pumps were now not in a state efficient enough to admit of a test being made. It was uncertain whether the breakdown of pump motors Nos. 2 and 4 was due to moisture previously in the coils or moisture drawn in from outside. With regard to the 10,000-volt test, this had been made between coil and iron only; the insulation between turns had not been tested. The presence of copper salts on the wires led him to believe that the coils had never been properly dried. With the exception of motor No. 3, the motors had not sufficient cooling surface to dissipate the heat generated. Mr. W. M. Mordey, who had tested the generating plant and one of the pumps for the defendant company, gave full particulars of the manner in which the tests were carried out. He said that whereas the specified steam consumption was 28 lb. of steam per kilowatt hour, the results of a six-hour test gave a steam consumption of 44 lb. per kw. hour on an average load of 250 kw. (the rated load). It was impossible to get the 25 per cent. overload mentioned in the specification, even with a slightly increased steam pressure. Thus, with a pressure of 108 lb. per sq. in., the maximum load obtainable was 256 kw. The maximum temperature rise of the generator was 90° Fahr. After 5½ hours' run the pump motor was too hot to run safely, and the temperature was still rising rapidly. The mean internal temperature was about 212° Fahr., and in his opinion no insulating material would stand that for long. He did not believe in asbestos insulation, as inflammable materials were used in the composition. The tests made by the plaintiffs were, he said, inaccurate and useless. In his opinion the machines were clearly overloaded, and were also not in accordance with the specifications.

PARLIAMENTARY INTELLIGENCE

LONDON POWER BILLS.—A full report of the Proceedings in Committee will be found on pp. 762 and 785-786.

DONCASTER CORPORATION BILL.—This Bill, which has been before the Police and Sanitary Committee in the House of Commons during the week, proposes by Part 3 the borrowing of £9,000, repayable in 40 years, for the construction of new tramways, the period for the construction of which is five years. There was no opposition to this part of the Bill. It was reported for third reading.

ELECTRIC LIGHTING PROVISIONAL ORDER CONFIRMATION BILL, No. 3.—This Bill, which has just passed the examiners in the House of Commons, confirms Electric Lighting Provisional Orders granted by the Board of Trade under the Electric Lighting Acts, to the Brigend Urban District Council (extension), Hendon (Messrs. Crompton & Co., amendment), Llandaff and Dinas Powis Rural District Council (amendment), Llansamlet Rural District Council, Oulton Broad Urban District Council, Sowerby Bridge Urban District Council (amendment), and Tewkesbury Corporation (amendment).

LONDON UNITED TRAMWAYS.—The Court of Referees on Wednesday last week granted the promoters of the West London, Barnes, and Richmond Tramways Bill a *locus* against the London United Tramways Bill.

METROPOLITAN DISTRICT RAILWAY.—All opposition to this Bill has now been withdrawn, and it has been referred to the Unopposed Committee.

NORTH-EAST RAILWAY.—This Bill was before the Unopposed Committee of the House of Commons on Thursday, and was ordered to be reported for third reading. It proposes an extension of time in respect of the construction of the railway authorised in 1906.

NOTTINGHAMSHIRE & DERBYSHIRE TRAMWAYS.—The Nottingham and Derbyshire Tramways Co. have introduced a late Bill which proposes to transfer to the Nottingham Corporation certain of the tramways for which powers are held by the company, and also includes powers for the construction of additional tramways by the company. The Bill came before the examiners in the House of Commons last week, and was ordered to be reported to the Standing Orders Committee owing to the Standing Orders not having been complied with in consequence of the Bill having been deposited later than the statutory time.

PROGRESS OF ELECTRICAL BILLS.—Electric Lighting Provisional Order Confirmation Bill, No. 1, was read a third time in the House of Commons last week.

The Motherwell Borough (Extension) Bill, the Wishaw Electricity Bill, and the Tramways Order Confirmation Bill, No. 2, were read a second time in the House of Lords on Thursday.

Electric Lighting Provisional Order Confirmation Bill, No. 2, was read a second time in the House of Commons on Monday.

The West London, Barnes, and Richmond Tramways Bill was read a second time in the House of Lords on Monday.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of 1/- per line (column width). Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of 1/- for the first 12 words and 3d per word afterwards. Three insertions for the price of two. Advertisements can be received up til Wednesday morning first post.

Letters should be addressed to THE KILOWATT PUBLISHING CO., LTD., 203-6, Temple Chambers, London, E.C.

TENDERS INVITED.

ILFORD URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

THE ILFORD URBAN DISTRICT COUNCIL invite tenders for the Supply and Erection of the following Plant, and are prepared to accept Tenders subject to the Local Government Board's sanction being obtained to the necessary loan :

Contract A6. Surface Condensing Plant and Cooling Tower.
Contract A7. Steam and Feed Pipes, Boiler Feed Pump, etc.
Contract A8. Extensions and Alterations to Main Switchboard.

Copies of the Specifications, including General Conditions, Forms of Tender, &c., may be obtained on and after Monday, 25th May, 1908, on depositing a cheque for One Guinea for each Contract, with the undersigned, which sum will be refunded to *bona fide* Tenderers after the Tenders have been adjudicated on.

Extra copies of the Specification may be obtained by *bona fide* Tenderers at a charge of Ten Shillings per copy, which sum will not be refunded.

Any further information may be obtained at the Offices of Mr. Arthur Shaw, M.I.E.E., A.M.I.Mech.E., Electrical Engineer to the Council, at the Electricity Works, Ley Street, Ilford.

Tenders, sealed and marked "Tender for Contract A-, Electricity Works," to be addressed to the Chairman of the Urban District Council, Town Hall, Ilford, and to be delivered on or before 12 o'clock noon on Wednesday, the 10th June, 1908.

The Council do not bind themselves to accept the lowest or any Tender.

Town Hall, Ilford,
May, 14th, 1908.

JOHN W. BENTON.
Clerk to the Council.

SUMMARY

A correspondent draws our attention to the difference between the prices for ordinary cable quoted by firms belonging to the Cable Makers' Association and their foreign competitors. In the case of 3/20 V.R. cable of the 600-megohm class, for instance, the C.M.A. price is £23 8s. per mile, and the price of a foreign firm £11 17s. per mile. In 19/16 cable the difference is in about the same ratio.—We have also received a communication from Mr. E. Raymond-Barker on the relative speeds of telegraphic transmission by "wireless" methods and submarine cables. (Page 802.)

A surface-box explosion occurred in the mains of the St. James and Pall Mall Electric Co. on Saturday morning in Pall Mall, near Marlborough House. (Page 802.)

Some tests were carried out on Tuesday last on a new type of leadless insulated cable, in which the insulation consists of paper impregnated with a compound known as "Liconite." Cables in which the insulation consisted purely of this compound pressed on to the conducting core were also tested. Although the cables had been immersed for some days in water, the $\frac{3}{8}$ in. thickness of insulation withstood pressures up to 70,000 volts. Bending tests were also carried out. (Page 803.)

The Dublin and Central Ireland Electric Power Bill, which was rejected by a Committee of the House of Commons last month, was recommitted to the Committee after a short discussion in the House of Commons last week. The reason for this is that the promoters have agreed to cut out of the area the City of Dublin and the Urban Districts of Rathmines, Rathgar, and Pembroke. The name of the Bill has been altered to the Central Ireland Electric Power Bill and the capital reduced from £450,000 to £150,000. The promoters have admitted that their financial evidence on the last occasion was not strong enough, and have amended their case considerably in this respect. (Page 803.)

In evidence given by Sir Clifton Robinson before a House of Commons Committee last week, it was stated that the London United Tramways, Ltd., had been obliged to pay enormous sums for the local authorities' consents in some cases. He said that no less than £1,119,296, or over £20,000 per mile, had been paid at various times, irrespective of the cost of the construction and equipment of the lines. The particular case in point was the obtaining of wayleaves for passing over Kew Bridge. The Middlesex and Surrey County Councils demanded £1,000 each,

Digitized by Google

and the Committee finally fixed the sum at £500 each. (Page 804.)

AT the Institution of Electrical Engineers last Thursday Mr. HUGO HIRST read a Paper on tungsten lamps, with particular reference to the osram lamp. The Paper included references to some of the more important patents, and described briefly the method of manufacture employed for the osram and "Just-Wolfram" lamp. Useful figures of life and efficiency were given, together with tables and curves. Quantitative data were also given as to the losses in the small transformers for use with 25-volt metallic filament lamps. Contrary to expectation, the discussion was hurried through so as to be completed the same evening, as a meeting for the adjourned discussion had not been arranged. Mr. HAYDN HARRISON said that incandescent gas mantles dropped 20 per cent. in candle-power after 100 hours' burning, and 40 to 50 per cent. after 500 hours, whereas tungsten lamps fell only 10 per cent. in candle-power after 1,000 hours. He also pointed out that enclosed arcs took nearer 2 than 1 watt per candle, and were, therefore, less economical than osram lamps and that street lighting with osram lamps might even be cheaper than with open arc lamps, if the cost of carboning was taken into account. Mr. B. DRAKE mentioned the breakage trouble, to which he said tantalum lamps were less subject. Dr. LOUIS BELL said that the shorter life of the tantalum lamp on alternating-current circuits was due to the frequency of heating and cooling; he had found that the life shortened at frequencies of 60 cycles and upwards, and that at 5 or 10 cycles per second it was very short. Generally, he said the life of tantalum lamps on A.C. circuits was two-thirds that on D.C. circuits. In America, tungsten lamps are largely replacing enclosed arcs. The standard sizes there are now 100, 60, and 40 watt. Mr. HANDCOCK pointed to the higher ratio of the mean horizontal to the mean spherical candle-power in the case of metal filament lamps, and thought that comparisons on the basis of horizontal candle-power were, therefore, rather unfair to the carbon lamps in which the ratio was less. Mr. A. CAMPBELL SWINTON questioned the assumption of the existence of selective emissivity. Mr. C. C. PATERSON said he did not see why the new lamps should not be standardised in candle-power instead of in watts. His experience of the gas mantle differed from that of Mr. Harrison; he found that the candle-power rose largely during the first 100 hours or so and then dropped. Nor did he attach importance to the difference between the ratios of mean horizontal and mean spherical candle-power in the carbon and metal filament lamps. It amounted to no more than 5 or 6 per cent.; the reduction factor was 0·85 or 0·86 on the one hand as against 0·7 to 0·8 on the other. Mr. T. H. LOWDEN said that the British Westinghouse Co. were now selling a 220-volt 32-c.p. lamp. Mr. WORDINGHAM deprecated the suggestions made in Messrs. Handcock & Dykes' Paper that the price of electrical energy should be raised. Mr. GASTER, Mr. J. S. RAWORTH, and the President (Col. CROMPTON) also spoke, and Mr. HIRST replied to several of the points that had been raised. (Page 805.)

THE annual report of the Stepney Electricity Department records a further diminution of working costs, which now amount to 0·93d. per unit, a figure which is brought up to 1·58d. by the inclusion of all capital charges. (Page 813.)

AN article on the Birmingham electrical fittings industry describes several interesting and artistic designs, and also includes a brief reference to the adoption of the "looping-in" system by the Admiralty. (Page 815.)

A LOCOMOTIVE caught fire in the Clapham Common station of the City and South London Railway during the small hours of Sunday morning, and some difficulty was found in obtaining access to the platform to extinguish it. The cause of the fire was not "electrical." (Page 818.)

CONSIDERABLE progress has been made with the arrangements for the Manchester Electrical Exhibition which is to be held in October. One of the features of the exhibition is to be a series of exhibits illustrating the applications of electric-power in the textile industries. We are able to publish the rules for the wiring of the stands in full. A three-phase alternating supply at 400 volts 50 cycles will be available, as well as continuous current at 200 volts for lighting and at 400 volts for power. The charge to exhibitors will be 2d. per unit for lighting and 1d. per unit for power. (Page 819.)

Under ELECTRICAL SCIENCE in the British and American Section are given the results of some experiments by T. MATHER and F. E. SMITH, comparing the Board of Trade and the National Physical Laboratory ampere-standards. A Paper read before the Royal Meteorological Society relates to the colour of lightning. An account of a new method of generating low-power alternating currents of frequencies suitable for telephonic measurements, and a note on the heat developed in thoria by its own radioactivity are also given. In the Continental Section a Paper by FÉRY, describing an improved electric pendulum, and another by SMIRNOW, in which he brings forward some general rules governing atmospheric ionisations, are abstracted. (Page 821.)

In general the use of electricity when it is employed for heating purposes in chemical processes is due to the ease with which very high temperatures can be obtained. Mr. F. T. SNYDER, however, employs it for the distillation of turpentine, not because a high temperature is required, but because it is important to regulate the temperature and not to allow it to rise much above 200° C. The process is described under ELECTROCHEMISTRY AND ELECTROMETALLURGY. A Paper on some attempts which have been made to synthesise hydrocyanic acid directly, by electrically heating carbon rods in an atmoshere of hydrogen and nitrogen, is abstracted. If such a process could be carried out cheaply, it would probably revolutionise the cyanide industry. A note on the production of aluminium shows how the output of this metal has increased during the last ten years. (Page 822.)

AMONG the patent specifications published on Thursday last is one by the FELTEN & GUILLEAUME-LAHMEYERWERKE AKT.-GES. relating to a method of signalling or selectively operating apparatus at a distance by means of electric currents of various frequencies. An improved tramway track brake is described in a specification by J. F. SIMPSON. A specification by S. O. COWPER-COLES gives particulars of an electrolyte for the electro-deposition of iron, and another by P. B. & T. H. BLACK relates to contact boxes for surface-contact systems of electric traction. The elastic support of metallic filaments is dealt with in a specification by T. S. LOWDEN and the WESTINGHOUSE METAL FILAMENT LAMP CO., and an improved winding for the commutating poles of continuous-current turbo-generators is the subject of a patent by W. PARKER and the SIEMENS BROS.' DYNAMO WORKS CO. (Page 823.)

As announced in our last issue, financial evidence in connection with the London and District Electric Power Bill was given on Wednesday last week, when Sir Hugh Bell guaranteed to be responsible for the

Digitized by Google

raising of £250,000, and stated that he was authorised on behalf of Lord Fitzwilliam to state that he would also be responsible for a very substantial sum. On Friday, Sir Hugh Bell stated that Sir Edward Tennant had authorised him to say that he also would be responsible for capital to the extent of £100,000. In the cross-examination of the financial witnesses on the purchase clause, the London County Council indicated that it desired the terms of the Electric Lighting Act of 1888 instead of the repayment of the total capital expenditure as proposed by the promoters. Evidence from railway companies and power users in various parts of the area were called on Wednesday and Thursday, and on Friday an early adjournment was made in order that the promoters might confer with the London County Council with a view to coming to an agreement over the purchase clause. On Monday Mr. L. Maltby, a member of the firm of Messrs. Deloitte, Pender, Griffiths & Co., was called in support of the purchase clause, but serious cross-examination was postponed pending the result of the conference with the London County Council. The case for the opposition was opened on Monday, and continued over Tuesday and yesterday. The evidence from West Ham was to the effect that there were several power users of over 250 kw. in that district, and that power could be supplied at lower prices than those in the Bill. (Page 825.)

THE sale of the Bath electricity undertaking from the Corporation to a syndicate which already holds powers in the surrounding district has now been definitely decided upon. The loss on the undertaking has, however, been much reduced during the past year.—There has been considerable discussion as to the revision of tariff at Marylebone, but no alteration is to be made at present.—It is stated that negotiations are in progress for the acquisition of the Brighton Corporation Tramways by a syndicate.—The annual report shows that the power load at Burton-on-Trent now exceeds the lighting load. In spite of a rise in the cost of fuel of 33·7 per cent, an increased profit is shown. It is proposed to fit Mr. PRINGLE'S new tramcar brake to six of the cars.—Telegrams are now accepted for wireless transmission to the Channel Islands.—The Paddington Borough Council has agreed to support the Metropolitan Electric Tramways Bill for tramway extensions along Harrow Road, subject to certain conditions. (Pages 831–833.)

THE London County Council has accepted a tender of Messrs. Heenan & Froude for tramway trucks. The lowest tender, that of the Brush Co., was rejected owing to questions regarding the general conditions. In consequence of troubles experienced previously with deliveries from foreign firms, the tender of Messrs. Bolckow, Vaughan & Co. for British steel rails has been preferred to lower tenders for Continental rails. (Page 834.)

THE annual report of the American General Electric Co. records a substantial increase of business for the whole year, notwithstanding a serious falling off of orders during the last few months.—Meetings have been held during the week of several companies whose reports were given in our last issue, including Callender's Cable and Construction Co. Although this company is paying a dividend of 10 per cent. and a bonus of 5s. per share, the results are not as good as previous years, mainly owing to the variations in the price of copper and the stringency of the money market. (Page 835.)

SOME new electric drills and grinders, automatic motor-starting switches, and electric light fittings are described on pages 837 and 839.

MR. HUGO HIRST'S Paper on the osram lamp, read at the Institution of Electrical Engineers last Thursday, was an excellent *résumé* of what had been done in the manufacture of a lamp that has attained so rapid a popularity, but the discussion which followed it was to some extent a disappointment. From notes of life observations that have appeared in our columns during the last few weeks, it is evident that a large number of station engineers have these and other metal filament lamps in use and are carefully watching them, but practically no new data were given by disinterested parties. Enough has already been published, however, to show that the 100-volt metal filament lamp is a success, and that it has attained its present position during the last two or three years with a rapidity exceeding all anticipations. We have lamps of about 30 British candle-power taking $1\frac{1}{4}$ watts per candle with a life of over 1,500 hours, and lamps of 16 c.p. taking about 1·7 watts per candle, as good and reliable as the carbon filament lamps which consume some $3\frac{1}{2}$ watts per candle for a similar life. Two hundred volt metal filament lamps still present many difficulties in manufacture, however, but we are convinced that it is only a question of time before these will be overcome. The tungsten filament of the osram lamp has a diameter of only about one thousandth of an inch, and the specific resistance of the metal is so low compared with that of a carbon lamp that a 100-volt lamp must have a filament about three times the length. To produce a metal filament lamp for 200 volts, therefore, a very long filament is necessary, unless a metal with a higher specific resistance can be employed, or unless the diameter of the filament can be reduced still further, and a long filament means a high candle power. Although Mr. HIRST is not sanguine as to any great improvement in this direction at an early date, there are many workers in the field, and, in fact, one speaker in the discussion spoke of a 220-volt 32-c.p. lamp being already on the market. No sample of this lamp has yet reached us, and no announcement, so far as we know, has been made as to its reliability or its price, but, still, we feel confident that the workers at the problem are by no means disheartened, and that the minimum candle-power obtainable for a 200-volt metal filament lamp with high efficiency and reasonable life will be gradually reduced. The carbon filament lamp has already become practically a lamp employed in special circumstances only, and its use, except in small rooms, is rapidly diminishing.

THE attention of all members of the Cable Makers' Association, and also of those contractors who desire that good work should be put in and good prices paid for it, is called to a letter which we have received from a correspondent this week on the relative prices of C.M.A. and foreign cable. In two particular cases cited the price of a well-known foreign firm is almost exactly half that of the price charged by the Association firms for what is nominally the same class of cable—that known in the trade as 600-megohm. Our correspondent belongs to a well-known firm of wiring contractors who are in a position to obtain the lowest prices for material of this class, and his figures are very significant and call for explanation from cable makers. We understand, also, that the foreign firm

Digitized by Google

in question is one of the largest Continental houses. If the cable makers in this country are keeping up their price unduly, they should be warned that this must in the long run be against their interests. On the other hand, if cable of an inferior quality is sold as of a higher grade than it really belongs to, some action should be taken to prevent it. The designation vulcanised rubber cable of the "600-megohm" class is perhaps a loose one, but it has generally been accepted by the trade in this country to imply a definite quality of high-grade vulcanised india-rubber insulation which gives an insulation resistance of at least 600 megohms per mile in the larger sizes and a correspondingly higher insulation in the smaller sizes.

URBAIN's announcement, to which we referred last week, that a metal has been found whose oxide is 12·8 times as magnetic as the corresponding iron oxide, will have been read with interest by electrical engineers bent upon reducing the weight and volume of their electrical machinery. The metal in question is dysprosium, discovered spectroscopically by Lecoq de Boisbaudran in 1886, and isolated by Urbain two years ago. Its separate identity has long been questioned, but may now be taken as completely established, since Urbain has clearly identified no less than 30 spectrum lines of the metal in the ultra-violet, and has obtained 50 grammes of it wherewith to experiment. Its atomic weight is 162·5, which places it among the rare earths between terbium and holmium. What URBAIN does not state, but what interests us particularly, is whether he has examined the magnetic properties of dysprosium in the metallic state. These should be of a somewhat remarkable character, if the promise made by the oxide is carried out. Dysprosium is obtained from a mineral called terbine. It also occurs in cerite and other such rare earth minerals. If there should be a demand for it, it should not be very difficult to discover a commercial method of producing it. At present its isolation is an exceedingly lengthy and tedious process. It is not encouraging to be told that it takes 20 fractionisations to remove its near congeners, such as holmium, and these operations take from 18 months to two years. It has been suspected for some time that other rare earths, such as erbium, are highly magnetic also. Perhaps some one among these may turn out to be the stuff we are waiting for, but for the present iron and steel are evidently not about to be displaced in dynamo and transformer manufacture.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 28TH.

Institution of Electrical Engineers.

12.30 p.m. Annual General Meeting at 92 Victoria Street, Westminster, London, S.W.

Institution of Civil Engineers.

8.30 to 11 p.m. Conversazione at the Royal Albert Hall.

Subways for Electric Cables.—According to a British Consular Report, the city of Baltimore, U.S.A., has constructed 95 miles of subways in the city, in which all lighting, power, and telegraph cables owned by companies must be placed. In some places the subways contain as many as 48 ducts. The total cost of the subways was £360,000, and after deducting from the rentals the interest on the loans and the working expenses there was a profit to the city in 1907 of £2,966. The electric lighting of the city is entirely in the hands of the Consolidated Gas, Electric Light, & Power Co. of Baltimore, which company has recently made a contract with the McCalls Ferry Power Co. for the supply of electrical energy from the large water-power station which is being built on the Susquehanna River.

CORRESPONDENCE

THE PRICE OF CABLE.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The wide differences between the figures of a successful tenderer and those of his highest competitor, which frequently occur, are often a matter for comment in the electrical Press and elsewhere. There are many reasons for these differences, some of them perhaps hardly legitimate, but the object of this letter is to point out that cables vary in price to a degree which ought to be more publicly known, and that any consulting engineer who frames his specifications in such a way as to permit the use of either foreign or "non-association" cables, practically invites just such differences in his clients' lists of tenders.

The present C.M.A. prices compared with the current prices of a well-known foreign firm, compare as follows:—

600-Megohm Cable.

PRICES PER MILE.

	C.M.A.	Foreign.
3/20	£23 8s. 2d.	£11 17s. 6d.
19/16	£196 17s. 8d.	£107 2s. 0d.

In a contract, therefore, where the cost of the wire forms a large proportion of the total, there is room for a very wide difference in the amounts of the tenders, and those contractors who stick conscientiously to C.M.A. cable are pretty sure to be hopelessly undercut. I have just completed a Bill of Quantities for a large building in which the wire and cable amount to 36 per cent. of the whole cost: the use of foreign cable in this case would give the competing firm an advantage of nearly 18 per cent.

A remedy for this state of things is not obvious; perhaps you, Sir, or one of your contributors, may suggest one, but I would suggest that much may be done by more care in specification.

I am,

6 Dudley Road, Wimbledon. Yours faithfully,
May 26th, 1908. H. ELLIS THOMPSON.

"Wireless" and Cable Speeds.—Mr. E. Raymond-Barker sends us, just as we are going to press, a cutting from the *Morning Post* of Wednesday, May 20th, in which a passage occurs comparing wireless telegraphy speeds with speeds on submarine cables, together with a copy of a letter correcting certain statements in this article, which the editor of our contemporary has refused to insert. The statement to which Mr. Raymond-Barker takes particular exception is attributed in the article to Mr. Marconi, and is to the effect that greater speed has been attained in wireless telegraphy than can be reached even by expert operators on transatlantic cables. Mr. Raymond-Barker rightly points out that a comparison of hand speeds has nothing to do with the matter, as mechanical or automatic signalling is employed every day on transatlantic cables, and he cites speeds of 45 and 50 words per minute having been obtained on transatlantic cables, even more than 13 years ago. Such cables could be worked at nearly 100 words per minute duplex. Mr. Marconi was apparently comparing hand speeds; and, however he may have been reported, we cannot think he meant to imply that the maximum speed of wireless working is greater than the maximum speed of submarine working, for he is, of course, well acquainted with the facts of the matter.

Surface Box Explosion in Pall Mall.—At eight o'clock on Saturday morning an explosion occurred in two surface boxes in Pall Mall, in close proximity to Marlborough House, on the opposite side of the street. As usual, the Fire Brigade was summoned, but only sand and not water was directed on the cables. The Fire Brigade's report is that a "defective electric circuit" was the cause of the explosion, and it appears probable that gas in the box was ignited by a short circuit, but the St. James's and Pall Mall Electric Light Co., on whose mains the occurrence took place, will give no technical particulars at present. We are informed that the Board of Trade is investigating the matter. No personal damage was done, but a shop window was broken and some of the contents were injured.

Digitized by Google

A NEW "LEADLESS" CABLE

ON Tuesday afternoon, at the Victoria Works, Charlton, a series of tests were carried out on a new type of leadless insulated cable. The new material from which the insulation of the cable is made is known commercially as "Liconite." This is a black, plastic substance of a bituminous character, made by a process patented by Mr. E. S. Ali Cohen, of Singapore. It is a cheap material, and has properties which render it particularly suitable for the insulation of cables. The following are some of the properties claimed:—It is unaffected by dilute acids, alkalis, oils, moisture, or electrolysis, is non-hygroscopic, resists large variations of temperature, has a high dielectric strength, is elastic and tough, and does not flow or crack. The cables exhibited were of three distinct types, in which the insulation consisted respectively of: (1) layers of paper impregnated with "Liconite"; (2) solid "Liconite Elastic," a preparation from "Liconite"; and (3) alternate layers of impregnated paper and "Liconite Elastic." A 200-yard length of cable of the first type, consisting of a 0·25 sq. in. stranded copper core insulated with 56 layers of "Liconite" impregnated paper to a thickness of $\frac{3}{8}$ in., and covered with two layers of "Liconite" tape and one layer of Hessian tape, had been immersed in water for 12 days, and withstood successfully a pressure of 32,000 volts between the core and the surrounding water for five minutes. The insulation resistance tested after nine days' immersion was 10·3 megohms per mile. A two-yard length was cut off the above cable, and bent round a drum 18 in. in diameter (12 times the diameter of the cable), three times in each direction. This piece did not break down until a pressure of 70,000 volts was reached. It is stated that this high degree of flexibility and freedom from damage due to bending is maintained throughout the life of the cable. A two-yard length of the same cable, which had been immersed with its ends bare and under water for seven days, and which before being immersed was bent round an 18 in. drum three times each way, was also subjected to the high-pressure test, and did not break down until a pressure of 70,000 volts was reached. In the manufacture of these cables, the paper is impregnated before being wound on the core, and impregnation in a vacuum chamber of the wound cable is not required. The cable is taped and braided, and, if necessary, is armoured for protection from mechanical injury. It is stated that the cost of the impregnating substance is not high, and that in consequence the cable is cheap.

A three-phase cable of the second type, in which the insulation consists of "Liconite" elastic (without paper) pressed on to the core, was also tested. Each core of this cable consisted of 19 strands of 0·085 aluminium covered with a thin layer of lead to decrease the curvature and the resultant electric stress, as proposed by Mr. O'Gorman. The diameter of the core was 0·55 in., the thickness of insulation 0·5 in., and the total diameter of the three cables laid up to 3·5 in. A 200-yard length of this cable immersed in water withstood successfully a pressure of 50,000 volts between cores for seven minutes. The third type of cable, in which the insulation consists of alternate layers of "Liconite" elastic and impregnated paper, is stated to be much preferable to the solid "Liconite" type, as decentralisation is impossible, and each layer of "Liconite" is pressed between the layers of paper forming a good mechanical job. A 40-yard length of such cable, with 0·5 in. thickness of this "reinforced" insulation withstood a pressure of 30,000 volts for five minutes.

These cables were manufactured by Messrs. Johnson & Phillips for Messrs. A. Hendrichs & Co., of Amsterdam, who own the patents for the impregnating material. An experimental plant for manufacturing these cables has been erected at Charlton.

Street Lighting in the City of London.—The City of London Engineer has issued a report with regard to experiments which, at the instance of the two City electric lighting companies, are being carried on for the purpose of comparison between the respective merits of electricity and gas for street lighting. Experimental lighting has been installed both in the main thoroughfares and side streets. The City of London Electric Lighting Co. are lighting Holborn Viaduct, Holborn, and part of the Old Bailey with 21 "Oriflamme" white or golden arcs of 1,500 actual candle-power; Farringdon Street with 18 small enclosed arcs of 500 candle-power; and Newgate Street with 10 smaller lamps, and the Charing Cross, West End & City Co. have supplied a number of centrally-hung flame lamps in Cannon Street (see ELECTRICAL ENGINEERING, Vol. II., page 693). As the high-pressure gas mains are in the whole of these thoroughfares, excepting between Holborn Circus and the corner of Gray's Inn Road, the City Engineer considers that a comparison of cost will be obtainable under very favourable conditions. For the Holborn Viaduct and Old Bailey area the existing lighting costs £390 annually, and it is stated that the proposed lighting would cost £262, as against £251 for high-pressure gas. In Farringdon Street the present cost is £312, and the cost of the proposed lighting would be £193, compared with £211 for gas. In Newgate Street a cost of £182 is at present involved, and the new scheme proposed would mean an expenditure of £95, as against £71 for high-pressure gas. Thus, for the three areas a total annual saving of £332 is anticipated compared with the present cost, and the difference in favour of gas is practically negligable.

PARLIAMENTARY INTELLIGENCE

Electricity from Peat

Central Ireland Electric Power Bill

IN the House of Commons on Thursday, on the motion of Mr. John O'Connor, it was agreed that the Dublin and Central Ireland Electric Power Bill be recommitted to the former committee, with instructions that they have power to reconsider their decision on the preamble of the Bill as reported by them to the House, except in so far as the same related to the city of Dublin, the urban districts of Rathmines and Rathgar, and Pembroke.

It will be remembered that this Bill came before a committee of the House of Commons, presided over by Mr. Luke White, on March 30th and 31st, and April 1st (ELECTRICAL ENGINEERING, April 2nd, page 503), and was rejected, presumably on account of insufficient financial evidence. We commented upon this in an editorial note in our issue for April 9th.

The Bill came before the committee again on Tuesday, when Mr. Freeman, K.C., said that the promoters had now satisfied themselves that, without the districts mentioned above, they could make the scheme perfectly remunerative, and consequently the name of the Bill had been altered to the Central Ireland Electric Power Bill. As a consequence the original capital of £450,000 with borrowing powers had been reduced to £150,000 with borrowing powers, and these were the material alterations in the Bill. The view which was laid before the Committee on the last occasion, that there were various industries which would take electricity if a supply were given in the area scheduled, had been strengthened very much during the past few weeks, particularly, in consequence of the passing of the new Patent Act, for they understood that a great deal of foreign manufacture was coming to this country, and they had the strongest possible belief that if the Bill were now passed in its present form, the undertaking would be a successful one. It was made a condition in the Bill now that before any powers could be exercised, £50,000 of capital would have to be subscribed. On the previous occasion there was no doubt that the evidence in respect of the financial support was not as full and complete as it might have been, and a certain amount of blame attached to all who were connected with the Bill, because they had a great deal more financial support behind them than appeared before the Committee. He now had a certain number of names of financial gentlemen in respect of all of whom they had received actual letters saying that they were prepared to give substantial support to the Bill. These were Mr. W. Geoghan, a director of the Great Southern and Western Railway Company of Ireland, who had subscribed £1,000 to the preliminary expenses and was willing to subscribe more if desired; Mr. Samuel Geoghan, a director and shareholder of the Irish Industries Co., who had subscribed £1,700 to preliminary expenses and would take a substantial interest in the concern; Mr. Griffiths, of Rathmines Castle, Engineer to the Dublin Docks Board, and a shareholder in various industrial concerns, who had subscribed £1,000 towards preliminary expenses; and other subscribers had found portions of the preliminary expenses, so that altogether £5,626 had been found in this way. In such a comparatively small matter as this was now, he thought this was a substantial guarantee that the capital would be found; in fact, one of the subscribers, who had also promised to take an interest in the company, had taken the trouble to go over to Germany and see the peat process in operation there before giving a decision. The only opponents to the Bill now were the Dublin Corporation, who wanted some protection with regard to their property outside the city boundary, which was perfectly reasonable, and the Alliance and Dublin Gas Company, whose position had not altered since the Bill was last before the Committee, namely, one of competition.

Sir RALPH LITTLER, K.C., for the Alliance and Dublin Gas Co., protested most strongly against the Committee re-opening the case for the Bill, as it was wholly without precedent in Parliamentary practice. What the promoters were asking was to amend their financial evidence, it having been insufficient on the previous occasion, and he would like to know where petitioners against Bills would be in the future if such a precedent were to be set up; he ventured to suggest that there would be an end to all established Parliamentary practice. He also had to complain that it was usual, when seeking permission to recommit a Bill, to consult all parties, including the petitioners against it, but in this case his clients had not been consulted.

The CHAIRMAN pointed out that Parliament had decided that there should be a new trial.

Sir RALPH LITTLER stated that in his view the recommendation to the Committee was that they should have power to reconsider their decision, and he asked the Committee not to go into the merits of the Bill again for the reasons he had stated.

The CHAIRMAN thought the Committee would be acting wrongly if they decided simply to reject the Bill once more, and thought they were bound to hear evidence.

Sir RALPH LITTLER said that in view of this decision, and the fact that his clients had had no time to prepare their case

Digitized by Google

against the Bill in its altered form, he must withdraw from any discussion on the matter at the present stage.

Evidence having been called with regard to finance, the preamble of the Bill was found proved, and it was ordered to be reported for third reading.

London United Tramways Bill

Tramways over Kew Bridge

THIS Bill was before a Committee of the House of Commons, presided over by Mr. D. A. Thomas, last week. The Bill proposed to confer powers upon the London United Tramways, Ltd., for constructing tramways and widening and altering streets and roads, and for other purposes, but there was only one part of the Bill opposed, viz., a proposed tramway, three furlongs in length, over Kew Bridge. The object of this line, said Mr. Balfour Browne, K.C., who appeared for the promoters with the Hon. J. D. Fitzgerald, K.C., Mr. Lewis Coward, K.C., the Hon. Evan Charteris, and Mr. Lynden Macassey, was to connect the electrical system of the company on the north of the river Thames with the horse service between Kew and Richmond on the south side, when the latter system would be reconstructed. The Middlesex and Surrey County Councils, however, opposed, because the tramway company would not agree to pay to each of them £1,000 per annum wayleave for the use of the bridge. As a matter of fact, the authorities in question refused their consent to the company's proposal on these grounds, but the Standing Orders Committee decided that the Bill should go forward. Sir Clifton Robinson, the managing director and engineer of the London United Tramways Co., gave evidence, and said there would be no difficulty in constructing a double line of tramways across Kew Bridge, as there would be 11 ft. on either side of a double line down the centre. Sir Clifton was very emphatic about the manner in which the local authorities had treated the London United Tramway Co., in the past, and handed in an abstract of his evidence before the Royal Commission on London Traffic, in which he showed the various sums in which the company had been mulcted at various times. This, he said, amounted to £1,119,296, or over £20,000 per mile, irrespective of the cost of construction and equipment of the lines. The Committee eventually found the preamble of the Bill proved, but as the parties were unable to agree as to the amount of the wayleave which should be paid, the Committee fixed it at £500 per annum each, to the Middlesex and Surrey County Councils.

BRISTOL TRAMWAYS.—This Bill was before the Unopposed Committee of the House of Lords on Wednesday, and was reported for third reading.

LONDON ELECTRIC POWER BILLS.—A full report of the proceedings before Lord Cromer's Committee will be found on pages 825 to 831.

LONDON UNITED TRAMWAYS BILL.—A report of the proceedings before the House of Commons Committee, which considered this Bill last week, will be found elsewhere in this issue.

RADIOTELEGRAPHIC CONVENTION.—In the House of Commons on Monday, Sir Edward Sassoon asked the Under-Secretary of State for India whether any expression of opinion had been received from the Government of India as to the provisions of the Berlin Convention on Wireless Telegraphy; if so, whether they desired to participate in them; and, if not, would they be allowed to contract out. Mr. Buchanan replied that the Government of India has expressed their wish to adhere to the Berlin Convention on its ratification by his Majesty's Government.

THE G.B. SURFACE CONTACT SYSTEM.—In the House of Commons on Monday Mr. B. S. Straus asked the President of the Board of Trade whether he is aware of the danger to horses and human beings owing to the defective state of the stud system which the London County Council Tramways Committee has put down on the section between Aldgate and Bow; whether he was aware that accidents of a serious character have already occurred; and would he say what action he proposed to take for the safety of the public. In reply Mr. Churchill stated that on the section in question, which is not yet completed, two accidents, one to a man and one to a horse, have been reported by the police as having occurred through contact with a defective stud while the track was being tested. Fortunately neither accident seemed to have been of a serious character. Before the lines are brought into use for traffic, an inspection would be held and the Board's officers would require to be satisfied that all proper precautions have been taken. He was informed by the County Council that any necessary tests of the system in the meantime would be carried out when the traffic was very light, or at night.

PROGRESS OF ELECTRICAL BILLS.—The North-East London Railway Bill was read a third time in the House of Commons on Thursday, and a first time in the House of Lords on Friday.

The Nottinghamshire and Derbyshire Tramways Bill was read a first time in the House of Commons on Thursday.

Electric Lighting Provisional Order Confirmation Bill No. 3 and the Leeds Corporation Bill were read a second time in the House of Lords on Wednesday last week.

The Wolverhamption Corporation Bill was read a third time in the House of Commons on Monday.

King's College, London (Transfer) Bill was read a second time in the House of Commons on Monday.

Electric Lighting Provisional Order Confirmation Bill No. 1 was read a third time, and passed in the House of Commons on Monday.

WIRELESS TELEGRAPHY IN INDIA.—In answer to a question by Mr. Rees in the House of Commons on Thursday, Mr. Buchanan stated that no communication by wireless telegraphy has yet been established between India and any other British possession, but wireless communication was at present working between Diamond Island and Port Blair, and between Saugor Island and the pilot steamer at the Sanhead.

The Berlin Wireless Telegraph Convention.—It is announced that the Canadian Government has definitely decided to ratify the Berlin wireless telegraph convention of 1906.

Telegraph Traffic.—The cable between England and Gurnsey ceased to operate on the 20th instant, but was again put into working order on the 25th instant. We have to announce the interruption of the cable between Gibraltar and Tangier on the 22nd instant, and also of the cable between Pera and the Dardanelles. It is stated, however, that communication over the latter cable has only been stopped for the purpose of carrying out some repairs. Floods are responsible for the interruption of the Fao route, and the via Hanekin line was down in two places between Diarbekir and Bagdad, and Alep and Bagdad, but the latter line was again in working order on the 21st instant. The Compagnie Française des Cables Télégraphiques succeeded in effecting a repair of their cable between Martinique and Guadeloupe on the 21st instant, the interruption having lasted since the 8th instant. The interrupted cable between the Dardanelles and Constantinople was repaired on May 26th, while on the same day the telegraphic service between Constantinople and Rome was stopped. Owing to the "Trawlers" incidents (see page 818 of this issue), some delay exists on the lines of the Commercial Cable Co.

Newcastle Local Section of the Institution of Electrical Engineers.—The annual general meeting was held on Friday. The following officers and council for the ensuing session were elected:—*Chairman*, Mr. A. T. E. Drummond (District Manager National Telephone Co., Newcastle); *Vice-chairman*, Mr. W. D. Hunter (Managing Director, Newcastle and District Electric Lighting Co.); *Past Chairmen*: Prof. W. M. Thornton (Armstrong College), Mr. H. L. Rixley (Newcastle-on-Tyne Electric Supply Co.), and Mr. J. Pigg (North-Eastern Railway). *Committee*: Mr. J. H. Holmes (Messrs. J. H. Holmes and Co.), Mr. G. G. Stoney (Messrs. C. A. Parsons and Co.), Mr. G. Ralph (Messrs. J. H. Holmes and Co.), Mr. C. S. Vesey-Brown, Mr. A. S. Blackman (Borough Electrical Engineer, Sunderland), Mr. C. Turnbull (Borough Electrical Engineer, Tynemouth), Mr. F. Tremain (Superintending Engineer, G.P.O., Newcastle), Mr. J. A. Anderson, Mr. E. Fawssett, Mr. H. W. Clathier (Messrs. Reyrolle and Co.), Mr. H. Henderson (North-Eastern Railway), Mr. T. M. Clague, Mr. W. T. Dalton (Corporation Tramways, Newcastle), Mr. A. H. Law, and Mr. G. S. Whitmore. *Hon. Sec.*: Mr. C. S. Faraday Proctor (Edison-Swan United Electric Light Co.). *Hon. Treasurer*: Mr. W. A. Clatworthy.

Electric Tunnel Railways for the Berlin Mails.—According to *Engineering*, the German postal authorities intend to connect the general letter post-office in the Königstrasse of Berlin by special tunnels with the post-offices at the chief railway stations, which will be coupled by a circle line. The line to the Potsdamer Bahnhof is being built as an experiment. The double-track tunnel is to be immediately under the pavement, and is to have a width of 6 ft. and a height of 30 in.; a depressed footpath is to be provided between the two tracks, so that a man can walk through the tunnel; but there will be no attendants on the trains. The tracks are to have a gauge of 16 in. Each train is to consist of one motor-car and four trailers, the latter long enough to take a large mail-sack. All the cars, including the locomotive, will run on two axles; the locomotive will have a coupling in front and rear. The roof of the car is to be arranged to open on each side. The power is to be derived from three-phase currents of low voltage, taken up by trolley-arms of 6 ft. length from two lines. Trains are to follow one another at intervals of 1·5 minutes.

OSRAM LAMPS

Paper by Mr. Hugo Hirst

IN a Paper read before the Institution of Electrical Engineers last Thursday, Mr. Hugo Hirst (Managing Director of the General Electric Co.) gave some useful information with regard to osram lamps.

He commenced with a short historical sketch, pointing out that the early metallic filament lamps, made long before the Edison or the Swan carbon filaments were invented, were never a commercial success, because the melting-point of platinum is only slightly higher than that temperature to which it has to be raised for the economical production of light. In consequence, the slightest increase in the voltage was sufficient to melt the filament. In 1881 the carbon filament lamp came to the front and stopped the researches and experiments in connection with the perfection of the then existing metallic filament lamps. It was only after a lapse of nine years that the next American patent dealing with a new metallic filament lamp made its appearance—this was the Poland patent No. 432,710, of 1890, for the iridium lamp. The author referred next to the researches of Auer von Welsbach, and his invention of the gas mantle and the osmium lamp. The quiet peculiar radiation of the incandescent gas mantle, which consists of thorium oxide containing 1 per cent. of cerium oxide, has been, he said, the subject of numerous researches which have furthered the purely theoretical knowledge of radiation. Very careful experiments, especially the now famous investigations of Lummer, have shown that bodies exist which at the same temperature radiate as light a larger percentage of the supplied energy than the so-called "black bodies." The Welsbach mantle owes its high efficiency to this property.

The osmium lamp was the first commercial metallic filament lamp, invented by Auer von Welsbach in 1898, and it was put on the market in the following years. Its regular commercial supply commenced in 1902. In this lamp the filament is made of metallic osmium, which has a considerably lower specific resistance than carbon. The osmium lamp consumed 1½ watts per candle-power, and had a useful life of over 1,000 hours, with scarcely any decrease in candle-power during that period. At first the osmium lamps could only be produced for 37 volts, which necessitated the connection of three lamps in series on a 110-volt circuit. The lamps were very fragile, and had to be burned in a perpendicular position. Their cost was about ten times that of a carbon lamp, due largely to the limited quantities of osmium available. This did not prevent millions of these lamps being manufactured, but it was evident that it would be impossible to produce them in the quantities required to supply all Europe, which would need between 30 and 40 million lamps per year. During the following three years the osmium lamp was further improved and made available up to 77 volts, enabling two in series to be used for 110 volts, and three in series for 220 volts.

The Tungsten Lamp Patents.

After a short reference to tantalum lamps, Mr. Hirst came to the patent, applied for in 1904 by Drs. Just and Hanaman,* for incandescent bodies consisting of pure tungsten. This, he said, is the first English patent describing the manufacture of pure tungsten filaments—all previous inventors had failed to produce metallic bodies from this element which were free from oxides, carbon, or carbides.

The second claim of their patent reads :—"Process for the manufacture of incandescent bodies in accordance with Claim 1, characterised by the fact that tungsten or molybdenum or compounds of these metals are mixed with organic binding media, formed and carbonised, whereupon the carbon is chemically eliminated, substantially as described."

Quite independently of these inventors, the Deutsche Gasglühlicht Aktiengesellschaft (the Auer Company) applied for a patent† which covers a process for the manufacture of pure tungsten filaments. In 1906 and 1907 a large number of British patents were granted both to the Deutsche Gasglühlicht Aktiengesellschaft and to Drs. Just and Hanaman, which describe further improvements in the manufacture of tungsten filaments.

The two patents above mentioned cover what is known as the "paste" process of producing tungsten filaments—another method called the "coating" process was protected by Drs. Just and Hanaman in their British patent No. 11,949 of 1905.

These Mr. Hirst regards as the fundamental patents protecting the processes according to which tungsten filaments can be manufactured commercially at the present time, but he mentioned also a few patents by some other inventors :—

Heany (American patent No. 859,585) proposes to use an alloy of tungsten with titanium.

* British patent No 28,899, 1904.
† British patent No. 19,379, 1905.

Kuzel (British patent No. 28,154 of 1904) suggests the manufacture of glowing bodies from colloidal metals.

British Thomson-Houston Company (British patent No. 18,749 of 1906 and subsequent patents) describes the manufacture of filaments of tungsten with the help of volatile metals or alloys, chiefly amalgams, which could be drawn into wire.

Zerning (British patent No. 2,554 of 1906) claims the use of hydrogen and nitrogen compounds of tungsten as the materials from which to construct tungsten filaments.

"As far as I know," Mr. Hirst added, the hydrogenous compounds of tungsten have never been described by a chemist, and from the information I have been able to obtain the statement of Sir Henry Roscoe still stands. In his famous work, 'Elements of Chemistry,' he refers to the treatment by Berzelius of tungsten trioxide in a current of hydrogen. I understand that the result of the experiments of this famous scientist, which were confirmed by his French contemporary, Moissan, was the production of nothing by pure tungsten powder without any trace of hydrogenous compound being formed. As Zerning's experiments were directed towards the same object, it would denote a wonderful achievement if he should have produced a result which is not described in any scientific work, and which the above eminent authorities found to be impossible. The nitrogenous compounds are well known, and it is proved that they cannot exist at the high temperature at which the filaments have to be burned. The patent description is not very clear, but indicates that Zerning intends to make use of the 'paste' process thus producing filaments containing probably carbon or carbide."

After a careful consideration of all the patents on the subject, the author maintains that of the multitude of processes that have been applied for and tried since the first application of the Deutsche Gasglühlicht Aktiengesellschaft and the Just and Hanaman patents, these two alone have during the last two years produced to the world commercial and useful lamps. It has been ascertained, he says, that all metallic filaments burning at a consumption of one watt per candle have been made with tungsten filaments. If ever so small percentages of other substances are added to the tungsten, the economy and useful life of lamps with such filaments suffer immediately.

Manufacture of the "Osram" Lamp.

"Osram" is the name under which the Auer Company introduced the first commercial tungsten metal filament lamp. The osram lamp is manufactured by the "paste" process, the principle of which consists in preparing from solid substances, such as the metals themselves in the most finely divided form, a paste with binding or stiffening agents such as the gums, dextrin, and other similar bodies. Such a mass has the consistency of putty, and is then squirted through a very fine orifice in a diamond, with a pressure of several tons per square inch. The result of the squirting operation is that one obtains a somewhat moist thread, which, however, has enough coherence to be formed into filaments that do not break while being dried.

The filaments are first heated under exclusion of air and then possess sufficient strength to be held in metal clamps. They are then subjected to the passage of an electric current which raises them to a high temperature, causing the filaments to sinter. The process of sintering is carried out in gases which chemically attack all the constituents of the binding agent, without the metal being affected, so that eventually a filament of pure metal remains. This filament is dense and homogeneous, but being obtained by a sintering process it is different in structure from the still denser metal which would be obtained from a melted mass.

The difference of the filament of the osram lamp, which is pure tungsten metal, from the filament of the osmium lamp, shows itself by the following characteristics. Owing to the higher melting-point of tungsten, an osram filament will stand a temperature at least 100° C. higher than the osmium filament. Their specific resistance and resistance coefficients differ, and there is considerable difference in their radiation properties. The colour of the osram filament is a steel to a silver grey, whilst the osmium filament has a bluish-grey appearance.

D

Digitized by Google

When preparing osram filaments for lamps of 120 volts, 22 to 27 c.p., burning at an efficiency of about 1·1 watts per candle-power, taking 0·2 to 0·25 amperes, the diameter of the filaments is 0·03 mm. The jet from which this filament is squirted is, of course, much larger. The diameter of the jet at point of issue from the diamond is about 0·055 mm. The thread, after being squirted, shrinks to 0·050 mm. when dried. After it has been heated to a red heat under exclusion of air, it becomes a very porous filament, with a diameter of 0·045 mm. When this is sintered by the passage of an electric current, which raises it to the brightest white heat, its length is reduced, and it finally shrinks down to a diameter of 0·030 mm. The shrinkage is caused by the removal of the carbon and other material forming the organic binding medium, which originally amounted to 84 per cent. of the volume of the paste. It follows that, during the whole process, 84 per cent. of the original volume must disappear, and the shrinkage corresponds to a linear contraction of 55 per cent. It is easy to alter the amount of shrinkage by selecting suitable proportions of the binding medium or by adding volatile substances which disappear on heating.

During this heating process the filament is fastened in clamps and placed in globes or other arrangements containing certain gases. The heating is effected by the electric current to a gradually increasing amount, and while the thread decreases in length and diameter, it at the same time allows the passage of increased current. This is due to the sintering of the particles and also to the filament being freed from carbon, which even in minute quantities increases its resistance. The process is controlled by the operator, who has a voltmeter and ammeter to guide him. The current increases rapidly at first, but reaches a constant value within a few minutes. This is common to all sintering processes, and the same phenomena are observed with osmium, iridium, or molybdenum filaments. The filament so obtained is elastic but brittle. The osram thread, 0·03 mm. diameter, can be bent into a loop of about one centimetre diameter without breaking. After this bending it returns to its original form.

Each filament is fastened on to its leading-in wires without the application of any paste. The end of the leading-in wire is melted down to a small globule by means of an electric arc. This globule holds the filament securely, and the resistance from the passage of the current from the leading-in wire to the filament is negligible.

The evacuation of the lamp is carried out in the same way as with carbon filament lamps. Any process, mechanical or chemical, is suitable, but it is found that any traces of the gases occluded in the tungsten filament escape much more slowly than in the case of the carbon filament. The result is that the evacuation process requires a longer time with the osram than with the carbon filament lamp.

The other method of constructing tungsten filaments was developed by Drs. Just and Hanaman simultaneously with, but quite independently of, the Deutsche Gasglühlicht Aktiengesellschaft. Their lamp was introduced commercially under the name "Just-Wolfram." They use what is known as the "coating process," as described in the British patents 11,949 of 1905 and 3,684 of 1906. Ordinary carbon filaments of very small diameter, 0·02 to 0·06 mm., are raised to a bright red heat by means of an electric current in an atmosphere of volatile tungsten compounds in the presence of hydrogen. The compounds most used are the chlorides and oxychlorides of tungsten. The heat of the filament causes the hydrogen to reduce the volatile metallic compounds, depositing the metal in homogeneous condition on the carbon filament. A later patent discloses a process whereby three or more filaments are coated in series at one operation.

After the filaments have been coated in this way, they are submitted to the action of an electric current in an atmosphere of highly rarefied inert gas, such as, for example, hydrogen at a pressure of about 20 mm., until they show the clearest white incandescence. This process causes the carbon to combine with the tungsten surrounding it, forming a carbide. This change is so complete that in the resulting filament the cross-section is tubular, and no carbon can be distinguished under a microscope at the point of fracture. The filaments so obtained containing carbon (mostly as carbide) present a glittering white metallic appearance.

In the next process they are raised to a high temperature through the passage of an electric current while they are surrounded by a mixture of hydrogen and a little steam. This causes the carbon to be oxidised by the same reactions which go on in the water-gas process. The carbon may, however, be eliminated by any other method which gives a resulting filament entirely free from carbon.

Drs. Just and Hanaman have also obtained patents* protecting their process of mounting the tungsten filaments to the leading-in wires. This is effected by means of a paste consisting of finely divided tungsten metal mixed with coal-tar or gum. These paste mounts are dried and finally made red hot by any suitable means before the filament is heated in the bulb.

The finished filaments made by this process have a light grey silvery appearance and a little smoother surface than those made by other methods; in fact, they most nearly approach the appearance of a drawn wire. The tungsten or osram lamps produced by either of the above-described processes have identically the same characteristics.

It has been proved that these lamps will burn for from 1,000 to 2,000 hours with a consumption of about 1 watt per Hefner candle-power, without any appreciable falling off in the candle-power. Of all the metals which have been experimented with up to now, the author says, only pure tungsten has such a life.

In economy, the result is also better than has been obtained with other filaments, thus the osmium filament takes 1·5 watts and the tantalum 1·7 watts for direct current, and somewhat more for alternating.

Output, Efficiency, and Temperature Coefficient.

In the following comparisons between the osram and carbon lamps the author has adopted the Hefner candle-power in every case.† At the present, he says, it is found next to impossible to try to standardise metallic filament lamps in candle-power; it would make the lamp commercially impracticable.

The following figures give a comparison between the energy taken and power radiated from the surfaces of osram and carbon filaments:—The filament of a 25-c.p. osram lamp, consuming per mean horizontal candle-power 1·1 watts, has a total surface of about 50 sq. mm., which equals per candle-power 2 sq. mm., or per watt of supplied energy, 1·8 sq. mm. A good surfaced carbon filament consumes per mean horizontal candle-power 3·5 watts, which equals per candle-power 5·5 sq. mm., or per watt of supplied energy 1·57 sq. mm. It results, therefore, that 1 sq. mm. surface of osram filament gives 0·5 c.p., and consumes 0·55 watt; 1 sq. mm. surface of carbon filament gives 0·182 c.p., and consumes 0·63 watt.

Returning to the much-discussed question of selective emissivity, the Paper says:—It will be seen from the above figures that the osram filament radiates only 87 per cent. of the energy radiated by an equal surface of the carbon filament, but gives 275 per cent. of the light given by the carbon filament. If the kind of radiation were the same in both cases, the carbon

† A Hefner candle is 0·88 of a standard British candle, so that one watt per Hefner c.p. corresponds to 1·14 watt per British c.p.

Digitized by Google

filament ought to get hotter than the osram filament by about 60° C., because of the higher total radiation per unit of surface. On the other hand, considering the greater light emanating from the osram filament, its temperature ought to exceed that of the carbon filament by about 200° C. These contradictory conclusions show clearly how different is the radiating power of the osram filament as compared with the carbon filament. The latter behaves much more like the "black body" of the radiation theory. From approximate calculations the temperature of an osram filament burning at 1·1 watts per candle-power is about 250° C. higher than that of a carbon filament burning at 3·5 watts per candle-power. If a carbon filament were to be overrun to such an extent as to consume only 1·1 watts per candle-power, its temperature would then have to be raised by 360° C. The favourable radiating properties of the osram filament, therefore, mean that its temperature is 100° lower than that of a carbon filament of the same efficiency. If it were not possessed of this radiating property it would have to be burnt at an efficiency of 1·5 to 1·6 watts per candle-power, in order that it might have the same life it actually possesses at 1·1 watts per candle-power.

A further favourable property possessed by all tungsten filaments is their high positive temperature coefficient of electrical resistance. If one takes the resistance of carbon, tantalum, osmium, and tungsten filaments at ordinary temperatures, the resistances at those temperatures which, in a vacuum, correspond to 1·5 watts per candle will be as follows:—

For a carbon filament, 0·55 of the original.
For a tantalum filament, 5·70 times.
For an osmium filament, 8·50 times.
For a tungsten filament, 11·00 times.

At temperatures of about 2,200° C. absolute, each increase of temperature of 10° increases the resistance of a tungsten filament about 0·45 per cent. If the pressure is raised from 100 to 104·5 volts, the current

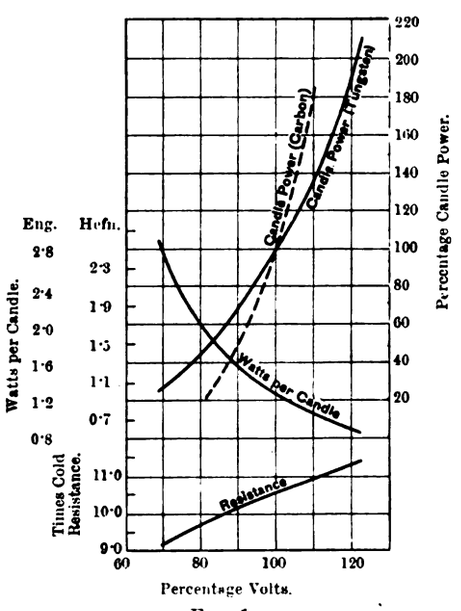

FIG. 1.

rises from 1 to 1·027 amperes. For a carbon filament the amount of the increase would be from 1 to 1·05 amperes. The total energy supplied, therefore, rises in the former case about 7·3 per cent., and in the latter about 9·7 per cent. Near the normal conditions the light of a carbon filament lamp rises and falls with the 6·3 power, that of a tungsten filament lamp with the 3·6 power, of the voltage.

Mr. Hirst is of opinion that the latter differences are too great to be explained by the increase of energy caused by the change of pressure. The small changes in the light of the osram lamp, as compared with a carbon lamp for the same change of voltage, can, he thinks, only be completely explained by the supposition that with a change of energy the radiated light is altered in a different way with the two lamps. Near the normal efficiency, the light of a carbon lamp changes with the third power of the energy, whilst such change for an osram lamp progresses with 2·5 power of the energy. These proportions have a very important practical consequence, which is clearly shown by the accompanying curve (Fig. 1) and Table I.

Table I.

	Osram.	Carbon.
Increase of light due to 10 per cent. increase in voltage	36 per cent.	84 per cent.
Decrease of light due to 6 per cent. decrease of voltage	21 ,,	34 ,,

High-voltage Lamps.

High-voltage metallic filaments of the osram type have recently been put upon the market, manufactured both by the D.G.A. and the Just-Hanaman processes. Tests have shown that the average life of a 1-watt per c.p. lamp seems to be between 800 and 1,000 hours. During this period there is said to be no appreciable drop in candle-power, and the lamps have shown themselves to be equally good as the low-voltage osram or Just lamps. These high-voltage lamps, made for from 200 to 250 volts, require double the number of filaments used in the low-voltage lamps. It is evident, therefore, that they cannot be produced for small candle-power. Up to the present 40- to 50-c.p. is about the lowest unit that has been obtained in a commercial lamp, and, Mr. Hirst says, some extraordinary development or discovery will have to be made before that candle-power can be largely reduced.

The Use of 110-volt Lamps on 220-volt Circuits.

To meet the demand for lamps to burn in series, elaborate arrangements have been made at the Osram Works for testing lamps that will run in series. They are tested to one-hundredth of an ampere, and sorted out in from five to seven series numbers according to the type of lamp and carefully marked, and the reference numbers (ranging from, say, 28 to 38, which are marked on the caps of all lamps. singled out for series burning) practically mean the consumption of current is 0·28, 0·29, 0·30, 0·31, &c., of an ampere.

The Effect of Metallic Filament Lamps on Supply Systems.

Mr. Hirst predicts that the introduction of the new lamps will probably mean an increase of 100 per cent. in the unit adopted for electric light. Sixteen-c.p. carbon lamps will be replaced by 25 to 35 watt tungsten lamps, and those places in which a low illumination is desired will still be supplied with carbon filament lamps of 2½, 5, and perhaps 8 c.p. As it is not practicable at present to make osram lamps for 110-volt circuits of a lower candle-power than 25, it is likely that in small rooms greater illumination will have to be used. Where larger spaces have to be lighted, it is easily possible to obtain the present illumination by using fewer lamps, but he thinks that, with the cheaper light, the general tendency will be towards higher illumination. Station engineers will find that the increased load from new consumers will more than make up for the decreased consumption of existing ones.

Price, Breakages, and Blackening.

As has been the case with so many new inventions, so the tungsten lamp on its introduction had to run the gauntlet of many reproaches on the part of the more conservative elements in our profession. Burning in vertical position up to now has had to be insisted upon by the manufacturers, but lamps can now be supplied to burn in any position. The price of these lamps is for the moment a trifle higher, but before many months the author believes that they will be supplied at the same price as the others. The price itself is naturally held up as a disadvantage, especially when a consumer is displacing old lamps for new ones. The outlay then appears serious, but Table II. is given to show that the saving in current for given illumination rapidly wipes off this expenditure.

Much has been made of the brittleness of the metallic filament and of the percentage of breakage in certain

Digitized by Google

instances. From the moment it was understood how to pack the osram lamp, however, the author states that the breakage in bulk has been a negligible quantity. It now only affects the supply of the lamps in small parcels of one half-dozen to one dozen. This problem is now being dealt with, with every prospect of an early success.

Another point about which there has been considerable outcry is the blackening of individual bulbs which occasionally occurs. It is at present thought that this blackening is due to some extent to the great sensitiveness of the filament to small changes in vacuum. Other theories exist as to the cause of this, but what for the moment mainly interests the users is that if a lamp is going to blacken it usually happens at a very early period of its life, when the makers are prepared to deal with the matter generously. It is quite different in this respect to a carbon lamp, in which a blackened bulb means as a rule that the lamp has been kept on circuit for an indefinite period, far exceeding its useful life.

Life Tests.

The samples of osram lamps, tests of which are recorded in the tables and diagrams, were selected at efficiencies corresponding to the limits of sorting, that is, 1·0 to 1·25 watts per Hefner candle-power, so that they represent the lowest and highest efficiency at present on the market.

Test I. on Table II. and Fig. 2 was made by Faraday House on an ordinary commercial lighting circuit, alternating current, with a variation of voltage of about 3 per cent. each way. Twelve lamps were tested, and nine gave a life of 2,000 hours, with a 20 per cent. drop in candle-power. The first failure took place at 900 hours, the other two failures following between 1,200 and 1,400 hours. The cost of lighting with such lamps comes out at the very low figure, including renewals, of 5¾d. per 1,000 c.p.-hours.

Tests II. and IIa. in Table II. are other examples of osram lamps burnt at a slightly lower efficiency, and after 1,500 hours' use the drop in candle-power only amounted to 11 per cent. This test was continued to 3,350 hours, when nine lamps were still good. Their average candle-power was then 70 per cent. of the initial candle-power. It is interesting to note from this test that it pays to run these lamps to a point when the candle-power has dropped 30 per cent., as will be seen from the table.

The test No. V. (Fig. 3) of tungsten lamps made by the Just-Hanaman process shows that these lamps are quite as good as the osram. The test was only carried to 1,000 hours, but it is quite possible that the lamp could have lasted up to 2,000 hours or more, with a proportionate reduction in the cost of renewals. After the 1,000 hours the drop in candle-power was exceedingly small, amounting to only 3 per cent.

The tantalum tests, No. VI. on Fig. 4, Mr. Hirst says, give a much less favourable result than the above

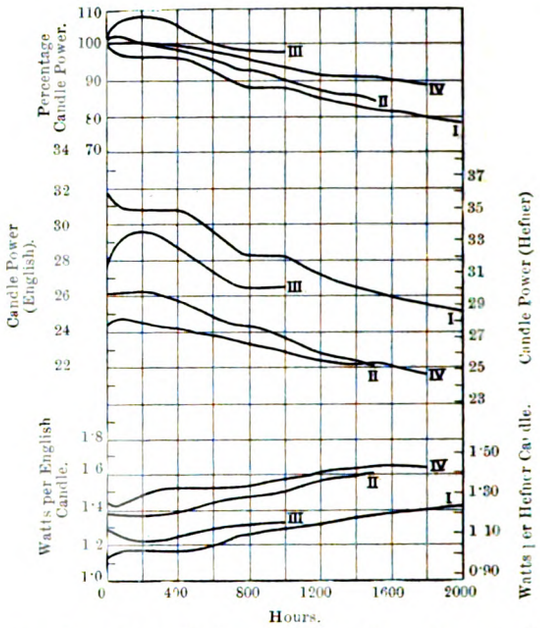

Fig. 2.—"Osram" Average Life Test Curves, &c.

figures. The test is on a direct-current circuit, and the cost per thousand candle-hours works out at 9½d., or 73 per cent. more than the osram lamp.

The carbon filament lamp results, test No. VII. on Fig. 5, were selected from a large number of tests, and represent the average English-made lamp. A comparison of the figures in the last column of Table II. shows that the total saving from the use of osram lamps over carbon lamps when equal voltages are compared is 60 per cent.

Test No. VIII. in Table II. shows the trials of high-voltage tungsten lamps, which were made on an

25-volt Lamps Used with Transformers.

The following is an abstract of the remainder of the Paper, which deals with 25-volt osram lamps and house transformers. Osram lamps for 25-volt circuits have been standardised for both 10 and 16 c.p. These lamps consume respectively 10 and 16 watts, and for this consumption give the same candle-power as the ordinary carbon filament lamps taking 40 and 60 watts. For use with these lamps, transformers have been constructed the iron loss on which is as low as 5 watts on a transformer designed for 300 watts output. Table III. shows the units taken per year by this and two other transformers of a larger size to overcome iron losses:—

Table III.

Details of Iron Losses of Small Transformers.

Output of transformer in watts.	Number of 16 c.p. osram lamps alight at one time.	No load.	Iron losses.	Units taken per year.	Cost per year at 4d. per unit.
		Watts.	Percentage.		£ s. d.
300	19	5	1·67	44	0 14 8
750	47	10	1·33	88	1 9 4
1,500	94	17	1·13	149	2 9 8

The cost per year at 4d. per unit is given in the last column.

The copper losses in these transformers are not large, and only occur when the lamps are being used. The total loss in the copper of the transformer, and in the wires between the transformer and the lamps, will not be appreciably higher than the copper losses in the cables alone when carbon lamps are used.

Table IV. shows the financial results from the use of these 25-volt 16-c.p. osram lamps in a private house requiring 25 lamps. It is assumed that the smallest size of transformer in the preceding table will suffice, as 19 lamps alight at one time is about the extreme maximum load in such a house. The total saving in current shown in the last column varies with the number of hours the lamps are in use; at 500 hours' use the saving in current is £6 4s. 9d. on a yearly bill of £9 10s. when carbon lamps are used. The current account is thus reduced 65 per cent., but the bill for lamp renewals will be somewhat higher.

A formula is given for calculating the comparative cost of osram and carbon lamps if the copper losses are also taken into account.

Using the following symbols :—

a = Open circuit loss in watts.
b = Number of lamps.
c = Candle-power.
d = Cost per unit.
e = Average hours of running per year.
f = Copper loss on average load.

The cost of lighting with osram lamps per year works out at—

$$8{\cdot}76\,a\,d + \frac{b\,c\,e\,d}{1{,}000} + \frac{f\,e\,d}{1{,}000}$$

The yearly cost of lighting with carbon filament lamps as against this works out to be—

$$3{\cdot}5\,\frac{b\,c\,e\,d}{1{,}000}$$

This under the assumption of an efficiency of 1 watt per Hefner candle for the osram lamp and 3·5 watts for the carbon filament lamp.

The saving in running cost, therefore, is per year—

$$3{\cdot}5\,\frac{b\,c\,e\,d}{1{,}000} - 8{\cdot}76\,a\,d - \frac{b\,c\,e\,d}{1{,}000} - \frac{f\,e\,d}{1{,}000}$$
$$= d\left(\frac{2{\cdot}5\,b\,c\,e - f\,e}{1{,}000} - 8{\cdot}76\,a\right).$$

Taking the cost of an actual installation with 25 16-c.p. lamps as an example, and assuming $a=5$, $f=12$ (to be on the safe side the maximum copper loss has been taken, not the average), d=4d., and e=1,000, the saving works out to £15 14s. 9d. on a total of £23 6s. 8d., equivalent to a *saving of* 67·4 *per cent.*

Without transforming down, but taking the smallest obtainable candle-power, namely, 28-watt osrams (against 16-c.p. carbon lamps), the saving would have been £11 13s. 4d., equal to 50 per cent. Taking further into consideration the cost of renewals and the additional cost of the transformer, as the latter costs £2 2s., and a 5-years' life may be assumed, the annual charge for this is 9s. The cost of renewals for osram lamps (25×3s.) is £3 15s., and the cost of renewals for carbon lamps (25×1s. 3d.) is £1 11s. 3d., so that the actual saving is therefore £15 14s. 9d., less £2 12s. 9d. = £13 2s., which is equivalent to 56·2 per cent.

In some cases the iron losses have been found so small that they will not keep the meter running, and it is therefore suggested that those supply engineers who wish to make use of osram lamps to extend their private-house load should themselves supply these small transformers and charge the consumers a slight increase per unit to cover the iron losses, and also the capital expenditure involved.

There is another large field for these low voltage lamps in connection with isolated plants for the supply of country houses, workshops, &c. Where small units of light are quite sufficient, the cost of the generating plant can be reduced very largely as the output required falls in the ratio of the efficiency of the filaments used in the lamps. Thus the maximum load in any given case falls in the ratio of 3½ to 1, and neither the factory inspector from the Home Office nor the fire insurance company claims that supply at 25 volts is dangerous.

DISCUSSION.

Mr. Haydn T. Harrison, who opened the discussion, referred first to the fact that the gas mantle differed in a most important feature from the metallic filament lamp, namely, that in the first 100 hours of burning the candle power dropped 20 per cent., and after 500 hours burning it dropped from 40 to 50 per cent., whereas the tungsten lamp had the peculiarity that in 1,000 hours it dropped less than 10 per cent. in candle power. He next called attention to a patent taken out by the British Thomson-Houston Co. (No. 16,530, of 1907), and published in Electrical Engineering of May 14th last, in which it was said that when tungsten was heated to a temperature below that of oxidisation in the atmosphere, it was ductile, and could be drawn down. The filaments now made were not drawn, but if tungsten was ductile at a temperature below oxidisation, of course there might be considerable possibility in this particular idea. He believed it was only in patent form at the present moment, but probably Mr. Hirst would know more about it. Later on in the Paper Mr. Hirst said that elaborate arrangements had been made for testing lamps to one-hundredth of an ampere, but as the lamps only took 0·3 of an ampere this was rather a large percentage, and the corresponding percentage difference in volts would be greater than the difference in current on account of the temperature coefficient. Between 0·31 and 0·29 was a difference of over 6 per cent., and the voltage difference would be between 8 and 10 per cent. Nearly every ammeter or instrument in a lamp factory would work within closer limits than that, and he thought there must be a clerical error in the Paper. He had had a great deal to do with both street and private illumination, and he found that the big units of light were appreciated. If they took an economical large unit of light they could afford to diffuse it, and he supposed one of the greatest disadvantages in incandescent electric lighting was the high intrinsic brilliancy of the filaments themselves. With Osram lamps he, personally, had never used them in a house unless they had been frosted or put in globes, with the filaments not visible. They could not afford to do this with carbon lamps at 4 watts per candle, but with 1 watt per candle they could. All the way through the Paper Mr. Hirst had used a comparison between Osram lamps and other incandescent electric lamps and gas lamps. He did not know whether many people had realised that the fact that the Osram lamp was giving a light at one watt per candle, took it into a much bigger region than that. The enclosed arc lamp took nearer two watts per candle than 1 watt per candle. The open type arc lamp, the nearly horizontal rays of which were the most important for street lighting, was also taking over one watt per candle, and it therefore came to a comparison of the cost of renewals and the cost of labour and carbons. He had worked it out that where big units were required, say, from 500 to 600 c.p., it was more economical to use a group of Osram lamps giving this candle-power because the cost of carbons and labour in an arc lamp was considerably higher than the cost of lamp renewals as given in the Paper. In connection with the reference in the Paper to Canterbury, where a large number of lamps were mentioned as having lasted 2,434 hours, he might mention that a big percentage of these lamps were still burning last Saturday, and that brought the average life of all the lamps referred to in the Paper in connection with the streets of Canterbury to over 2,000 hours.

Mr. B. Drake (Messrs. Drake & Gorham) said that he had had the honour of being associated with Mr. Hirst in connection with the introduction of the Nernst electric lamp. It had been a very troublesome problem, and it must have been a great relief to Mr. Hirst, after the difficulties encountered there, to be able to sail in smoother waters. The advent of the metallic filament lamp at this period of the electrical industry was most welcome, at any rate, to those connected with private plants. The difficulty up to the present had been that electric light had been so expensive, and that although it was admitted to be the best, people would go in for competitive forms of lighting. He thoroughly agreed with the previous speaker that the engineers in charge should use their endeavours to get people to use their light in a more rational way. The ordinary pendant with a clear filament should be replaced by a lamp of two or three times the candle-power with a shade put on the underside instead of above. With regard to the name of these lamps, Mr. Mordey had suggested "wire lamp"; this would apply more to the tantalum than to any other lamp, and he preferred the suggestion, "metal lamp." The great difficulty with these lamps had been to get them to the consumer; they were so brittle. Mr. Hirst's company had overcome this in a practical way in bulk, so much so that when lamps were sent in their casings, the breakages were only about 2 per cent. With the tantalum lamp, which was much stronger, no special precautions were necessary, and it was probably for this reason that the tantalum lamp had been most favoured up to the present. Certain phenomena in connection with these lamps had been brought to his notice, which perhaps some of those present might be able to explain. There was a general feeling that metal lamps had a longer life in winter than in summer. Whether this was so he did not know, but he had been told it many times by users. Could it be due to temperature? Others had stated that in streets they noticed the lamp when exposed to snow lasted much less time. Possibly this might be due to the greater number of times the lamps were switched on in the winter than during the summer, or it might be the temperature. Tantalum lamps had a much longer life on alternating currents with low frequency than high frequency. This seemed to point to the fact that breakages were due to molecular vibration, which

Digitized by Google

was borne out by the fact that they usually broke in several places. With regard to competitive forms of lighting, he had had to compete recently in private installations with two forms of lighting, viz., acetylene and petrol gas. The former was preferred on account of its colour; it was said to be the closest approach to sunlight of any form of artificial lighting; but the cost of working was high; it came to 2·2d. per 1,000 c.p. hours. Petrol gas seemed to vary according to the price of petrol in the district and the veracity of the salesman; it was anything from 1·3d. per 1,000 c.p. upwards. This was enough to show that the metal lamp had again put us in the running, and although from a central station point of view it might be looked upon as a drawback at present, he was quite sure it would benefit the industry in the end.

Dr. LOUIS BELL (Edison Illuminating Co., of Boston) said that there were many metallic filament lamps in use in America at the present time. At first came the tantalum lamp, which was received with open arms and a great deal of enthusiasm, but it was very promptly pushed aside by the tungsten lamp as soon as this came in. The reason for this was that a very large number of distributing circuits in America were alternating current, and the tantalum lamp had a shorter life on this circuit—from his own experience about two-thirds that with direct current. In connection with what Mr. Drake had said, his experience was that tantalum lamps worked badly both at high frequencies and at very low frequencies. He had experimented on the cause of failure in life of these lamps on alternating-current circuits very considerably, and the facts seemed to be these, namely, that the faulting of the filaments was due to the continuous heating and cooling rather than anything else. The heating and cooling, of course, took place more rapidly as the frequency rose, but at the lower frequencies the temperature change was more complete, as the filament had time to cool. As a result, after having carried out a large number of experiments at all sorts of frequencies, he had found that at 60 cycles and above—particularly above—the life was very materially limited, whilst on the other hand, at a very low frequency, say 5 or 10 cycles, the lamps could hardly be put in fast enough to keep them alight. Following the tantalum lamp came the tungsten lamp, at first in the form of the imported lamps, and mostly made on the Just-Hanaman process, and some on the Auer process. These latter were taken up by the General Electric Co. of America, which now produced most of the lamps in use there. The lamp which was first put on the market was a 100-watt 80-c.p. lamp. They were working there at 1¼ watts per English candle. He thought the watts per candle ratings were mostly based on the Hefner unit. The large lamps were most welcome, because they enabled them for the first time to have a successful substitute for the extremely uneconomical enclosed arc lamp, which they were in the habit of using. Enclosed arcs at 80 volts at the arc, worked on a 120-volt circuit, were about as striking an example of lack of economy as could well be found, and the high candle-power incandescent lamps had been most welcome. Manufacturers had been very slow to put out the lower candle-power lamps, but importation of German lamps had forced them to it, and the standard lamps now put out were 100 watts, 60 watts, and 40 watts. These were substantially like the Osram lamps in their general character; the life was excellent, and, save for the fragility in shipment, the success of the lamp was, on the whole, thoroughly good. In making many life tests of them he had noticed that the specific emissivity seemed to change during the life of the lamp, so that it was quite a common thing in testing a batch, and getting life curves, to find individual lamps, and sometimes nearly all the group, rising in candle-power after they had fallen 10 or 12 per cent., and eventually breaking after a very long life. One question uppermost in their minds now was the most economical efficiency at which to run these lamps. At one watt per English candle, most of the experiments indicated that the lamp was being overrun. At 1½ watts the life was admirable, and in the small candle-power lamps of 40 watts and below it would probably pay to run at this somewhat reduced efficiency. Casually he had heard several rumours which he hoped to investigate during the course of the next few weeks on the Continent. One of them was that our German friends, who had passed on so many good things in lighting, had up their sleeves carefully concealed a lamp which would run at half a watt per Hefner, or something of that sort. With regard to the use of these higher candle-power lamps, he wished to endorse most heartily the suggestion made that they should always be used either in such a position that they were fairly without the field of vision, so that the eye would be shielded by the brow from direct radiation, or else that they should be used behind diffusing shades. In American practice tungsten lamps were never used except under one of these conditions, and the company with whose practice he was most familiar, namely, the Edison Illuminating Co., of Boston, was putting out a great many of these lamps, every one half frosted, and, moreover, they put above that a shade which had deep skirts nearly to the top of the lamp, and in every case where the lamp was to be installed fairly within the field of vision the shade was sand-blasted or etched, so that the light was completely diffused so far as the observer's eye was concerned. The intrinsic brilliancy of these lamps was between 1,000 and 2,000 c.p. per square inch, and the effect upon the eye was terrific. These new illuminants must be treated this way, or else the eyesight would suffer. As a rule most of the American central stations furnished renewals, and in that way they were able to control the output of these lamps. These renewals were put out to the customer not free, but at a small renewal charge which was really less than the cost of the lamp, but which was enough to make the customer and the station share the benefit of the smaller consumption of energy, and he thought no American central station manager had the slightest fear of the use of metallic filament lamps. One witty friend of his referred to these troubles as merely the growing pains of the industry, which he thought a fair characterisation. One other leading central station manager in America had told him bluntly quite recently that he proposed to put out these tungsten lamps free, and added—a result which he knew to be the fact already—that every time he had reduced his price to the consumer he had increased his net profits. He thought that if the matter was met in that spirit these new lamps were going to be a boon to the industry all over the world.

Mr. H. W. HANDCOCK (Messrs. Handcock and Dykes) complained of the confusion that arose owing to the arbitrary use of the Hefner or British standard with their very different values. Another point was the present method of measuring the candle-power of lamps. If the mean horizontal candle-power were taken, he was not sure that it was fair to the carbon filament. In the case of the metallic filament, practically the whole of the illumination was horizontal. It was true that this had advantages for street lighting and disadvantages for room lighting, in certain cases, but if they took the horizontal measurement for metallic filament lamps and compared that with the horizontal measurement for carbon filaments, without due regard to the mean spherical value, clearly, if the results obtained were worked out in watts per candle-power, the tendency was to reduce the watts per candle for the metallic filaments as compared with the carbon filaments. As an instance of this, he thought it would be found that if they took an ordinary 8 c.p. lamp in the horizontal position and compared this with the illumination obtained from a metallic filament 50 watt lamp, immediately under the lamp, in that position the 30 watt carbon lamp was giving considerably higher illumination than the 50 watt metallic filament. It illustrated the difficulties due to taking all measurements in the horizontal plane. He thought they might with advantage lay more stress on the benefits that accrued to the central station as regarded the less sensitiveness of the new lamp to variations in voltage, and on the fact that the candle power of the metallic filament lamp was so well sustained as compared with the carbon filament. A minor point, on the other hand, was that something a little bit in advance of the present arrangements in portable lamps was required if metallic filament lamps were to be used. The portable lamp was an important factor in the ordinary dwelling house, and for this purpose they must have either a 25-volt osram lamp, or revert to the carbon filament lamp. Referring to the effect of the more efficient lamp in reducing the central station load, he mentioned the offer which the author had recently said he had made to the London stations to supply lamps to them, to let them distribute the lamps and have control of the distribution. His own opinion was that from the business point of view the author was so absolutely right that the central stations, when they passed that offer, missed a golden opportunity.

Mr. A. A. CAMPBELL SWINTON said that without calling into question the statement made by the author that it had been shown that bodies existed which at the same temperature radiated as light a larger percentage of the supplied energy than the so-called black bodies, he wished to suggest that it was not at the present moment proved that the Welsbach burner owed its high efficiency to this property, as the author had stated. Experiments had been made—he forgot for the moment by whom—in which a mantle made of the Welsbach mixture—namely, 2 per cent. of ceria and 98 per cent. of thoria—was heated up in a furnace. At the same time, in the same furnace, mantles made of pure thoria were heated, and it was found that they gave exactly the same amount of light. He would also refer to a paper of his own read some years ago before the Royal Society, where the same experiment was tried, the two mantles being heated by means of kathode rays in a vacuum, and again the same result was obtained. In the incandescent gas mantle it was well known that the 2 per cent. additional ceria enormously increased the amount of light, whereas in the experiment he had referred to, the addition of the ceria made no difference whatever, or, at any rate, no difference that was ascertainable. This went to show, he thought, that it was not a question of emissivity, but probably a question of chemical action, which took place only when these bodies were heated by a flame. He only wished to mention the matter because he thought it undesirable that a question about which there was still a considerable amount of controversy should be referred to as a settled matter.

Mr. C. C. PATERSON (National Physical Laboratory), referring to the author's statement that it was next to impossible to try to standardise metallic filament lamps by candle power, said he did not see why this should not be done, at least from the consumer's point of view, whatever might be the view of the makers. Carbon filament lamps had been standardised by candle

Digitized by Google

power, and surely, if they could standardise a lamp which varied in candle power as the sixth power of the voltage, they ought to be able to do so with a lamp which varied only as the cube or fourth power. They bought lamps to give candle power and not to consume watts, whatever the central station man might say. He was sorry to see Mr. Hirst expressing so many results in Hefner candles. We had a British candle, which was a pertectly substantiated one, and was used in America and France, and why should we hark back to the Hefner, which was used in Germany and was not generally understood here. At the same time, in the curves, he was pleased to see Mr. Hirst had put in English units as well. He had been looking at a number of test-sheets that day, and noticed the same difference between the initial performance of osram lamps as was shown in Mr. Hirst's diagrams. Some seemed to rise largeiy in the initial stage, as Test No. 3 at the Reichsanstalt; others dropped almost at the beginning without any rise. He would like to know if Mr. Hirst could give a reason for this. It would be very interesting to get some idea as to the total output of lamps in Great Britain; how many million lamps were made during the year and consumed, and how many did Mr. Hirst think it was possible to replace with metallic filament lamps within the next four or five years? He did not know whether that was too difficult a question to ask, but one would like to get some idea as to what was the probable output of carbon filament lamps in the near future. Mr. Harrison had made one remark as regards gas mantle tests, namely, that the gas mantle fell off very much from the beginning; he must say that this had not been his experience. He had found when testing in the ordinary way without any special laboratory conditions that they rose very largely during the first hundred hours or so, but after 150 hours they began to drop. Referring to Mr. Handcock's point with regard to the distribution of light, that the candle-power was always measured in the horizontal position, he really did not think this put carbon lamps at such a disadvantage. Of course, there was some disadvantage, but not more than 5 to 6 per cent. difference. The reduction factor for metallic filament lamps was about 0·7 or 0·8, *i.e.*, a reduction from the mean horizontal to the mean spherical. For the carbon lamps, it was 0·85 or 0·86.

Mr. T. H. LOWDEN (The Lowden Electric Lamp Co.) said that there was only one paragraph in the Paper which he wanted to quarrel with, viz., "Up to the present 40-50 candle-power is about the lowest unit obtained in a commercial lamp, and some extraordinary development or discovery will have to be made before that candle-power can be greatly reduced." He absolutely denied that statement. The British Westinghouse Co. at the present moment were selling a 220-volt 32 candle-power lamp; it could be bought on the market, and he had very good reason to know that in a short time high-voltage 25 candle-power tungsten filament lamps would be on the market, and would be a stock line. Mr. Hirst had referred to the blackening of lamps, and thought that this might possibly be caused by the vacuum not being what it should be. He knew for a fact that any lamp which was not properly exhausted would blacken immediately, and he had never yet met a lamp which would blacken if it were properly exhausted. There was a good deal of credit due to the people who had invented these metal filament lamps, but there was a good deal more to be done besides just making the filament. If the lamp were not made properly there was going to be trouble, and he was sure Mr. Hirst and Mr. Wilson would appreciate this.

Mr. C. H. WORDINGHAM said he would like to record his conviction that the metallic filament lamp was a blessing, and only a blessing, to the electrical industry. He had not an opportunity to speak upon the last Paper on this subject, but he did think that to hear central station engineers talking about raising the prices to keep out their best friends was painful in the extreme. The people to get revenue from were the people using gas, and the only possibility of getting them was by some such epoch-making invention as this, which cut the consumption down to one-third. Only those who had run a central station knew how impossible it was to get consumers unless they were told that they were to be charged a low price. There was a remarkable field for them, for they had not yet anything like a decent proportion of the possible consumers, and he was positive that the metallic filament lamp would enable them to take up this field. His only other remark was that he thought inventors might devote their attention to doing for the Osram lamp what they had done for the Welsbach mantle, and that was to invent a simple and useful anti-vibration holder.

Mr. L. GASTER, referring to Mr. Hirst's remark that he would treat people liberally in the matter of blackened lamps, asked if it was his intention to change them over the counter; or what did he mean by liberally. Another point was the condition of lamps when they reached the consumer. Out of one batch of 24 that reached him, 20 were broken. These were not osram lamps, however, but another metal filament lamp. That these lamps were fragile there was no doubt, and he thought that the more the user was impressed with the fragility the better. In this connection he referred to the German prescription which was sent out with the lamps. This stated that the lamp must not be dusted with a dry cloth, because it produced an electrostatic discharge and broke the filament, and recommended that when the lamps were dusted, the cloth should be damped. The patent question was also another important matter, and as consumers they ought to know to what extent they were likely to meet with trouble later on.

Mr. J. S. RAWORTH said he remembered the time when they paid 25s. for carbon filament lamps, and when the box was opened half of them were broken. Therefore he wished to say to Mr. Hirst that even if there was a little fragility in his new lamps he need not be downhearted about it, because that had been cured with regard to the carbon lamp, and no doubt it would be cured with regard to the osram lamp. He was rather annoyed that Mr. Drake should say that they did not use their lamps with sufficient intelligence, but at the same time he thought this was partly true. In his own drawing-room he had six lamps which had been there for ten years. If, however, he thought that the lamps were using more current all the time, then he would have them down to-morrow, even if he had to send for the gasfitter to do it. Twenty-five years ago, when the Swan lamp had come out, he had read a Paper before one of the scientific societies of Manchester upon the electric light of the future, and pointed out that for every ton of coal they were then burning under their boilers to produce electric light, only half a pound of it eventually appeared in the shape of light. He had forgotten how he had obtained the data for this calculation—it might have been by weighing glow-worms. The fact remained that they had been going on for 25 years, and had been burning three times as much coal under their boilers as they ought to have done, and when previous speakers spoke of giving the carbon filament lamp a chance, his answer was that it had no chance. The manager to one of the largest lamp factors in this country came to him the other day and said that he must have a metallic filament lamp because he could not sell carbon lamps. This was a very good reason, and he did not think there was a better one in the world.

The PRESIDENT (Colonel CROMPTON) said he was sorry they had not heard any speakers on the side of the supply companies, but he thought Mr. Wordingham was a little hard in his utterances in this respect. Perhaps, however, Mr. Wordingham was not aware that there were many cases of supply companies where gas did not compete at all, and where they had got all the consumers they could get. Therefore any reduction meant practically the loss of their dividends, and, secondly, that any money that would be spent during the next few years on replacing lamps in the houses would be very largely taken out of the consumer's bills for energy. How much that would be checked by the natural conservatism of the English householder, who hated to see the wiremen inside the house and to see any changes made, they did not know. It would for a certainty, in the case of stations which supplied the better class houses, undoubtedly be a very anxious time, and it was a curious thing that this, which was undoubtedly one of the greatest improvements which had taken place in the art of illumination, would cause such great anxiety to people who had put their capital into the illumination business.

Mr. HIRST, in his reply, thanked the speakers for the very kind manner in which the Paper had been received. Throughout he had been trying to keep the manufacturer in the foreground and the trader in the background; but by the questions that had been put to him and the points that had been raised it was not his fault if he had to answer a few questions in his capacity of trader. Both Mr. Gaster and other speakers had put questions to him which he could only answer in the same way as had been indicated by Dr. Louis Bell. We were not very well organised in this country for introducing a new delicate scientific thing. In America and in Germany the manufacturers were also the central station engineers; they were also traders in direct contact with the consumer, and they could bring out a new thing from beginning to end. In England they had to deal with a different state of things, and that was why they met difficulties which were not encountered in other countries. It was why he suggested some time ago that central station engineers should take this matter up. They had answered that they could not fall out with the contractors. Surely if anybody could not afford to fall out with the contractors it was the lamp makers. He would like to sell shades as suggested by Dr. Louis Bell, for he had various ideas intended to overcome this difficulty of fierce light; but the lamp maker could not get at the consumer. They had told the contractors that the lamps broke if they were treated roughly or if they were put in holders which jerked when the lamp was switched on. They had told them that they would not burn upside down, or that they would not burn in one position or another position, but how few contractors were organised to let the consumer know this? The same thing applied to series running, and even central station engineers at the beginning did not take the maker seriously. It was quite true, as Mr. Gaster had stated, that he had promised to be liberal with black lamps. So far as he knew he had been liberal, and all the leading contractors would bear him out in this, but how many small contractors were there who, when they exchanged lamps, thought it better business not to exchange them with the customers? He did not say this in any unkind way; the small contractors treated it as a matter of business, and the lamp makers had no power to control it. As regards series running he thought one-

Digitized by Google

hundredth of an ampere was correct, and considering the little difference a few per cent. made in the life of a metallic filament lamp, and considering the experience they had had of these tests, he thought they were quite justified in sticking to this standard. Series running had proved a success from the moment it had been understood how to pair lamps properly. If he said that series burning would have to continue because he was afraid that no lower candle-power high-voltage lamp would come into the market at an early period, he said so because of what he knew of the manufacture of these lamps. He knew that it would require twice the length of filament for a 200-volt lamp than for a 100-volt lamp, and he failed to see with present methods how they could get a smaller unit of light. If, however, there were other methods, he thought it would take some considerable time before they were introduced, and in stating this as his own opinion he wished the Institution to understand that it was no use thinking that in a month, or in two months, or in six months, or in twelve months, these lamps would be a marketable thing. Their firm on the Continent, which made millions of these lamps, had at present no idea how a lamp could be commercially made with the lower unit. He had himself seen a 25-candle-power 200-volt lamp, but the price would not be a commercial one at all. On the question of breakage, he could only say that there were exaggerated ideas of this. His company first introduced a 5 per cent. breakage allowance for all who used these lamps, and recently they had offered to exchange any lamps that were broken. He did not know of a single instance in which the user had taken advantage of this offer. This, after all, was the best proof that the breakage could not be so terrible, and he believed that the breakage had been due more to carelessness in handling the lamps when they arrived than to breakage in actual transit. With regard to Mr. Handcock's remark as to why he used Hefner candle-power, he did this for the simple reason that the lamps came from countries in which Hefner candle-powers were generally used. He had no doubt that in course of time all these lamps would be dealt with in English candle-powers, although he personally must say that if he could prevent these lamps being sold on candle-power he would like to do so. He would like to sell the lamps by watts, as Mr. Bell had stated they sold them in America, where the standard sizes were 100, 60, and 40 watts.

Dr. BELL said they were rated in watts, but the candle-power was distinct from the rating. They were sold to run at 1¼ watts per English candle.

Mr. HIRST said he thought they would have a very good case when the Standards Committee came to deal with this matter, of trying to stick out for watts. Continuing his reply, he said he would not go through the whole list of speakers, but would promise everybody a full reply in the *Journal*. With regard to Mr. Campbell Swinton's remark, the statement had not been made on the strength of his own experiments. The information had been given him by the inventors of the gas mantle themselves, who had been working on this theory, and as collector of the information he thought it wise to give it to the meeting.

On the motion of the President, a vote of thanks was accorded Mr. Hirst for his Paper.

STEPNEY ELECTRICITY SUPPLY ACCOUNTS

THE report of Mr. W. C. P. Tapper, engineer and manager to the Electricity Department of the Borough of Stepney, for the year ended March 31st last shows an increase of net profit of £753 over that of the previous year, in spite of a decrease of 7 per cent. in the revenue per unit, this latter being 1·62d. per unit against 1·74d. last year. It is interesting to compare these figures with the average charge made by all the companies and Local Authorities of London, viz., 2·88d. per unit. The increases in the maximum load and the units sold are shown in the tables below. With regard to the use of metal filament lamps, Mr. Tapper reports as follows:—

The outstanding feature of the year, from the lighting point of view, has been the adoption by a very large proportion of the consumers of the new metallic filament lamps. These lamps mark an enormous advance in the utilisation of electrical energy for lighting purposes, the saving in energy per candle-power being from 50 per cent. to 75 per cent. of that taken by the carbon filament lamp, according to the type adopted. The new lamp results in as great an economy in the use of electricity as that effected in the consumption of gas by the introduction of the gas mantle, and at the extremely low prices ruling in Stepney to long-hour users electricity is undoubtedly cheaper than gas for equal candle-power. To the use of these lamps must be attributed the reduced increase in the sales for lighting purposes, in spite of the very much larger number of lamps connected.

The following table shows the number of units generated and sold for various purposes during the last two years with other interesting figures:—

Units sold and generated—	Year ended Mar. 31, 1907.	Year ended Mar. 31, 1908.
Units sold for private lighting ...	2,528,228	2,793,026
,, ,, power	1,229,000	1,833,130
,, ,, public lighting ...	993,954	1,086,528
Total units sold	**4,751,182**	**5,712,684**
Units used on works	158,434	184,591
,, in distribution	368,282	541,317
Total units generated ...	**5,277,898**	**6,438,592**
Connections (equivalent in 8 c.p. carbon lamps) —		
Private lighting	12,685	16,390
Power	19,636	41,776
Public lighting	448	282
	32,769	58,448
Plant capacity of station at end of year	3,720 kw.	3,720 kw.
Maximum supply demanded ...	2,414 kw.	2,831 kw.
Load factor	17·5 %	21·1 %

The units used in distribution will, of course, go up from year to year, but the opening of the Blyth's Wharf Station will materially check the rate of increase, as it will reduce the heavy transmission losses occasioned by supplying the eastern end of the borough from Osborn Street.

The following figures, calculated from the revenue account, give an analysis of the costs in pence per unit sold with the corresponding figures for the previous year (see ELECTRICAL ENGINEERING, Vol. I., page 830):—

COSTS PER UNIT SOLD.

Generating costs—	Year ended Mar. 31, 1907.	Year ended Mar. 31, 1908
Coal	0·34d.	0·39d.
Steam from dust destructor ...	0·14	0·10
Oil, waste, water, and stores ...	0·03	0·03
Wages	0·11	0·10
Repairs and maintenance	0·06	0·04
Distributing costs *—		
Wages, repairs, and maintenance	0·04	0·04
Total works cost	**0·72**	**0·70**
Management charges, &c.—		
Rents, rates, and taxes	0·09	0·08
Salaries and wages	0·11	0·11
Stationary, insurances, legal and establishment charges	0·06	0·06
Total cost per unit sold (excluding capital charges) ...	**0·98**	**0·93**
Interest and repayment of loans	0·62	0·62
Cost of temporary work written off	0·02	0·02
Total cost per unit sold (including capital charges) ...	**1·72**	**1·58**

The total working expenses, as analysed above, were £24,347 (including maintenance to public lamps), and the receipts from all sources amounted to £48,827. Of the balance thus given, interest and repayment of loans absorbed £15,282, and £270 was written off as cost of temporary work, leaving a surplus of £1,928. The balance carried forward from the previous year was £2,467. Of the £3,395 thus produced, £547 was written off for various purposes, and £1,200 was carried to reserve, so that £2,946 was finally carried forward to the next account.

* Attendance and repairs to public lamps is not included in the distribution costs as given above, but amounted to £2,004 or about 0·4d. per unit sold for public lighting for 1907, and £2,355 for 1908.

Digitized by Google

With regard to the cost of fuel, Mr. Tapper writes as follows in the report:—

The accumulation of an exceptionally large stock of coal due to the threatened coal strike in the early part of the winter, together with the slightly higher coal prices obtaining during the year, and the necessity for the more extended use of the turbines, running non-condensing during the past winter, have unfortunately left their mark upon the coal bill. The quantity of coal used during the year has been 12,514 tons, 2,441 tons being Welsh coal (large and small) purchased at an average price of 19s. 5d. per ton, and 10,073 tons bituminous small coal, the average price of which was 13s. 8d. per ton.

The following figures will be of interest, viz.:—

	1906-7.		1907-8.	
	Coal.	Destructor steam.	Coal.	Destructor steam.
Units generated ...	3,945,643	1,332,255	5,050,037	1,388,555
Total cost of fuel ...	£6,651	£2,507	£9,247	£2,314
Average cost per unit generated	0·405d.	0·451d.	0·439d.	0·400d.

It will be seen that a slight increase in the fuel cost per unit is recorded. This has, however, been more than covered by reductions in other directions, bringing the total cost down by approximately 8 per cent.

The following table shows the capital expenditure under different headings up to March 31st, 1908:—

	£.	£ per kw.
Land	22,650	6·1
Buildings	60,344	16·2
Machinery	58,985	15·9
Accumulators	2,565	0·7
Mains	111,554	30·0
House services	12,006	3·2
Meters and demand indicators ...	7,502	2·0
Electrical instruments	2,948	0·8
Tools	896	0·2
Other items	8,510	2 3
	£287,960	£77·4
Deduct amount written off out of profits	8,346	2·2
	£279,614	£75·2

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday: *Associate Members*—T. C. Baillie, J. S. St. G. Cooper, W. H. Frazer, J. Lustgarten, L. C. Morris; *Students*—J. Brander, E. A. Corbin, H. Cross, S. H. Crow, F. De Lautour, J. J. Fitzsimons, F. J. Gibson, C. Higgins, A. Hutt, A. Lee, T. B. Richardson, F. J. Stevenson, H. P. P. Trimingham, F. R. D. Wickham.

Canadian Electrical Association.—The eighteenth Annual Convention of this Association will be held in Toronto on June 10th, 11th, and 12th next. Several Papers on power transmission and distribution are to be read and discussed. One Paper is of a legal nature, and deals with contracts, with special reference to the sale and purchase of power and the drawing up of specifications and purchase of machinery.

Metropolitan District Railway.—Last week the running of a nine-car train from Barking to the City was commenced. It is claimed that this forms the longest multiple unit train in the world. The train is 450 ft. long, and carries 1,000 passengers. Five motor-cars and four trailers are used. At Whitechapel the train is uncoupled and divided into two of four and five cars respectively, which proceed separately, as the platforms of the stations further west are not of sufficient length to accommodate nine cars.

State Monopoly of Electricity Supply in Belgium.—According to the *Elektrotechnische Zeitschrift*, the Belgian Government has granted concessions for large power-stations in Brussels, Charleroi, Antwerp, and Ostend, for a period of 25 years. At the end of this period, the whole of the transmission and distribution cable network becomes the property of the State, which also reserves the right of superintending and acquiring the power-stations. The four stations are large enough to supply nearly the whole of Belgium, and arrangements are provided whereby the four separate systems can be linked up together if necessary. The stations are guaranteed the supply for the State railways, and for other State purposes, on terms not exceeding those of other competing supply authorities. Municipalities are allowed to enter into contracts for supply for periods of not more than 18 years.

THE "METALIK" INCANDESCENT LAMP

On page 767 of our last issue, in the course of an article on metal filament lamps for street lighting, reference was made to the satisfactory results which have been obtained at Croydon with "Metalik" lamps, which have been in use since the end of January for street lighting. We are now able to give a few particulars of this promising type of lamp, which has been put on the market in this country by G. M. Boddy & Co., incandescent lamp manufacturers, Newington Works, Liverpool. In addition to the favourable results reported by Mr. A. C. Cramb, of Croydon, we understand that at Bradford an average life of 1,407 hours has been obtained, and that on another corporation system, lamps are reported to be still unblackened which have been burning 1,356 hours. Other places where the lamps are in use include Hoylake, where a life of over 1,000 hours is also reported, Liverpool, Waterloo, Sheffield, and Wallasy, and great progress has been made since the first introduction of the lamp last year.

The efficiency of the lamp is approximately 1¼ watts per c.p., and at present lamps are made in the following sizes:—50 volts, 25 c.p.; 75 to 130 volts, 32 c.p. and 50 c.p.; 100 to 130 volts, 100 c.p.; and 200 to 250 volts, 50 and 100 c.p. A 24-volt 10-c.p. lamp, specially suited for train lighting, is also being introduced. Although the lamps have their filaments anchored in such a manner that it is possible to use them both in the case of high and low voltages, in practically any angular position, they are usually most successful if fixed in a downward vertical position. The filaments are manufactured under a special chemical process, of which we are unable at present to give full particulars, and the makers claim that they are of a tougher nature than any other metal filament, although quite as efficient.

The standard lamps have mostly been made hitherto in the usual elongated bulb, but recently it has been found possible to make the filaments shorter and more rigid, and a new type has been brought out with a smaller sized bulb, specially suitable for chandelier and ornamental fittings. This form includes 32-c.p. lamps for voltages from 70 to 130 volts. Although of slightly higher price, the lamps have found much favour, especially in Paris, where large numbers are already in use, and we understand that during the last few days an order for 250 of these has been received for fixing in chandeliers in a church in England. The high-voltage 50-c.p. lamps are also now made with spherical bulbs, which we understand are preferred by many corporation engineers for street lighting, for various reasons.

Electrically Propelled Commercial Vehicles.—The lorries manufactured by the Siemens-Schuckert Werke are provided with batteries of lead cells, manufactured by the Akkumulatorenfabrik A.-G., of Berlin. The battery, which is placed under a hood in front of the driver, consists of 40 cells, and has a capacity of 244 ampere-hours at a five-hour discharge rate. A two-ton lorry with this battery will travel 27 miles on one charge. The motor is a 7 h.p. series motor, geared to the back wheels through differential gearing. All gear wheels are of nickel-steel, and run in oil. The efficiency of the motor varies between 80 and 85 per cent. The wheel of the band-brake situated on the motor shaft is constructed in the form of a fan to assist in cooling the motor. An omnibus with the above equipment is capable of carrying sixteen passengers.

Arc-Lamp Electrodes.—A Paper, read by A. B. Cornwell before the American Institute of Electrical Engineers, and reported in a recent issue of the *Western Electrician*, contains some interesting information concerning arc-lamp electrodes. Electrodes were grouped into three classes: (1) carbon electrodes, (2) impregnated carbon electrodes, and (3) electrodes of metallic oxides and of metals. Carbon electrodes will maintain a steady arc on alternating-current circuits at a low voltage. The one-half-inch carbon is most generally used, but experiments show that five-sixteenth-inch carbons have a higher efficiency, whiter light, and hold a steadier arc. The expense of trimming, however, is increased with the smaller carbon. A few of the minerals used for impregnating electrodes of the second class are silicates, chlorates, phosphates, and boric acid to reduce combustion, magnesia and borates of soda and potash to increase the conductivity, and salts of calcium and phosphates to increase the luminosity. The proportion of minerals sometimes reaches as high as 7 per cent. In the third class the electrodes are made up of metallic oxides, such as magnetite and hematite; titanium oxide possesses good luminiferous properties, but is a bad conductor. In the magnetite arc-lamp the negative electrode contains oxides of magnetite, titanium, and chromium. The positive electrode is usually a metal, copper having been used to some extent. The life of a magnetite electrode is about 175 hours to about 120 hours for the carbon. A magnetite arc requires no inner globe. It can be operated off direct-current circuits or off alternating-current circuits with a mercury rectifier.

THE BIRMINGHAM ELECTRICAL FITTINGS INDUSTRY

MANY of our readers will doubtless be interested to have some account of the present condition of the fittings industry, and as Birmingham is the chief centre for this branch of manufacture, we propose to give the results of our investigations in this city. Several reasons combine to render Birmingham specially adapted for this class of work. Birmingham brassworkers have always displayed enterprise and foresight in adapting themselves to new conditions, and at the advent of electric light took up the manufacture of electroliers and other fittings to such purpose as to obtain a practical monopoly of this trade. Rolling mill and tube works abound in the neighbourhood, and provide the sheets and tubes for conversion into fittings of every description. The glassware for use in connection with fittings is also produced largely in the district.

A large proportion of the fittings turned out are of the machine-made description, the parts being stampings rather than castings, spinnings rather than hand-

Fig. 1.—Birmingham Guild of Handicraft : Table Standard.

raised or hammered work. At the present time, however, it is noticed that there is a distinct tendency towards the introduction of a more artistic fitting, into the production of which individual skill enters to a considerable extent. The Municipal School of Art has recently started a special class for brassworkers, and it is to be anticipated that the craftsmen trained in this manner will exercise a beneficial effect in the industry. At the same time it should be pointed out that the power to improve the type and design of fittings rests almost entirely with the head of the firm, and there appears to be considerable need for an art class in metal work for the benefit of the employer as well as the employee.

Whilst on this subject it should be pointed out that the Guilds of Handicraft are exerting a good influence on the design and manufacture of electrical fixtures. The Birmingnam Guild of Handicraft set before themselves a high artistic standard and steadfastly refuse to undertake work which does not conform to this standard. This firm takes every year one or two apprentices who have been through the complete course at the Municipal School of Art, and has now a staff of workers with both artistic perception and technical skill. Practically the whole of the work turned out by this firm is hand-made, and it is significant of the demand for this type of fitting that several orders have been received from the United States. It may be

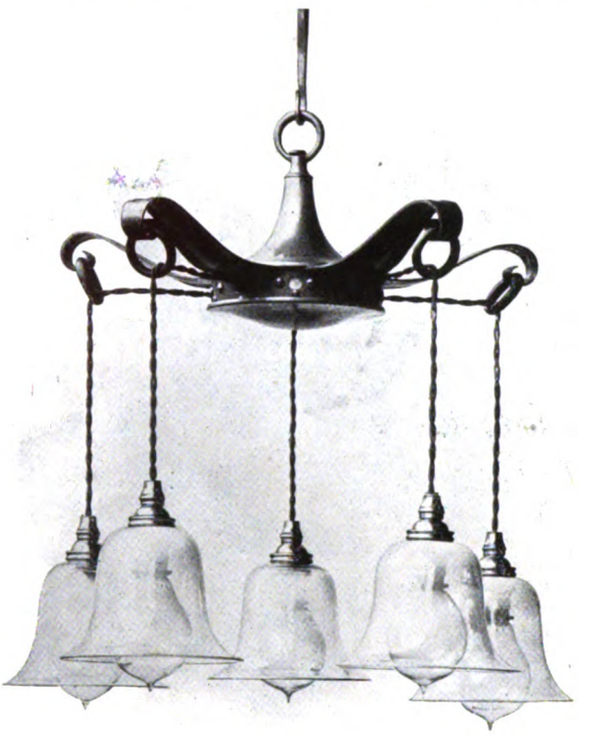

Fig. 2.—Birmingham Guild of Handicraft : 5-light Fitting.

mentioned that the Guild was created by the Kyrle Society with the object of providing work for metal workers and others who were in need, and reached by gradual steps its present semi-commercial status.

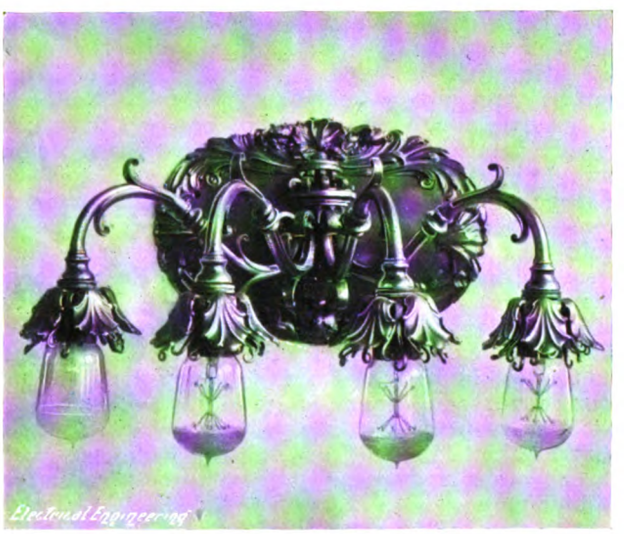

Fig. 3.—Fittings with Tantalum Lamps made by the Bromsgrove Guild of Applied Arts.

Another guild which is carrying out highly artistic work at the present time is the Bromsgrove Guild of Applied Arts, which was founded some seven years ago by Mr. Gilbert with the express object of reviving the class of work for which the eighteenth and earlier cen-

Digitized by Google

turies were famous, work which bore the mark of the feeling and care taken in its execution, in contrast to the machine-made repetition work, which was the

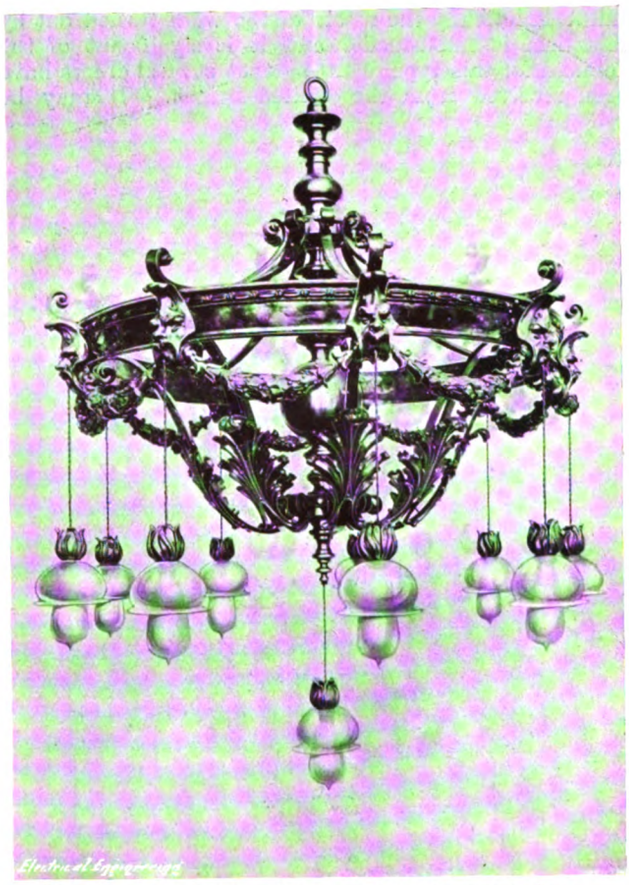

Fig. 4.—Electrolier made by the Bromsgrove Guild of Applied Arts.

natural outcome of the vast development of machinery in the Victorian era. This guild is located at Bromsgrove in the centre of one of the prettiest rural districts in mid-England.

Before describing the specialities of various firms we may mention that during our visit of inspection of some of the shops we noticed that a new system of insulation has recently been adopted by the Admiralty for fittings to be used on board ship. Instead of earthenware, or other fragile material, mica or micanite is employed, one object being to employ a thoroughly reliable insulating material, and to avoid risk of fracture during the firing of guns. Switches, plugs, fuse, distribution, and main switchboards were in process of construction on these lines. The larger boards are built up of angle iron, the live parts being insulated from the frame by sleeves or washers of micanite: in the case of switches and plugs, the bodies of which are of brass, discs of micanite are inserted to act as an insulating lining. The Admiralty has also recently taken up the loop-in method of wiring for ship work, and this has caused considerable alterations of ceiling roses, &c., on account of the larger number of glands necessary for the additional leads. These glands are of circular section, with grooves slotted in the periphery for tightening purposes.

General Electric Co.—As would naturally be expected in the case of the firm which is responsible for the introduction of the Osram lamp, a considerable amount of attention has been devoted to fittings specially adapted for use with this peculiarly shaped bulb. Although a series adaptor is a cheap and convenient method of utilising the Osram lamp where the voltage is too high for single lamps, nothing whatever can be said in its praise as an *objet d'art*, and some of the recently designed fittings produced by this company are a great advance in this respect. Mill fittings, pendants, bulkhead and ceiling fixtures have all been modified to meet the altered conditions, and naturally the shades and globes have also come in for revision.

On account of the less satisfactory working of Osram lamps of high voltage in any other position than the vertical, the company are at present getting out a new design of swivelling ball socket to get over the difficulty. This socket consists of two half-spheres held together by a bead, and so arranged as not to damage the insulation of the conductors.

A novelty is now being put on the market under the title of "Easyphix," which may be said to resemble the well-known child's toy, "Mechanics Made Easy." The basis of the fixture is a spinning in the shape of a flat ring, in the periphery of

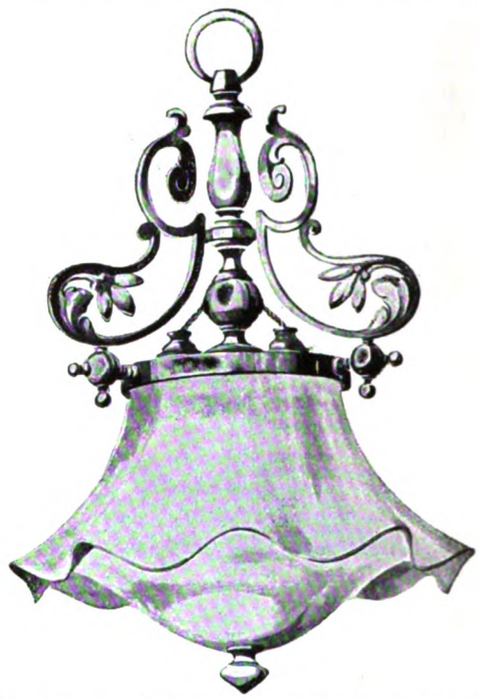

Fig. 5.—General Electric Co.: New Pendant for two Osram Lamps.

which there are sixty holes. In these holes are fixed a greater or less number of arms of various designs, so that the fitting can be used at will for 2, 3, 4, 5, 6, 10, 12, or 20 lights. The figure 60 was selected as affording the greatest number of permutations of convenient size. One of these fittings is illustrated on the opposite page.

Stampings and spinnings enter very extensively into the make-up of fittings, as they are much more cheaply produced than castings when made in large quantities, but a large amount of casting is done, more especially in connection with the smaller parts.

C. J. Thursfield & Co.—This old-established but comparatively little-known firm devote their attention largely to the manufacture of fittings to special designs which are for the most part of substantial construction. The parts are mainly castings which are finished almost entirely by handwork, and it is interesting to note that the firm does its own casting. A considerable number of fittings have been supplied for the Indian market, and some massive fittings have been supplied for Government buildings. As an indication of the care taken by this firm to study the wishes of their customers, it may be mentioned that a special line of what a Britisher would style unduly ornate fittings has been developed to suit the Oriental taste of the Indian, who is not satisfied with the more plain fittings used for the most part in England.

Verity's, Ltd.—This firm have a good supply of orders, and are busy in all departments. In the fittings line more artistic and elaborate designs are in demand, and these necessitate a greater amount of handwork than the cheap style of article. An improved type of electrolier was seen, in which the arms, instead of being screwed direct into the central ball, are fixed in a ring of substantial design, and the ball is divided along its horizontal diameter beneath the ring, so that by the loosening of a vertical screwed rod the bottom half may be removed, and the wiring carried out with great ease. This obviates the trouble often experienced in wiring the old type of fixture. Another interesting item is a tilting shade carrier for cord pendants, which is capable of adjustment in two planes, so that the direction of the light can be varied with facility.

Digitized by Google

This is on new lines, and is a great advance on previous designs.

Another new development by this firm is an improved type of suspension chain, consisting of a ring with four projecting pins 90° apart, on opposite pairs of which are fixed links. This invention is due to Mr. Smith, and its object is to provide a safe and convenient method of running the flexible conductor. The conductor is threaded through the rings, and is consequently not subject to the same liability to injury as with the ordinary type of chain.

Fig. 6.—General Electric Co.: "Easyphix" Fitting (10 lights).

Fig. 7.—Verity's, Ltd.: Electrolier with Split Ball for easy wiring.

Fig. 8.—Verity's, Ltd.: Tilting Shade Carrier for Cord Pendant.

J. H. Tucker & Co.—This firm found that its quarters in the heart of Birmingham did not allow of sufficient room for the necessary extension of their business, and taking the bull by the horns have moved out into what a year or two ago were open fields. Here they have unlimited room for future extensions, have first-rate shops designed without regard to restrictions of space, with the advantage of much better natural lighting than is possible in a crowded city area, and much more healthy conditions for their employés, who are, for the most part, women and girls. To indicate one economy effected we may mention that the amount of artificial light required is reduced by two hours per diem. Messrs. Tucker's are shortly bringing out a new catalogue embodying the recent improvements in the design of their manufactures. Among these may be mentioned an improved construction of tumbler switch, in which the necessity for putting a strain on the insulating bush is done away with (Fig. 9), and a double contact is employed (Fig. 10), acting on both sides of the switch blade, and adjusting itself much more easily than the single contact, which only acts on one side of the blade. This arrangement avoids the possibility of there being bad connection with consequent sparking. A large number of the parts of the switches, &c., are turned out by automatic turret lathes, but the majority of the stamping is done by hand.

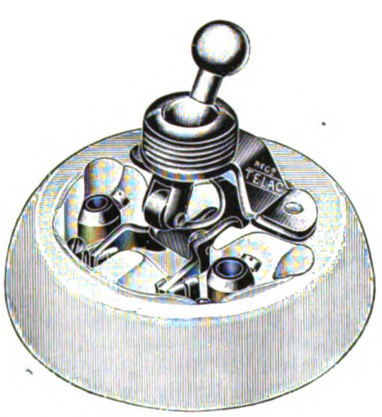

Fig. 9.—J. H. Tucker: Tumbler Switch down, showing Roller Action.

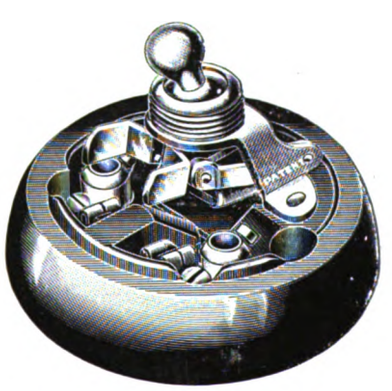

Fig. 10.—J. H. Tucker's Tumbler Switch, with Double Contact.

Digitized by Google

F. and C. Osler, Ltd.—It may not be generally known that this firm were originally manufacturers solely of glassware. When electric light came into vogue, a demand arose for electroliers of the cut crystal type, and the firm gradually took up

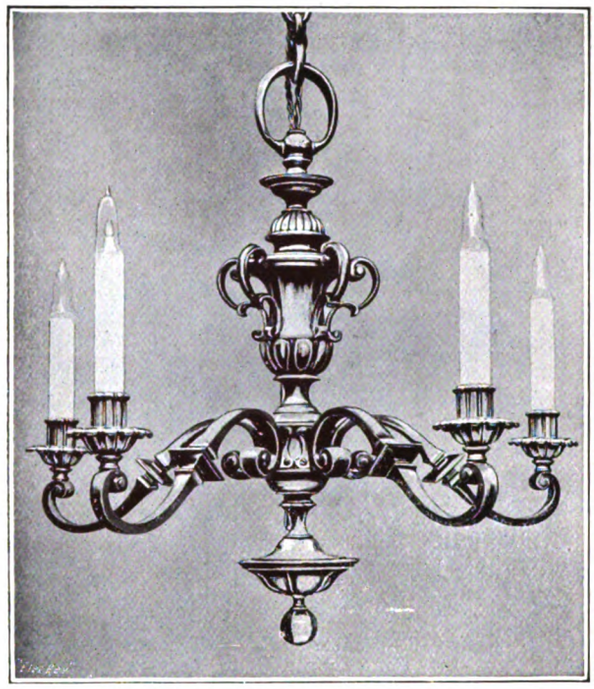

Fig. 11.—Osler & Co. : Candle Fitting, Georgian Style.

metal work. It may be remarked that the fact of the firm producing both the glass and the metal ware greatly facilitates the production of artistic fittings. One example which came before our notice was a small pendant with gunmetal frame,

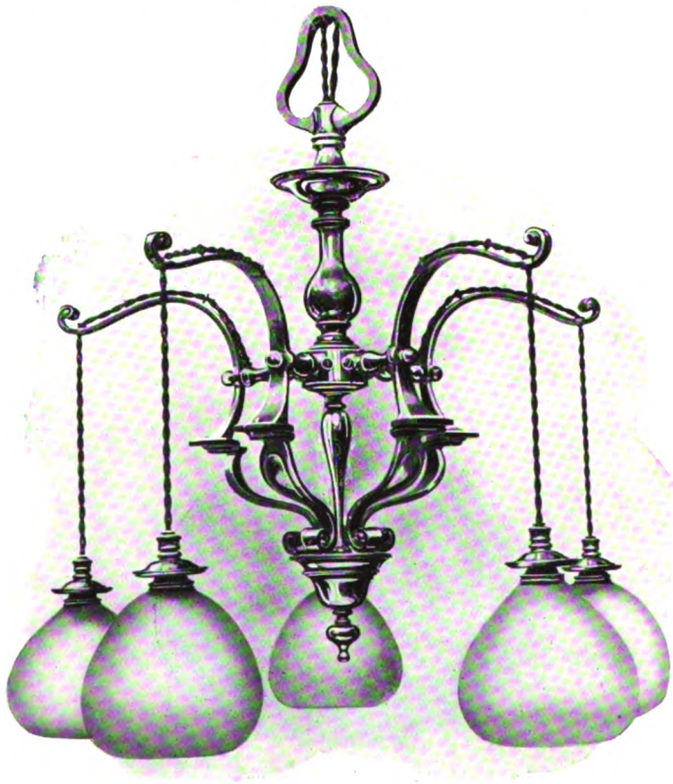

Fig. 12.—Osler & Co. : 5-light Fitting, Georgian Style.

into which the glass globe had been blown whilst still in plastic condition.

The class of fitting for which this firm is now justly famous is the 18th century or Georgian style, which has been evolved by Mr. Herbert Pepper after long and careful study of the architecture, furniture, and decorative art of this period. They may be said to hold the same position in regard to electric light fittings that Sheraton and Chippendale do to furniture, and if it is borne in mind that there were no examples of such work extant for the designer to reproduce and imitate, it must be acknowledged that great credit is due to this firm for its creation of this style of fitting. Other styles produced are the Adams and Dutch.

During a tour of the works, the point which strikes one most forcibly is the large amount of manual skill exercised. Most of the processes are carried out by hand in contrast to the automatic machine methods used to such a large degree at the present time. The price of a cut glass dish for bulk-head or ceiling fitting is seen to be perfectly reasonable when the time and skill necessary for its production is taken into account. The grooves are first ground out roughly by a steel wheel with fine sand as the triturant, next smoothed up by a stone, and finally polished by a wood wheel. The amount of care, skill, and patience necessary to do this must be seen to be properly appreciated.

FIRE ON THE CITY AND SOUTH LONDON RAILWAY

A FIRE occurred in the Clapham Common Station of the City & South London Railway on Sunday morning under somewhat peculiar circumstances. On Saturday night the last locomotive was left in the station as usual, and everything was shut down, including the generating station, at a quarter-past twelve. The station is only opened at half-past eleven a.m. on Sunday morning, as there would be practically no City traffic on that morning, and the line is not working, but at seven o'clock smoke was seen to be issuing from the top of the station. The alarm was given, and fire engines and fire escapes arrived on the scene. The firemen experienced some difficulty in getting down to the platforms, owing to the dense smoke that was rising, but finally, by using smoke helmets, they succeeded in descending to the platform. There they found that the locomotive already mentioned was in flames, and it was only a matter of a few minutes to extinguish it.

In a report, which appeared in the *Times* on Monday morning, it was stated that the fire was probably the result of "the current having short-circuited," and mention is also made of "the hazardous task of shifting the engine motor out of the way of the other rolling stock." Needless to say, it is quite impossible for the fire to have been electrically caused, as the current was entirely switched off and the generating station had been actually shut down since the previous night. It is thought that the fire may have been due to the emergency oil lamp having been left burning and in some way setting fire to something, or else that a match or cigarette end had been left in the cab of the locomotive near a box in which waste, &c., is kept. The watchman, who was below at 3 o'clock in the morning had reported that all was well.

Although the locomotive was of steel construction, the fire had done considerable damage, as all the cables and casing had been burnt out, and there is very little of the controller left.

Damage to Cables by Trawlers.—A Reuter telegram reports that the Commercial Cable Company has made representations to the State Department at Washington, requesting diplomatic correspondence with Great Britain on account of damage done by English fishing trawlers to the American submarine cables between America and Europe. The Commercial Cable Company states that during the past three months it has been put to an expense of over $100,000 in repairing its cables within fifty miles of the Irish coast on account of these fishing trawlers, two and even three of the cables having been injured and broken at a time. The interruptions affect not only communication between Europe and America, but also between Great Britain and Canada, and, consequently, between Great Britain and Australia.

THE MANCHESTER ELECTRICAL EXHIBITION

A GOOD deal of progress is being made in the arrangements for the Electrical Exhibition, which is to be held in Manchester in October next. At the last meeting of the Committee, held in the Electricity Department of the Town Hall, Manchester, on Tuesday, May 12th, applications and inquiries for space from some 130 would-be exhibitors were dealt with, and a very large number of allotments were made. Since that date applications and allotments are being dealt with as received, and there are ample indications to prove that the Exhibition will be thoroughly supported by all branches of the industry. A number of interesting exhibits of machinery in operation have already been arranged for by combinations of the principal motor manufacturers and the makers of textile machinery, machine tools, and the like. As already announced, the Exhibition is receiving the support not only of the Manchester and Salford Corporations, but of some thirty adjoining towns and the Lancashire Electric Power Co., which is in itself a strong indication as to the importance which is attached to it. It will undoubtedly serve as a great impetus to the industry.

The electrical trade generally must not underrate the importance of the Exhibition, as it is their own, being run by themselves and for trade benefit only; and as Manchester is known to be the centre of one of the greatest manufacturing districts in the world, the far-reaching effect of such an Exhibition is bound to bring beneficial results to all taking part in it.

A further meeting of the Committee was held in the Town Hall, Manchester, on Tuesday last, when a number of important applications for special exhibits, which it is considered are likely to be particularly attractive, were arranged for.

Supply of Current.

Electricity for exhibitors' stalls will be supplied by the exhibition to each stand at 2d. per unit for lighting, and 1d. per unit for power. The supply will be (*a*) three-phase alternating 50 periods at 400 volts, and (*b*) continuous current at 200 volts for lighting, and 400 volts for power. (For 3½ h.p. motors and below this power 200 volt continuous current may be used.) Alternating current lighting supplies will be furnished at 240 volts, *i.e.*, the voltage between either phase, and the star point. Exhibitors must arrange to balance up their lighting equally between the three circuits, where three circuits are taken to one stand.

Wiring Rules.

The necessary meters, main fuses and main switches, at a rental varying from one to two guineas, according to capacity, will be provided by the exhibition authorities. The exhibitor must provide suitable space on his stand, and a board on which the above can be mounted. The connection of the supply-leads to the main switchboard will be carried out by a duly authorised firm on behalf of the exhibition. Exhibitors will be required at their own cost to wire their stands generally in accordance with the regulations of the Manchester Corporation and to the following details.

The exhibition reserves the right through their Consulting Engineers, Messrs. Pearce & McCowen, members of the I.E.E., to refuse to connect any stand which does not comply with the above regulations or conditions herein set forth; and for the purpose of ascertaining that their regulations are complied with, their Consulting Engineers shall have the right to examine the wiring and connections to each and every stand; and in the event of any disagreement, the matter to be referred to the Hon. Consulting Electrical Engineer, Mr. S. G. Castle Russell. The exhibition also reserves the right to limit the supply to any consumer.

Distribution Boards and Local Circuits.—The supply to each stand from the main switchboard must be sub-divided into circuits and controlled by D.P. fuse boards, to be supplied by the exhibitor. The fuses are to be of the bridge or other approved enclosed type; the terminals and bus-bars are to be efficiently mounted on porcelain or slate bases, and contained in boxes lined with asbestos sheets and amply divided between opposite poles. No incandescent lamp circuit shall exceed four amperes, and no other single circuit 15 amperes, without first obtaining the approval in writing of the Consulting Engineers. Branch switches, if used, shall be of the tumbler type, high pressure pattern to carry four amperes. Arc lamp circuits must be controlled by D.P. fuses and linked switches. Motor circuits must be controlled through D.P. fuses, linked D.P. switches, and mounted in metal cases. All switches with projecting handles must be so protected that they cannot be actuated accidentally. Enclosed type starting switches and resistances must also be supplied, the latter being provided with "maximum" and "no-voltage" releases.

Conductors.—No bare conductors allowed. All conductors shall be of tinned copper, and shall be so proportioned to the work that the current density shall not exceed a ratio of 800 amperes to the square inch. All conductors, except flexible cords, shall be insulated with pure and vulcanised rubber, taped, braided, and compounded, and have an insulation resistance of not less than 1,000 megohms per mile. Flexible cord shall be insulated with pure or vulcanised rubber, and covered with stout silk, cotton, or other approved braiding. Its use must be restricted to pendants and portable appliances approved by the Consulting Engineers. Wires and cables shall be adequately and firmly fixed, and in all cases where wires are within reach of the public they must be enclosed in wood casing or other approved covering. All joints must be covered with pure rubber and proof tape. On circuits to carry more than four amperes, clamped joints must be used.

Protection of Conductors. Unencased conductors must be out of reach of the public, securely supported on insulators, run in such a position as to be reasonably free from any interference that might otherwise cause them to be damaged, and tappings must be made by insulated conductors other than flexible, with properly taped joints. Unencased conductors must not be in contact with bunting, gauze, cloth, or other covering material. "Fairyland" strips are allowed, but unless holders are fitted with metal backs, must be securely mounted on Uralite or similar board or insulators out of reach of the public. No. "E.L.B." flexible strip or boards will be allowed unless in iron cases with glass fronts. Wiring at the back of wood sign boards must be encased. Wood casings with batten holders will be allowed. Exhibitors proposing any system of lighting not included in the above will please send full particulars to the manager forthwith, for consideration, as otherwise it may not be possible to connect their stands.

Celluloid.—No imitation candles, shades, or other accessories made in celluloid will be allowed on fittings connected to the supply or to accumulators.

Metal Tubing.—If metal tubing be used, both lead and return wires must be in the same tube, screw jointed, and earthed, unless exemption be granted by the Consulting Engineers.

Local Switches.—All switches must be of quick action, ample dimensions and "break," and without intermediate position between "on" and "off." They must be placed out of reach of the public, and must not be placed beneath counters or in show cases, but preferably mounted and protected as distribution boards.

Show Cases.—These must not be lighted from the inside.

Arc Lamps.—Not more than six arc lamps shall be simultaneously in use on one stand, and the supply for any one arc lamp shall not exceed 15 amperes by 55 volts, 7¼ amperes by 110 volts, or 4 amperes by 220 volts. No naked arcs will be allowed. Arc lamps must be enclosed with one or more globes, and ash trays, if provided, must be efficient. The outer globe must be protected with wire netting if deemed necessary by the Consulting Engineers. The lamps must be suspended on insulators by steel wire or hooks, *not* by the conductors. The connecting cables must be suitably protected from contact with inflammable material. External resistances must be in fire-proof cases, and must be mounted at least 12 ins. horizontally and 18 ins. vertically from woodwork or other inflammable material. Each series of arc lamps must be controlled through D.P. cut-outs and linked switches.

Electric Motors.—Motors exceeding ¼ h.p. must be of the "totally enclosed" or "ventilated enclosed" type, and must be mounted on sheet-iron trays to catch oil. In the latter type the ventilated openings in the motor must be covered with metallic gauze. The starting currents of any motors and the number of steps on the starter must conform to the standard regulations of the Manchester Corporation. If the starting current of any motor be excessive in the opinion of the Consulting Engineers, they reserve to themselves the right to determine certain times for starting up, or alternatively, to request the exhibitor to provide an improved type of starter. For three-phase motors, squirrel cage wound rotors will be allowed up to 40 h.p. Above this the slip ring type of rotor, or some other means of starting, must be provided, to be approved in writing by the Engineers.

Transformers and Accumulators.—Neither live transformers nor accumulators will be allowed unless special permission be granted by the Consulting Engineers.

Stand Roofing.—If and where stands may be covered on the top, the roofing must be of solid construction, otherwise the stand will not be connected.

Contractors.—The names of proposed contractors other than those on the Corporation's registered list must be submitted to the exhibition manager for approval by the Consulting Engineers, and all stands must be ready for connecting up at least 72 hours before the opening of the exhibition.

Digitized by Google

CATALOGUES AND PAMPHLETS RECEIVED

ARC LAMPS AND ACCESSORIES.—Two new leaflets are to hand from Mr. G. Braulik, of 217 and 218 Upper Thames Street. One of these deals with a new semi-enclosed continuous-current arc lamp, known as the "Aster Eclipse," intended to take the place of small flame arc for interior lighting, and the other describes several forms of ratchet winches for lowering arc lamps.

CRANE CONTROLLERS.—A new list from Messrs. Siemens Brothers Dynamo Works, Ltd. gives illustrations and full particulars of a complete series of crane controllers, embracing a number of patterns for continuous and alternating currents. These controllers are of a simple and substantial drum type with magnetic blow out. The contact fingers are of hard-drawn copper of a special hinged design pressed against the panel by a stout flat steel spring. No combustible material is used in the construction of the drum. A large number of different forms of hand wheels and levers can be fitted, including the convenient universal arrangement for working two controllers by the movement of the same handle in different planes. The resistances can be attached to the controllers, arranged in separate cases. Special care is used in the graduation of the various steps. Both the continuous and alternating-current controllers can be arranged for various different combinations of forward, reverse, free running, and braking positions. A complete series of spare parts is listed, and very full information is given of the different forms of controller available. A frontispiece shows a 1-ton crane fitted with Siemens motors and controllers recently erected at Tower Bridge Wharf.

ELECTRIC FANS.—Particulars of a variety of forms of continuous-current "Stellite" fans are given in a new list just issued by the Electric and Ordnance Accessories Co., Ltd., of Stellite Works, Aston, Birmingham. These fans are British made, and are designed to pass the tests of the British Admiralty. The "A. P." pattern combines in itself the distinctive features of the desk, trunnion and bracket types, and is thus equally suitable for use on table, floor, desk, wall or ceiling. The frame consists of an ornamental cast-iron pedestal, with a gimbal ring of the same material. The pedestal is fitted with rubber feet to absorb vibration, and to prevent damage to polished surfaces. The gimbal has brass fittings. The field cores are cast in one piece with the motor body. The commutator is of hard drawn copper, and the slots of the armature are carefully lined with insulating material. Double silk covered high conductivity copper wire is used for the armature and field windings, and before and after taping all coils are impregnated under vacuum with an insulating compound, and the armature bearings, of phosphor bronze, are fitted with wickfeed lubricators. The starting switch and speed regulator are fitted inside the base, the resistance consisting of wire coils wound on non-hygroscopic porcelain. Spring catches ensure the switch being left central on the respective stops. In addition to this universal type, ordinary pedestal fans, cabin fans, and porthole fans are listed. With the exception of the "cabin fans," which are intended for rooms with low ceilings and have two horizontal blades with 26 in. or 36 in. sweeps, all these fans are made in the 12 in. and 16 in. sizes, driven by what is described as a 1/16 h.p. motor. The motor for the larger cabin fan is an $\frac{1}{8}$ h.p.

ELECTRIC LIFTS.—A pamphlet from the Electric Construction Co., Ltd., of Wolverhampton, describes their different types of passenger and goods lifts. These can be obtained with either "drum" or "friction" drive, and with hand-rope, car-switch, or press-button control. The motors are specially designed for lift work, and are coupled to the winding drums through worm and worm-wheel reduction gear. Illustrations of some of the standard types of continuous-current and three-phase alternating-current control switchgear are given.

SMALL MOTORS, CRANES, AND TRACTION EQUIPMENTS.—Several new pamphlets have recently been issued by the Oerlikon Co., of Zurich. One of these gives an interesting description, with numerous views, of the departments of the works where small motors are manufactured. These shops have recently been considerably extended. Illustrations of a number of types of the machines manufactured are also given. The other two pamphlets give a very good idea of the large amount of work the firm is doing in the direction of electric cranes and heavy traction, by lengthy lists of contracts carried out, and excellent illustrations of some typical examples of plant supplied, and views of railways equipped.

STEAM TRAPS.—A leaflet from W. Geipel & Co., of Vulcan Works, St. Thomas's Street, S.E., gives particulars of the latest forms of the well-known Geipel "Rapidity" steam trap, including both the ordinary and special Admiralty types.

SWITCHGEAR, TESTING APPARATUS, &c.—A set of lists is to hand from Messrs. Morris and Lister, of Carlton Works, Coventry. Illustrations are given of complete switchboards for various purposes, and particulars are contained of a number of items of switchboard equipment, which the company specialise in, including quick-break knife switches, tubular porcelain switch fuses, thermal excess current alarms, ironclad switches, and a new form of thermal overload circuit breaker. In the last-mentioned piece of apparatus, two contact blocks are fixed rigidly to, but insulated from, the switch arm. They are connected electrically by two parallel strips of suitable metal, each fitted with a steel catch piece. When the switch is closed, the strips are sprung apart over a fixed catch, and the full rated current does not loose the catch. Overload causes the strips to move apart, and the circuit breaker flies off under the action of a spring. The testing apparatus dealt with includes Messrs. Morris and Lister's well-known eddy current brake for testing small motors, and a series of specially designed choking coils for testing alternating plant on inductive loads, on the lines described in Messrs. Morcom and Morris's recent paper before the Birmingham Local Section of the Institution of Electrical Engineers.

PORTABLE LAMP WITH PRIMARY BATTERY.—The New Ignition Syndicate, Ltd., of Canal Bridge, Old Kent Road, have sent us pamphlets relating to a portable lamp with a primary battery, and have also showed us a specimen of it. The lamp is intended for emergency use, &c., and consists of a wooden box containing the battery, with the lamp fixed on the front. The battery used is a single-fluid one, and when the box is in its ordinary upright position, the plates are out of the liquid. To ignite the lamp, the box is simply inverted. The zinc is removable for replacement, and forms part of a watertight stopper. Two sizes are used, one containing a single cell, and the other containing two cells. The latter measures 6 in. by 3½ in. by 7 in. high, and weighs 5¼ lb. when charged. Metal filament lamps are used. It is stated that one charge suffices to light the lamp for six consecutive hours in the small pattern, and ten consecutive hours in the two-cell pattern.

TWO-WAY SWITCHES, &c.—A new leaflet from A. P. Lundberg and Son describes the construction and applications of this firm's well-known "Marvel" switch, by which a large number of systems of control of several lamps from one or more points can be effected (see ELECTRICAL ENGINEERING, Vol. II., p. 624).

WIRELESS TELEGRAPHY.—Several new publications have been issued by Marconi's Wireless Telegraph Co. These comprise reprints of Mr. Marconi's lectures, given recently before the Royal Institution and the Liverpool Chamber of Commerce, and a pamphlet entitled "Ten Years of the Marconi System of Wireless Telegraphy." This contains a historical account of the development of the Marconi system, from the experiments of Mr. Marconi in 1895, founded on the work of Hertz, Branly, and Lodge. The forms of coherers and other apparatus used in the earlier stations are described, and the simpler forms of "syntonic" and duplex transmission are explained by means of diagrams. The now familiar history of the perfection of transatlantic wireless communication is recounted, and an illustration is given of the Marconi magnetic detector. A good many of the historical details have recently been given in our columns in connection with the company's annual report.

Post Office Underground Telegraphs.—In a reply to a memorial from the Associated Chambers of Commerce, the Postmaster-General stated that the extension of the underground system is progressing as rapidly as possible. The line to Cornwall, which is of importance in connection with the submarine cables, is approaching completion. Work on the Newcastle-Leeds line and the main underground line to the north is being pushed on as quickly as possible, and the line from Edinburgh to Glasgow is nearly complete.

Automatic Transformer Switch for Metallic Filament Lamp Circuits.—Mr. W. J. Davy, of Arc Lamps, Ltd., has a new automatic switch for metallic filament lamp transformer circuits, in the stages of commercial development at present, and has a specimen of the apparatus under trial, so that it may be expected to be placed on the market at no very distant date. The switch is combined with the transformer, and a feature of it is that no alteration is made to the existing wiring, and one lamp switched on or the last lamp switched off will automatically cut the transformer in or out as the case may be. A brief reference to the patent was made in our last issue.

Manufacture of Metallic Filament Lamps.—According to *L'Electricien*, a method for the electrolytic manufacture of metallic filaments has been recently patented. The method consists in electrolytically depositing a skin of osmium-iridium alloy on an ordinary carbon filament. The filament is made the cathode, and the electrolyte is a solution of potassium osmiate with a small amount of iridium chloride. The carbon core is vaporised by raising the whole to a very high temperature by means of an electric current. The resulting osmium-iridium filament is stated to be strong and ductile.

ELECTRICAL SCIENCE

British and American

Comparison of the Board of Trade Ampere-Standard-Balance with the Ayrton-Jones Current-Weigher.—During the last few years a new current weigher, designed at the Central Technical College, has been constructed at the National Physical Laboratory with a precision not previously obtained in any instrument for the absolute determination of current. When the Board of Trade ampere balance was set up and verified in 1894, the platinum weight used with the instrument was adjusted so that a current which deposited silver at the rate of 1·118 milligrammes per second produced, on reversal, a change of force equal to the weight of the platinum. At that period such a current was believed to represent the ideal ampere with a fair degree of accuracy. T. Mather and F. E. Smith read before the Royal Society, on March 26th, an account of their experiments to compare these two instruments. The comparison was carried out by the aid of cadmium cells and resistances used as secondary standards of current; for example, if a current be passed through a resistance, and the strength of the current be adjusted until the P.D. between the terminals of the resistance is equal to the E.M.F. of a standard cell, then, when the cell and the coil are at given temperatures, a perfectly definite current must be passing through the coil. If the current be determined in absolute measure by means of a current weigher, the combination of cell and resistance is standardised, and can be used subsequently as a secondary standard of current. Knowing the relations between E.M.F. and temperature for the cell, and between resistance and temperature for the coil, the current required to produce equality of P.D. and E.M.F. at any given temperature can be found. The authors in this way standardised certain combinations of cells and resistance by means of the Ayrton-Jones weigher at Bushy, and then these were taken by hand to the Board of Trade Laboratory at Whitehall. Two slightly different methods of using the Board of Trade balance were employed, and the mean of six independent comparisons carried out on three successive days show that currents, as measured by the Whitehall balance, are about 0·053 per cent. higher than their values in terms of the Bushy balance. That is, the Board of Trade ampere is about 1/30 per cent. smaller than 1/10 of the C.G.S. unit of current as determined by the National Physical Laboratory current-weigher. Further, the recent determination of the electro-chemical equivalent of silver at Bushy, taken with the above result, shows that the Board of Trade ampere is equal to the international ampere, as defined by silver deposit, within one part in 10,000. In an appendix to the Paper the authors deduce from the above, and from certain previous measurements at the National Physical Laboratory on standard cells, that the E.M.F. at 20° C. of the normal cadmium cell is 1·0186, Board of Trade volts, and that the E.M.F. at 15° C. of the normal Clark cell is 1·4330 Board of Trade volts. The former is in good agreement with the value 1·0186 volts published by the Reichsanstalt, and the latter is in good agreement with the value 1·4329 determined by A. P. Trotter at the Board of Trade Laboratory in 1904.

The Colour of Lightning.—At the first afternoon meeting of the Royal Meteorological Society on May 20th, Mr. Spencer C. Russell read a Paper on "Observations on the Colour of Lightning, made at Epsom, 1903 to 1907." The author gave results of observations of fork lightning made during 57 thunderstorms, and 78 observations of sheet lightning. It appears that in fork lightning red is the colour of the most frequent occurrence, and this is followed closely by blue, the least frequent colours being orange and green. White is of the greatest frequence in sheet lightning, red and yellow being next. It seems that the presence of hail, when occurring in association with a thunderstorm, is intimately connected with blue lightning.

Production of Small Alternating Currents for Telephonic Measurements.—At the Physical Society meeting last Friday, B. S. Cohen read a Paper on the above subject. For telephonic measurements alternating currents of frequency ranging from 100 to 2,000 per second are of great service, and the output of the apparatus need be only about one watt. A variety of methods have been proposed and used, such as small alternators, humming telephones, and vibrating wire interrupters. The author's new device may be classed as an improvement of the vibrating wire method. This method in its ordinary form consists of a stretched metal wire carrying a tongue dipping into mercury. The current through the mercury and the wire energises a magnet, which is so arranged as to draw the tongue out of the mercury. The consequent stoppage of the current allows the contact with the mercury to be remade; and, of course, the frequency of the interruptions is mainly determined by the natural period of the wire. It is found very difficult to construct a vibrating wire which will run steadily at above a frequency of 300 per second; the output is also small, and the frequency cannot be varied much. In order to overcome these difficulties the author arranges that the interruptions made by the vibrations of the wire do no more than charge and discharge a circuit or circuits comprising capacity and self-induction of variable magnitude. The frequency of the oscillatory charging or discharging of such a circuit is quite distinct from the wave frequency. The simplest form of the apparatus consists of a steel wire 1·06 mm. in diameter, loaded with a soft iron armature at its centre. The iron is kept in vibration by an electromagnet with a core of laminated stalloy, and it carries two platinum wire contacts dipping into two mercury cups. The wire is provided with a tension adjuster, and runs well at frequencies between 100 and 250. The one mercury cup serves to interrupt the current through the electromagnet; the other mercury cup serves to make and break a circuit containing a battery of cells and a condenser of self-inductance in parallel. The result is to set up damped trains of electrical vibrations in the condenser and self-inductance circuit. Part of the self-inductance constitutes the primary of a small transformer, and the alternating current to be used for experimental purposes is taken off the secondary of this transformer. The apparatus shown by the author was such that frequencies of 490, 959, and 2,880 were produced by using capacities of 2·88 mfd., 0·8 mfd., and 0·1 mfd. The oscillographs exhibited showed that the electrical oscillations were produced by this apparatus only at the break of the mercury contact. Adding resistance to the circuit that is interrupted causes the appearance of oscillations at the make of the contact; and the result is better if, instead of adding a resistance, a condenser shunted by a self-inductance be placed in the circuit. If, further, the added oscillation circuit contain a winding which can be used as primary of a transformer, waves can be taken from this transformer as well as from the transformer associated with the first oscillation circuit. By joining up the two secondaries so that these two waves either assist or oppose each other, some interesting results have been obtained. For instance, the secondaries can be so joined that the result is seen in the oscillograph as a continuous curve, or complex curves of definite formation can be built up, and are often useful, for telephonic tests. In concluding, the author mentioned a curious phenomenon which he has noticed in connection with the sparks at the platinum-mercury contacts used by him. The contact point has an amplitude of motion of about 4 mm., and the mercury cup possesses an adjustment for raising or lowering it while the wire is vibrating. It is found that if the cup be slowly raised, a series of sparkless points are passed through. These points are very sharply defined; a movement either way of about 0·07 mm. restores the usual sparking condition.

Heat Developed in Thoria by its Radioactivity.—In the May *Physical Review*, the experiments of G. B. Pegram and H. W. Webb on the elevation of temperature of thorium oxide due to its own radioactivity are described. About four kilograms of the material were placed in a spherical Dewar bulb, and this, with a metal cylinder for protection, was put in an ice bath. One junction of a thermo-couple was put in the mass of oxide and the other junction was kept in the ice. The measurements of the E.M.F. between the junctions showed that the mass of thorium oxide maintained a higher temperature than the ice bath. By sending a small current through wires previously laid in the oxide, heat was introduced at a known rate and the small elevation of temperature measured by the thermo-junctions. A comparison of the elevation of temperature produced naturally in the oxide with that produced artificially as indicated, led to the conclusion that the thorium oxide was developing heat at the rate of $0{\cdot}96\times10^{-5}$ calories per hour per gram, or about one-tenth of an erg per second per gram. From this value the heat developed by pure thorium oxide in its equilibrium state was calculated to be 2×10^{-5} calories per hour per gram. As measured by the total energy liberated per second, thorium oxide is about a three-millionth part as radioactive as radium bromide.

Continental

Electric Pendulum.—A pendulum is essentially a regulator, and should be employed as little as possible for driving, or for transmitting a driving force. Mechanical escapements have reached a great perfection, but wherever solids are in sliding contact there is friction and wear, and even when the friction is minimised by means of oil, the oil becomes varied after a time and loses its lubricating power. On Cornu's principle, now extensively applied, a bar magnet is attached to the bob, and moves in and out of a fixed coil. The driving impulse may thus be transmitted magnetically without any solid contact. An extension of this is proposed by C. Féry, in Bulletin No. 278 of the French Physical Society. He substitutes a horseshoe magnet for a bar-magnet. The second pole moves through a ring of copper attached to the bob of an auxiliary pendulum synchronous with the first pendulum, but which automatically sets itself to swing a quarter-period behind the first pendulum in phase. It is this auxiliary pendulum which releases the current impulse used for driving the chief pendulum, and works any relays used for recording apparatus. The minimum interference with the swing of the chief pendulum is thus secured.

Atmospheric Electricity.—The study of atmospheric ionisation has lately been assiduously cultivated on account of its influence on the range of wireless transmission. D. Smirnow contributes some general results of his observations to the *Physikalische*

Zeitschrift for May 15th. In the winter, when the sun's effect is feeble, positive ions accumulate in the upper air, and the field intensity between them and the negatively charged earth increases. The author distinguishes three main controlling factors. The cooling of the earth's surface at night produces a diminution of the conductivity of the air nearest to it, and a consequent diminution of the field above. This process is reversed in the morning. Ascending currents, especially in summer, carry up positive ions mainly, and leave behind the negatively charged dust. This produces a decrease of the field in the lowest layers. As regards the direct effect of the sun's rays, they produce negative charges in the highest atmosphere, a diminution of the positive ions in the middle strata, and a diminution of the potential gradient near the ground. This is especially marked in winter in the northern hemisphere, when the earth is nearest the sun.

ELECTROCHEMISTRY AND ELECTROMETALLURGY

At the thirteenth meeting of the American Electro-Chemical Society, held at Albany, April 30th, Mr. F. T. Snyder contributed a Paper upon the "Distillation of Turpentine by Electricity." Pine woods contain volatile hydro-carbons with boiling points varying from 130° C. to 250° C., and the fraction boiling between 155° to 170° constitutes what is commercially known as turpentine. The process of obtaining turpentine from wood is an extractive one, as the turpentine is actually contained in the raw wood. One of the chief difficulties in connection with turpentine distillation is the fact that at 175° C. the turpentine commences to decompose, and the higher the temperature the greater the decomposition. Consequently, it is necessary to distil it within relatively narrow temperature limits. If the heating is insufficient, part of the turpentine is left in the wood; if the temperature is too high, a portion of the turpentine is decomposed; and if decomposition does take place, small quantities of objectionably smelling products are produced and become incorporated with the turpentine, and this very materially affects its selling price. There are two processes for obtaining turpentine: one by tapping the tree and subsequent distillation of the resinous products obtained, and the other, which is of more recent date, at any rate in America, the distillation of wood refuse. The difficulty of distillation in ordinary iron retorts is the tendency for the wood against the sides of the retort to become overheated and spoil the quality of the turpentine. It was considered that perhaps the temperature might be more easily regulated electrically than by ordinary fire heating. An experimental plant, electrically heated, was recently fitted up at Vancouver, B.C. As the results obtained were considered satisfactory, a commercial plant capable of dealing with three cords per day was erected, and has been in operation satisfactorily at Vancouver since July, 1907. Oblong "cans" are placed in the brick retort, consisting of a number of brick chambers, and the retorts are flanged so that they dip into grooves round the top of the retort, which are filled with tar, thus forming a gas seal when the can is in the retort. An electrical current at 110 volts pressure is carried through the retort by means of wrought-iron strips, which are threaded through the brickwork. The current supply for each retort is independently controlled by the switchboard, which also holds the direct-reading pyrometers, one of which registers the temperature at the outside of the can, and the other which registers the temperature at the centre. The leads of the pyrometers end in flexible extensions on the top of the retorts, so that they can be removed from the one can to the other. The turpentine vapour passes from the retort through a removable copper pipe, and thence through a condenser. The brickwork of the retort when a newly-filled can is placed into it has a temperature of 250°. The can rapidly absorbs heat from the brickwork, the temperature of which is maintained by a current of 400 amps., which is passed through the resistance strips for about two hours. During this time the temperature inside the can rises from 75° to 130°. The turpentine then commences to distil, but the temperature at the centre of the can is only about 45°. The current is then shut off, and the temperature of the can slowly rises by absorption of heat from the brickwork for two hours longer, when the temperature has reached 150° C. on the outside of the can and 205° C. in the centre of the can, and the turpentine has been substantially all removed. The temperature, being higher in the centre, is caused by a slow decomposition of the wood. In practice, it is found that from 90 to 95 per cent. of the turpentine in the wood, as determined by analysis, is removed during this interval. While the turpentine is coming off, the pitch in the wood melts and runs down to the bottom of the can and out through perforations, and is collected in the bottom of the retort, from which it is drawn off at the end of the run into the barrels in which it is shipped. It may be noted that this charcoal, being retort charcoal and cooled out of contact with the air, is tough and suitable for special purposes. The amount of wood held by a can varies with the quality of wood, but averages at Vancouver about 1,000 lb. The electricity used per can is about 90 kilowatt hours, and costs, at Vancouver, 18 cents per can of wood. The plant is operated by one man in each shift, there being two twelve-hour shifts per day. When the wood is large an extra man is employed on the day-shift to split it.

At the same meeting of the American Electro-Chemical Society E. W. Smith and R. S. Hutton presented a Paper on "The Direct Synthesis of Hydrocyanic Acid." The Paper is of interest because if it were possible to obtain a cheap method of direct synthesis, it would be very useful, from a commercial point of view, for the preparation of cyanides. The authors have carried out a series of experiments to ascertain whether the direct synthesis of hydrocyanic acid can be carried out at lower temperatures and under conditions which preclude the intervention of any of the complicated electrical conditions which prevail in the arc. The apparatus consisted of a rod of carbon heated by the resistance which it offers to the passage of an electric current, precautions being taken to prevent arcing. Water-cooled brass tubes served to conduct the electric current to the carbon rods (of 3 to 6 mm. diameter), the ends being electro-coppered and soldered to the tubes. The temperature was carefully regulated, and was estimated optically with a Wanner pyrometer. The brass tubes were fixed air-tight into a tubulated glass flask of about 1·5 litres capacity, in such a manner that the heated rod was at a considerable distance from the glass walls. A slow current of gas was passed through the apparatus, the exit gases being allowed to bubble through water containing caustic soda solution. In all cases, the indication of hydrocyanic acid by the Prussian blue test was confirmed by an estimation of the quantity produced by titration with N/10 silver nitrate solution. In general, the experiments clearly prove that when carbon is maintained in contact with hydrogen and nitrogen below a temperature of some 1,800° C., cyanide is not produced in noticeable quantity. This conclusion was borne out not only by the analysis and the presence of cyanides in the caustic potash used as absorbent, but also by the unaltered appearance of the carbon rod. On the other hand, at all temperatures above about 1,800° C., the reaction proceeds, hydrocyanic acid is produced, and the carbon rod shows evident signs of attack, disintegrating to quite a marked extent; moreover, the relative quantity of hydrocyanic acid formed rapidly increases with the temperature, experiments having been performed at different temperatures ranging up to 2,500° C. In the case of ammonia, the production of cyanide is, as may be expected, increased, but it is of some interest to note that the temperature at which the reaction occurs is not to any marked extent lower than with nitrogen and hydrogen. Finally, the production of cyanides from mixtures of gases containing carbon monoxide, such as correspond to producer gas, has been shown to proceed satisfactorily, and particularly in this latter case the process is of practical value, on account of the difficulty and expense of preparing pure nitrogen. In another form of furnace an attempt was made to obviate the somewhat wasteful expenditure of energy which is necessarily incurred when the highly heated zone is surrounded on all sides with a free gas space. The form of apparatus used had two carbon electrodes, with a surrounding charge of ground carbon; the portion of the charge between the two electrodes being heated to a high temperature by the resistance which it offered to the passage of the current. One of the electrodes was provided with a central channel through its axis for the removal of the gas. A fireclay cylinder served to retain the charge of carbon in place, and a large water-cooled iron bell, with water seal, renders the whole chamber gas-tight.

According to the *Journal du Four Electrique et de l'electrolyse* for May the production of aluminium during the last ten years has shown a steady advance, as instanced by the subjoined table.

	Tons.			
	1898.	1901.	1904.	1907.
United States and Canada ...	2400	3200	3900	**8000**
France	600	1700	1700	**6000**
Germany, Austria, and Switzerland	1600	2500	3000	**4000**
United Kingdom	300	600	700	**1800**
Italy	—	—	—	**300**
	4100	7500	9300	**20,100**

Twenty-five years ago the total daily production of aluminium at Salindres was but 10 kilograms per day, and this was the world's production. Although last year 20,000 tons were manufactured, there was a shortage, and the price was high. More works have been, and are being, equipped for the manufacture of this metal, and with the very much lower prices now prevailing, and the active sales, there is no doubt but that this year will see a still larger production It now remains for further outlets and uses for this metal to be discovered; it is no longer out of the question to solder the metal, but there are not many, if any, really satisfactory methods known for plating upon the metal, and here is a fruitful field of research for electrochemists.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 21st, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.

1906 Patent

21,347. Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. An improvement in the method of signalling, or selectively setting in operation apparatus from a group of several, by means of a set of vibratory bodies, for example, springs, at the receiving station. Any one spring can be set in motion by transmitting an intermittent or varying current of a frequency corresponding to the vibration frequency of the spring. Instead of the rotary generator as hitherto proposed for generating the current, a vibrating contact and electromagnet in series with a battery can be used. One contact, in which the natural period of vibration of the vibrating body can be varied, may be used in place of several contacts having different periods. Four claims, two figures.

1907 Patents

9,390. J. F. Simpson. An improved track brake for tramcars, &c. (See also Electrical Engineering, Vol. I., p. 912.) The brake shoes are drawn magnetically into contact with the rails, the electric current operating the magnets being taken either from the motors (acting as generators) or from the line wire. In order to bring the whole weight of the car on to the shoes directly they grip the rails, relative longitudinal movement between the car body and the brake mechanism is allowed for. A roller attached to the brake mechanism is so arranged under an arched surface fixed to the body that relative movement between body and brake causes the body to be lifted up off the wheels, all the weight being taken by the brake shoes. Four claims, two figures.

10,367. S. O. Cowper-Coles. A perfectly smooth electrolytic deposit of iron which is close in texture, will readily anneal, is difficult to rust, and which does not flake off during the process of deposition, may be obtained by using an electrolyte of ferrous chloride, suplho-cresylic acid, and iron oxide kept in suspension. A current density of 75 amps. per square foot may be employed, and the electrolyte is preferably maintained at a temperature of about 65° C. Th electrolyte is kept as neutral as possible by the use of a large anode surface, and by keeping the iron oxide in suspension. Three claims.

10,636. P. B. Black and T. H. Black. In a surface-contact system of electric traction, in which contact boxes are used, an armature is pivoted between the poles of a magnet so that when the magnet is energised the armature swings round and closes a switch. The present specification describes an improved form of armature which is so pivoted that it returns to its original position on cessation of the magnetic flux by its own unaided weight. The contact arm of the switch is fixed to the spindle of the armature. Four claims, three figures.

13,882. T. W. Lowden and the Westinghouse Metal Filament Lamp Co. Elastic supports for filaments subject to expansion and contraction. Instead of using a loop, two straight parallel filaments are connected together at one end by a cross-piece of conducting material to the extremities of which the ends of the filaments are welded. A spring is attached to the centre of the cross-piece, and is fixed at its other end to the glass pedestal or to the side of the bulb. This arrangement permits of unequal contraction of the two parallel filaments. When several pairs of filaments are in one bulb, the cross-pieces may be connected together mechanically (but insulated from each other), and supported from the pedestal or bulb by means of one spring. Two claims, five figures.

16,051. Siemens Bros.' Dynamo Works and W. Parker. When continuous-current turbo-generators fitted with commutating poles are run in parallel, there is often a tendency for certain machines to take an excessive share of the load. This may be due to the fact that one machine has a larger amount of kinetic energy than another, and therefore takes a sudden load easier, or it may be due to a difference in the characteristics of the machines. The difficulty is overcome by the following arrangement, by which the commutation flux is increased, but the main flux reduced when the load increases. Each commutating pole is wound with one or more incomplete turns, the extra half-turns being arranged on that side of the commutating pole which any rotating armature conductor leaves last. These extra half-turns will produce an increase of the commutation flux, but a decrease of the main flux in the case of a generator, whilst in the case of a motor an increase of flux in both main and commutating poles will be produced. Thus the arrangement can be advantageously applied to motors. The commutating poles may be wound in the ordinary way, and the half-turns added afterwards, or the part turns may be arranged in the gap between the main and commutating pole windings. Four claims, six figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of the more important of these patents will appear in our next issue.

1907 Patents

2,986, Dawson & Buckham. Electrical apparatus for transmitting and receiving signals.
4,988, Heyland & Korda. Rotary transformers.
5,301, Igevsky. Electric furnace.
10,065, Coward. Manufacture of insulators.
10,119, Newbery & British Prometheus Co. Electric cooking and heating apparatus.
10,169, McNeil. Electric fire alarms.
10,171, Allgemeine Elektricitäts Ges. Control of electrically-operated winding engines.
10,513, Beck. Arc lamps and electrodes.
10,515, Condict. Braking electrically-propelled vehicles.
10,641, Mitchell. Leakage detectors for surface contact electric traction systems.
10,662, Winther-Hansen & Bouchsein. Arc lamp.
10,665, British Thomson-Houston Co. (*Allgemeine Elektricitäts Ges.*). Switches and fuses.
10,666, British Thomson-Houston Co. (*Allgemeine Elektricitäts Ges.*). Electric switches.
10,687, Brown. Electrical block signalling system.
10,943, Brown. Connecting up electric cables.
10,969, Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. Repulsion motors.
11,066, Leitner. Dynamos for train lighting.
11,086, Sullivan. Telephone receivers.
12,462, Lawley-Pinching & Walton. Sockets.
13,279, Simpson. Brakes for tramway vehicles.
13,543, Highfield. Control of the supply of electrical energy to consumers.
15,451, British Thomson-Houston Co. (*General Electric Co.*). Manufacture of refractory electrical conductors.
18,261, British Thomson-Houston Co. (*General Electric Co.*). Laminated core structures.
21,299, Bellini & Tosi. System of directed wireless telegraphy.
23,586, Weman. Galvanic element.
25,343, Allgemeine Elektricitäts-Ges. Alternating current commutating machines.
27,177, Barclay. Electric insulators.
28,427, Raymond & Ramp. Oil tight casings for transformers.
28,634, Lamme & Storer. Electric locomotives or motor vehicles.

1908 Patents

35, Weissenborn. Electrical pattern for the manufacture of Jacquard cards.
889, Amalgamated Radio Telegraph Co. Radio-telegraphy.
3,700, Schmidt. Arc illuminating apparatus.
3,770, Bluemel, Bluemel, Bluemel, & Shill. Electrically-controlled pneumatic dispatch tubes.

Complete Specifications open to Public Inspection before Acceptance.

1907 Patent

16,503, Deutsche Gasglühlicht Akt.-Ges. (Auer ges.). Method of attaching tungsten filaments in electric lamps.

1908 Patents

8,206, Elektricitäts Ges. Alioth. Electrical devices for the measurement of speeds.
8,288, Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. Differential relays.
9,479, Schäffer. Supporting-hooks for lamp filaments.
9,502, Allgemeine Elektricitäts-Ges. Arc lamps.
9,577, Allgemeine Elektricitäts-Ges. Dynamo-electric machines.
9,676, Fromaget. System of electro-magnetic transmission.
9,844, Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. Automatic cut out.

Expiring Patents

No patents of electrical interest expire during the current week.

LONDON ELECTRIC POWER BILLS

OUR report last week concluded the engineering evidence, and on Wednesday the financial portion of the Bill was gone into.

WEDNESDAY, MAY 20TH. (NINTH DAY.)

Sir THOMAS HUGH BELL, Bart., one of the promoters of the Bill, and managing director of Bell Bros., Ltd., said he was also a director of Messrs. Dorman, Long & Co., and that he had been one of the promoters of the Cleveland and Durham Electric Power Act of 1901. Before the promotion of the Cleveland and Durham Electric Power Company, he had laid down separate generating plants at several of his works, but, since the power company had come into existence, all power required beyond that supplied by the separate generating plants was to be taken from the power company, as it was better and cheaper. He was putting down the largest electrically driven rolling mills in this country, and all the power required could be taken from the power company to the extent of probably 1,000 h.p. He had applied his experience of the Tyneside district to London, and desired very much to see London put in the same position as other places in the north, of having a bulk supply. Dealing with the provisions of the Bill, he said he had left the question of prices and engineering matters to the engineers, but amongst the matters considered by the promoters was Clause 52, the modified Kitson clause, which had been drafted with a desire to act in concert as far as possible with existing authorised distributors. With regard to purchase, when an undertaking of a necessarily speculative character was embarked upon, such as that involved in electricity supply in London, it was essential that the undertakers should have somewhat extensive powers of recovering the capital which it was necessary to invest, for, of course, anything which had the effect of making the return of the capital less certain, meant an increase in the quantity of capital required for the purpose. It was for these reasons that the purchase clause, which provided for the return of the capital expenditure, had been drafted. They could raise their capital much more easily, if they had the power of recovering the money expended. It might be many years before they were in a position to pay dividends, and they must therefore have the power to get back the deficiency of income. As a justification of the clause, he mentioned that in no power company's act previously had a purchase clause been necessary; in fact, the joint committee of the two Houses of Parliament, presided over by Lord Cross in 1898, had reported that the power of purchase under the Electric Lighting Acts should not be made applicable to power companies. The terms of purchase proposed were something less favourable than those given to gas and water companies. The object of the clause was to be fair to the investors, and at the same time not to impose too heavy a burden upon the authority deputed by Parliament to purchase. He had gone carefully into the figures connected with the scheme, and was quite satisfied that it was a workable one, and, if it were passed substantially in the form presented to the committee, the necessary capital would be raised. He was prepared to take a substantial interest in the concern, and to be responsible for finding the sum of £250,000; in addition to this he was authorised to speak for Lord Fitzwilliam to the effect that he was prepared to take a substantial interest and be responsible for raising a very considerable sum. Mr. Owen Smith, who would follow him, would speak for the rest of the promoters. Subject to reasonable conditions obtaining in the market, there would be no difficulty in resigning the capital for this undertaking, on equitable and reasonable terms, although any obligations that were imposed upon the undertaking to raise money within a short limit of time would very largely increase the difficulty of raising it, for moneylenders had not altered in their habits, and if it were known that the money was urgently needed, the cost of obtaining it would very rapidly go up.

Lord CROMER asked if the obligation to raise money in a certain time was not closely allied to another aspect of the question. Both Mr. Parshall and Mr. Hammond had stated that contracts would have to be made with large power users before they could go to the public for capital. These contracts would be based upon the assumption that there would be a supply in a certain time, and therefore, apart from any obligation in the Bill, it appeared to him that the money would necessarily have to be found in a certain time in order to give the effect to any such contracts.

Sir HUGH BELL replied that the existence of a number of contracts of this character would very largely influence the raising of the capital, but he wished to emphasise the point that the larger the powers given under the Bill, the better not only for the promoters, but for the people they were going to supply. He also pointed to the clause in the Bill under which, before any compulsory powers for the purchase of land could be put into effect, the sum of £500,000 must be subscribed. Under Clause 75 of the Bill it was laid down that unless the company made a substantial commencement with its works within five years from the date of the passing of the Act, the powers under the Act should cease. The promoters were quite willing to reduce this period to two years, leaving it to the Board of Trade to determine whether a substantial commencement had been made.

Lord CROMER raised a doubt as to the interpretation of the word "substantial," but Mr. Fitzgerald pointed out that this would be interpreted by the Board of Trade, and that unless the word was in the clause, a mere nominal commencement of the works would be sufficient to safeguard the company.

Sir HUGH BELL'S cross-examination was commenced by Sir Ralph Littler, K.C. for the City of London, in reply to whom he stated that no contracts had yet been entered into for supply.

Mr. LEWIS COWARD, K.C., for the London County Council, asked if Sir Hugh Bell had anything in writing from Lord Fitzwilliam as to providing capital for the undertaking.

Lord CROMER said that he had received that morning a letter from Lord Fitzwilliam to the effect that he was prepared to take an interest in the scheme and to assist in its finance.

Mr. COWARD then referred to the Administrative Bill of 1905, in which it was provided that a substantial commencement should be made with the works in three years, and that supply must be given within five years. The witness thought sufficient concession had been made in reducing the period for the commencement of works to two years. With regard to the expense of raising the capital, it was quite impossible to fix a sum for this: obviously the promoters would not pay more than was required.

Lord CROMER asked if after the preliminary sums had been provided the remainder would be underwritten.

Sir HUGH BELL thought this would be the method adopted.

Mr. COWARD was pressing the witness to give a figure for the cost of raising capital in this way, when Lord Cromer suggested it would be unfair to expect a reply, for if Sir Hugh Bell gave a price then, he would probably not be able to get it any cheaper when the time came.

In answer to further questions by Mr. Coward, Sir Hugh Bell would not agree to accept the purchase clause in the Administrative Bill of 1905, as this was upon the terms of the Electric Lighting Acts. He agreed that no provision had been made for repairs, renewals, or depreciation, and that there was a danger of the plant being allowed to deteriorate towards the end of the concession, but he was willing to come under obligations to keep the plant in proper condition.

In reply to Lord Welby, who inquired what the London County Council wanted, Mr. Coward stated they asked for the insertion of the purchase clause which was agreed to by the Administrative Co. in 1905, for they held the view that under the purchase clause now proposed, the more the power company wasted the more the purchasing authority would have to pay.

Mr. BALFOUR BROWNE pointed out to the committee that, under the Electric Lighting Acts, the purchasing authority got the plant which was suitable and only paid for that plant, but under the proposed clause the purchasing authority would have to refund all the capital expenditure, whether the plant existed or not.

In the course of his cross-examination for the Electric Lighting companies, Mr. Balfour Browne asked if the interest paid out of capital during construction would be regarded by the power company as capital properly expended, and would have to be refunded by the end of forty-two years, together with 6 per cent. interest upon it. Witness replied that he thought it was, as it was capital; upon which Mr. Balfour Browne commented that although it was capital, there were no works to represent it.

In answer to further questions by Mr. Balfour Browne as to the raising of the capital, Sir Hugh Bell stated that he would not give a definite answer as to whether he would or would not find the £250,000 personally, nor would he mention the names of people from whom he was likely to get support; but he said he could give a guarantee that within six months of the passing of the Act, he would succeed in raising £250,000.

Mr. BALFOUR BROWNE: If you do not get your purchase clause, you will not raise the money?—If I have not an assurance of getting my money back, I shall not raise the money; no promoter would, and London will not get advantages which we think it ought to have.

Further cross-examination on the part of Mr. Balfour Browne elicited the admission that the money market was at present in a difficult condition, and there might be difficulties in the way of raising the capital.

On the point of whether any of the schemes before the committee would be mutually destructive, Sir Hugh Bell, replying to the chairman, stated that if there were two people in the market at the same time for money for the same purpose, there would be a difficulty for both of them, but from the point of view of supplying London with cheap electric power, he did not thing any of the schemes were mutually destructive. In answer to a question by the Chairman as to more specific information as to the reasons for his confidence of raising the capital, Sir

Digitized by Google

Hugh Bell said he had approached certain very important financial houses in the City, and had received assurances which entitled him to conclude that the capital could be raised, always assuming that the Bill passed substantially in the form in which it now was. The most important clause in the Bill, from the financier's point of view, was the purchase clause. If this was cut down so as to take away from investors a fair security for their money, then the scheme would fall flat in the City. At the same time, he did not suggest that the purchase clause, as it at present existed, was incapable of modification. Any clause which gave the security he had already indicated would be acceptable to the financiers.

Lord CROMER next pointed out that in the case of the Administrative Bill a very long list of promoters was handed in. Up to now only three names of promoters had been given. Was it intended to give further names?

Sir HUGH BELL said he thought not, unless the committee insisted.

The CHAIRMAN said the committee had no right to insist. It was a question for the promoters whether they thought it advisable.

Mr. BALFOUR BROWNE pointed out that, so strong was the financial case for the Administrative Bill, that there was no cross-examination upon it.

Continuing under cross-examination by Mr. Balfour Browne, witness stated that he was not unwilling to come under an obligation to set aside a sum for renewal of plant. He disagreed with a suggestion that the Bill put "a screw" on the existing companies and local authorities in order to make them take a supply from the power company. They wished to supply the authorised undertakers, but if they did not, then the power consumer must be looked after. Asked to cite a single case of a pure power company which had been a success, Sir Hugh Bell said he was not prepared to do so, nor did he think it affected the question. Mr. Balfour Browne said that all the power companies on the north-east coast were grafted on to the Newcastle Supply Co., which had a distribution order, and the only other successful power company, and this also had distribution orders, was the North Metropolitan Power Co., with which this Bill proposed to compete.

In answer to further questions on the purchase clause, Sir Hugh Bell agreed that a sinking fund should be set aside to provide for obsolescence of plant, and that it should be handed over to the purchasing authority. At present there was nothing to this effect in the Bill.

In re-examination, Mr. Clode directed the attention of Sir Hugh Bell to the desire of the opposition to have the terms of purchase inserted in the Bill as they were in the Electric Lighting Acts, and pointed out that under these terms the dividends of the companies were unlimited. Consequently the two sets of circumstances were not similar. On the point as to the possibility of the purchasing authority having to pay twice over for plant replaced, Sir Hugh Bell said Mr. Balfour Browne had taken absurd assumptions and drawn ridiculous conclusions. He had seemed to imagine that plant renewed would be charged to capital twice over, whereas the replacement must be charged to revenue, as the plant would be renewed for a revenue reason. If, however, the cost was charged to capital, then it would be the duty of the auditor to call attention to the fact.

Mr. FREEMAN, for the London County Council, pointed out that Mr. Fitzgerald had already admitted that the auditor would not have the power to do this.

Sir HUGH BELL said he was willing to come under the necessary obligations to make this clear. On the point that the interest on capital during construction was to be treated as capital, this was nothing unusual. It was always done in the same way as preliminary expenses were treated as part of the capital.

Mr. OWEN HUGH SMITH, the next witness, said he was one of the proprietors of Hay's Wharf, chairman of the Farringdon Works and of Messrs. Pontifex & Sons. He was also a director of the Provident Clerks' Assurance Co., and a son of Mr. H. Collins Smith, a director of the Bank of England. In regard to some of the other promoters, he said that Mr. John Young was on the board of the Underground Electric Railways Company of London, Mr. Vincent Yorke was a director of the London and Westminster Bank, Mr. R. Miller was a director of the National Bank of India, and Mr. G. Rowe was a partner in a firm of stockbrokers. He had authority from some of his co-promoters to state that they would be responsible for the finding of substantial portions of the capital requisite for this scheme, and all of them would be prepared to take holdings. None of the promoters, however, had named any figures as to the extent to which they would go. The undertaking was at present in a very early stage, and it was not easy to get financial houses to name sums, but he thoroughly believed that they would be able to raise the capital.

In cross-examination by Mr. C. A. Cripps, K.C., for the London companies, witness stated that he was aware that Hay's Wharf took electrical energy from the County of London Electric Supply Co., but he was not familiar with the price which was put to him as £4 per kw. and 0·33d. per unit for direct current, compared with £4 10s. per kw. and 0·33d. per unit, which was the maximum price in the Bill for this class of supply.

With regard to the purchase and the payment of the full capital expenditure, Mr. Cripps put the case of an expenditure of £100,000 upon plant, which, when written down to £75,000, had to be replaced by new plant costing another £100,000, would promoters expect to be repaid £175,000 or only £100,000?—The witness hesitated to give an answer offhand, but Lord Saunderson pointed out that even if the company expected to be repaid the £175,000, the purchasing authority would be buying the increased revenue-earning power of the new machinery.

Mr. FREEMAN, for the London County Council, asked the witness to agree to the Administrative Bill purchase clause, but the answer was that this introduced so much uncertainty as to the amount the company would be repaid at the end of its period, that money would be very difficult to raise.

Lord LYTTON pointed out that the clause in question was put upon the promoters by Parliament as the result of the second reading debate, and was not their own clause.

Mr. FREEMAN replied that they had accepted it.

Lord LYTTON: They were obliged to.

The CHAIRMAN pointed out that during the examination of the witnesses it had been agreed that the purchase clause should be amended in so far as the provision to maintain the plant in proper order was concerned, and suggested modifications had also been acquiesced in.

Mr. TALBOT said that the only alteration to which they had consented, so far as he knew, was that power should be given to the auditor in respect of provision for renewals.

Lord WELBY said he would like a definition of the word "properly" in relation to the capital expenditure, in the clause saying the promoters should be refunded the amount properly expended. He doubted very much whether the auditor had power to deal with this.

Mr. TALBOT said the promoters would consider this point.

Lord CROMER stated that he wanted the auditor to be able to say not only that a certain sum had been expended, but that if necessary a certain sum had not been expended upon renewals, for instance, when it should have been expended. He suggested that the promoters should go into the question of the modifications agreed to by the witness, and bring up amended clauses giving effect to them.

In re-examination, Mr. Smith stated, with regard to the suggestion that the purchasing authority would have to pay much more than the undertaking was worth, that if the undertaking was not a success, obviously nobody would buy it, whereas if it was a success it would be a very advantageous bargain for the purchasing authority. The promoters fully anticipated getting £500,000 for the initial stages of the undertaking without going to the public.

Mr. OLIVER BURY, General Manager of the Great Northern Railway Co., was called to give evidence as to their desire for obtaining a cheap supply of electrical energy in connection with the conversion of their suburban lines to electric traction. For this purpose about 20,000 kw. would be required, and the main obstacle for carrying out the scheme had been the large capital expenditure required in generating plant, the cost of which it was estimated by their electrical engineers would be 35 per cent. of the whole cost of electrification. The company therefore welcomed such a Bill as this, because it would hasten the day when they could electrify. At present the working expenses upon their suburban traffic were such that the company kept the figures to themselves, and their feeling was that if a supply of electricity could be obtained at a sufficiently cheap rate, the cost of working these lines would be materially reduced.

THURSDAY, MAY 21ST. (TENTH DAY.)

Mr. J. F. S. GOODAY, General Manager of the Great Eastern Railway Co., was called in support of the Bill, and spoke as to the need of a bulk supply in London for the purposes of railway electrification. He instanced the bad results upon the East London Railway Co. since the through trains from the Metropolitan and District companies had been discontinued. If a cheap supply of electric power could be obtained, the question of electrifying the East London line would be seriously taken in hand.

In answer to Sir Ralph Littler, witness admitted that both the Metropolitan and Metropolitan District companies were partners in the East London Co., and therefore both could give a supply from their own existing generating stations. He said he was not pledging the Great Eastern Railway Co. to take electricity from the power company, for any purpose, but the Board had passed a resolution authorising him to give evidence in favour of the Bill. With regard to the possibility of a supply from the North Metropolitan Electric Power Co., he was not aware that the company could give a supply for railway purposes outside their area. Mr. Balfour Browne put it to the witness that the proposed power company could not supply the whole of the Great Eastern suburban lines.

In re-examination, Mr. Clode pointed out that there was a clause in the present Bill permitting supply for railway purposes outside the area.

Answering the chairman, Mr. Gooday said his company would not enter into contracts with any outside company for electric supply without considerable guarantees from the company that the supply would be afforded and be absolutely reliable. They

Digitized by Google

were quite satisfied with the promoters of this scheme. None of the promoters were connected with the Great Eastern Railway Co., although Mr. Hugh Owen Smith had been a director some time ago for about a month.

Mr. V. L. RAVEN, Chief Assistant Mechanical Engineer to the North Eastern Railway Co., spoke as to the advantage of taking electric supply from the Newcastle Electric Supply Co. There had been no discontinuance of the supply, and he did not think the North Eastern Co. would have electrified their lines if they had had to go to the expense of a generating station of their own.

In cross-examination, Mr. Raven said there had been temporary breakdowns of supply, but none of them had necessitated falling back upon the steam engines for working the traffic. In case of breakdown they had no guarantee from the supply company, but their agreement provided that the railway company should receive the first supply after a breakdown.

Mr. E. M. DUNCAN, Consulting Electrical Engineer to Messrs. Maple & Co., said that firm had an electric lighting plant of their own, but the prices quoted by the power company were sufficiently low to justify Messrs. Maple taking a supply from them. The difference between the prices quoted by the power company and the St. Pancras Council would give a saving of £400 per annum to Messrs. Maple on the former terms. Another reason for preferring the power company was that St. Pancras, in supplying at 1d. per unit, retained the right of cutting off the current at any time on giving notice. In answer to Mr. Courthope Munroe, who appears for the St. Pancras Council, witness stated that he was not aware that special terms had been offered Messrs. Maple in respect of their Highgate Road factory, where the private generating plant was situated. Counsel thereupon refused to ask further questions, having hinted that negotiations had taken place with Messrs. Maple without the knowledge of the witness. In re-examination, however, witness raised the question as to whether any special offer could be made, if this would constitute preferential charging, which was prohibited by the Provisional Orders.

In answer to Lord Lytton, he said that Messrs. Maple would make a greater saving than the £400 per annum already mentioned as between the price offered by the St. Pancras Council and the power company, if the private plant was scrapped and the supply taken from the power company. The generating costs of the private plant were confidential figures.

Mr. COURTHOPE MUNROE, for the St. Pancras Council, said that the barring clause referred to by the witness was put into the application forms as a safeguard, as it was felt that they owed a duty to the lighting consumers, and that they should have the first supply in the event of a breakdown, but as a matter of fact during the past 15 years the clause had not been put into effect.

Mr. CLODE, for the promoters of the Bill, said this was the whole point of the Bill, viz., that the main supply of the authorised distributors was lighting, and that the power users were not sufficiently cared for.

Mr. J. S. CONRADI, Superintendent of the London factories of Messrs. Vickers, Sons, & Maxim, said that at their Erith works they had a private plant of 800 kw. capacity. Extensions were in contemplation at their Dartford and Crayford works to the extent of 1,160 kw. He was convinced that it would pay them to take this from the power company. He would be quite willing to scrap the existing generating plant at his Erith works in favour of taking a supply from the power company on the terms in the Bill. He said he had convened a meeting of manufacturers on April 10th of this year to discuss the question of electric power, when a resolution was passed protesting against the prices now being charged by authorised distributors as militating against the full advantages of electric power being obtained. The resolution called upon the Government to sanction such a scheme as that now proposed, and a further resolution stated that the manufacturers at the meeting would support the Bill, subject to certain modifications. These included an alteration in the maximum prices in the Bill, a lowering of the limit of 250 kw. under which the power company could compete, and a reduction of the period of seven years for the agreement under which supply would be given to power users. After the meeting, some 300 circulars were sent out to other firms asking for their assent to the resolutions, and as a result witness handed in a list of some 56 firms which had so assented, and from which a committee was formed, which had authorised him to attend and give evidence on behalf of the Bill.

Mr. TYLDESLEY JONES, in the course of a long cross-examination, directed his questions to showing that none of the concessions mentioned, and upon which the assent of many of the firms had been obtained, had been secured from the power company. This the witness agreed to, but stated that there had not been sufficient time to go into details with the promoters. Witness made the general statement that he was confident he could obtain energy from the promoters, but upon being questioned as to the cost of generation by his own private plant he refused to give the details. Similarly, Mr. Conradi said he had no knowledge of the manner in which the list of firms had been selected, nor in many cases of their business or possible demands.

Counsel for the opposition generally complained, but the chairman suggested that the witness could not be expected to say more than so far as his own works were concerned; he believed there would be an advantage in taking from the power company.

Several firms in the list were thereupon objected to, and the promoters promised to call representatives.

Mr. CYRIL HILL, Manager of Messrs. Locke, Lancaster & Co., lead merchants of Stepney and Poplar, said his firm took 500,000 units per annum from the Poplar Borough Council at 0·8d. to 0·9d. per unit, and 150,000 units per annum at 0·95d. per unit.

Mr. A. L. STRIDE, Chairman and Managing Director of the London, Tilbury & Southend Railway Co., referred to the powers which the company has for working by electric traction, and mentioned that a site for a generating station had been acquired, but no works commenced. Having gone into the question of electrification, the company had come to the conclusion, rightly or wrongly, that it would be cheaper to get a supply from an outside source. Negotiations had been carried on with Poplar, Stepney, East Ham, and West Ham, and with the Charing Cross Co., but all to no avail on account of the inability of any of these to supply outside their areas. They had almost arranged a contract with the Charing Cross Co., whose mains run over the Tilbury Company's tunnels, but the local authorities threatened a legal action to test whether the company were legally entitled to supply outside. He admitted that before the directors would embark upon any further extension of electrical working, they would require to see a reduction in the working expenses, but it was possible that the taking of a supply from a power company such as this would be a factor in such reduction.

A large number of other witnesses were called, who expressed their desire to have cheap electric power, and in cross-examination, the general answer was that they did not mind from whom such a supply was obtained; the main point was cheapness. Among the witnesses so called were Mr. James McGregor, managing director of Messrs. Johnson & Phillips, and Mr. Frank Grier, the chief goods manager of the London & North Western Railway, who referred to the tube railway which the company has powers to construct between Euston and Watford. The cost of a separate generating station was put at £250,000, and if this could be avoided, he thought it would hasten the construction of the line.

FRIDAY, MAY 22ND. (ELEVENTH DAY.)

Mr. A. G. LUPTON, Chairman of the Yorkshire Electric Power Co., was called on behalf of the promoters of the Bill, and said that a supply was commenced from the Thornhill generating station in December, 1903, and that up to date agreements had been made for the supply of between 7,000 and 8,000 h.p., of which 3,250 h.p. was within the last six months of 1907. Supply was being given to a number of urban district councils who did their own distribution, whilst the Brighouse Corporation had decided to close down their generating works and take the whole supply from the power company. Although local authorities generally in their area had opposed the company very strenuously at the commencement, their attitude had completely changed, for they had found that so far from doing them harm, the power company was able to supply them with power much cheaper than they could generate it themselves.

In answer to Lord LYTTON, witness stated that the general tendency of the establishment of large generating stations giving a supply of cheap power was to bring about the erection of new factories in the districts served.

Some other questions were put by the Committee to show that it had taken the company four and a half years to get clear, so to speak, and to yield a profit to the shareholders.

In cross-examination by Mr. FREEMAN, for the London County Council, Mr. Lupton stated that the clause in the Yorkshire Act stipulating a substantial commencement of the works in two years and the cession of their powers within four years if they were not in a position to give a supply, had not acted against the company, as they had been well within the margin of four years, and had made a substantial progress within the two years. As a matter of fact, they had never looked at the clause from the time the Act was passed

In answer to Mr. BLENNERHASSETT, for the Westminster City Council, he stated that the Yorkshire Company's powers were simply to supply authorised distributors by consent, and to railways, tramways, and canals without consent, of the Local Authority. They had no powers to acquire the undertakings of authorised distributors.

Questions were next put by Mr. SEYMOUR BUSHE, K.C., for the Westminster and Kensington companies, on the point that certain districts within their area of supply had been cut, there being electric supply authorities already existing in these areas. With regard to the supply to Brighouse, the price was £6 per kw. of maximum demand per annum, and 0·25d. per unit. The power company did all the conversion, and guaranteed that the maximum price did not exceed 1½d. per unit.

Mr. RIGG, K.C., for the City Corporation, directed his questions to showing that in the large towns comprised in the

Digitized by Google

Yorkshire Company's area, the company was not entitled to lay mains through the centre of these towns without the consent of the Corporation, and witness admitted that no inconvenience had arisen from that clause.

In answer to Mr. TYLDESLEY JONES, on behalf of the London Electric Lighting Companies, Mr. Lupton stated that in spite of the hampering conditions placed upon the Yorkshire company, by cutting out certain areas from their power area, the company had made good progress.

In re-examination, the Hon. J. D. FITZGERALD, K.C., said he was glad of the admission on behalf of the London companies that the cutting out of specific areas in a power supply area must have had a hampering effect. The Yorkshire Power Co., said Mr. Lupton, was supplying in 26 districts, either through local authorities or through the medium of a distribution company, which had been formed by the Power Co.

At the conclusion of this evidence the Hon. J. D. Fitzgerald said he had drawn up alterations in the purchase clause, and desired to recall Sir Hugh Bell upon it. We gave the original drafting of the purchase clause on page 722 of our issue of May 14th. The first alteration, said Mr. Fitzgerald, affected the words "properly expended" in sub-section 1, as a criticism had been made that this meant properly expended upon the undertaking, but not necessarily properly chargeable to capital account, and accordingly the first amendment proposed was to strike out "properly" before "expended," and bring it in before the word "chargeable" later on, so as to make it perfectly clear that it was the amount expended and properly chargeable to capital account.

Continuing, Mr. Fitzgerald said that the following additional sub-sections were also proposed :—

"In the sixth and in every succeeding year after the company commence to supply electrical energy under the provisions of this Act they shall, before arriving at the profits of the undertaking available for dividend, set apart to form a fund (hereinafter in this Act called the 'maintenance and renewals fund') such sums as the said auditor may determine to be necessary to maintain the buildings, plant, mains, and apparatus of the company in an efficient and proper working condition, and to renew the same when necessary, and the company shall out of such fund maintain and renew the said buildings, plant, mains, and apparatus accordingly.

"If the company consider any determination of the said auditor to be incorrect or unreasonable, they may appeal thereon to the Board of Trade, whose decision shall be final.

"For the purposes of this section any sums so expended by the company in such maintenance and renewal shall not be deemed to be chargeable to capital account."

Sir HUGH BELL was recalled in connection with these alterations, and expressed his opinion that the effect would be to keep the plant in good and efficient order, as under these sub-sections the company would have to form a maintenance and renewals fund, and the auditor would determine whether a sufficient sum was being included for the purpose in question. If they were dissatisfied with the auditor's decision, they could appeal to the Board of Trade. There were also, he said, other small changes in sections 4 and 5 which were simply consequential. He also mentioned that sections 4 and 5 of the original purchase clause had been struck out by the desire of the Board of Trade, and consequently sections 6 and 7 now became 4 and 5.

Some discussion took place as to the inconvenience of this method of dealing with the matter, and it was agreed to have the new purchase clause printed complete by Monday morning. Discussion upon the alterations was thereupon not continued.

Sir HUGH BELL stated that he would like to add something to what he had already said on the question of finance. After the observations of the Committee he had made it his business to see if he could say more on this question, and was now authorised by Sir Edward Tennant to say that he would put himself in the same position as he (Sir Hugh Bell) would put himself. He had Sir Edward Tennant's authority to state that he would be responsible for capital to the extent of £100,000, or, if it was preferred, he could put it in this way, viz., that he, Sir Hugh Bell, was in a position to say that he was prepared to substitute the figure of £350,000 for the £250,000 which he had already mentioned.

In answer to Mr. FREEMAN, Sir Hugh Bell stated that it was the intention of the promoters that the requirements in the purchase clause that the dividend should be made up to 6 per cent., should remain if the purchase took place at the end of 42 years. He had not considered the question put to Mr. Hammond as to the attitude the promoters would take towards purchase in 1931, when the electric lighting companies in London would become purchaseable. Mr. Fitzgerald upon this point said he did not propose to bring up any suggestion, but if the London County Council had one, the promoters would consider it.

Mr. BALFOUR BROWNE, K.C., asked some questions as to the capability of the auditor to judge upon what he thought rather important points, namely, the sum necessary to maintain the buildings, plant, mains, and apparatus. An ordinary auditor, he presumed, would not be sufficiently expert to be a competent judge on that point, and he desired Sir Hugh Bell's opinion on the subject.

Sir HUGH BELL stated that auditors had now acquired such an enormous amount of information on subjects of this kind that it was becoming usual to refer to auditors even on expert points. Personally, he was quite accustomed to confer with his auditor on the very points as to whether the particular sum or rate on which he was depreciating certain of his plant was a right one or wrong one, and it was on this ground that they had to see the auditor was a proper person.

Mr. BALFOUR BROWNE said that an auditor had not necessarily any scientific knowledge of such questions as to what was necessary to keep the plant in order.

The CHAIRMAN asked if there would be any objection to the auditor taking expert independent advice to guide him on technical questions.

Sir HUGH BELL thought no one would object to the auditor being instructed if he were in doubt on any points; he did not see how he could put it any differently to that. Personally, he regarded it as purely an accountants' question, and not an engineers' question.

The CHAIRMAN stated that this was a point upon which he was not quite at one with witness, although from a financial point of view, he would be satisfied with the auditor because he thought he would be more drastic probably than the expert engineer.

Hon. J. D. FITZGERALD said he was informed that if a question of this kind did arise before an auditor, which he did not feel himself equal to deal with, it was the practice of the auditor to get advice. His next witness would be an accountant, and this matter would be dealt with.

At the suggestion of the CHAIRMAN, the promoters agreed to confer with the London County Council to see to what extent they could come to an agreement with regard to the purchase clause.

The accountant who will be called on Monday will be the last witness for the promoters of this Bill, and arrangements have been made for the various local authorities and others against the Bill to oppose first, leaving the promoters of the London Electric Supply Bill, who are represented by Mr. Balfour Browne, K.C., Mr. C. A. Cripps, K.C., and Mr. Tyldesley Jones, to wind up the opposition.

The CHAIRMAN inquired if, as the local authorities were opposing all three Bills, the Committee were to hear three speeches. He hoped they would not.

MONDAY, MAY 25TH. (TWELFTH DAY.)

At the commencement of the proceedings Mr. FITZGERALD stated that although the promoters had had a conference of three hours on Saturday with the London County Council in an endeavour to come to an agreement with that body on the question of the purchase clause, no definite arrangements had been arrived at, but it was proposed to carry on the conference for the next two days, when it was hoped that something definite could be announced.

Mr. W. B. WOODHOUSE, Engineer and Manager to the Yorkshire Electric Power Co., was called to amplify Mr. Lupton's evidence of Friday, which he corrected in one or two minor details. On the question of figures, he stated that the average price was below ¾d. per unit, and not 1d. as Mr. Lupton had said, and that transformed current was actually sold at £4 per kilowatt and 0·25d. per unit. At a load factor of 25 per cent. this came out at 0·69d. per unit. These charges were lower than those of any local authority in the Yorkshire area. The prices charged approximated fairly closely to those in the present Bill, and were considerably lower than the maximum prices he was entitled to charge under his own Act. As showing the progress of the power company, he stated that within a radius of four miles of the Thornhill generating station there were originally eight generating stations, but since the power company had commenced operations, five of these had been converted into sub-stations. The date of commencement of supply of the power company was December, 1904, and not December, 1903, as previously stated. The output last year from his station showed an increase of over 100 per cent., and for the present year there was every indication that the rate of increase would be exceeded. The lowest price in Leeds, he said, was 1¼d. per unit, and no mill in the Yorkshire area was taking the whole of its supply from municipal mains for electric driving, whereas the power company was already supplying no less than seven textile mills with power for driving all their machinery, and two others were being negotiated with. In the small area round the Thornhill Station there was an estimated horse-power of 36,000, of which the power company were supplying 8,000, and had contracts for 2,000 more. Offers of bulk supply had been made to several local authorities, under which a considerable saving over their present working costs had been guaranteed, but these offers had not been accepted. At the same time, the smaller local authorities had agreed to let the power company supply in their districts to large power users, and took a supply in bulk themselves for ordinary purposes.

In cross-examination Mr. Woodhouse stated that the estimated horse-power available for electric driving in the whole of the Yorkshire Power Co.'s area was 2,000,000. He explained that, so far as his company was concerned, they had no power to appeal against the decision of the local authority in large

Digitized by Google

cities on the question of whether they should supply within the boundary or not.

At the close of this evidence Mr. Fitzgerald suggested that he should postpone his accountant's evidence on the ground that the purchase clause would not be in its final form until the conference with the London County Council had been concluded. Both Sir Ralph Littler and Mr. Balfour Browne for opponents opposed this course of action on the ground that it was the usual procedure, before the opponents to a scheme presented their case, that the promoters' case should be completed. All the opponents, it was argued, had been basing their calculations on the purchase clause as it stood, and they asked the Committee to say that the Bill as it stands must be adhered to and that the promoters should make application to introduce their purchase clause when it had been drafted.

After consultation, the Chairman suggested that the promoters should proceed with their further evidence, reserving the right to recall the accountant when the new clause was presented.

Mr. Lionel Maltby, F.I.C.A., and a member of the firm of Messrs. Deloitte, Pender, Griffiths & Co., auditors of a number of electric light, water and other undertakings, said he was familiar with the purchase terms of the Electric Lighting Act of 1888, but, as the period of purchase under this did not arrive until 1931 in London, there was no experience at present as to how these terms would work out in practice. The only purchases which had taken place had been by agreement. The general objection to the terms of the Electric Lighting Act in relation to the raising of capital was the uncertainty in the minds of investors as to whether they would get their money back, or how that section would be interpreted. Further, the company would find it difficult to raise fresh capital as their term drew to an end. Under the proposed clause as it at present stood, there would be no uncertainty, nor would there be any need for proceeding to arbitration for determining the purchase price. He did not think an auditor would allow the amount spent on renewals and repairs to be placed to capital; he certainly would not, and he would favour the introduction into the clause of a definite provision that the company should maintain the plant in a good and reasonable condition, because although the auditor would not permit renewals actually made to be charged to capital, he could not compel the company to make the necessary renewals. If such a clause were in the Bill as he had suggested, the auditor could do this in conjunction with an expert adviser, and the result would be that the purchasing authority would take over the undertaking in good working order. In his opinion the clause limited the amount of the purchase money. Hitherto no purchase clause had appeared in a Power Bill, and he regarded this as a departure in favour of the purchasing authority as compared with the purchase terms in the past of gas and water undertakings, especially in view of the fact that the sinking fund, insurance fund, and reserve fund would go towards diminishing the purchase price, whilst at the same time the purchasing authority was relieved altogether from any claim for goodwill or profits.

In cross-examination by Mr. Freeman, for the London County Council, Mr. Maltby agreed that he was most anxious to avoid any ambiguity. Questions were put to the effect as to what would happen, taking the life of plant at 25 years, as has been suggested by the engineers to the scheme, if, say, in ten years a new invention was to be made which rendered it absolutely necessary, from the revenue point of view, for the company to scrap some of its existing plant. Witness replied that he would propose to write off the sum still outstanding to capital account, either at once, or, in the event of it being too hard upon the undertaking to do this, the amount could be carried to a suspense account and spread over a short term of years. It would be the auditors' duty to see that the balance was written off when the plant was scrapped in this way. Mr. Freeman suggested that this might make the company unwilling to go in for new inventions, and so fail to keep the undertaking in a high state of efficiency when it was nearing the end of its term. Witness replied that he did not suppose the company would go in for new plant at any time unless they could see a profit coming from it.

Mr. Freeman then asked whether witness had calculated any sums as the amount which the purchasing authority would have to make up if the undertaking had not been paying 6 per cent. It was put to the witness that, assuming 4 per cent. only had been paid during the whole existence of the company, the sum which the purchasing authority would have to provide to make this equivalent to 6 per cent. would be £3,750,000, which would practically act as a prohibition on buying.

Mr. Maltby said he had not considered the matter in this aspect.

In answer to the Chairman, Mr. Fitzgerald stated that as the Bill stood, the 4 per cent. which was to be paid out of capital during construction would have to be made up to 6 per cent. at the end of the period, but Sir Hugh Bell had stated his willingness to modify this.

A further discussion took place as to the obligation of the purchasing authority, assuming the option to purchase is not taken advantage of in 42 years, but is postponed for a further ten years, as provided in the Bill. Mr. Fitzgerald stated that in his opinion the Bill made it quite clear that if the purchase were postponed for 52 years, or any other period of years, the obligation to make up the dividends did not apply. As the Chairman, however, had stated that in his opinion it was not quite clear, he was quite willing to make it so.

Some questions by Sir Ralph Littler seemed to indicate that he preferred the terms hitherto paid to gas and water companies, and Mr. Fitzgerald, for the promoters, suggested this in re-examination.

Sir Ralph Littler objected to this interpretation of his meaning, and stated that he desired the terms of the Electric Lighting Acts.

This closed the case for the promoters, Mr. Fitzgerald stating that a report by the Board of Trade with regard to certain alterations in the Bill had been complied with, and that a clause had been agreed upon with the Commissioner of Works. He also announced that clauses had been agreed with the Thames Conservancy, Duchy of Cornwall, the Metropolitan Water Board, the Camberwell Borough Council, Inns of Court, Duke of Bedford, London United Tramways, Commissioners of Sewers for Havering, the Commissioner of Sewers for Essex, West Kent Sewerage Board, and all the railway companies with the exception of one in the metropolis.

Case for the Opposition.

Croydon.

Mr. Wedderburn, K.C., for the Croydon Corporation, who led the opposition, drew attention to the fact that this area was distinct from any other area in that it was not industrial, and from the evidence of the promoters themselves was never likely to be. Croydon was also on the boundary of the area of the Bill, and he failed to see any reason why it could not be detached. In the Administrative Bill of 1905, the promoters had agreed a clause with Croydon to the effect that the powers of the Bill should not apply to Croydon except for wayleaves, supplying energy to railways, docks, &c., and by agreement only with the Corporation. This clause was agreed again in 1906. Mr. Hammond had stated that the clauses agreed with previous power bill promoters should be again accepted, and this was a clause which, if this Bill ever came to that stage, he thought the promoters were bound to accept if the Croydon Corporation desired it. There had been no evidence to the effect that the present supply at Croydon was in any way unsatisfactory. The capital expenditure upon the municipal undertaking was about £340,000, and he asked whether it was worth while to exchange this personal control for reliance upon one source of supply 20 miles away, unless there was a substantial financial advantage. The promoters' figures showed a saving of £5,908 to the Corporation if a bulk supply were taken, but the Corporation, taking the basis upon which the promoters had worked, estimated a loss of £329, whilst, if the proper figures had been taken, the loss would work out to £1,504. This was on the basis of scrapping the works. If the Corporation took a bulk supply for the purpose of the peak load, then they estimated a loss of £1,907.

The Chairman suggested that as the Corporation or any other distributor was not bound to take a supply, he did not think any argument as to whether they would gain or lose by taking a bulk supply would influence the decision of the Committee. Counsel would be more to the point if they confined themselves to showing how they would lose by the competition clause.

Mr. Wedderburn, in conclusion, although he had already stated that his area was a purely residential one, and that there were practically no power users, went on to argue that the Power Company could come in and compete for small power users on unequal terms. He therefore asked that, even if Croydon remained in the Bill, it should be left to the Corporation to decide whether they might give any supply in the district.

Mr. A. C. Cramb, Electrical Engineer to the Croydon Corporation, said there was nothing in the nature of a large factory in Croydon, and the introduction of factories would alter the whole residential aspect of the town at present. He characterised as absurd Mr. Hammond's suggestion that a man at 30s. per week would be sufficient to deal with the high-tension supply from the power company.

In cross-examination, Mr. Cramb said the income from power was £1,500 per annum, or 1½ per cent. of the total. Having ascertained that the cost of coal at Croydon varied from 15s. to 23s. per ton, that water had to be obtained partly from the town mains at 6d. per thousand gallons, and that cooling towers were used, Mr. Fitzgerald asked if it were possible under these conditions to generate at anything like the figures given in this Bill. Mr. Cramb answered that it was not proposed to do so, but that the present expenses were being reduced. Mr. Cramb also said that the present coal cost at Croydon was 0·5d. per unit. Asked as to whether it would not be an advantage to have the option of taking a bulk supply, instead of incurring further capital expenditure on new plant, witness replied that this would depend upon the circumstances.

In re-examination, Mr. Cramb stated that the Corporation would always be able to get a supply from the power company, even if the district were cut out of the area, as there was a clause in the Bill which enabled the company to supply in contiguous areas.

Digitized by Google

MARYLEBONE.

The case for the Marylebone Borough Council was next taken.

Mr. E. W. DEBENHAM, Chairman of the Electricity Committee, said the Council were advised that the power company could not benefit them, because, on whatever price the power company might charge, there must be added something in respect of the purchase of the Metropolitan Electric Supply Co.'s business in the district. In spite of this, however, the price for lighting had been reduced from 5·15d. per unit to 4·42d. per unit. Apart from the purchase price for the company's undertaking, the Council claimed to be able to generate more cheaply than the promoters could supply. The Administrative Co. placed Marylebone in the "non-industrial area," and eventually the district of Marylebone was placed within the bulk area of the Metropolitan Electric Supply Co., who, however, had no powers of compulsory supply of any sort. The Council feared competition at cutting prices, in order that the company might secure their power business.

Mr. ARTHUR WRIGHT, Consulting Engineer to the Marylebone Borough Council, said he considered the load factor taken by the promoters as very low compared with most of the districts in London. He had made calculations which showed that to take a peak load from the power company would not be profitable, because it would cost them more than if they generated the whole of the energy themselves. The figures of his estimates showed an actual loss of £300 per annum at a 15 per cent. load factor. At any other load factor the disadvantage would be greater. In his tables, Mr. Hammond had assumed a higher load factor for Marylebone, viz., 54 per cent., than for Stepney, which was a purely manufacturing district, and for St. Pancras, where a much larger amount of power was used; and he could not understand why. The Marylebone costs, worked out from the accounts just published, were equal to £4·36 per kw. and 0·395d. per unit. When the existing works were selling 12,000 kw., the costs would be reduced to £3·1 per kw. and 0·35d. per unit. Of the 350 power consumers in the Marylebone power mains, 256 averaged 11·4 kw., and the average load factor was 12·8 per cent. The price charged on the present scale at this load factor was 1·445d. per unit, without discounts, whilst the power company's supply for such a consumer supplied with direct current was 1·473d. The Council's price, without any addition for the award in respect of purchase of the Metropolitan Co.'s business, would be 1·25d. per unit. The prices to the two largest consumers in Marylebone, of 57 kw. and 52 kw. respectively, were 1d. and 0·98d. respectively on the present scale. The power company's price would be 0·996d. and 0·946d. respectively; whilst without any allowance for the awards the Council's price would be 0·815d. His feeling was that the advent of the power company would give rise to a feeling that electricity could be supplied at much cheaper rates than was now the case in Marylebone, whereas the fact was that the Council was at present supplying more cheaply than the company could.

In cross-examination, Mr. Wright admitted that the power load in Marylebone was small, but it was a growing one, but said that if it were taken away by the power company, then the lighting would have to bear the whole of the standing charges, as the power load reduced the standing charges on lighting. He expressed the opinion that the diversity factor assumed by the promoters was too high. This was a figure which very few electrical engineers had information about. In the Victoria Falls Power Scheme, of which he was a joint engineer, they assumed a diversity factor of 1. In London it ought to be safe to assume 1·2, but, generally speaking, it was very dangerous to assume a higher figure than 1. The only terms upon which it would pay authorised distributors to take energy from the power company would be at about £3 per kw. and 0·22d. per unit; but judging from the power company's calculations, it looked as if at their proposed prices the cost of distribution would wipe out the advantage of generation on a large scale.

TUESDAY, MAY 26TH. (THIRTEENTH DAY.)

Mr. A. B. CANE, counsel representing the Marylebone Borough Council, first referred to the arbitration proceedings in connection with the purchase of the Metropolitan Electric Supply Co.'s business in Marylebone, and said that when it was considered that the Council was buying a 20 years' undisturbed monopoly, no one could say that the price of £1,250,000 was exorbitant, and he wished to repudiate any suggestion of having made a bad bargain. At the same time, the Council had been compelled by Parliament to make the purchase on the ground that competition should not be allowed with the company, which was already installed, and he asked that the Council, which was now working in place of the company, should be treated in the same manner that the company had been treated, viz., that they should be free from any sort of competition. It was admitted in the promoters' tables that 10 kw. would have to be generated at Barking for every 9 kw. delivered in London, and he contended that the cost of distribution would wipe out any benefit derived from the cheaper cost of generation. The Administrative Company excluded Marylebone from the industrial area, and did not propose to compete for the power business, but this company would undoubtedly come in and compete for the small power load that existed. In reply to a question by the Chairman, Mr. Cane said that undoubtedly the Kitson clause gave a measure of protection, but Marylebone preferred to be left alone altogether.

Mr. CLODE, for the promoters, said that, failing the clause in the Bill at present, the promoters were willing to accept the Kitson clause.

WEST HAM.

The opposition of the West Ham Corporation was then taken.

Mr. A. H. SEABROOK, Electrical Engineer to the West Ham Corporation, said the capital expenditure upon the electrical undertaking was £410,000. Three-quarters of the supply was for power purposes, and if the Newcastle Supply Co. was excepted, the business was larger than that of any of the power companies of the country. In fact, the consumption of one consumer, with whom they had a contract for five years, was larger than the whole of the bulk output of the Yorkshire Power Co. The total power supply in the borough would, in the next two weeks, amount to 8½ to 9 million units per annum, and including tramways, the total output for power purposes now amounted to 12½ million units per annum. He gave a list of power consumers whose maximum demand was over 250 kw., and also mentioned that there were a large number whose maximum demand was 200 kw. or thereabouts. Of the total power demand of 6,000 kw., about one-third was to consumers of over 250 kw. In making a number of corrections which he said were necessary to bring the tables up to date, he said that the works costs should be, at April, 1908, 0·572d. per unit instead of 0·585d.; the capital charges 0·330d. instead of 0·375d., and the total costs would be 0·842d. per unit instead of 0·958d. These corrections reduced the saving to the Corporation under the Bill to practically nothing, whilst, in any event, as the Corporation had a large number of contracts for day and night supply, with very heavy penalties attaching to failure, they would not be disposed to rely on an outside source of supply. He also doubted whether the profit shown in the clause in the Bill regulating supply to authorised distributors, in connection with consumers under 250 kw., would actually be made in consequence of the uncertainty of the diversity factor. Some of the power consumers in West Ham had a load factor of 80 per cent. to 100 per cent., and, of course, there was no diversity factor.

In cross-examination by Mr. Clode, Mr. Seabrook said that as the Corporation had already very large buildings, boiler plant, coaling plant, &c., the capital charges on additional generating plant would only amount to about 10s. per kilowatt, so that the question of extensions compared with taking a supply for the power company was not so serious as might be the case with other distributors. With regard to the usefulness of having a bulk supply to fall back on, he mentioned that the Corporation had authority to take such a supply from the power station of the Charing Cross, West End, and City Electricity Supply Co., which was in the borough.

Mr. H. E. BLAIN, Tramways Manager to the West Ham Corporation, gave evidence as to the possibility of interference with the tramway system by the laying of the power company's mains, owing to there only being two routes out of the borough into London.

Mr. CLODE said the promoters were perfectly willing to discuss a clause for the protection of the West Ham tramways.

Mr. MORTEN, in the course of his speech for the West Ham Corporation, referred to the railway works in the borough. In the London Electric Supply Bill, which is next on the list before this Committee, there was a proviso that the supply to railways should be restricted to haulage and traction, or for lighting carriages drawn by such haulage or traction, and he asked that, if the Bill went forward, this restriction should be put in. Speaking generally of the attitude of the West Ham Corporation, counsel said they were a self-governing county borough, and had gone to great expense in erecting a works with room for extensions up to 20,000 kw. Rather than give up the supply of electrical energy to a company, they would fight the company, and sell at a loss, if necessary, to do so. He regarded clause 52, which regulated the supply to authorised distributors, as infinitely worse than the Kitson clause.

HAMPSTEAD.

The case for the Hampstead Borough Council was then presented by the Hon. EVAN CHARTERIS. He stated that the capital expenditure upon the municipal electricity undertaking was £383,000, of which £80,000 had been repaid. The Hampstead Council, he said, in 1893, came to the conclusion that the period for repayment of loans allowed by the London County Council, viz., 42 years, was too long, and it initiated the lower period of 25 years. In spite of this handicap, a very successful undertaking had been built up. The supply of power was very small, practically a negligent quantity, but there was a fair amount of energy sold for heating purposes in Hampstead, which the Council naturally desired to keep.

Mr. C. FLEETWOOD PRITCHARD, the Chairman of the Electric Lighting Committee, gave evidence in which he, alike with other opponents, challenged the accuracy of the basis of the tables put in by the promoters.

Digitized by Google

The Chairman said that this was the first time the question of heating had been put before the Committee, and he presumed that the promoters, at a later stage, would deal with this matter.

Mr. Clode said he was not disposed to deal with it at the moment, but it would be dealt with in the promoters reply.

Stepney.

Mr. Williams next addressed the Committee on behalf of the Stepney Borough Council, arguing that the trend of the action of Parliament hitherto had been that it would not inflict irreparable hardship upon the authorised distributors, whose money had been invested in electrical undertakings in the proposed area. In a general review of his case against the Bill, as revealed in his cross-examination of the promoters' witnesses, Mr. Williams referred to the question, already raised by the Committee, of what would happen to London in the event of damage to the Barking station from various causes, such as a foreign invasion, &c., and expressed the opinion that, great as were these dangers, there were equally great dangers from within. In the event of accident to the generating plant, which shut down the whole supply to London, the forces of disorder would have their opportunity; this, he said, was a risk too great for the Committee to sanction. He complained of the possibility of competition for lighting business under the clause which allows a power-user to use 20 per cent. of his total supply for lighting. As an instance, he argued that, if the power company supplied the Tilbury Railway Co. for power, this 20 per cent. would be sufficient to light all the stations in the borough, which at present brought in about £1,200 per annum to the Council's electricity undertaking.

Mr. W. C. P. Tapper, Borough Electrical Engineer and Manager of the Stepney Electricity Works, said the capital expenditure to date was £288,000, and further powers had been granted for an expenditure of £87,886 in connection with the Blyth's Wharf scheme. The average price for private lighting was 2·21d. per unit; for power, 0·95d.; and for public lighting, 1·27d., making an average over the whole of 1·62d. per unit. The power supply during the past year showed an increased consumption of 604,000 units compared with the previous year. When the Blyth's Wharf scheme is in operation, Mr. Tapper said that the charges would be £3·12 and 0·33d. per unit against £4 10s. and 0·33d. in the Bill. Compared with the Administrative Co.'s offer of 1905, the charge of the London & District Co. was 24·8 per cent. higher.

The Chairman again urged Council not to labour the point of whether the Council would be hurt or not by taking a bulk supply. They were not bound to do this, and the Committee would prefer that the question of possible competition should be dealt with. He also asked upon what experience the 20 per cent. for lighting clause had been based.

Mr. Clode said that he was informed that the 20 per cent. was put in by the Board of Trade when they first settled the clause.

LOCAL NOTES

AUCKLAND (NEW ZEALAND).—It is reported that the tramway strike is at an end.

BATH: *Electricity Accounts.*—The accounts for the past financial year show an increase in the revenue of £2.000, due mainly to growth of the power load from large consumers, including Messrs. Stothert & Pitt, and the Great Western Railway. The net loss on the undertaking has been reduced from £1,440 to £392. The gross profit was £9.671, but £10.C54 was absorbed by interest and sinking fund. The cost of coal has been very high during the year, but slight economies have been effected in other directions.

Sale of the Electricity Undertaking.—At Monday's meeting the Corporation decided by 28 votes to 9 upon the sale of the electricity undertaking, subject to the approval of the Board of Trade, to Mr. Schenk's syndicate, which already holds powers for supply in the surrounding districts. The terms of the sale were given on page 751 of our issue of May 14th. The Corporation are relieved of all financial responsibility, and the profit is calculated at £65.000.

BELFAST: *Tramways.*—At the weekly meeting of the Tramway and Electrical Committee on the 25th inst. Sir Robert Anderson, Lord Mayor, presiding, the general manager, Mr. Nance, submitted a report recommending the reduction of the car service at a saving of about between £6.000 and £7.000 per annum, and a scheme for the readjustment of the fares was also submitted and approved of by a majority.

BIRMINGHAM: *Electricity Accounts.*—The report for the year ended March 31st last records an increase in units sold from 10,887,684 to 20,793,670. of which 9.600,894 were for lighting and power, and 11.192,776 for tramways. The costs show a reduction of 0·294d. per unit, in spite of the high cost of fuel. The lamp connections have increased by 66.329 16-c.p. lamps, and the motors connected by 3,491 h.p. The accounts show a sum of £60.926 available for payment of interest and sinking fund.

Tramway Accounts.—The accounts for the year ended March 31st, to which we alluded briefly in our last issue, report a gross profit for the year of £121,112, and a net profit after meeting capital charges, &c., of £72.037. Of this, £37,037 is to be placed to reserve, and £35.000 carried to the borough fund. The traffic revenue over the 34 miles of route (equivalent to 56 miles of single track) has averaged 11·42d. per car-mile, and the average working expenses are given as 6·72d. The total revenue was £289,556, and the working expenses £168,444. 10,577,540 units of current were purchased from the Electricity Department at 1·283d. per unit.

BLACKBURN: *Proposed Tramways.*—Presenting a report of the Light Railway Commission at Blackburn to the Great Harwood Council on May 20th, Mr. T. Noble, chairman, said the impression was conveyed that the scheme would be proceeded with within the next two years, and the opinion was expressed that the suggested tramway would tend to link up the three townships of Great Harwood, Rishton, and Clayton. It was mentioned that an undertaking had been given that when the railway was being laid, the promoters would guarantee certain road repairs.

BOSTON: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the electric lighting order granted to the Boston Urban District Council in 1906.

BRAY: *Electricity Supply.*—At the meeting of the Urban Council last week the electric lighting scheme came up for discussion on the recommendation of a committee that a sum of £5.000 be expended upon the existing works for the purpose of making the concern efficient and self-supporting. Mr. Bradshaw, chairman of the Electric Committee, set forth the details for the improvements, which he believed were the only way out of the fact that the works involved a loss of £1.000 per annum. After a lengthened discussion, the matter was postponed till a special meeting be held.

BRIGHTON: *Tramway Accounts.*—The Corporation Tramway undertaking shows a deficit of £969 as compared with a profit of £2,410 for the previous year. The revenue has declined from £16,153 to £12.641. It is stated that negotiations are in progress for the acquisition of the undertaking by a London syndicate who propose to use a different type of car.

BROCKLEY: *Proposed Tramways.*—A letter has been received by the Hon. Sec. of the Honor Oak Park and Brockley Tramways Committee from the Clerk to the London County Council stating that the Highways Committee do not see their way to recommend the Council to proceed with the construction of these tramways authorised from Lewisham High Road to Forest Hill during the present year, as they are of opinion that the tramways will not be remunerative, and they feel that the electrification of other and existing lines is more urgently required.

BURTON-ON-TRENT: *New Tramway Brake.*—A demonstration of Mr. P. J. Pringle's new grooved skid tramway brake has been made before the tramway committee. The matter is to be discussed formally at the next meeting, but we are informed that, in any case, it is proposed to fit up six of the cars which are used on the most hilly route.

Electricity Accounts.—The annual report and accounts show a surplus of £1,104, as against £793 for the previous year. Of this, £636 will be devoted to wiping off certain capital expenditure, and £468 carried to renewals fund. The price of fuel has increased by 33·7 per cent., and the revenue has been affected adversely by the introduction of metal filament lamps and trade depression. In spite of this, the gross profit has increased from £5,828 to £6,117. The motor load now exceeds the lighting load, and is nearly as great as the tramway load. The works costs are given as 0·812d. per unit, and the total working expenses as 1·055d. per unit. Capital charges bring this up to a total of 1·915d. per unit. Satisfactory results are reported owing to the extended use of the restricted hour principle, which is adopted in 481 out of the total 737 h.p. of motor load.

Tramway Accounts.—The annual report and accounts record a decrease of £686 in the receipts, notwithstanding an increase in the car mileage from 421,317 to 430,913. The surplus of income over expenditure was £4,745, but £4,866 were required for capital charges, and £1,000 was set aside for reserve and renewals, so that there was finally a loss of £1,121 on the year's working. The expenses are analysed as follows:—Traffic, 2·61d.; repairs and maintenance, 0·92d.; management, &c., 0·78d.; power, 1·89d.; capital charges, 3·29d. Total 9·49d. per car mile.

BURY: *Tramway Accounts.*—The annual report and accounts show a surplus of £4,606, of which £2,500 has been carried to reserve and depreciation fund, and the remainder to the rates. The working expense, exclusive of power, are given as 5·711d. per car mile, and the total revenue per car mile as 9·27d. The current consumption from the Bury station averaged 1·68 units per car mile at 1·06d. per unit; power was also taken at 1⅛d. per unit from the Radcliffe station. Extensive repairs have been carried out to the permanent-way during the year.

Digitized by Google

CANADA: *Port Hope, Ontario.*—The Port Hope Electric Light and Power Co.'s generating station was destroyed by fire on May 9th. The loss is estimated at £10,000, and is said not to be covered by insurance.

CHANNEL ISLANDS: *Wireless Telegraphy.*—Notice has been given by the Post Office that telegrams for the Channel Islands are now received at inland rates at sender's risk for transmission, if possible, by wireless telegraphy.

CLACTON: *St. Osyth Light Railway.*—The Board of Trade have confirmed the Clacton-on-Sea and St. Osyth Light Railway (extension of time) Order, 1908, reviving the powers granted, and extending the time limited, by the order of 1904, for the compulsory purchase of lands and completion of the railway and works.

DUNDEE: *Tramway Profits.*—After a good deal of discussion it has been decided that a payment of £1,000 shall be made by the Tramways Department.

Tramway Extensions.—In connection with the proposed tramway extensions to connect the Maryfield and Fairmuir routes, the Council has decided to send a deputation to inspect Continental examples of the "trackless system," the adoption of which is proposed.

ERITH: *Tramways.*—A report just issued by the Tramways Manager shows that the financial result of the Urban District Council Tramways undertaking for the year ended March 31st last was as follows:—Total income, £8,539 (an average of 6·37d. per car mile); working expenses, £8,393 (6·26d. per car mile); gross profit, £145 (0·11d. per car mile); loan charges, £4,594 (3·43d. per car mile); net deficiency, £4.449 (3·32d. per car mile). In view of the approaching completion of the L.C.C. tramways to Abbey Wood, the District Council has suggested the desirability of an arrangement for through booking between Erith and Beresford Square, Woolwich, and *vice versa*.

HUMSBY: *Wireless Telegraph Station.*—At a meeting of the Electric Lighting Committee last week, Mr. W. H. Vignoles reported that he had been in communication with the Admiralty regarding the proposed wireless telegraph station at Humberstone, and expected soon to be able to put an agreement before the department for a supply of current.

HAMPTON WICK: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the electric lighting order granted to the Hampton Wick Urban District Council in 1904.

HASLINGDEN: *Tramways.*—Great progress has been made by the Haslingden Corporation in the matter of converting the three miles of their tramway system from steam to electric traction. The new electricity generating station will not be ready for twelve months, however. In the circumstances, arrangements have been completed by which Accrington will for twelve months supply current and cars at a charge of 7d. per mile for a length of two miles, Haslingden finding its own inspectors and taking third party risks. The cars are to be running over the first mile about a month hence.

Workhouse Lighting.—A deputation for the Haslingden Board of Guardians met representatives from the Rawtenstall Corporation on May 21st, when Rawtenstall made the following amended offer:—To supply the workhouse building with electricity at 3d. per unit, the Guardians to guarantee that they would take at least 25,000 units. Rawtenstall agreed to maintain the necessary cable. It was decided that further information be obtained, and a committee was appointed to visit Bury, Burnley, and other workhouses that have electricity installations and make inquiries.

LONDON: *London County Council.*—In connection with the proposal to issue a guide to the tramways system, it was originally intended to charge 2d. per copy for this, but the Highways Committee now recommend that the first issue of 100,000 copies should be sold at 1d. per copy. It is not thought probable that the revenue derived from the issued of the guide will entirely cover the cost of printing and publication, but the general advantage to the tramway system is held to justify the charge of one penny.

Tenders for Centrifugal Pumps.—The Highways Committee recommend that they should be authorised to accept tenders for the centrifugal pumps (already advertised for) in connection with the second portion of the Greenwich generating station, during the Whitsun recess.

Battersea.—The Electrical Engineer has submitted to the Electricity Committee a scheme for wiring and fitting of premises of consumers or prospective consumers on (1) a cash purchase system (based on net cost with a percentage addition for administration, supervision, &c.); (2) a hire-purchase system (based on payment by instalments over a term to be agreed with the consumer, and not to exceed five years, with again a percentage addition); or (3) a perpetual rental hire system. The Engineer also suggested the establishment of a show-room, the provision and maintenance of outside arc lamps, and supply of energy for them at a fixed price per annum for a definite number of hours, the maintenance of installations, motors, lamps, &c., at fixed prices per annum, the distribution of electrical literature, and the supply of motors, lamps, fittings, &c. The committee are not in favour of adopting the scheme in its entirety, but think that a start should be made by the Council undertaking the provision and maintenance of outside arc lamps at fixed prices, applying the cash or hire purchase system of payment. The London County Council General Powers Act, 1906, requires that the charges shall be so adjusted as to meet the expenditure incurred, and the committee think the Council would undertake too great a risk in carrying out the whole of the work. They have accordingly decided that the wiring for the arc lamps shall be done through contractors, and that this course be continued until the scheme seems likely to be a success, or the applications for installations are sufficiently numerous to justify the Council in doing the whole of the work themselves.

Hampstead: Street Lighting.—The question of substituting flame arc lamps for 28 lamps at present in use for public lighting in Finchley Road was considered at a meeting of the Borough Council on May 21st. The Lighting Committee reported that they had had a trial of various kinds of lamps, and found that the Oliver magazine lamp was the most suitable: moreover, by using this particular lamp, another 10 lamps could be installed in Finchley Road without any increase of energy at the electricity station. The proposals involved capital outlay amounting to £890 10s., made up as follows:—Lamps, switches, posts, and lowering gear, £547 10s.; erection of posts, £20: excavating for mains, laying cable, and making good, £325. The total annual cost for the 38 lamps, including loan charges, would be £827, as compared with £742 for the present 28 arc lamps. There was, however, an outlay of £76 per annum for the maintenance of 22 gas lamps which would be displaced by the 10 additional flame arc lamps, so that the extra charge per annum to the general fund would be only £9. The inclusive annual cost per arc lamp would, therefore, be reduced from £26 10s. per annum to £21 15s. 3d. The above figures were calculated on the assumption that the £567 10s. capital outlay which would fall on the general fund would be paid from capital account, but the Finance Committee were of opinion that the sum should be borne out of revenue. The Lighting Committee's recommendation to substitute magazine flame arc lamps for the present lamps, and to erect an additional 10 flame arc lamps, was referred back.

Electricity Finances.—A comparative statement of income in connection with the electric lighting undertaking has been prepared, which shows a total for the year ended Lady Day, 1908, of £65,738, as compared with £64,587 for the previous year. In respect of current the income amounted to £60,582, as compared with £57,475 for 1906-7, other items being meter rent, £2,059 (as against £3,870); other charges, £126 (as against £91); public lighting, £2,970 (as against £3,150). The Finance Committee has appointed a sub-committee to consider the present system of accounts in connection with the works and electric lighting departments, including stores and wages, and to report as to any change that may be desirable.

Marylebone: The Electricity Undertaking.—The Borough Council, at its meeting on May 21st, had under consideration the question of revising the present rates of charges for the supply of electrical energy, and the practicability of framing a tariff that should be applied universally throughout the borough. The Consulting Engineer (Mr. Arthur Wright) reported that it would be commercially inexpedient to raise the average price received per unit, or to interfere during the present year with the option which the old "Metropolitan" consumers have of remaining on their original scale of charges. There will be, at any rate for the next year, not sufficient revenue to warrant the Council taking the risk of causing loss of business that might follow the compulsory change of tariff to the 4,000 odd consumers who are now charged upon the Metropolitan Co.'s scale. With reference to the standard demand indicator tariff, he thought that the change should at once be made of basing each summer quarter's account on its own maximum demand instead of upon the mean of the demands during the winter months. He also considered advisable revision of the meter rents, and further that in those cases where a consumer is prepared to guarantee his load factor, or the total annual consumption per kilowatt of demand, the manager should be authorised to quote such consumer a flat rate corresponding to his load factor or consumption per kilowatt, so as to enable a quarterly bill to be made out on a flat rate at the nearest farthing above the calculated figure. The Council decided that the existing scale of charges should be continued until June 30th, 1909, but that each quarter's account should be based on the actual demand for the quarter. The Council also adopted a recommendation that meter rentals based upon the declared maximum demand of the consumer be charged at the following rates until June 30th, 1909:—Up to 10 amp., 2s. 6d. per quarter; above 10 amp. to 25 amp., 5s.; above 25 amp. to 50 amp., 7s. 6d.; above 50 amp. to 100 amp., 10s.; all sizes above 100 amp., 15s. The rates apply alone to all sub-meters and meters for special classes of supply (*i.e.*, power, basements, signs, &c.). Small wall-plug meters for power purposes to be charged at 1s. per quarter.

The Electric Supply Committee, submitting estimates for the year ending March 31st, 1909, reported that for the year 1907-8 the total sales to private consumers reached the figure of 8,535,000 units. Making allowance for the effect of the high efficiency lamps now on the market, the estimated increase has been put at 250,000 units instead of 500,000. The total cost of production for the six months ended December last (for an annual output of 8·5 millions) were at the rate of 1·49d. per unit. The cost for a similar output this year would not exceed

Digitized by Google

1·4d. The additional sales of 250,000 units were estimated to cost only 0·5d. per unit (*i.e.*, the cost of extra coal, oil, and station stores), and it was reported that the total cost should not, therefore, exceed :—8,530,000 units at 1·4d., and 250,000 at 0·5d., or a total of 8,780,000 units at an average of 1·374d. The committee reported satisfactory reductions in management expenses, which during the half year ended December were 0·248d. per unit sold, stating that the rate of costs for the ensuing year would be safely estimated at 0·230d. This compared with 0·270d. estimated last year. Distribution expenses were estimated at 0·220d., and miscellaneous expenses at 0·190d., there being left a margin of 0·734d. to cover generating expenses. The generating costs during the half year to December worked out at 0·8d. per unit sold. The consumption of coal per unit generated showed a very substantial improvement, and there was a saving in the quantity of current consumed at the station. The estimated deficiency shown by the estimate, £6,967, would, it was explained, be met out of the credit balance of £29,325 in hand at March 31st, 1907, which would not be depleted by more than £3,000 at March 31st, 1908. The Council was reminded that the advent of the metallic filament type of lamp, though for the moment causing a serious diminution in the gross revenue of every electric supply undertaking, was bound to prove ultimately a very great boon to the electrical industry. The loss of revenue sustained now was small compared with the increased extent to which energy would be made use of in the future, as the outcome of the economy brought about by the introduction of the new lamps. The estimate for capital expenditure, amounting to £10,600 (which, like the estimate of £166,652 on revenue account, was approved), was as follows :—Generating station—For coal and ash handling plant, £510; staying thermal storage drums, £750; spare armatures for coal crane and ash conveyor, £55; sundry expenditure, £285. Mains Department—For new services, £900; new meters and demand indicators, &c., £1,600; extension of distributing mains, new disconnection boxes, &c., £2,500; alterations to Aybrook Street sub-station buildings, £4,000.

Paddington.—The Borough Council has agreed to support the Bill of the Metropolitan Electric Tramways Co. for extension of their lines along Harrow Road as far as Edgware Road, subject to the promoters consenting to reconstruct Harrow Road Bridge, and bearing the cost of certain road widenings already partly carried out. It is stated that the company are willing to agree to these conditions.

St. Pancras.—A contribution not exceeding £25 towards the combined electrical exhibit at the Franco-British Exhibition has been recommended by the Electricity Committee.

LUTON: *The M.E.A. Meeting.*—The Chairman of the Electricity Committee and the Electrical Engineer have been appointed delegates to the Convention of the Incorporated Municipal Electrical Association, to be held next month at Nottingham.

ROME: *Municipal Generating Station.*—A scheme for the erection of a municipal generating station has been approved by the Municipal Council.

RIO DE JANEIRO: *Water-power Scheme.*—The large dam which the Rio de Janeiro Tramway, Light, & Power Co. have had under construction for the past two years was completed last week. It is stated storage is thus afforded for sufficient water to run the 50,000-h.p. plant for several months.

WARSAW.—*Telephones.*—A consular report states that the number of subscribers to the telephones in Warsaw is rapidly increasing. Within the course of six years the number has increased by 414 per cent., and amounts now to about 11,000. As the central telephone station is only constructed to provide for 13,000 members, it is proposed to erect another station in the near future. Manufacturers and merchants complain of the very high fee, which is £7 a year, and efforts are being made by them to have it reduced to £3. The Warsaw-Lodz line is little used, as it is often more convenient to use the telegraph; 75 c. is paid for three minutes' talk. Besides this it is difficult to talk, as the Lodz telephones are of an old type. The authorities have taken up the matter, and it is intended to supply the line with new telephones.

Electric trams.—It was expected that the electric trams would run at the end of the year, but there has been much delay and there is still plenty of work to be done, although the rails are already laid almost everywhere. In view of this, the tramway administration had again to buy horses from Hungary, where they are usually obtained, although during the last two years no horses were bought in the expectation that the trams would run. The total number of tramcars will be 200.

Electric Light.—In the second half of the year the larger streets were illuminated by electric light; but these works also were much delayed, and the electric company asked the authorities for a postponement up to July, 1908. The company themselves sustained losses by the delay amounting to £1,700.

WEST HAM.—*Tramways.*—The Borough Council has received a letter from the Chief Officer of the L.C.C. Tramways, inquiring what the Council is prepared to pay for the use of the tramways between the Iron Bridge and Abbott Road or Orchard Street, if this length were electrified by the L.C.C. The West Ham Tramways Manager is to negotiate for such use upon the basis of either an agreed percentage upon the capital expenditure, or a rate per mile run by the West Ham cars.

WESTCLIFF-ON-SEA: *Decorative Lighting.*—It is stated that an elaborate scheme for decorative lighting of the cliffs has been decided upon, including festoons of incandescent lamps hung from the trees.

TENDERS INVITED AND PROSPECTIVE BUSINESS

CLEETHORPES.—Tenders are invited for the erection of a wireless telegraph station. Particulars from District Surveyor of Coastguard Works, 28 Pavement, York, or Director of Works Department, Admiralty. Tenders by June 12th.

CLYDE NAVIGATION TRUST.—Tenders are invited for the supply of asbestos packing, coal, electrical stores, india-rubber, oil, &c. Particulars from Superintendent of Stores, 16 Robertson Street, Glasgow. Tenders by June 6th to T. R. Mackenzie, General Manager.

DARTFORD.—Tenders are invited for a surface condensing plant. Particulars from the Borough Electrical Engineer, fee £1 1s. returnable, and tenders to the Town Clerk by June 3rd.

GREENOCK.—Tenders are invited for the supply of steam coal (washed singles and pearls), oil, and engine-room stores for the year ending June 30th, 1909. Particulars from Burgh Electrical Engineer, fee 5s. returnable. Tenders to Town Clerk by Tuesday, June 2nd.

HANLEY.—The Local Government Board have sanctioned a loan for the Electricity Department of £20,643 out of the £21,969 applied for.

HASLINGDEN.—The Guardians desire tenders for carrying out the work of the proposed new infirmary to contain 158 beds, together with maternity ward and nurses' home and proposed new boiler house, with engine-room and chimney. Applications to be accompanied by a fee of two guineas. Tenders close on Tuesday, June 2nd, 1908.

HOLYWOOD (COUNTY DOWN).—At the monthly meeting of the District Council last week, Mr. George Murdoch presiding, letters were read regarding the proposed electric lighting of the town, and it was decided to have a consultation in committee with an electrical engineer regarding the approximate cost of the scheme.

ILFORD.—Tenders are invited for surface condensing plant and cooling tower, steam and feed pipes, boiler feed pump, &c., and extensions and alterations to main switchboard. Full particulars from Mr. A. Shaw, Electrical Engineer to the Council, Electricity Works, Lea Street, Ilford, and tenders to the Chairman of the Urban District Council by June 10th. (See an advertisement last week.)

LONDON: *London County Council.*—The Council has decided to proceed with the construction of the tramways from Crystal Palace Road to Forest Hill on the conduit system at a cost of £32,400 for trackwork, and £230 for cable ducts and sub-station equipment.

Woolwich.—The Borough Council is to invite tenders for the supply of about 6,000 tons of coal for the year commencing June 25th. Of this amount 3,000 tons of washed nuts are required for the Plumstead Electricity Works, and 1,500 tons of rough coal for the Electricity Works at Woolwich.

NEWCASTLE-ON-TYNE.—Tenders for various stores, including incandescent lamps and arc-lamp carbons, are required by the River Works Committee by June 1st. Particulars from Secretary, Berwick Street, Newcastle-on-Tyne.

SHEFFIELD.—A Local Government Board inquiry is to be held on June 2nd, into a proposed loan of £20,000 for the electricity department.

SWANSEA.—The erection of two power stations at a cost of £25,000 to £30,000 for the supply of electrical energy to the new King's Dock has been decided upon.

Annual Tramway Congress.—As we have already announced, the Tramways and Light Railways Association has decided to inaugurate an annual congress, and it has been definitely settled that the first shall be held this year at the Franco-British Exhibition on July 9th and 10th. Members will be received in the Congress Hall of the Exhibition by the Chairman of the Council, the Hon. Arthur Stanley, M.P., and by the members of the Reception Committee at 10.30 a.m. on Thursday, July 9th. At 11 a.m. Sir Clifton Robinson, Vice-President, will open the proceedings with a lecture on "The Tramways of the World," in which he will relate the experiences of his extended world's tour from which he has just returned. At 12 noon a Paper will be read on "Tramway Rail Joints," by Mr. A. H. Gibbings. On the following day Mr. A. L. C. Fell, Vice-President, will take the Chair at 11 a.m., and Prof. C. A. Carus-Wilson will deliver a lecture on "Rail Corrugation." This Paper will be discussed later at a meeting to be held at 35 Parliament Street, Westminster, on Friday, July 24th. In the evening of July 10th a dinner will be held at 7.30 p.m. in the Banqueting Hall of the Exhibition.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

BIRMINGHAM.—The tender of Messrs. John Bowen & Sons for additional buildings at the Dale End Station for testing department and office accommodation has been accepted subject to the approval of the Council.

EAST HAM.—The Borough Council has received the following tenders for the reconstruction and electrification of the tramways in the Romford Road:—G. J. Anderson: (*a*) permanent way, £10,054; (*b*) overhead work, £750; (*c*) paving sides, £7,035. Acme Flooring & Paving (1904) Co., Ltd.: (*a*) £8,255; (*b*) £320; (*c*) £6,376. Fry Bros.: (*a*) £9,515; (*b*) £578; (*c*) £6,838. W. Manders: (*a*) £8,765; (*b*) £785; (*c*) £6,693. G. Law: (*a*) £10,148; (*b*) £755; (*c*) £7,890. D. T. Jackson: (*a*) £9,121; (*b*) £589; (*c*) £6,650. W. Griffiths & Co., Ltd. (accepted): (*a*) £8,074; (*b*) £608; (*c*) £6,425. Dick, Kerr & Co., Ltd.: (*a*) £8,634 (*b*) £503; (*c*) £6,752. R. W. Blackwell & Co., Ltd.: (*a*) £8,553; (*b*) £479; (*c*) £6,876. In the first instance, a resolution was passed accepting the tender of the Acme Flooring and Paving (1904) Co., Ltd., but eventually this was deleted. The tender of W. Griffiths & Co., Ltd., amounting in the gross to £15,108, or alternatively £15,761, with an allowance of 1s. 6d. per yard in case of old setts taken up and retained by them, and £2 per ton for old rails, has now been accepted, subject to their supplying English made rails, the firm originally tendering for Lorain American steel rails. Acceptance is also subject to the other following conditions:—(*a*) the track work to be commenced within three weeks from date of formal notification of acceptance of tender, and to be completed and ready for inspection by the Board of Trade within ten weeks from the aforesaid date, and (*b*) at least two-thirds of the unskilled labourers employed to be residents in the borough. The acceptance of the tender for the tram track and roadway work is, of course, also subject to the sanction of the Board of Trade and the Local Government Board respectively.

ERITH.—The Urban District Council has accepted a revised offer from Beadle Bros., Ltd., for the supply to the electricity department of Longhurst rough small coal at 12s. per ton. In February last the coal was quoted at 12s. 6d. per ton.

HANLEY.—The tender of the British Westinghouse Co. for the supply and erection of a new 500-kw. steam generating set has been accepted.

HASLINGDEN.—At the Town Council meeting on May 21st the Town Clerk submitted a tabulated list of the tenders received for the overhead tramway equipment, and that of Messrs. Dick, Kerr & Co.'s was accepted.

The Haslingden Town Council have accepted the following for the erection of the combined destructor and electricity generating station: Masonry, J. Tomlinson, Haslingden; joinery and plastering, T. Tattersall, Ltd., Haslingden; slating, H. H. Tomlinson, Haslingden; painting, R. Whittaker, Haslingden; steel work, T. Blackburn, Preston; chimney, J. Tomlinson, Haslingden; Weigh-bridge, Hodgson & Stead, Manchester. The contract for clinker crushing machine was deferred.

An estimate was submitted for the purchase of the site of the refuse destructor and electricity works at Prinny Hill, amounting to £1,400. The Town Clerk was authorised the seek the necessary borrowing powers.

LEEK.—The tender of Messrs. Crompton and Co. for switchboard extensions at a cost of £9 has been accepted.

LONDON: *London County Council.*—The following tenders have been received for the manufacture, supply, and delivery of 175 sets of maximum traction swing bolster trucks required for the Council's tramways:—The Brush Electrical Engineering Co., £26,670: alternative tender, £26,276 (not to specification); Mountain & Gibson, tender for foreign steel, £26,775; alternative, £26,250 (not to specification); Heenan & Froude, £27,037 10s.; Mountain & Gibson, tender for British steel, £27,650; alternative, £27,125 (not to specification); United Electric Car Company, £27,650; Magnolia Anti-Friction Metal Company of Great Britain, £28,043 15s.; Metropolitan Amalgamated Railway Carriage and Wagon Company, £29,050; Thornewill & Warham, £29,575; Hurst, Nelson & Co., £29,793 15s. The lowest tender in accordance with specification is that submitted by the Brush Electrical Engineering Co., Ltd. This firm takes exception to the terms of the arbitration clause in the form of contract, and states that it presumes that any question arising after the completion of the contract affecting financial matters would be referable to independent arbitration. Moreover, the firm has not completely filled in, as required, the schedule of rates of pay to be observed in the execution of the work. In these circumstances the Highways Committee do not see their way to recommend the Council to accept either of the tenders submitted by the company. The third and fourth tenders, submitted by Mountain & Gibson, Ltd., provide for the use of steel of foreign manufacture, and one of these is also not in accordance with the specification. The third lowest tender, according to specification, is that submitted by Heenan & Froude, Ltd., and this provides for steel of British manufacture. This is only £262 10s. higher than the tender submitted by Mountain & Gibson for steel of foreign manufacture. Having therefore very carefully considered the matter, the Committee recommend the tender of Heenan & Froude, Ltd., amounting to £27,037 10s., should be accepted for the work.

The following tenders have also been received for the supply and delivery of track rails and fastenings required for the construction and reconstruction of further lines included in the programme of tramway works for 1908-9. Alternative tenders were invited for about 2,000 or 5,000 tons, and the following are the particulars of the six tenders received after arithmetical errors have been corrected:—Société Anonyme des Aciéries d'Angleur, Belgium, for about 2,000 tons, £12,429 14s. 2d.; for 5,000 tons, £32,098 6s. 8d.; Edward Le Bas & Co., London (made by Société Anonyme d'Ongrée, Belgium), £12,623 3s. 9d. and £32,523 10s.; P. & W. MacLellan, Ltd., London (made by Angleur Co., Belgium), £13,115 11s. 3d. and £34,068; Messrs. Bolling & Lowe, London (made by the Phœnix Company, Ruhrort, Germany), £13,191 5s. and £33,805 10s.; Bolckow, Vaughan & Co., Ltd., London and Middlesbrough, £13,306 17s. 6d. and £34,640; Walter Scott, Ltd., Leeds, £13,761 5s. and £35,832 10s. The Chief Engineer's estimates comparable with the above tenders are £14,227 10s. and £36,567 10s. respectively. The first four tenders are for rails of foreign manufacture. The lowest tender for rails of British manufacture is that of Bolckow, Vaughan & Co., Ltd., amounting to £34,640 for 5,000 tons, and this is £2,541 13s. 4d. higher than the lowest tender actually submitted for the same quantity. The Highways Committee point out that, in the past, in cases in which materials required for tramway construction and reconstruction works have been obtained from abroad, considerable delay has arisen owing to difficulty in arranging for deliveries to be made in accordance with the requirements of the work for which the materials were to be used; further, in the event of it being necessary to reject any of the work, the delay caused thereby is a very serious consideration. Moreover, if one of the tenders for the supply of foreign rails be accepted, additional expenditure will have to be incurred for the inspection of the materials during manufacture. In these circumstances the Committee recommend the Council to accept the tender of Bolckow, Vaughan & Co., Ltd., for 5,000 tons.

Expenditure not exceeding £187 12s. is recommended for the provision of eight low-range meggers, 500 volts, 100 megohms, for testing the connections of magnetic brakes used on electric cars.

The tender of Messrs. Henry Bessemer & Co., Ltd., of Sheffield, for 3,500 driving-wheel tyres at 23s. per tyre, and 2,000 trailing-wheel tyres at 18s. per tyre, has been accepted. The total amount of the tender is £5,825.

The following tenders have been received for the manufacture, supply, delivery, and erection of rotary sand-drying apparatus for use in the tramway department:—Mountain & Gibson, Ltd., £650; Mountain & Gibson, Ltd. (alternative), (recommended), £620; the Albany Engineering Co., Ltd., £730; Ernest Newell & Co., Ltd., £1,192; Heenan & Froude, Ltd., £1,280; F. W. Rowlands & Co., £1,450.

Camberwell.—In March last the Borough Council accepted the tender of the Britannia Electric Lamp Works (1905), Ltd., for the supply of English-made plain and frosted electric lamps. The Public Health Committee, having learned that this company are now in liquidation, has decided to accept the tender of S. Burnby & Son at the following prices:—Plain lamps, 100 and 200 volts, 8 c.p., 7s. per doz.; 16 c.p., 7s.; 32 c.p. 8s.; frosted lamps, 100 and 200 volts, 8 c.p., 7s. 6d.; 16 c.p., 7s. 6d.; 32 c.p., 8s. 6d.

Marylebone.—The Borough Council has accepted the following tenders for the annual supply of stores, materials, and tools to the Electricity Department:—Pryke & Palmer, asbestos braiding tape, 2s. 11½d. per lb.; W. T. Henley's Telegraph Works Co., Ltd., vulcanised I.R. insulated wires and cables, 600 megs. grade S.W.G., 1/18s., £2 0s. 10d.; 3/22s., £2 11s. 2d.; 3/20s., £3 11s.; 7/22s., £3 17s. 8d.; 7/20s., £5 9s. 3d. per ¼ mile respectively; 7/18s., £4 2s. 1d.; 7/16s., £6 12s. 11d. per ⅛ mile respectively; 7/14s., £4 16s. 1d.; 19/20s., £2 19s. 3d.; 19/18s., £4 16s. 1d.; 19/16s., £7 6s. 1d.; 19/14s., £10 16s. 6d. per 1/16 mile respectively; fittings, wire, 3/25s., 9s. 6d. per 110 yards; fire resisting tape, 3s. 6d. per lb.; flexible twin glacé cotton wire, S.W.G., 35/40, £1 12s. 6d. per gross yards; 70/40, £2 2s. 6d. per gross yards; flexible twin silk-covered wire, S.W.G., 35/40, £1 17s. 6d. per gross yards; 70/40, £2 10s. per gross yards. St. Helen's Cable Co: rubber tubing, ⅛ in. thick, 3s. 2d. per lb. General Electric Co., Ltd.: para rubber strip, 7s. 6d. per lb.; tubular lamps, 12s. per doz. Pooley & Austin: white silesian tape, 2s. per lb.; incandescent lamps, 16 c.p. 72s. per gross, 8 c.p. 72s. per gross, 32 c.p. 8s. per doz., 6d extra for frosting; white selvedge tape, 2s. per lb. British Insulated and Helsby Co.: binding wire tin copper, 14, 16, 18, 20, 22, S.W.G., 1s. 1d., 1s. 1½d., 1s. 2d., 1s. 3d., 1s. 4d. respectively. Edison & Swan, Ltd.: batten holders, 4s. 10½d.;

Digitized by Google

cord grip holders, 4s. 3d.; screw holders, 3s. 10d.; tumbler switches, 10 amp. 16s., 5 amp. 7s. 9d.; linked tumbler switches, 10 amp. 41s., 5 amp. 25s. per doz. respectively. Baxter & Caunter: wall sockets and plugs, 10 amp. 21s. per doz., 5 amp. 8s. per doz. Lundberg & Sons: switch plugs, 5 amp. 22s. per doz., 10 amp. 56s. per doz. W. McGeoch & Co., Ltd.: distribution boards, 1s. 6d. per double pole way; porcelain fuses, 3s. per doz. Union Electric Co., Ltd.: flame arc lamp carbons cored. 23 in. by 11 mm., 29s.; 23 in. by 10 mm., 25s.; 23 in. by 9 mm., 16s. 10d.; 12 in. by 9 mm., 14s.; 12 in. by 8 mm., 12s. 6d. per 250 feet respectively. Sloan Electrical Co.: Excello arc lamp globes, 2s. 10d. each; arc lamp carbons cored: 12 in. by 18 mm., 12s. 4d. per 250 feet; solid: 12 in. by 12 mm., 5s. 10½d.; 12 in. by 11 mm., 10s. 10½d.; 12 in. by 9 mm., 8s. 7d. per 250 feet respectively. Le Carbone: carbon brushes with flexibles at per doz. respectively: diagram No. 1, 5s. 0¾d.; No. 2, 7s. 6d.; No. 3, 5s. 10½d.; No. 4, 6s.; No. 5, 13s.; No. 6, 13s. 1½d.; No. 7, 5s.; No. 8, 4s. 1½d.; No. 9, 6s. 10½d.; No. 10, 3s. 9d.; No. 11, 6s. 7½d.; No. 12, 6s. 6d.; No. 13, 8s. 10½d.; No. 14, 9s. 3d.; No. 15, 11s. 7½d.; No. 16, 7s. 9d.; No. 17, 7s.; No. 18. 13s. 1½d. (without laminations); No. 19, 5s. 10½d.; No. 20, 17s. 6d.; No. 21, 2s. 7½d.; Nos. 22 and 23, 5s. 3d.; No. 24, 3s. 4½d.; Nos. 25 and 26, 3s. 9d.; No. 27, 6s.; No. 28, 6s. 7½d.; No. 29, 7s. 9d.; No. 30, 5s. 7½d.

PLYMOUTH.—The tender of Messrs. Cory Brothers, Cardiff, for the supply of a cargo of coal not exceeding 1,000 tons at 14s. 1½d. per ton has been accepted. The price of the last cargo was 15s. 4½d. per ton.

SOUTHEND.—The Corporation have accepted the tender at £370 of E. and B. H. Davey for the construction of a condenser water-tank at the electricity works. There were 11 tenders, varying from that accepted to £797.

SOUTHSEA.—The tender of Messrs. W. T. Glover & Co. for an additional high-tension cable at £1,030 has been accepted.

UXBRIDGE.—The Joint Hospital Board has received the following tenders for the installation of electric lighting at the new hospital buildings:—Taylor & Co., £109 10s.; Tilley Bros., £145; Eric Rivers Smith, £103; Wells, Rayner & Co. (accepted), £89 15s.; P. W. Baker, £110 4s. (10 years' guarantee); Windsor Electrical Co., £106; Park Bros., £96 10s.; Charles Pulan, £93 10s.; Cannon & Sons, £193 5s.

WEYMOUTH.—The tender of the Brush Electrical Engineering Co. for a turbo-generator, with condenser, &c., has been recommended for acceptance.

COMPANIES' MEETINGS AND REPORTS

AUCKLAND ELECTRIC TRAMWAYS.—The general meeting was held on Wednesday of last week. Auckland is the only important city in New Zealand where the tramways are not worked by a Municipal Tramway Board. The Chairman of the Auckland Electric Tramways Co., Ltd. (Mr. C. G. Tegetmeier) informed the shareholders that overtures had been made by the Auckland Council with a view to purchase. As the period of tenure does not expire until 1932 (when the undertaking will be purchaseable on the basis of a going concern), the directors would prefer to continue working the undertaking, all the more as the traffic is developing steadily. However, the Board has expressed its willingness to enter into negotiations for the sale of the tramways on an equitable basis, having regard to the terms and tenure of the concessions and to the present and prospective profit-earning capacity of the system. Last year nearly 22½ millions of passengers were carried—an increase of about 1,500,000 over the previous year. On special days the number of passengers has risen to about 110,000, which is a record figure for a population of 75,000. The balance available for distribution was £32,623, and the dividend paid on the ordinary shares 6 per cent., after placing £10,000 to reserve. The contribution to depreciation was also £10,000, and Mr. Tegetmeier considered that the average of £10,000 per annum set aside for that item during the last four years was adequate. For the period up to April 24th of this year about a million more passengers have been carried than for the corresponding period of last year, and the receipts have increased by £5,749. Thirty-two new cars have been added to cope with the developing traffic. The company has now about four hundred shareholders in New Zealand, and the issue of £50,000 in preference shares was nearly all taken up in Auckland.

CAPE TOWN TRAMWAYS.—The report and accounts referred to on page 757 of our issue of May 14th, were adopted at the meeting last week. Mr. R. Littlejohn, who presided, said the company had suffered in common with many undertakings from the reaction which followed the abnormal inflation of business immediately after the war.

CALCUTTA ELECTRIC SUPPLY.—At the annual general meeting held last Friday, the report given on page 796 of our last issue was adopted. Colonel A. J. Tilgate, who presided, said that the dividend recommended fell short of that of the previous year by ½ per cent., owing to the fact that the directors had special circumstances before them which might affect the company in the early future. Since the closing of the accounts it became necessary to issue more capital, and the directors had offered to the shareholders 20,000 five per cent. preference shares, which were all taken up.

CALLENDER'S CABLE & CONSTRUCTION.—The annual meeting of this company was held last Thursday at Hamilton House, Mr. Henry Drake presiding. In moving the adoption of the report, the chairman observed that the prohibitive price of metals and the stringency of the money market had rendered the company's operations difficult and less remunerative than in previous years. The most pronounced factor in restricting business in heavy mains had been the abnormal price of copper which prevailed in the first eight months of last year, leading to the temporary abandonment of nearly all new enterprise in electrical supply, and to the curtailment of extensions of existing networks in every direction. This was not confined to the home trade, as diminished orders were observed in almost every area throughout the world, in which the company carried on its business. The continuing downward trend of the market offered no inducement to consumers to undertake new work or to fill up their depleted cable stocks. The recent return of copper to its average price came after the season was at an end, and it might, therefore, be said that practically the whole of the company's business during the past year consisted of extensions which were absolutely necessary in connection with electrical supply stations already in existence. The subsequent stringency of the money market had delayed that improvement in business which might otherwise have been expected. Their business in Germany had been consolidated, and their own company had been registered under German laws, with its headquarters in Hamburg, excellent results having already attended this step. The available balance for distribution was £81,357, and the directors recommended the payment of a dividend at the rate of 10 per cent. per annum, with a bonus of 5s. a share, carrying forward, after placing £10,000 to Suspense Account, a balance of £45,107. Mr. John Varley seconded the motion. Mr T. O. Callender (managing director) observed that the past year had been a good deal less satisfactory than the two previous years. The most important reason for the falling off in the business was the uncertainty which prevailed in regard to the price of copper, which had fallen from £122 per ton to something below £60. However, the company was doing a fair business, and their works were occupied to a very considerable extent. No large contracts had been placed with them, and consequently they were not so busy as they should have liked to be, but he was sure that the company would get its fair share of all the business that was going. In his opinion an improvement in the business was sure to come, and the work waiting for execution, which at present was hung up, would, to a very large extent, be placed in the hands of this company. The report, which was referred to in our last issue, was unanimously adopted.

GENERAL ELECTRIC COMPANY (AMERICA).—The annual report for the year ended January 31st last states that the profits were $6,586,653, of which $5,183,614 were paid in dividends, leaving $1,403,039 to be carried forward. The effect of the drop in price of materials has been to reduce the book value of stocks, &c., by about $2,000,000. During the year the business of the Stanley G.I. Manufacturing Co. has been absorbed. A site has been secured near the city of Erie for the erection of new works, but building operations have been deferred for the present. The orders received for apparatus actually manufactured by the company represented $59,301,040, and the total sales reached a value of $70,977,168, an increase of 18·2 per cent. over the previous year. The orders received during the six months from February 1st to July 31st, 1907, increased 22 per cent. over the corresponding period of the year 1906. Owing, however, to the disturbed financial conditions prevailing during the latter part of the year, orders received for the second six months of the year decreased 25 per cent. as compared with the previous year. Attention is called in the report to a number of important traction contracts, including several for 1,200 volts continuous current. The sales of Curtis turbine sets are increasing, and several sets of 14,000 kw. capacity are in process of manufacture. The area of floor space of the various works now reaches a total of 6,400,000 sq. ft., and 20,000 men are employed as against 28,000 last year, the decrease being due to the shrinkage of orders during the last quarter already referred to.

MANX ELECTRIC RAILWAY.—The ordinary general meeting was held at Douglas last week. The meeting was only formal, and no business was transacted, as the report and accounts for the previous year had been dealt with at the meeting in London last December.

PERTH ELECTRIC TRAMS.—At the meeting last Friday the report referred to on page 796 of our last issue was adopted. The chairman, Mr. A. P. Stoneham, said that although the results were not quite as good as during the previous year, when the exhibition was held, there was every indication of a steady increase in the traffic receipts.

Digitized by Google

UNDERGROUND ELECTRIC RAILWAYS OF LONDON.—At an extraordinary meeting held on Tuesday, resolutions passed at a meeting on the 11th inst., approving the Great Northern, Piccadilly, and Brompton Railway Bill, now before Parliament, agreeing to a scheme "for the conversion or exchange of the profit-sharing secured notes of the company, and for other purposes," and winding up the company voluntarily for the purpose of carrying the scheme into effect, were confirmed.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted Tuesday night, was £59 to £60 per ton (last week £60 to £60 10s. per ton).

LIQUIDATIONS, BANKRUPTCIES, &c.—The first meeting of creditors in the bankruptcy of E. A. Gresham, electrical engineer, Westborough, Scarborough, will be held to-day at the Official Receiver's Office, 24 Bond Street, Leeds, and the public examination will take place at the County Court House, Albion Place, Leeds, on June 30th, at 11 a.m.

The liabilities of Alfred William Bennett (lately trading as Bennett & Co.), electrical engineer, 45 Elford Grove, late 32 Park Cross Street, Leeds, are stated at £1,124 13s. 4d., and there are said to be no assets.

The first meeting of the creditors in this case was held on Monday last at 24 Bond Street, Leeds, when, no resolutions being passed, the estate remains with the Official Receiver, who, therefore, acts as trustee. The failure was ascribed to competition and bad trade.

A petition for the winding up of the Kevan Electric Co., Ltd., will be heard before Mr. Justice Swinfen Eady on June 2nd.

The Electric Traction Construction and Equipment Co. is to be wound up voluntarily. Mr. C. R. Jeeves, assistant secretary to the company, is liquidator.

ARC LAMPS, LTD.—This firm has now made definite arrangements for shifting their works from St. Paul's Crescent, Camden Town, to St. Albans. The new works will be called the Sphere Engineering Works, and Messrs. Arc Lamps, Ltd., will manufacture their lamps and also turn out other engineering details there. The works will be quite up to date in respect to the building, and quite on modern engineering lines. The firm expects to be installed there by the middle of next month. The whole building, however, will not be completed for three months from now, but it will be sufficiently advanced by June 20th for the firm's removal.

In connection with the Royal Naval and Military Tournament now being held at Olympia, the whole of the electric light fittings, which were used in the Royal box, have been supplied for the occasion by the Edison and Swan United Electric Light Co., Ltd., of 36-37 Queen Street, London, E.C.

ST. PETERSBURG RAILWAYS.—The Siemens & Halske Akt.-Ges. and the Allgemeine Elektrizitäts-Gesellschaft have made an offer to the St. Petersburg Municipality, to take over the construction and management of the City Railways for a period of sixty years.

NEW PUBLICATIONS

"Die Revision elektrischer Starkstromanlagen." By P. Stern. (Hannover: M. Jänecke.) M.3.60.

Lead Refining by Electrolysis. By A. G. Betts. (London: Chapman & Hall.) 17s.

Metallic Filament Lamps for Street Lighting.—In connection with the results obtained at Exeter with Osram lamps for street lighting, it may have been noticed that the figures do not appear quite so favourable as others we have collected. It should be explained, however, that the conditions at Exeter are slightly different. The gas company, under the severe competition to which it is subjected by the electricity works, maintain their mantles and lamps exceptionally well, and, in consequence, Mr. H. D. Munro, the City Electrical Engineer, has used a 55-watt Osram lamp in place of the old gas lamp, whereas for instance Mr. Wilkinson at Harrogate takes only a 35-watt lamp to compare with an ordinary incandescent gas-burner. Moreover, we understand that a number of the Osram lamps at Exeter have been renewed before they have actually burnt out, to prevent their being reported "out" by the police. Thus the figure of average life given is somewhat lower than what it should actually be. The proportion of lamps with long lives has been increasing lately, and it must not be forgotten that Exeter was practically the first place to adopt Osram lamps to any extent for street lighting, so that the lamps used in the earlier stages of the experiment did not possess all the improvements of the more recent lamps sold.

MISCELLANEOUS CITY NOTES

BRITISH COLUMBIA ELECTRIC RAILWAY.—An interim dividend at the rate of 5 per cent. has been announced on the preferred ordinary stock, together with an additional dividend at the rate of 1 per cent. for the nine months ended March 31st, 1908.

COMPANIES STRUCK OFF REGISTER.—The following companies have been struck off the Register of Joint Stock Companies:—Ariel Arc Lamp Syndicate, Electrical Inkless Printing Syndicate, Medical Electrical Institute.

GLOBE TELEGRAPH AND TRUST CO.—A dividend of 5s. 9d. per share has been announced.

WEST INDIA AND PANAMA TELEGRAPH.—A dividend of 6s. per share has been recommended on the first preference shares, and 26s. per share on the second preference shares.

APPOINTMENTS AND PERSONAL NOTES

Mr. H. A. Howie, Deputy Electrical Engineer, Wolverhampton; Mr. F. W. Purse, Deputy Electrical Engineer, Warrington; and Mr. B. H. Hornby, Deputy Electrical Engineer, Bolton, were the three candidates for the position of Electrical Engineer to be interviewed by the Watford Urban District Council. It was stated that the undertakings with which these candidates were connected were all profitable. By 11 votes to 9, Mr. Purse, who is 30 years of age, was appointed.

NEW COMPANIES

BRADNINCH AND DISTRICT ELECTRIC SUPPLY CO.—This company was registered on May 20th, with a capital of £2,000 in £1 shares, to carry on at Bradninch, and elsewhere in Devonshire, the business of an electric light company in all its branches. The subscribers are:—D. K. Muir, J. P. Hepburn, J. Horsburgh, W. A. Nicks, H. C. Nicks, W. Baker, F. W. Cuming. No initial public issue. Registered without articles of association. Registered office:—Kensham, Bradninch, Devon.

CAMPBELL & ISHERWOOD.—This company was registered on May 15th, with a capital of £10,000 in £1 shares, to take over the business of electrical and mechanical engineers, carried on by G. F. D. Campbell and J. A. G. Williams, at Raleigh Street, Bootle, Lancashire, and elsewhere, as "Campbell and Isherwood." The subscribers are:—G. F. D. Campbell, J. A. G. Williams, C. E. Campbell, E. J. Faraday, T. F. Meade, G. F. Thomas, A. J. McQueen. No initial public issue. The number of directors is not to be less than two nor more than five: the first are G. F. D. Campbell, J. A. G. Williams, and L. Murphy. Qualification, £200. Remuneration (except managing director) as fixed by the company. Registered office: Raleigh Street, Bootle.

E. A. PREVETTE.—This company was registered on May 14th, with a capital of £3,000 in £1 shares, to acquire patents and rights for inventions relating to an electrical burglar-alarm and an electrical clock, to acquire the business of E. A. Prevette, at 35 Grove Road, Eastbourne, and to carry on the business of electricians, electrical, telegraph, mechanical, sanitary, gas, and water engineers, clock and watch makers, railway contractors, ironmongers, builders of electric tramcars, motorcars, cycles, and other vehicles, manufacturers of, and dealers in, dynamos, motors, telephones, bells, electroliers and arc and other lamps, &c. The subscribers are:—Miss A. F. White, E. A. Prevette, R. G. Hudson, R. H. Bradford, E. Prevette, A. J. R. Morris, D. W. A. Roberts. No initial public issue. Registered without articles of association. Registered office: 35 Grove Road, Eastbourne.

GRASSE AND CANNES ELECTRIC TRAMWAYS SYNDICATE.—This company was registered on May 22nd, with a capital of £2,100 in 2,000 ordinary "A" shares of £1 each, and 2,000 deferred "B" shares of 1s. each, to construct, lease, or acquire tramways and light railways in France or elsewhere, to equip, maintain, and work the same by electricity, or other power, &c. The subscribers are:—H. R. Green, A. H. Chifferell, A. B. Bose, C. Orchard, E. E. Johnson, G. Jackson, H. W. Newman. No initial public issue. Registered without articles of association by Lumley and Lumley, 37 Conduit Street, W.

TEWKESBURY ELECTRIC LIGHT.—This company was registered on May 4th, with a capital of £5,000 in £1 shares (2,000 pref.), to acquire the interest of J. Parker under the Tewkesbury Electric Lighting Order, 1905, to adopt an agreement between the Town Council of Tewkesbury and J. Parker, and a provisional contract between the same parties whereby the company will acquire a lease of a site for the generating station, and to carry on the business of an electric light and power company in all its branches. The subscribers are:—J. Mitchell, A. Johnson, J. Parker, T. W. Meats, C. W. Jones, J. H. Edwards, A. L. Stephens. Minimum cash subscription, £1,000. The number of directors is not to be less than three nor more than five; the first are:—J. Mitchell, A. Johnson, J. Parker, and J. H. Edwards. Qualification, £100. Remuneration as fixed by the company. Registered by Clarkson, Greenwell and Co., 10-11 Lime Street, E.C.

ELECTRIC DRILLS AND GRINDERS

THE use of individually operated tools considerably increases the efficiency of the average workshop, as it is generally cheaper to take the tool to the machine than to take the work to the tool when dealing with heavy work. For this reason electrically operated tools, particularly drills and grinders, have become very popular, and are in extensive use in workshops of all kinds. In a catalogue recently issued by the Armorduct Manufacturing Co., Ltd., of Farringdon Avenue, E.C., some new types of the well-known "Little Hustler" drills and grinders are described. The motors in those machines intended for operation off direct-current circuits are shunt-wound, and speed variation is obtained by means of a mechanical gear. The general appearance of a breast drill of this type for use on direct-current circuits is seen from Fig. 1. The motors can

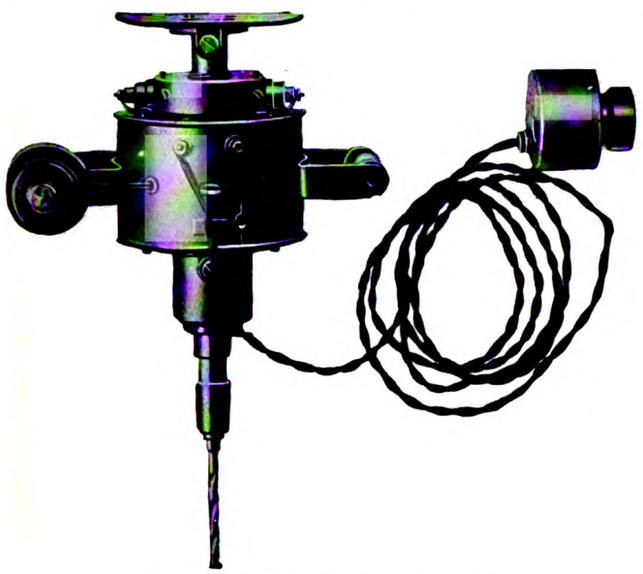

FIG. 1.—PORTABLE ELECTRIC DRILL.

be obtained for all voltages up to 500 volts, and drills and grinders for operating at this high pressure should be found particularly useful for tramway work. The difficulties in the way of bringing out a compact and reliable machine for 500 volts were very great, and this type of machine is quite a recent addition to the list. All machines have three running speeds, the fastest running at 1,730 to 830 r.p.m., and the slowest at 100 to 45 r.p.m. This last machine has a drilling capacity of 2 inches in cast iron, weighs about 130 lb., and takes 3·5 amps. at 250 volts. A feature of the design is the employment of an aluminium alloy for all non-magnetic parts, for the purpose of keeping the weight as low as possible. A ball-bearing thrust is provided for taking up the thrust of the drill. In Fig. 2 is illustrated the patent automatic overload cut-out with which all the direct-current machines are supplied. It is contained within the adapter plug shown on the right of Fig. 1, and is adjusted to a certain maximum current. The motor is automatically stopped

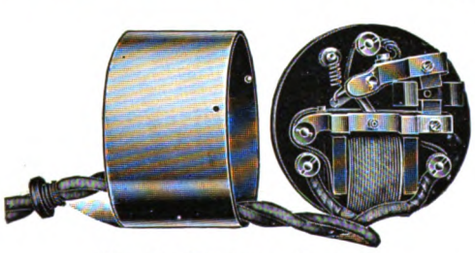

FIG. 2.—OVERLOAD CUT-OUT.

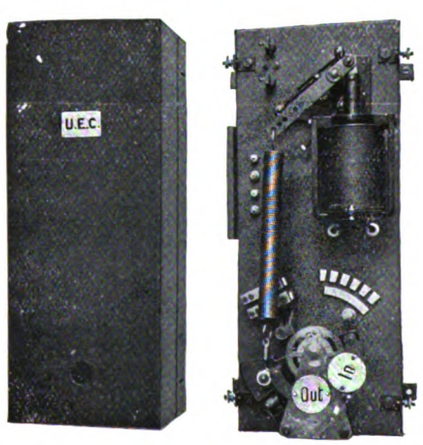

when an excessive overload is applied, and automatically re-started when the pressure is reduced to the normal value. The chief advantage of this method of protection over the ordinary form of fuse protection is that in the latter method a serious loss of time is incurred in the replacement of the fuses, whereas with the automatic cut-out the machine is ready for work again directly the overload is taken off.

Drills similar to the above, but for use on either two- or three-phase alternating-current circuits, can be obtained, but reliable drills for operating off single-phase circuits have not yet been constructed. These alternating current machines can also be obtained for operating pressures up to 500 volts. All machines are fitted with reversing switches for tapping purposes at a slight extra cost. The larger motors must be supported from some kind of pedestal or bracket. A recent development in this direction is a form of swinging bracket which is attached to the wall, and from which a drill is supported by means of a carriage frame. The wall-bracket is movable within a semi-circle, and the frame supporting the drill moves the length of the bracket arm. The feed is obtained by means of a lever working in a ratchet bar. Another novelty is a special drill for use in mining soft stones, slate, alkali, and similar semi-hard substances. This is a rotary drill, similar in construction to those already described, and would, of course, not be suitable for drilling hard stones—for the latter purpose drills of the percussion type are necessary. The machine is attached by means of two substantial collars direct to a two-legged frame, which is fitted with a ratchet drive, thus admitting of lowering and raising according to requirements. The motor, which is totally enclosed in a dust-proof outer case, is a 2 h.p. three-phase motor, but will give an output of 8 h.p. for short intervals. The drill weighs about 230 lb., and the two-legged support 66 lb.

For drilling iron or steel plates, a drill may be used in combination with an electro-magnetic hold-on frame. The magnet coils are contained within the base of the two supports, and take 0·4 amps. at 220 volts. These magnetic hold-on equipments can, of course, only be used where a direct-current supply is available. Another useful tool is a small hand grinder. The tool is held by means of a handle, and an extended neck between the motor and the wheel. These machines have, of course, only one speed.

AUTOMATIC MOTOR STARTING SWITCHES

AUTOMATIC starting devices for use with electrically-driven pumps are employed in cases where a continuous water supply is dependent upon storage tanks which are filled from time to time by the pump. At certain pre-determined minimum or maximum levels of the water in these tanks the motor is started or stopped by means of a float gear. In some cases the motor starter can be arranged quite close to the tank, and in these cases the switching on or off can be effected mechanically direct by the float, and its counter-balance weight. Starting switches of this class may be termed "Float Starters." In other cases the tanks may be situated some distance from the pump, rendering it difficult, or inadvisable, to arrange the starter in such a position as to allow of the float operating direct mechanically, and in these cases a small contact arrangement is operated by a simple float mechanism fixed on the tank. This contact is connected electrically to the automatic starter, which may or may not be arranged near the pump. A contact pressure gauge may also be used in place of the float contact arrangement. Starting switches of this class may be termed "Contact Starters." The Union Electric Co., Ltd., of Park

ELECTRICALLY OPERATED STARTER FOR 10-H.P. C.C. MOTOR.

Street, Southwark, S.E., supply automatic switches of both the above types, and a description of these will be of interest.

A starting switch of the first-class, which is operated mechanically direct from the float mechanism, is constructed as follows:—On a fixed centre spindle three levers are arranged, each capable of movement in either direction. One lever is attached to the float mechanism, another is provided with a tilting weight, and the third carries the brush for the starter contacts. When the water level in the tank falls, the float sinks, and carries with it the float lever, which can turn

Digitized by Google

through an arc of 100°. This lever engages the tilting-weight lever by means of a pin, and as soon as the weight passes the centre line the tilting-weight lever falls. The latter lever during this movement draws with it the starting lever and causes the same to move across the resistance contacts, the speed at which the resistance is cut out being controlled by a fan mechanism. As the water level in the tank rises, the float rises, and the float mechanism moves the float lever back, this carries back with it the tilting-weight lever, the starter lever remaining for the time being in its position, but as soon as the tilting-weight lever is carried over the vertical position, the weight falls and carries with it the starter lever. This return movement is not retarded by the air fan, as the mechanism is fitted with a ratchet arrangement. From the above description it will be seen that the operation of switching "on" is effected by means of the weight of the float, and switching "off" by the counter-balance weight.

The second class of apparatus consists of a small switch operated by means of a float, which is electrically connected to an automatic starting switch. A suitable form of starter for this purpose is illustrated on the previous page. This is an automatic starting switch for direct-current motors from 1 to 10 h.p. output. A strong solenoid is excited by closing the circuit by means of the contact arrangement. The core of this solenoid is free to move, and is connected through a lever to a tension spring. When the core is sucked into the solenoid, this spring is extended, and owing to the pull exerted by the spring the starter lever is drawn over the contacts of the starter, the rate of movement being retarded by the mechanical time element. The current through the solenoid windings is only momentary, as the windings are short-circuited as soon as the starter arm reaches the first contact stop. The lever which holds the spring in tension is held in position by a pawl, controlled by an electro magnet in the releasing circuit, which is closed by either the float contact apparatus or a contact pressure gauge. This switch is claimed to have all the advantages of the slow-starting automatic switch, and to be free from the disadvantage found with dash-pot types, namely, that the speed of operation varies in accordance with the air temperature. This apparatus is supplied for both direct-current and alternating-current motors.

NEW "EDISWAN" ARTISTIC FITTINGS

THE latest edition of the electric light fittings catalogue of the Edison and Swan United Electric Light Co. contains a number of new designs of fittings which distinguish themselves by their utility as well as artistic excellence of design. A feature of the catalogue is its large number of illustrations, most of which are photographic reproductions one-sixth full size. The accompanying figures are chosen from among them, and represent a handsome electrolier, and an example of the special ornamental pendant for the company's large bulb "radiolite" lamps.

FIG. 1.—SPECIAL PENDANT FOR LARGE BULB LAMPS.

The large collection of fittings comprise examples of various styles, from those which, owing to their simplicity and suitability for everyday use, have become more or less independent of fashion, to others which represent the most novel artistic designs. The collection of pendants and electroliers is particularly complete, and a number of handsome bronze statuettes are included.

One of the most useful features is the comprehensive general and numerical indexing, by means of which any fitting can be found, either under its catalogue number, or under its description. The arrangement is also to be commended, every class of fitting being brought together under its respective class heading, as plain pendants, hall pendants, ceiling fittings, bronzes, &c. This saves time in referring to any particular type, eliminating the necessity, which is often found, of turning over pages of fittings of another class in order to find one sandwiched in, as it were, amongst others of a different type.

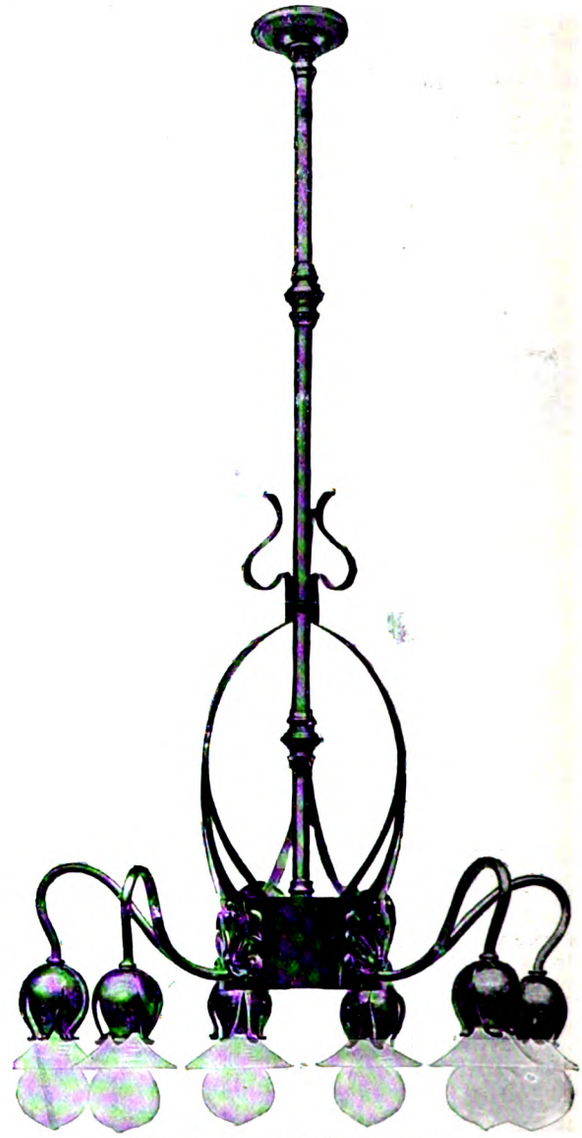

FIG. 2.—SIX-LIGHT ELECTROLIER.

The Westinghouse Metal Filament Lamp.—In case the origin of the 220-volt 32 c.p. metal filament lamp mentioned by Mr. T. H. Lowden in the discussion on Mr. Hirst's Paper last Thursday may not be quite clear, we have obtained some information as to the arrangements for the manufacture of these lamps. The 200-volt 32 c.p. lamp which was spoken of as being already on the market in this country is made at present at the Vienna works of the Westinghouse Metal Filament Lamp Co., and sold in this country by the British Westinghouse Co. The Lowden Electric Lamp Co., Ltd., have only so far manufactured experimental lamps for the Westinghouse companies, and have been carrying on a large amount of experimental work relating to details of manufacture. The building of a factory in England for the manufacture of the Westinghouse metal filament lamp on a large scale will however be commenced very shortly, and probably a new company will be formed for the purpose. There is, of course, a close connection between the different companies concerned. We understand from Mr. Lowden that great improvements are being made in the filaments and their supports which have considerably reduced the liability to breakage in transport, and that the production of lamps of lower candle-power for high voltage is now regarded only as a matter of time.

SUMMARY

A slight fire occurred on Monday at one of the Paris telephone exchanges. (Page 842.)

In connection with the alleged damage to cables by trawlers off the Irish coast, two questions have been asked in the House of Commons, and the President of the Board of Trade has stated that he has the matter under consideration. The subject was brought up at the International Telegraph Conference at Lisbon, to which a letter, signed by the cable companies, has been submitted. There is now no doubt that the damage has been done by trawlers, as pieces of net have been found on one of the damaged cables of the Commercial Cable Co. It is thought that the question will be settled between the cable companies and the fishing industries without the intervention of the Government. (Page 842.)

Letters have been received from Hooper's Telegraph & Indiarubber Works and the Union Cable Co. *apropos* of the letter we published last week on the price of cable. Both firms characterise the prices of the Cable-Makers' Association as too high. Mr. W. C. P. Tapper writes to correct an inaccuracy in the fuel costs at Stepney, published in our last issue. The fuel costs per unit generated were 0·49d. (Page 843.)

At the last meeting of the Newcastle Local Section of the Institution of Electrical Engineers, an informal discussion was opened by Mr. C. Turnbull upon the subject of the overload capacity of generating sets. Mr. Turnbull said that the maximum overload of the plant should be the maximum overload of the engine, the dynamo being made to suit. The dynamo should also be capable of running continuously at any load which the engine would deal with economically. Mr. G. G. Stoney dealt with the question more particularly as regards turbo-generators, and Mr. Brooking mentioned a way of avoiding damage through overloads to cables. (Page 843.)

Under Electrochemistry and Electrometallurgy a gas battery in which the calorific energy produced by the oxidation of sulphur dioxide to sulphuric acid is described. The E.M.F., however, is only from 0·5 to 0·3 volt. The depolarising of batteries of the Bunsen type is brought about by the addition of oxidising agents; when, however, the concentration of the oxidising substance falls below a certain strength it becomes inefficient as a depolariser. Dr. Heintz states that if the concentration of the sulphuric acid is kept high the depolarisation is efficient, even with dilute solutions of the oxidising agents. (Page 844.)

Under "Electrical Science" a report is given of Sir Oliver Lodge's presidential address to the Faraday Society on the work of Lord Kelvin. (Page 844.)

Digitized by Google

MR. A. A. VOYSEY, Electrical Engineer to the City of London, has made a full investigation of the subject of the street lighting in the City. He reports that light for light, high-pressure incandescent gas-lighting costs four times as much as flame arc-lighting, and that about £6,000 a year may be saved and a doubling of the average illumination throughout the City streets effected by flame arc-lighting assisted by a few metal filament lamps. (Page 845.)

THE Institution of Electrical Engineers has awarded premiums to Messrs. STONEY and LAW, PECK, SNELL, BARLOW, and Drs. RUSSELL and GEE for Papers read during the past session. Students' premiums have been awarded to Messrs. SPEYER, CARR, and HAMILTON. The Wiring Rules Committee will commence the preparation of a revised edition in the autumn. A Government grant of £100 a year has been given to the British Committee of the International Commission for standardisation. These and others matters are dealt with in the annual report of the Institution of Electrical Engineers. (Page 847.)

A TREATISE on "The Steam Turbine," by R. N. NEILSON, is reviewed in this issue. (Page 849.)

THE Patent Specification for the IGEWSKY electric furnace, a description of which appeared in our issue of May 14th, was published on Thursday last. Among the other specifications published is one by E. A. MITCHELL, describing a device for indicating when a road-stud on a surface-contact traction system is left alive by a passing car. Another by J. S. HIGHFIELD relates to coin-operated switches for small consumers on electric lighting systems. The process for manufacturing tungsten filaments, in which the powdered tungsten is mixed with a cadmium-mercury-bismuth alloy, is described in detail in a specification by the BRITISH THOMSON-HOUSTON Co. The specification for the BELLINI and TOSI system of directing wireless telegraphy, and one by C. B. RAYMOND and H. M. RAMP relating to oil-tight casings for transformers, are also published. An application by F. HARRISON for amendment to a patent for a process of producing tungsten alloys has been made. A patent by ALEXANDER MUIRHEAD for some improvements in transmitting apparatus for use in submarine telegraphy expires during the current week. (Page 850.)

A 600-KW. rotary converter which has recently been installed in a sub-station in Glasgow is provided with special arrangements for starting up from the alternating side. (Page 851.)

A SHORT illustrated article describes an application of chain driving to large powers. (Page 852.)

A PAPER read at a recent meeting of the Société Belge d'Electriciens by Prof. E. PIÉRARD gave full details of the temporary re-establishment of the Antwerp Telephone Exchange system after the fire which completely destroyed the exchange last October. A new C.B. exchange was in course of construction at the time, and its switchboard has been adapted for use with the old single-wire circuits, which are still in the majority in Antwerp. (Page 853.)

THE most interesting feature during the past week in connection with the London Electric Power Bills, which are still under consideration by Lord Cromer's Committee, was the evidence on Tuesday of Mr. James Falconar, chairman of the company which promoted the Administrative County of London and District Electric Power Bill. Mr. Falconar was called by the London electricity supply companies against the London and District Electric Power Bill, and he explained that the promoters of the Administrative Bill had now abandoned the project on the ground that, after having most carefully considered the matter, they had come to the conclusion that the conditions had so materially altered since 1905 that there was now no scope for a power company on the lines now proposed. The two main reasons for this conclusion were that the existing authorities had so reduced their cost of generation that it was doubtful whether the power company's agreement with them to supply at lower rates than those at which they themselves could generate would be profitable; and, further, in many areas agreements had been made with the largest consumers for several years ahead. The cross-examination of Mr. Falconar, on behalf of the promoters of the London and District Bill, brought out the fact that the decision to abandon the Administrative Bill was not absolutely unanimous, and, in fact, Mr. Samuel Insull, of the Chicago Edison Co., had sent over two of his assistants to London to give evidence in favour of the scheme now before the committee. The last opposition, namely, that of the group of eight of the largest London supply companies, is now being placed before the Committee, and since our last issue all the Borough Councils have stated their cases, and also the Middlesex County Council, and the London County Council. The opposition of the latter was set out at some length by Mr. Freeman, K.C., and was confined to suggested modifications in the Purchase Clause, and restrictions with regard to the raising of capital and the commencement of work. In this connection we give this week the modified Purchase Clause of the promoters, which, however, by no means satisfies the requirements of the London County Council, and, as a matter of fact, negotiations between the two parties have fallen through. The chief alteration in the new Purchase Clause is that definite provision is made for the institution of a maintenance and renewals fund, the object being to prevent the promoters from allowing their plant to fall into a bad state of repair near the end of their concession, and at the same time forcing the purchasing authority to pay the full capital expenditure. The London County Council and several other opposing authorities desire to impose the purchase terms of the Electric Lighting Acts. (Page 857.)

THE Belfast Corporation have finally agreed to a through service over their lines of the Cavehill and Whitewell Tramways, and reserve the right of purchasing the undertaking at any time within five years, at a sum not exceeding £600,000.—The statement which has been made in some quarters that the Bray electricity undertaking is working at a loss of £1,000 per annum, is incorrect. The deficit on the last year's working was £390.—The liquidation of the deficit on the Glasgow telephone undertaking, which amounts to £16,000, is to be spread over a period of five years.—A new electric ambulance station has been opened in the City of London.—The first of the overhead trolley lines of the London County Council tramways, from Hammersmith to Harlesden, was opened last Saturday.—Notwithstanding an increase in the price of coal of 25 per cent., the total costs, including capital charges, at Nottingham, have decreased from 1·70d. to 1·63d. per unit sold. (Pages 863-865.)

AN application is to be made to the Local Government Board for £36,345, for the purpose of remodelling the Wigan electricity station.—The tender of Messrs. Siemens Bros.' Dynamo Works for generating plant driven by a Howden engine, and the tender of Messrs. Babcock & Wilcox for boilers, have been provisionally accepted by the Bermondsey Borough Council.—The tender of Messrs. Siemens Bros.' Dynamo Works for two engines and dynamos has been accepted by the Walthamstow Urban District Council. (Pages 865-866.)

A FURTHER issue of capital is to be made by the Durham Collieries Electric Power Co., in order to cover the great expense which has been entailed by the conversion of the plant to the same frequency as that of the Newcastle-on-Tyne Electric Supply Co., in conjunction with whom the supply is now given.—A scheme

Digitized by Google

for the reconstruction of Bruce Peebles & Co., Ltd., has been submitted for the sanction of the Court.—The Felten & Guilleaume-Lahmeyerwerke, in their annual report, state that, although business has been generally very good, it has been thought advisable to reduce the dividend from 11 to 10 per cent. Their dynamo works turned out 9,330 machines last year, aggregating 385,000 h.p.—A prospectus has been issued offering for subscription 250,000 7 per cent. cumulative participating preference shares of £1 each by Marconi's Wireless Telegraph Co. The money is to be devoted principally to the completion of the company's transatlantic wireless telegraph stations. (Pages 867-868.)

THE appeal by the National Telephone Co. against the decision that the company are liable to pay royalty to the Post Office for private lines used between two firms for business purposes has been allowed. The three appeal judges were unanimous that the lines in question were exempt from the Postmaster-General's monopoly, and by a majority of two to one decided that the company was not liable to pay royalty on them by the terms of its licence. The dissenting judge was the Master of the Rolls. Lord Justice Fletcher Moulton, however, expressed the opinion that if two business firms shared the cost of connecting their premises by a private line used for both their businesses the line would be within the Postmaster-General's monopoly and would be liable to royalty. (Page 871.)

SOME particulars are given of a 200,000-volt insulator for the suspension type. (Page 874.)

THE Hull municipal telephone accounts show a net profit of £1,055 after deducting sinking fund and interest charges. We publish some particulars this week, and reserve our more detailed analysis until our next issue. (Page 872.)

WE are able to publish this week the text of a report submitted by Mr. A. A. VOYSEY, Electrical Engineer to the Corporation of the City of London, to the Streets Committee on the experimental lighting by means of arc lamps, which has been carried out during the past winter by the two City electric light companies in certain streets. The report deals with the matter in some detail, and, with its numerous photometer curves, is not only of importance on account of its proof that better illumination can be obtained at a less cost with flame arcs than with high pressure gas, but also as giving interesting comparisons of the distribution of light obtainable with various arrangements of lamps. The relative merits of central suspension and posts at the side are discussed from several points of view, especially as regards distribution of illumination; the general results are favourable to the use of the former arrangement when other circumstances permit. The experiments have so far been directed mainly to the lighting of main streets, but the improvement of the illumination of the side streets of the City is quite as important a problem. This part of the subject is dealt with in a general way in the report, and further experiments in this direction are recommended. In the more confined spaces a considerable field should be afforded for the metal filament lamp, the application of which to street lighting in provincial towns has met with so much success. As was recently pointed out by Mr. HAYDN HARRISON at the Institution of Electrical Engineers, street illumination by metal filament lamps is not only cheaper than by ordinary incandescent gas-burners, but is even cheaper than with enclosed arcs, and can compare with ordinary open arcs. We heartily endorse Mr. Voysey's plea for more artistic design of lamp standards, and we hope that his unhesitating conclusion that about £6,000 a year may be saved, and a doubling of the average illumination throughout the City streets may be effected, by flame arc lighting, assisted by metal filament lamps at certain points, will receive the due consideration of the City Fathers. The illumination of the streets in the famous "square mile" should not be inferior to that of any municipality in the world.

LAST year when judgment was delivered in the case of the Postmaster-General *v.* the National Telephone Co., to the effect that the private telephone lines between premises of different ownerships were covered by the Post Office telegraph monopoly, we warned contractors that the decision was of general application and would affect others as well as the National Telephone Co. Although this decision has now been reversed in the Appeal Court, care should still be exercised in carrying out work of this nature, as there will still be an appeal to the House of Lords, and the final decision, if in favour of the Post Office, will apply to work already done, as well as to prospective contracts. Firms who erect private telephone lines, therefore, whether on a rental or "sale outright" basis, should insert a clause in their agreements with the purchaser or lessee, that in the event of a royalty becoming payable, or of the Postmaster-General objecting to the connection altogether, the burden is to rest on the purchaser or lessee and not on the contractor. It should be noted, also, that although the appeal has been allowed in the present case, Lord Justice FLETCHER MOULTON expressed the opinion that the Post Office monopoly extends to cases where two business houses are connected by a telephone line, the cost of which they share; therefore, before such contracts are accepted the contractor would be well-advised to obtain a licence from the Postmaster-General as a preliminary step.

THE annual report of the Council of the Institution of Electrical Engineers, which we publish this week in an abbreviated form, signalises no new change of policy, and the financial position disclosed in the accounts (which we do not publish, as every member has received a copy) is eminently satisfactory. There was thus no necessity for a large attendance of members at the annual general meeting last Thursday, at which the report and accounts were adopted, and, as is now well known, these meetings are sometimes so poorly attended that the number of members present has been less than the number of speeches required for proposing and seconding the various formal resolutions that are put. But the question arises: is it not bad policy to let the annual general meetings drift into mere matters of form? The meeting has to adopt the Council's report for the year, and this is only presented at the meeting itself. It might well happen on some occasion that the report contained matters upon which it was desirable to hear expressions of opinion from the members generally, but so long as the meeting is regarded as one of mere formality, it would be difficult to awaken any sudden general interest in it after a long period of indifference. The occasion should also be one upon which the general

Digitized by Google

policy and work of the Institution should be open to discussion. The remedy for the present condition of affairs is difficult, and probably the only one would be to add something to the proceedings of the annual general meeting which would attract more men to it. To revert to the practice of holding the meeting before or after an ordinary meeting, at which a Paper is discussed, would not meet the difficulty satisfactorily. If the annual meeting were taken before the Paper members would be shy about protracting the discussion, as it would take away valuable time from the technical debate to come. On the other hand, if it were taken after the ordinary meeting, the proceedings would be hurried, as members would want to get away home. A proposal was made some time ago that the various sectional committees of the Institution, which now do very little to justify their existence, should each present a report on the position and progress during the year of its particular branch of the industry that it represents. There are four of these Sectional Committees:—(1) Traction, Light and Power Distribution, (2) Telegraphs and Telephones, (3) Manufacturing, and (4) Electrochemistry and Electrometallurgy. If reports by these were prepared by the beginning or middle of May each year, and circulated to the members with an intimation that there would be an open discussion at the annual general meeting, it would do much to arouse interest in the meeting and to secure an attendance capable of intelligent appreciation or purposeful criticism of the Council's report also.

American Municipal Electrical Convention.—The annual convention of the International Association of Municipal Electricians will be held at Detroit, Mich., August 19th, 20th, and 21st.

Proposed Electrification of Dock Plant at Alexandria.—In November last the Egyptian Government announced its preparedness to proceed to the execution of the important scheme it was known to have been contemplating for some time for the electrification of the discharging apparatus and quay plant of the port of Alexandria. Specifications were issued in due course, and tenders invited; the contract was expected to amount to a considerable sum, not less than £E200,000. In a period of declining enterprise generally it is not surprising that some twenty-five firms, of various nationalities, responded with tenders. From that moment to the middle of April nothing more was heard of the matter, and extreme surprise was occasioned among those firms by whom considerable trouble, expense, and ability were expended in the task of framing designs and estimates for a contract of the particularly complicated character of the electrical engineering in this instance. Towards the close of April the Government published a note in the Press, stating that it had been decided to abandon the scheme for the installation of the electrical plant, owing to the lack of available funds and the decline in exports and imports. Further down, however, the note, as published in the *Egyptian Gazette*, proceeds to say that "for these reasons the Government considers it opportune to postpone the work." It would therefore appear that the scheme will be carried out sooner or later, and this, or something like it, appeared to be indicated by implication by Admiral Sir Massie Blomfield, who, on retiring from the post of Director-General of the Port of Alexandria and Lighthouses Administration, referred, in his farewell address last month, to the projects for the completion of the Government's intentions to render Alexandria a port, in its equipment, design, and spaciousness second to none in the Mediterranean. It is being said in Egypt that the French tendering firms were likely to feel the disappointment most keenly. There are no clear grounds for ascertaining why it is generally assumed in Egypt that this important contract would have fallen to the French, unless it be on account of the particular care and elaborate minuteness with which the French tendering firms did their work of *reconnaissance* and design; but that is the impression generally held. In any case the scheme would have been an interesting demonstration of electrical engineering applied to a great port. Whether it will be adhered to in full on its realisation is not yet certain, nor yet whether the tendering firms will stand in the same order of success. Doubtless modifications will occur in the one and the other.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 4TH.

Royal Society.

4.30 p.m. Among the Papers down for reading is the following:—"The Electrical Properties of Porcelain, with Special Reference to Dielectric Losses," by H. F. Haworth, communicated by Prof. W. E. Ayrton, F.R.S.

TUESDAY, JUNE 9TH.

Faraday Society.

8 p.m. Meeting at the Institution of Electrical Engineers, 92 Victoria Street, Westminster. Paper to be read:—"The Utilisation of Atmospheric Nitrogen in the Production of Calcium Cyanamide, and its Use in Agriculture and Chemistry," by Dr. Albert R. Frank.

FRIDAY, JUNE 12TH.

Physical Society.

8 p.m. Meeting in the Physics Laboratory of the Royal College of Science, South Kensington. Included in the agenda are the following Papers:—(1) "Experiments on a Directive System of Wireless Telegraphy," by Messrs. Bellini and Tosi; (2) "On the Resistance of a Conductor of uniform thickness whose breadth suddenly changes, and on the Shapes of the Stream Lines," by Prof. Lees; (3) "On the Self-Inductance of two Parallel Wires," by Dr. Nicholson.

Fire at a Paris Telephone Exchange.—The *Morning Post* reports that a small fire broke out on Monday on the second floor of the central telephone exchange in Rue Gutenberg. Although there was considerable panic amongst the operators, no one was injured. The fire was got under control in about forty minutes, but a good deal of damage was done, and the service to about 1,200 subscribers will be interfered with for some days.

Damage to Cables by Trawlers.—In connection with the note on page 818 of our last issue, relating to damage to cables by fishing trawlers off the Irish coast, reference may be made to a question by Mr. Boland, in the House of Commons on Thursday, who asked the Vice-President of the Department of Agriculture (Ireland), whether his attention had been called to the published statement of the diplomatic representations made by the United States Government on the subject of the breaking of the submarine cables off the coast of Kerry by trawlers; whether he was aware that these trawlers carry on operations within the prohibited limits, and, in addition to the damage done to the cables, had inflicted serious loss on the local fishermen; and whether, in view to safeguarding the interests of the fishermen and of the cable companies, nine of whose cables are laid in a space of one and a half miles in Ballingskelligs Bay, he would endeavour to secure protection from the operations of these trawlers in this district. Mr. T. W. Russell replied that the alleged damage to submarine cables by steam trawlers had been brought under the notice of the department. The protection of cables was not the direct work of the department, who had, however, taken all steps that were reasonably possible to secure the due observance of their fishery bye-laws. In reply to a similar question in the House, addressed to the President of the Board of Trade by Mr. Joynson-Hicks, on Tuesday last, Mr. Churchill replied that he had received numerous representations from bankers, brokers, merchants, and shipowners, and that he was considering, in consultation with the Postmaster-General, whether any steps might be taken under the International Telegraph Convention and the Submarine Telegraph Act, or otherwise, for the protection of the cables. He understood that one of the companies concerned had recently substituted a stronger cable in the area afflicted, with good results. With regard to issuing warnings, there were very obvious objections to showing the routes of these cables on the Admiralty charts. A letter signed by representatives of all the cable and telegraph companies has been submitted to the International Telegraph Conference now sitting in Lisbon. In this letter it is stated that the Anglo-American Company alone within the last two years has been obliged to repair the shore ends of three out of four of its cables which land at Valentia, at a cost of over fifty thousand pounds. It has been proposed that, as in the case of the seal fishing industry of Newfoundland, a guard-boat should be kept near the fishing grounds where the cables lie, to warn off the trawlers. Although it has been stated that the damage was done by coral, pieces of fishing net have been found on the cables, which have also been found flattened for a considerable stretch, and it is evident that trawlers have done the damage. At the Lisbon Conference a German delegate announced that a trawl had been invented which would not cause any damage to cables. The chief difficulty of the situation is that the Government has no power to interfere outside the three-mile limit, but it is thought that the question may be settled between the cable companies and the fishing industries without Government intervention.

CORRESPONDENCE

THE PRICE OF CABLE.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The letter of Mr. H. Ellis Thompson in your issue of May 28th may be dealt with in various ways according to the interests affected. In your editorial note you mention "The designation vulcanised rubber cable of the '600 megohm' class is perhaps a loose one," and we quite agree, as no one appears to know what the insulating material on "class wires" may be guaranteed to consist of. In one catalogue of "association grade wires" the specification of the insulating material for 300-megohm grade, 600-megohm grade, and 2,500-megohm grade appears to be the same for each, consisting of a thick lap of pure para rubber and two coats of best vulcanising rubber, with the same diameter for each grade, which raises the question as to what "best vulcanising rubber" can be expected to represent.

When manufacturing firms compete for a contract to a strict and definite specification, their prices begin to approach the comparative level of the "foreign wire." We would suggest for contracts of the description mentioned in Mr. Thompson's letter, consulting engineers might issue specifications, giving the true description of the component parts of the wires and cables they wish to have, and specifying the mechanical and electrical tests which have proved reliable in obtaining the best results, such as the rules issued by the Institution of Electrical Engineers.

The experience gained by the behaviour and durability of wires and cables supplied to the Government Departments and other public authorities should be of value to the consulting engineers, and we believe they would then find they could ensure for their clients vulcanised india-rubber wires satisfactory to them for insulation, durability, and price.

Yours faithfully,
JNO. P. HOOPER, Managing Director.
(Hooper's Telegraph and India Rubber Works.)
31 Lombard Street, London, E.C.
June 1st, 1908.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—It is the "C.M.A." which, like the blessed word "Mesopotamia," does the trick. Some engineers prefer to pay 100 per cent. more for their cables in order to have the magical letters "C.M.A." attached, and "C.M.A." manufacturers are to be congratulated. We know other engineers who have been buying cable not made by the C.M.A. manufacturers for the last eight years, and who are quite content to go on in the same jog-trot way, getting a fair share of work at remunerative prices and pocketing the money which the letters "C.M.A." did *not* cost them.

Yours faithfully,
J. A. BLACKWOOD, Secretary and Manager.
(The Union Cable Co., Ltd.)
27 Eagle Wharf Road, London, N.
June 1st, 1908.

STEPNEY ELECTRICITY SUPPLY ACCOUNTS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—With reference to the notice of our accounts appearing on pp. 813-4 of your current issue, I beg to call your attention to two inaccuracies in the costs per unit sold. You have evidently divided the total number of units sold into the coal costs and dust destructor steam costs *separately*, and the results thus obtained make our coal costs appear much lower than is actually the case, while the cost of destructor steam becomes ridiculously low. On p. 814 the extract you have made from my report gives the accurate costs per unit for coal and destructor steam, and, of course, do not agree with the figures you show on the previous page.

Yours faithfully,
W. C. P. TAPPER, Engineer and Manager.
(Electricity Works.)
27 Osborn Street, Whitechapel, E.
May 30th, 1908.

[Mr. Tapper is right. The items for "coal" and "steam for dust destructor" under "generating costs" should be added to give the costs of fuel per unit sold. The fuel costs per unit sold were, therefore, 0·49d. for the year ended March, 1908, as compared with 0·48d. in the previous year. The fuel costs per unit *generated* from coal were 0·439d. in 1907-8, as against 0·405d. in the previous year, and from destructor steam 0·400d., as against 0·451d. in 1906-7.—ED. *E.E.*]

OVERLOAD CAPACITY OF GENERATING SETS

Newcastle Discussion

AN informal discussion on the above subject was opened at the last meeting of the Newcastle Local Section of the Institution of Electrical Engineers by Mr. C. Turnbull (Borough Electrical Engineer, North Shields).

Mr. Turnbull remarked that in the early days of electricity supply the steam engine was almost always more powerful than the dynamo which it drove. Engine building was an established industry when dynamos came into being, and engine builders were accustomed to build to liberal proportions, while electrical manufacturers were not then emancipated from the instrument makers, who suffered from the delusion that it was merely necessary to touch two wires together to enable them to carry any current. It was standard practice in those old stations to have an engine which could run its dynamo off its legs, and a switchboard which would not safely carry all the current which the dynamo could give it. Switchboards even yet have not entirely overcome this fault.

Engines are still frequently made more powerful than the dynamos attached to them. A case recently noticed was that of a 3,500-kw. set, which gave better economy to 6,900 kw. than at nominal full load. It would probably have given up to 8,000 kw. with the by-passes open. The most economical load was at 5,000 kw. In a case of this kind one must come to one of two conclusions: either the nominal rating is a misnomer, or else there is an astonishing waste of potential power. One can hardly believe that the dynamo would be capable of doing from 5,000 kw. to 7,000 kw. continuously at ordinary power factors, with good regulation, and if it were not able to do this it could not work on the best part of the curve. Probably some £700 more spent on the dynamo would have enabled it to stand up to the engine's full load, and this small sum would have given the owners of the plant some 2,000 kw. extra capacity. This would have also saved in running costs, as less plant would have been in operation if this set could have run at these heavy loads. For a maker to supply the engine so much more powerful than its dynamo shifts the economical part of the consumption curve beyond the user's reach, and in case of a short puts an unduly heavy strain on the dynamo. One sometimes hears that dynamos need not be made with great overload capacity. It is difficult to agree with such a contention. The stresses which a dynamo must endure when a partner breaks down are tremendously severe, and the breakdown of one machine may wreck the whole of the running plant if the dynamos be not liberally proportioned. Good overload capacity enables one to face such contingencies, if not with an easy mind, at any rate with hope. There is another thing which particularly applies to direct-current sets, that commutators run much better below full load.

Mr. Turnbull summarised his views as follows:—The consumption curve usually slopes down to a certain point and then up again. Full load might be defined as the point where the most economical load is exceeded by, say, 10 per cent. Overload is beyond this. Combined plant must give at least the specified power. It must also be capable of running continuously at full load as specified above, and at such overload as may be agreed. The maximum overload of the plant should be the maximum overload of the engine, the dynamo being made to suit. The dynamo should also be capable of running continuously at any load which the engine would do economically.

The discussion was continued by Mr. A. S. BLACKMAN, who thought that generating plant built a few years ago usually gave more overload capacity than modern machinery. He did not think that thermometers were used sufficiently in finding out the limit to which a machine can run on overload during working conditions, and he would like to know the limits to which it was safe to carry the temperature of armature windings. Mr. Turnbull had incidentally mentioned that switch-

Digitized by Google

boards were frequently designed so as to render overload out of the question. This is probably due to the very careless way in which some specifications for switchboards are drawn up. For instance, he knew of one board in the Midlands designed to carry about 10,000 kilowatts capacity, in which the only stipulation was that it should carry the load with "reasonable temperature rise."

Mr. A. H. LAW said that overloads on engines could be frequently coped with by passing the high pressure steam directly to the low pressure cylinder. In colliery work, overload was nearly always accompanied by a poor power factor. Therefore the excitation of the dynamo must have a very large margin. In lighting work the overload often improved the power factor, either if it came directly or through synchronous motor generators. For alternators, the voltage drop was the limiting factor even more than the temperature rise. In direct current there was the commutation limit. As regards insulation, it should be remembered that overloading a machine is safe for a certain definite time only, the life becoming shorter as the overloads are increased.

Mr. G. G. STONEY (Messrs. C. A. Parsons & Co.) pointed out graphically the relation of overload to normal load, and exhibited a curve to show the varying behaviour of a reciprocating and a turbine set. According to Mr. Turnbull's definition, full load was located at point R 10 per cent. beyond point A, the most economical point on the curve XAR for the reciprocating engine. In the turbine set nominal full load was usually taken at point F on the curve XAR^1, the $1\frac{1}{4}$ load being located at the point A, and the $1\frac{1}{2}$ load at point R^1. The point to remember was that in a reciprocating engine, the consumption rapidly ascends again after it has reached its economical point, while

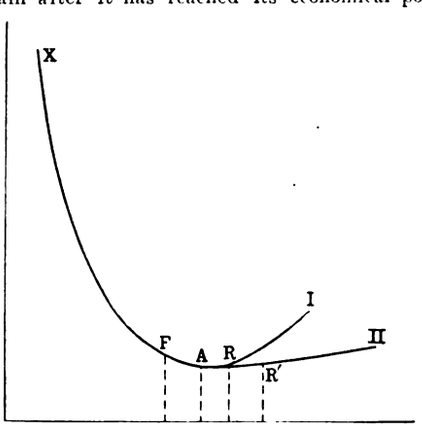

DIAGRAM ILLUSTRATING MR. STONEY'S REMARKS.
I. Curve for reciprocating engine.
II. Curve for turbine.
F. Turbine, full load.
A. Turbine, $1\frac{1}{4}$ load.
R. Reciprocating engine, full load.
R'. Turbine, $1\frac{1}{2}$ load.

in the turbine the curve continued practically horizontal. Moreover, the turbine, if it ran five minutes under overload, would run equally well for 500 hours. The point could be put this way: an alternator had a time limit but no load limit, while the turbine had a load limit but not a time limit, and the proper combination of a turbo-alternator depended on the balancing of these conditions. The best specification was generally one which required a 5 per cent. voltage regulation at full load, and an overload of 25 per cent. to the point where bye-passing became necessary, with a capacity of 50 per cent. overload when the bye-pass was opened.

Mr. BROOKING (Messrs. Glover & Co.) wished to know whether overload was confined to engines, dynamos, and switchboards in this Paper. If not, he would like to mention that cables, which form an important part of a supply system, are also subject to overload evils, such as decentralisation, expansion, and contraction. The trouble of decentralisation has been now overcome by the use of paper insulated cables and solid bitumen cable. The trouble of expansion and contraction has not, however, been thoroughly dealt with up to the present. A patent has recently been taken for the control of expansion and contraction locally along the conductor, and this is being taken up by his firm. The method consists of spacing each wire of the strands some little distance from one another, and doing away to a certain extent with the inner core. Expansion and contraction, therefore, takes place between the spaced wires at every inch of the length.

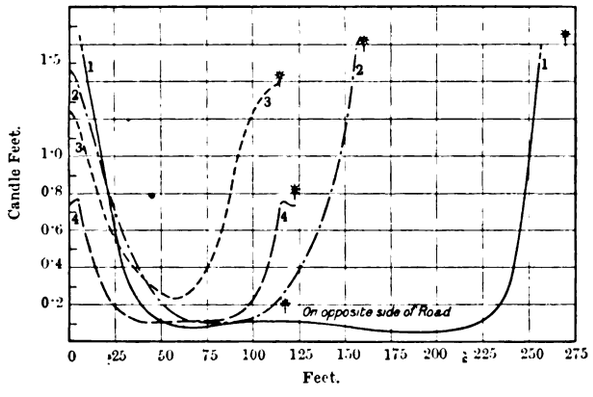
Mr. TURNBULL, in reply, referred to Mr. Ram's story of the station where everybody got behind pillars when a generator was being paralleled. He thought this illustrated the question of overload on some switchboards. The main point of his contention was, that it was better to run one machine at the point on Mr. Stoney's curve marked R^1 than two machines at the point marked F^1. Mr. Brooking's communication with regard to loose wire cable was interesting, but he would be inclined to say that the cable might easily absorb water.

ELECTROCHEMISTRY AND ELECTRO-METALLURGY

J. W. JUNGER, in an American Patent (No. 885,054), describes a gas battery in which the calorific energy of the reaction $SO_2+O+H_2O=H_2SO_4$ is converted into electrical energy. The sulphuric acid formed in the process is reconverted into sulphur dioxide by heating it with carbon. The apparatus consists of a stoneware vessel, which is divided into two parts by means of a porous non-conducting plate. In both compartments there are plates of conducting carbon, for example, graphite, the one being arranged as an oxidising electrode and the other to act as a reducing electrode. The one acting as oxidising electrode is surrounded with porous carbon, the best form of which is porous graphite, and is moistened with a solution of nitroso-sulphuric acid in highly concentrated sulphuric acid. The other plate is surrounded with finely powdered porous coke or retort carbon, and is moistened only with strong sulphuric acid. The porous partition is also saturated with sulphuric acid. Air and moist sulphur dioxide are passed through the battery, which, when it is connected with a suitable resistance, gives a constant electrical current. Sulphur dioxide, in presence of the oxygen of the air and water, is converted into sulphuric acid, which flows out from the battery. This, as already stated, may be reconverted into sulphur dioxide. The E.M.F. of the battery depends upon the concentration of the sulphuric acid, and varies between 0·5 and 0·3 of a volt.

In the *Centralblatt für Accumulatoren und Galvanotechnik* of May 20th, Dr. K. Heintz describes a method for obtaining the best effect from primary batteries of the Bunsen type. The E.M.F. of the cell depends upon the employment of a successful oxidising agent in order to prevent polarisation. Generally speaking, owing to dilution, the oxidising agent after a short time loses its power, and it is necessary to empty out the battery and to add a fresh quantity of this oxidising substance. The depolarising action is thus dependent upon the concentration of the oxidising agent. It is now stated that it is not necessary to use strong solutions of chromic acid or permanganic acid, provided that strong sulphuric acid is employed, and the acid when mixed with the electrolyte should not have a sp. gr. less than 1·25. By acting in this way, comparatively weak solutions of oxidising agents will work satisfactorily until they have been practically completely reduced. When they are no longer active a portion of the solution is withdrawn, some more oxidising agent added, and then strong sulphuric acid. It is thus not necessary to disconnect the battery and take it to pieces, but simply to withdraw a small portion, as already stated, of the electrolyte. After a time, however, the concentration of the produced salts becomes too great, and then the whole of the electrolyte must be replaced. The chief point, of course, is in it not being necessary to use concentrated solutions of the rather expensive depolarising agents, and in the fact that in the presence of strong sulphuric acid they can be completely used up.

ELECTRICAL SCIENCE



Presidential Address of Sir Oliver Lodge to the Faraday Society.—Sir Oliver Lodge commenced his presidential address before the Faraday Society on the work of Lord Kelvin last week by pointing out the difficulty of doing justice in the course of a short address to a man who from an early to an old age had turned out work embracing practically all branches of physical science. He had calculated the age of the earth, worked in the domain of electro-statics, optics, elasticity, telegraphy, besides many other practical subjects. Sir Oliver himself dealt with the more recondite and abstruse branches of his activity. He was not entirely able to agree with some of Lord Kelvin's assumptions, neither did he always consider that his practical work entirely bore out his conclusions. For instance, in the case of the kinetic theory of solidity, Kelvin seemed to consider that solids could be made from fluids and fluids from solids, and that matter might be ether in motion. But more recently he seemed to have rather modified his views, and appeared satisfied with the postulate of action at a distance through space without the intervention of connecting medium. Sir Oliver Lodge himself was unable to accept the explanation of action at a distance without the intermediary of some form of matter. Nothing in Lord Kelvin's work was finer than his publications in 1851, or showed the extraordinary keenness of mind aided by the tremendous natural powers which he possessed. His prescience was at that date even greater than that of Helmholtz. Posterity would probably consider that the greatest of all his work was that upon the conservation of energy and his enunciations upon the laws of thermodynamics. Reference was also made to the importance of his work upon absolute measurements, and Sir Oliver pointed out that some persons appeared to think that absolute measurements meant the metric system, but it did not matter in the least what units were employed so long as they were understandable.

STREET LIGHTING IN THE CITY OF LONDON

ON page 803 of our last issue reference was made to a report by the Engineer to the City of London as to the cost of street lighting in the City, especially in reference to the experimental electric lighting carried out during the past winter by the City of London Electric Lighting Co. and the Charing Cross, West-End, and City Electric Supply Co. We are now able to publish the report of Mr. A. A. Voysey, Electrical Engineer to the City, embodying some interesting photometric measurements, which has been presented to the Streets Committee. The report reads as follows: —

It is now my duty to report on the subject of the public lighting of the City, having regard to recent experiments which have been made with a view to improve and cheapen it. In the first place, I propose briefly to refer to what is called the science of photometry, of which I have made some use for the purpose of this investigation. Many people even to-day, in dealing with questions of artificial light, are content with a statement of the candle-power of the source of light—a statement frequently as false as it is vague—taking no account of the directions in which light is given, of the globe, lantern, reflector, position and surroundings of the lamp, all factors of the utmost importance in determining the useful lighting effect. However important the study of the source of light may be, the study of the actual illumination in the street under working conditions is far more essential. In 1892 the work of Mr. A. P. Trotter, now the Electrical Advisor to the Board

CURVE A, CURB LIGHTING.

of Trade, showed the lines on which such an examination might proceed, and at the same time provided an excellent illumination photometer for the purpose. I worked a great deal with this instrument in the City in 1896, taking measurements of the illumination on a horizontal surface six inches from the ground, and formed the opinion that the illumination measured on a horizontal surface may be taken as a sufficient indication of the effective lighting of a street. I am now again led to the same conclusion. But as the tendency is to measure illumination at a height of four feet from the ground, my recent tests have been made at this level. The photometer used is an improvement on the one used in 1896 and was sent to the National Physical Laboratory for verification. The unit of illumination is that produced by one candle-power at a distance of one foot and is called one candle foot.

Attached hereto will be found some curves showing the illumination given in Holborn, Cannon Street, and Queen Street by the experimental lamps. The length of the street in feet is plotted along a horizontal scale and the vertical scale is marked in candle feet and fractions thereof, so that the curves show the variation in illumination along the street. Curves "A" show the illumination along the curb line given by flame arc lamps in Holborn Viaduct and Cannon Street and by gas in Queen Street. Curves "B" are similar, but are taken along the centre of the road. Curves "C" show the difference in illumination along the curb in Cannon Street, between the central suspension of lamps at a height of 28 ft. and lamps on posts at a height of 20½ ft. Curves "D" are similar, but along the centre of the road. There is also shown the effect of turning out one of the centrally-hung arc lamps. Curves "E" show the effect of suspending the lamps in Cannon Street at 26 ft. instead of 28 ft. Curves "F" show the effect of lighting Tower Royal with the centrally-suspended flame arc lamp in Cannon Street, with a flame arc on a post and with two incandescent gas lamps. The arc-light curves marked "A" and "B" are each taken as the mean of several curves, and the atmo-

CURVE B, CENTRE OF ROAD.

spheric conditions, when the tests were made, were clear and favourable. The Curves "C," "D," "E," and "F" were taken with a view to make specific comparisons, and they each represent a single set of observations. The atmospheric conditions prevailing when curves "E" were taken were distinctly inclined to be foggy.

It is now necessary to consider what conclusions can be drawn from the curves. I have already stated that I think the illumination given on a horizontal surface can be taken as a sufficient indication of the value of the lighting in a street. Next, I have formed the opinion from observation and testing that the minimum illumination is the most important factor in good lighting, and I have come to the conclusion that about one-tenth of one candle foot is the minimum below which it is not desirable to go in the main streets of the City. If that figure is adopted and maintained, then I think that the main streets of the City will be very well lighted. If the curves

for Holborn Viaduct are studied, it will be seen that, although Holborn Viaduct is a very wide thoroughfare, the lighting is not very far from complying with the minimum value which I think necessary.

In order to meet any possible objection to unpleasant colour, the Holborn Viaduct lamps are trimmed with carbons giving a pleasantly-toned light, but the illumination is thereby reduced. If 7 m/m and 6·35 m/m (cores 3/32 in. and 1/16 in. respectively) carbons are used in Holborn Viaduct, giving a

Digitized by Google

yellower light, the minimum illumination would be increased so as not to fall far short of the necessary value, and it could be regarded as approximately fulfilling what I think are the reasonable requirements for the sufficient lighting of a City main street. I do not think that Holborn Viaduct can pro-

CURVE D, CENTRE OF ROAD.

perly be compared with Cannon Street, because, in addition to other reasons, the width of the Viaduct is about 50 per cent. greater than the width of Cannon Street. Therefore, I determined to make another test in Cannon Street, first with the centrally-hung lamps as used at present and then with identical lamps on posts on the footway, keeping the conditions of current and carbons the same for both. The arrangements for this test were kindly made for me by the City of London Electric Lighting Company, and the results shown in curves "C" and "D" indicate the advantage obtained by central hanging in a street such as Cannon Street, which is fairly typical.

The illumination curves of the centrally-hung lamps in Cannon Street show that the lighting also fulfils the suggested condition that the minimum should not be less than one-tenth of one candle foot, and I think the curves are very good ones and indicate what is obvious from an examination of the street, namely, that the lighting is very good, and, if we study the curves, the advantages of the central suspension and the extra height of the lamps are evident. From the central suspension there is, however, an additional gain for side streets and at the junctions of streets owing to the fact that the light of one lamp can be used over a greater area. For instance, 45 per cent. of the cost of lighting in Cannon Street is saved on gas in the side streets. This economy could to some extent be obtained by placing posts at the corners of streets, but I do not think it could be obtained to the same extent as is possible with the higher centrally-hung lamp.

An experiment was made in Cannon Street at the suggestion

CURVE E, CENTRE OF ROAD.

of the late Chairman, Mr. Stopher, some of the lamps being hung at 26 ft. instead of 28 ft. The result is given in curves "E," which, I think, show that the higher position is slightly better than the lower one. Curves "F" show the illumination in Tower Royal, a turning off Cannon Street, lighted by the centrally-hung arc lamp, and by the arc lamp on a standard in Cannon Street and by the two incandescent gas lamps on brackets in Tower Royal. The curves show the advantage of the central suspension.

Attention should be drawn to curve "D," No. 3, which shows the effect of extinguishing alternate lamps in Cannon Street. The curve does not fulfil the requirements of a well-lighted main street, but it shows a better result than Queen Victoria Street, and the lighting is very fair. If it were not for the fact that the cleansing of the streets is an operation which may be greatly assisted by good lighting, I should be inclined to recommend the turning out of half the lights in the main streets at midnight, and I think the matter is worth consideration. This is, perhaps, an opportune place to discuss the question of ligting hours. In my opinion the fixing of lighting hours between sunset and sunrise is a mistake, and I think the lighting might be curtailed on an average of about one hour per day, half in the morning and half in the evening, if a reasonable reduction were made in the annual charges. It is now desirable to consider the question of comparative cost, and this is bound up with the question of spacing.

The average distance between the centrally-hung lamps in Cannon Street is approximately the same as that of the standards in Holborn, though Holborn is 50 per cent. wider than Cannon Street. The average spacing of the centrally-hung lamps in Cannon Street is a little closer than the spacing of the old standards in that street, there being eleven of the

CURVE F.

suspended to ten of the lamps on standards. The extra lamp results really from the consideration of the side streets rather than from any need in Cannon Street itself. With regard to spacing, a regular distance should be followed as closely as possible, but due consideration must be paid to side streets and cross streets in order to obtain the most economical results. As will be seen from the curves, the distance between the lamps in Cannon Street varies from 112 to 165 feet. I think the latter distance may be regarded as the extreme, beyond which it is not desirable to go; whereas the former is closer than is necessary and can only be justified by a consideration of the side streets.

For the purpose of comparing the effect of gas with electric lighting I made a test in Queen Victoria Street, but I found a large portion of this street with a very low illumination, and neither from observation nor test did it appear to me at all comparable with Cannon Street. I therefore sought out a piece of good gas lighting, and I found this in a portion of Queen Street. It was interesting to find that the piece of street I picked fulfilled the condition which I had fixed as essential for a well-lighted street, namely, that the illumination on a horizontal surface four feet from the ground should in no place be less than one-tenth of one candle foot. The average illumination of the picked piece of gas lighting in Queen Street, which is, fortunately, just the same width as Cannon Street, is only about half that in Cannon Street, though it is about double the cost. This confirms what I reported three years ago as the result of some photometric tests, namely, that light for light, high-pressure incandescent gas light costs four times as much as the flame arc light. It may here be observed that departments of the Corporation, other than the Public Health Department, are now saving at the rate of about £3,000 a year, partly by changing from gas to electricity and partly by

Digitized by Google

bringing electric lighting up to date, and I have good reason for saying that this sum could be considerably added to.

On the whole, I think it may be fairly assumed that about 500 eleven-ampere flame arc lamps will light the main streets well, whether centrally-hung or on standards. The cost of these at £17 10s. each would be £8,750. The present cost of lighting the whole City is about £22,000 a year, about half the cost being for electric light and the other half for gas. In addition to this a sum of about £17,000 appears to have been spent in the last nine years on providing and maintaining apparatus for gas lighting. The side streets can be very much better lighted by centrally-hung arc lamps than they are at present for a sum which I estimate approximately at £5,000 to £6,000 per annum. It is very important in my opinion that the main-street lighting should not be arranged independently of the side streets. Economical effective lighting of both is bound up one with the other. A few lamps arranged in the side streets off Cannon Street would quickly show what can be done. I have very little doubt that the average illumination throughout the whole of the City streets can be at least doubled, and a saving of about £6,000 a year effected.

On the subject of lamp supports, I think it may be remarked, with regard to the central suspension, that the plan followed in Cannon Street of making them as invisible as possible is a good one. Attachments would have to be securely made and the supporting wires carefully examined, and, no doubt, the existence of a large number of such supports in the City would necessitate some extra cost to the Corporation in the supervision of overhead wires. But if reasonable care is used in the matter, there should be no danger whatever attaching to the central suspension of lamps. In the main streets the plan of trimming the lamps in position during the early hours of the morning is a sound one. No doubt some small occupation of the roadway space during busy hours would take place when a lamp went wrong at such a time, but it must be remembered that a standard on the footway remains for several thousands of hours each year as an obstruction to traffic and must necessarily be a much greater cause of inconvenience than the very occasional visit for a few moments necessitated by a fault in a centrally-hung lamp.

In narrow streets it would be advisable to arrange for bringing the lamps down to the footways for trimming, because otherwise a serious obstruction to traffic would occur. In some very wide streets, like Holborn and Farringdon Street, it might be advisable to use standards placed in the centre of the road, and in any case a certain number of standards may be required.

While I recognise the importance of economy and the consequent need to use existing material as much as possible, I think I ought to point out the unsatisfactory condition of London in the matter of lamp standards and especially electric-lamp standards. The design is usually left to an iron-founder's draughtsman. Mr. Norman Shaw has very kindly given his gratuitous aid in matters affecting the appearance of London, and I think his help might very well be asked. If new posts are found to be necessary, I think some endeavour should be made to redeem the reputation of London in this matter.

I will re-state my main conclusions:—(1) That the illumination on a horizontal surface four feet from the ground is a sufficient indication of the useful light in a street; (2) that the minimum value of such illumination is the most important factor in good lighting; (3) that such minimum should not be less than one-tenth of one candle foot; (4) that this illumination can be approximately obtained by eleven-ampere flame arc lamps with yellow flame carbons, spaced approximately as at present, either on standards at 20½ feet, as in Holborn Viaduct, or centrally hung, as in Cannon Street, at 28 feet from the ground; (5) that a more even distribution of light, and a more economical result can be secured by the centrally-suspended lamp at 28 ft. than by the lamp at 20½ ft. on a standard; (6) that economy and efficiency require the treatment of main streets and side streets together; (7) that a demonstration should be made in the side streets of centrally-hung arc lamps as soon as possible; (8) that about £6,000 a year may be saved and a doubling of the average illumination throughout the City streets effected by flame arc lighting, assisted by a few metallic filament lamps where arc lamps have not a sufficient area for economical lighting; (9) that where central suspension is used, it should be without lowering gear in broad streets, and with lowering gear in narrow streets; (10) that any new standards which may be required should be designed according to the advice of some reliable guide, such as Mr. Norman Shaw; (11) that the lighting hours can be re-considered with a view to economy without prejudice to lighting efficiency; (12) that the question of reducing the lighting in the main streets at midnight should be considered.

In order to obtain as soon as possible the great advantages in economy and better lighting that I have shown to be possible, I think a small demonstration should be invited from both companies in the side streets, and some of the streets adjoining Cannon Street would be very suitable for the purpose. I also think it would be a great advantage if a provisional decision were come to as to whether the lighting is to be divided between the two companies, and, if so, in what proportions. If that is done, and the side-street demonstration of lighting found satisfactory, then the way will be clear for the preparation of complete plans and specifications for lighting the whole of the City, and instructions might be given accordingly.

INSTITUTION OF ELECTRICAL ENGINEERS

ANNUAL PREMIUMS.

THE following premiums for Papers and communications have been awarded by the Council this year. In accordance with precedent, in deciding upon these awards the Council have not taken into account Papers contributed by members at present holding office on the Council.

The Institution Premium, value £25, to Messrs. G. Stoney (member) and A. H. Law (associate), for their Paper on "High Speed Electrical Machinery."

The Paris Electrical Exhibition Premium, value £10, to Mr. J. S. Peck (member), for his Paper, "Protective Devices for High-Tension Transmission Circuits."

An Extra Premium, value £10, to Mr. J. F. C. Snell (member), for his Paper on "The Cost of Electrical Power for Industrial Purposes."

An Extra Premium, value £10, to Dr. A. Russell (member), for his Paper on "Dielectric Strength of Insulating Materials and Grading of Cables."

An Extra Premium, value £10, to Dr. W. W. Haldane Gee (associate member), for his Paper on "Electrolytic Corrosion."

An Extra Premium, value £10, to Mr. T. M. Barlow (student), for his Paper on "Heat Conductivity of Iron Stampings."

STUDENTS' PREMIUMS.

A First Students' Premium, value £10, to Mr. H. R. Speyer (Frankfort-on-Maine), for his Paper on "The Electrification of the Mansfield Copper Mines."

A Second Students' Premium, value £8, to Mr. L. H. A. Carr (Manchester), for his Paper on "Electricity and Matter."

Three Students' Premiums, each of the value of £5, to Mr. A. Hamilton (Glasgow), for his Paper on "The Brown-Mackenzie System of Electric Block Signalling"; to Mr. H. W. Gregory (London), for his Paper on "The Motor Converter"; and to Mr. P. C. Jones (Manchester), for his Paper on "Starters and Control Gear."

Students' Papers which have been awarded a premium are printed in the *Journal* in full or in long abstract. [An article by Mr. H. R. Speyer, on the Mansfield Copper Mines, also appeared in ELECTRICAL ENGINEERING, Vol. II., pp. 570, 609, and 650.]

At the thirty-seventh annual general meeting of the Institution of Electrical Engineers, held on Thursday, the Council presented its report for the past session. Since the date of the last annual general meeting, 202 proposals for election to corporate membership, and 314 proposals for election as Student have been considered, and 492 of these 516 have been elected, viz.: 7 Members, 165 Associate Members, 17 Associates, and 303 Students. Forty-five Associate Members and five Associates have been transferred to the class of Members; 43 Associates and 96 Students to the class of Associate Members; and one Student to the class of Associates. There have, however, been a number of losses through deaths, resignations, and erasures, and the total membership is 6,048 members of all classes, as compared with 5,945 last year.

SCHOLARSHIPS.

The Council have awarded two Salomons Scholarships, value £50 each, to Mr. Herbert Carnegie, of the Finsbury Technical College, London, and Mr. Alfred Hutt, of the Central Technical College, London. A David Hughes Scholarship, value £50, has also been awarded by the Council to Mr. Clifford Higgins, of the Central Technical College, London.

STUDENTS' SECTION.

The Students' Committee organised a visit to Switzerland in the summer of 1907, where they visited the following works, laboratories, and other places of interest:—Messrs. Brown-Boveri & Co., Ltd., Messrs. Escher Wyss & Co., Maschinenfabrik Oerlikon, Messrs. Sulzer Bros., Schweizerischer Lokomotiv

Digitized by Google

und Maschinenfabrik, Winterthur, Zurich Polytechnic, and the Jungfrau Electric Railway Co. The arrangements of the visit were planned and carried out by the Chairman, Mr. E. W. Moss, and his committee, and the great success of the visit was largely owing to Mr. Moss's skilful organisation of the expedition. The party was everywhere most kindly and hospitably received. A series of visits to works and laboratories in and about London was made during the session.

The Manchester Branch of the Students' Section has also completed a successful session, having held seven meetings and read seven Papers. Visits to various works in the district were also organised by kind permission of the firms concerned. The Students' Committee at Manchester and Mr. J. Lawton Lovell, the Hon. Secretary, are to be congratulated on the success of the Section in that centre. Two meetings have also been held by the Glasgow Branch of the Students' Section, at which two Papers have been read under the chairmanship of Professor Magnus Maclean.

Imperial College of Science and Technology.

The Council have appointed Mr. Robert Kaye Gray, Past President, as the first representative of the Institution upon the governing body of the College, and he will hold office for a term of four years.

Home Office Regulations for the Use of Electricity in Factories.

The Institution was invited last year to consider and offer observations upon the new Draft Regulations prepared by the Secretary of State in pursuance of the Factory and Workship Act (1901). The question was referred to the Traction, Light, and Power and the Parliamentary and Industrial Committees in joint meeting, with Mr. Alexander Siemens, Past President, as chairman. Suggestions for the amendment of the rules were submitted to the Home Office, and Mr. Alexander Siemens attended on behalf of the Institution at the subsequent inquiry.

Wiring Rules.

Owing to the large demand for copies it was found necessary to reprint them in June, and in all about 3,600 copies of the last edition have been distributed. It is satisfactory to note that the rules have been adopted by 36 fire offices, and that 30 local authorities and supply companies have agreed to accept them as standard practice and to recommend their use. The committee hopes to resume its meetings in the autumn to consider such proposed amendments as have already been received, and also to revise the rules as far as may be rendered necessary by the putting into operation of the new Home Office Regulations.

International Commission for Standardisation.

The British Electrotechnical Committee was appointed by the Council on July 26th, 1906, to act under and in accordance with the proposed rules of the International Commission, which were provisionally agreed to at the preliminary meeting, held in June, 1906, in London. Sir John Gavey, C.B., was appointed President, and Sir William Preece, K.C.B., and Mr. Alexander Siemens, Vice-Presidents of the committee. The full list of the committee is as follows:—Sir John Gavey, C.B. (President); Sir Wm. H. Preece and Mr. Alexander Siemens (Vice-Presidents); Lord Rayleigh, Colonel Crompton, Colonel Holden, Mr. W. Duddell, Mr. K. Edgcumbe, Dr. Glazebrook, Mr. R. K. Gray, Mr. Robert Hammond, Dr. Gisbert Kapp, Mr. Mather, Mr. H. W. Miller, Mr. Mordey, Professor Perry, Mr. C. P. Sparks, Mr. Swinburne, Professor S. P. Thompson, Mr. Trotter, Mr. E. B. Vignoles, and Mr. Wordingham; Mr. G. C. Lloyd (honorary Secretary); Mr. C. le Maistre (Secretary).

In accordance with the rules of the Institution the committee is re-appointed annually. It has full direction of the work of the sub-committees, of which at present two have been appointed, the Sub-Committee on Nomenclature, with Mr. A. P. Trotter, the Electrical Adviser to the Board of Trade, as the chairman, and the Sub-Committee on Symbols, appointed January 16th, 1908, with the Right Hon. Lord Rayleigh as the chairman, and Professor Silvanus P. Thompson the vice-chairman.

At the second meeting of the committee, Colonel Crompton, the Honorary Secretary of the Commission, reported that committees had been formed in Austria, Belgium, Denmark, France, Germany, Hungary, Mexico, Spain, Sweden, and the United States, and that the matter was being considered in Australia, the Argentine Republic, Canada, Japan, South Africa, and Switzerland. With regard to Italy, he understood from Mr. G. Semenza, who had been a delegate at the preliminary conference, that there was every likelihood of a committee being formed there at no very distant date.

Owing to the death of Lord Kelvin, the office of President of the Commission became vacant, and steps to fill the vacancy will be taken at the next meeting of the Commission.

According to the rule which provides that each committee shall elect one delegate to the Council of the Commission, Dr. R. T. Glazebrook, F.R.S., has been appointed British delegate, and, together with the President of the British Electrotechnical Section, Sir John Gavey, C.B., will attend the meeting of that Council, which in all probability will be held in London next October.

A sub-committee will shortly be appointed to deal with the classification of electrical machinery and apparatus—that is to say, to undertake all practical questions. One of the first points to which they are likely to turn their attention is the question of "Standards of Light," and, with the co-operation of the other Electrotechnical Committees, it is hoped that a satisfactory decision may in due course be arrived at. Colonel Crompton announced that the British Government had officially recognised the Commission, and had allotted an annual grant of £100 to the British Committee.

Examinations in Wiremen's Work.

An Advisory Committee was appointed in 1906 by the City and Guilds of London Institute to revise their syllabus for examination in electrical wiremen's work, to which committee the Council of the Institution was invited to nominate representatives. Mr. James Swinburne, F.R.S., Past President, and Mr. W. H. Patchell, member of Council, were accordingly asked to act, and subsequently representations were made to the Council by that Institute that they were of opinion that considerable encouragement would be given to electric wiremen in raising their trade status if the Council could see its way to permit recognition by the Institution of Electrical Engineers of the City and Guilds certificates. It was agreed, subject to approval of the syllabus of instruction, to give assistance this year by appointing qualified persons to represent the Institution and attend the practical examinations. The following members very kindly agreed to give their services on behalf of the Institution and to furnish a short report on the manner in which the candidates performed the practical part of their work:—London Centre:—Woolwich, P. R. Friedlaender; Mile End Road, Dr. J. Henderson; East Ham, A. H. Seabrook; West Ham, W. T. Maccall; Poplar, J. H. Bowden; Clerkenwell, V. A. Mundella; Borough Road, J. T. Morris; Battersea, F. A. Bond; Chelsea, P. Still; Chiswick, A. W. Money; Paddington, W. R. Rawlings; South Tottenham, G. H. Baker; Wimbledon, H. Tomlinson-Lee; Kilburn, J. E. Pownall; Highgate, Dr. C. V. Drysdale; Barnsley, E. A. Barker; Bath, S. F. Walker; Belfast, R. Stanley; Birmingham, Dr. W. E. Sumpner; Blackburn, P. P. Wheelwright; Bolton, A. A. Day; Brighton, C. B. Smith; Bristol, Professor A. P. Chattock; Cork, H. G. Whiting; Croydon, A. C. Cramb; Darlington, E. Cox-Walker; Derby, W. C. Goodchild; Dublin, T. Tomlinson; Enfield, H. H. Perry; Huddersfield, A. B. Mountain; Kingston, J. E. Edgcome; Lancaster, W. A. Tester; Leeds, H. Dickinson; Manchester, E. S. Bradburne; Norwich, F. M. Long; Peterborough, G. H. Hardwick; Plymouth, E. G. Okell; Portsmouth, B. Handley; Redhill, A. W. Makovski; Rotherham, G. Young; Runcorn, A. Lester Taylor; Salford, A. Kelly; Sheffield, E. H. Crapper; Tunbridge Wells, Horace Boot; Wolverhampton, H. A. Howie.

The Territorial Army.

The Council was recently informed by the Army Council that the War Office proposed to establish Electrical Engineering Corps for attachment to the Territorial Army, at certain centres in the United Kingdom, and the Institution was invited to co-operate with the county associations in finding officers with electrical engineering qualifications to command these units. The Council is at present in communication with the county associations on the matter.

Museum.

Space has now been provided at the Institution for the temporary accommodation of the articles collected for the museum. Some valuable apparatus and objects of historical interest have been accumulated, due chiefly to the generosity of members and firms interested, and a committee is now in charge of the work of classifying and arranging the articles. It is hoped that members will assist in creating a museum worthy of the Institution by presenting apparatus of historical interest or by advising the Council of the existence of such.

Benevolent Fund.

The Committee of Management reports that the Benevolent Fund of the Institution shows a satisfactory increase for the past year. On December 31st, 1907, the capital account of the fund stood at £2.755 9s. 11d., as compared with £2,532 16s. 4d. at the end of 1906. The donations to the fund in 1907 include one of £52 10s. from the Western Electric Company, and another of £37 from the Committee of the Electrical Engineers' Ball. In January of the present year a special appeal was sent to all members of the Institution, with the gratifying result that the capital account of the fund has since the new year been increased to over £3,000. The special donations since the new year in answer to this appeal, which have not been taken account of in the balance-sheet for the year under consideration, include one of 100 guineas from Mr. W. B. Esson (Member). With their accustomed generosity, the Committee of the Electrical Engineers' Ball have given a further donation of £75 to the fund, this being their surplus from this year's ball.

Four grants in aid were made during the year under the rules of the committee.

The Wilde Benevolent Trust Fund stands at £1,744 16s., and one grant in aid has also been made from the income of this fund in 1907.

REVIEWS OF BOOKS

The Steam Turbine. By R. M. Neilson. Fourth Edition. 604 pp. 5¾ in. by 9 in. 387 illustrations. (London: Longmans, Green & Co.) Price 15s.

THE preface to the first edition of this book, published only in 1902, commenced with the statement "that the steam turbine is likely to be extensively used in the future is admitted by most engineers"; but few indeed would have thought that within five years the turbine would already have superseded the reciprocating engine not only for driving the largest electric generators built, but also for propelling the nation's finest battleship and the fastest Atlantic liners afloat! Perhaps during recent years nothing in the engineering world has been more remarkable than the rapid development of the steam turbine and the confidence that has been shown in it. It is not surprising that a work which covers so admirably the whole field of turbine design construction and use should have reached the fourth edition so quickly. The present edition has been revised and enlarged; it contains eighteen chapters, covering some 600 pages, and is illustrated by 46 half-tone blocks and to-scale drawings, in addition to 387 figures consisting of curves, diagrams, and details of turbine parts.

The arrangement of the chapters, and the manner in which the theoretical and practical features are dealt with, is most convenient. After an elementary description of the construction and working of the turbine, particulars of all the most important early turbines are given in an interesting historical chapter. Obviously Hero's rotating steam globe is first referred to. This is said to have been used by a German mechanic in 1577 to rotate a broach in place of a turnspit, and a turbine, also of the Hero type, was used at a printing establishment in Edinburgh about the middle of last century. The earliest de Laval turbines were also improved Hero's engines. As a practical machine the turbine dates from about 1885, as in that year a double-flow Parsons' turbine was constructed which revolved at 18,000 r.p.m., and was used for several years generating current for incandescent electric lamp manufacture. The features which led to the success of the early turbines of both Parsons and de Laval are clearly indicated and described. After a chapter devoted to the conversion of the heat energy of steam into kinetic energy, the various types of steam turbines are divided, for purposes of description, investigation, and comparison, into six classes, according to the way in which the steam is expanded with relation to its action on the vanes or blades. This classification is adhered to in the subsequent theoretical investigation of the correct design of buckets and blades, and later in the description of the numerous actual machines which have been or are now made. The combined entropy, temperature, and velocity diagrams given for each class of turbine go far to assist the reader to obtain a good general idea of the nature and difference between the various classes.

The sources of loss, the determination of the efficiency of various parts of the machine, the relation of vane speeds and bucket efficiency thereto are investigated, and the influence of these considerations on the design of the actual turbines is examined.

Then follows a description not only of the general features, but of the special details of practically every British, American, and Continental steam turbine, arranged under the classification already referred to. In many cases successive types of the same machine are described and illustrated, so that the alterations which have resulted in improved running and greater efficiency are clearly demonstrated. The latest designs of several makers' machines, some of which are only now under construction, are exceedingly interesting. The author has obtained so much information of this character that it is perhaps invidious to call attention to omissions, but we note with some surprise that when reference is made to the stripping of blades in the Parsons' type, no mention should have been made of the tipped blade, which has proved such a perfect cure for trouble arising from the fouling of blades during the last two years. A chapter is devoted to low pressure or exhaust steam turbines, and full particulars and drawings of some important installations in which these are employed are given. After the effect of steam pressure, superheat, and vacuum on the efficiency of the various classes of turbines has been considered, particulars are given of numerous steam consumption tests.

Plans of several typical power stations in which turbo-generators are employed have been included, and these well indicate the diversity of design adopted by various engineers in their endeavours to arrange the boilers symmetrically and conveniently in relation to the turbines, which in the larger sizes occupy relatively so little space.

Not the least interesting chapter in this book is that devoted to ship propulsion by steam turbines, which only dates back to 1894, when the *Turbinia* was constructed. This little steamship, after much labour had been spent upon the design of suitable propellers, attained a speed of 33 to 34 knots. Later some particulars are given of the turbine equipment of the *Lusitania* and *Mauretania*, also a table of many noteworthy and typical turbine steamships.

Among the appendices is a list of British patents relating to steam turbines from 1784 to the end of 1905.

To all engineers interested in the design, construction, or operation of steam turbines, this book may be recommended as invaluable.

"The Central." Magazine of the Central Technical College Old Students' Association. Vol. V., No. 14. 40 pp. 10 in. by 6½ in. 2s.

NUMBER 14 of the magazine contains a concise and well-illustrated description of the City of Victoria and Hill District Waterworks (Hong Kong), written by the resident engineer, Mr. D. J. Jaffé, who left the College in 1896. An abridgement of the Paper communicated to the Royal Society by Professors Callendar and Dalby on the "Measurement of Temperatures in the Cylinder of a Gas-engine," and an original article by L. Calisch, entitled "Some Remarks on the Electrification of Railways," are also given. In the latter the author attributes the conservative attitude of British engineers towards electrification of suburban lines to the cheapness of fuel in this country, and to the keen competition of motor vehicles and tramways. The "Old Student Notes" should be particularly interesting to old Central men, and the Association is to be congratulated on the large amount of information which has been gathered from old students all over the world. An excellent portrait of Dr. G. T. Moody is included in this number.

Fowler's Electrical Engineers' Pocket Book, 1908. 679 pp. 6¼ in. by 4 in. (Manchester: Scientific Publishing Co.) Cloth: 1s. 6d., leather 2s. 6d.

In the latest edition of this well-known pocket book, the contents have been rearranged in sections, under distinctive heads, to facilitate reference to any particular subject. Much of a mechanical nature has been eliminated from the work to admit of a more detailed treatment of electrical subjects, and for the former information, the reader is referred to the companion volume—"Fowler's Mechanical Engineers' Pocket Book." The sections dealing with power transmission, polyphase motors, electric traction, and dynamo design have been carefully revised and enlarged. The new (1907) Wiring Rules of the Institution of Electrical Engineers are included in the end of the volume, where the Board of Trade and Home Office Rules relating to the application of electricity are also to be found.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 28th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.

Names in brackets indicate communicators of inventions from abroad.

1907 Patents

5,301, B. IGEWSKI. An electric furnace for metallurgical purposes. This furnace was fully described and illustrated in ELECTRICAL ENGINEERING, May 21st, page 777. One claim, one figure.

10,641, E. A. MITCHELL. A device for use on the cars of a surface-contact traction system, for the purpose of indicating when any stud is not disconnected from the main conductor when the magnetic influence of the collector is removed. A brush or collector consisting of several sections, the distance between the sections being less than the width of a stud, is trailed behind the car. If this brush touches a live stud, a bell rings on the car. Short-circuiting between stud and rail on rounding a curve is avoided by the sectioning of the brush, as alternate sections of the brush are connected to different warning circuits. Four claims, two figures.

13,543, J. S. HIGHFIELD. A coin-operated switch for use in small installations, where the cost of a meter is too high in comparison with the cost of the rest of the installation to make the connection of the consumer practicable. The insertion of a coin connects the consumer's installation to the supply mains for a definite period. The supply is cut off either by means of a clockwork or an electromagnetic device after the lapse of the defined period. The amount of current which the consumer can take is limited by a suitable device. Three claims, one figure.

15,451, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). This specification gives further details of the process of manufacturing tungsten and other filaments, which was described in ELECTRICAL ENGINEERING, May 14th, page 738. The plastic mixture of tungsten powder and cadmium-mercury-bismuth alloy is squirted through a diamond die at a temperature of from 100° to 150° C. The resultant wire is pliable and tough, and of a smooth silver-white appearance. The wire is cut into lengths and bent into loops, which are then baked in a vacuum. The mercury and cadmium are evaporated, but the bismuth remains. The bismuth is driven out by passing a low current through the filament for 10 or 15 seconds, and the residue is then sintered together by passing a current through the filament, equal in value to the normal running current of the filament, for 15 to 30 seconds. Three claims, no figures.

21,299, E. BELLINI AND A. TOSI. The system of directive wireless telegraphy with closed oscillation circuits, described in ELECTRICAL ENGINEERING, Vol. II., page 771, and also in the issue of March 5th, 1908, page 348. Four claims, five figures.

28,427, E. B. RAYMOND AND H. M. RAMP. In the manufacture of oil-tight casings for oil insulated transformers, it is usual either to use sheet-iron sides and a cast-iron base, the joint at the base being made with solder or babbitt metal poured into a groove in the casting, or to construct the sides and base in a single casting. In the former case the joint is rarely oil-tight, and in the latter case the casing is heavy and difficult to cast. According to the present invention the base is cast on to the sheet-iron sides, so that the edge of the sheet-metal is fused and amalgamated with the cast metal. Two claims, four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Summaries of the more important of these patents will appear in our next issue.

1907 Patents

6,092, TAYLOR. Systems of electrical distribution.
8,562, PAWECK. Electro-deposition of zinc.
10,699, MARRIOTT. Pitch product for cable trenches.
10,719, MAYES, & FERRANTI, Ltd. Motor starters.
10,955, POTTER. Telephone switch mechanism.
11,271, MUIRHEAD. Hertzian wave telegraphy.
11,586, NICHOLLS & NICHOLLS. Contact breakers for inductor coils.
11,466, LA COUR. Starting, connecting up, and controlling the speed of combinations of induction motors.
11,476, KAY. Generators and motors.
11,594A, ALLGEMEINE ELEKTRICITÄTS GES. Electric motors for rolling mills.
11,979, DEUTSCHE BECK BOGENLAMPEN GES. Electrode for arc lamps.
12,253, BECK, AND DEUTSCHE BECK-BOGENLAMPEN GES. Alternating current electromagnet.
12,563, JULLIEN & DESSOLLE. Method of rendering electrolytic copper homogenous.
14,638, TAYLOR. Medical batteries.
15,602, LAKE (*American Railway Signal Co.*). Signalling systems for railway cars.
16,778, WRIGHT. Printing telegraph receivers.
18,259, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Electric heating devices.
18,670, MEYER. Transmitting signals by means of alternating currents.
18,742, HEYS (*Scott Electrical Co.*). Arc lamps.
19,546, CODD. Magneto-ignition apparatus.
19,697, VON KANDO. Suspension of electric motors for electrically-propelled vehicles.
20,202, SIEMENS BROS. DYNAMO WORKS, Ltd. (*Siemens Schuckertwerke Ges.*). Rotary converters.
20,814, BRITISH INSULATED AND HELSBY CABLES, Ltd., & ALLEN. Cable connecting devices.
21,167, PIRDSCHUN. Switches for electric circuits.
22,605, SIEMENS BROS. DYNAMO WORKS, Ltd. (*Siemens-Schuckertwerke Ges.*). Systems of electric power-transmission for driving ships' propellers.
22,808, POPPE. Contact breakers for internal-combustion engines.
23,239, BERGMANN. Electric switches.
24,023, CLYMER & WOODHOUSE. Electro-medical apparatus.
24,671, SIEMENS-SCHUCKERTWERKE GES. Arrangements on meters for determining the maximum consumption.
25,792, STRATTON, BEAVER, & CLAREMONT. Joint boxes for electric cables.
25,967, LINCOLN. Load equalisers for alternating current supply circuits.
27,284, LOUTZKY. Automatic reversing gear for motors.
27,385, COWPER-COLES. Electrodeposition of metals.
27,739, JANECEK. Arc lamps and electrodes.
28,451, HERRMANN. Method of lengthening the life of electric incandescent lamps.

1908 Patents

1,231, KAUFMANN. Manufacture of metallic paper or tinfoil substitute.
2,569, RAWLINGS & SMITH. Supporting incandescent lamps and reflectors therefor.
2,943, PICKARD. Oscillation receivers.
3,556, GELL. Automatic telegraphic instruments.
8,746, AUGER. Manufacture of incandescent filaments.
9,023, DENIÉPORT. Electric condensers.
9,552, BROWN. Block signalling apparatus.

Complete Specifications open to Public Inspection before Acceptance.

1908 Patents

7,586, JONES. Electrically-operated signals.
8,421, WOLFRAM-LAMPEN AKT.-GES. Filaments for incandescent lamps.
9,233, ALLEGEMEINE ELEKTRICITÄTS-GES. Process for extracting nitrogen peroxide from nitric oxide air mixtures.
9,569, JAEGER. Electric wire poles or masts.
10,211, POLLOCK & WERD. Insulators for telegraph wires.

Application for Amendment

Further particulars and instructions as to procedure in opposition to amendment will be found in the Official Journal of the Patent Office of May 27th.

23,988 of 1907. FRANCIS HARRISON seeks leave to amend his application for Letters Patent numbered as above, for "Process for producing tungsten metal combinations," by including C. H. DORMAN, electro-chemist, as an applicant for a Patent.

Expiring Patent

The following patent expires during the current week, after a life of fourteen years :—

11,069 of June 7th, 1894. ALEXANDER MUIRHEAD. Improvements in automatic transmitting apparatus for use with submarine cables. An adjustable revolving commutator or graduated cam, in a local circuit with an electromagnet, controls the movements of the contact-making levers so that the relative durations of the battery and earth contacts may be varied without stopping the mechanism. The commutator or cam is also utilised for the purpose of transmitting "curbing" currents.

A SELF-SYNCHRONISING ROTARY CONVERTER

THE 600 kw. rotary converter which the British Westinghouse Electric and Manufacturing Co. have installed in the Cathedral Street sub-station of the Glasgow Corporation Electricity Department is of interest as embodying a method of starting up from the alternating side, by which the machine is self-synchronising when thrown upon the line. The set, which is illustrated, together with its transformer and starting gear, in Fig. 1, converts from 25-period, three-phase, 6,000-volt current to direct current at from 470 to 600 volts, for lighting and power supply.

Starting is effected from the alternating side, and the machine is self-synchronising when thrown on to the line. To start it, it is only necessary to close the high-tension switch and turn the hand-wheel of the controller (seen between the rotary and the transformer in the figure) first to the starting position and then to the running position. The set can be brought up to speed ready to supply direct current in from 30 to 40 seconds.

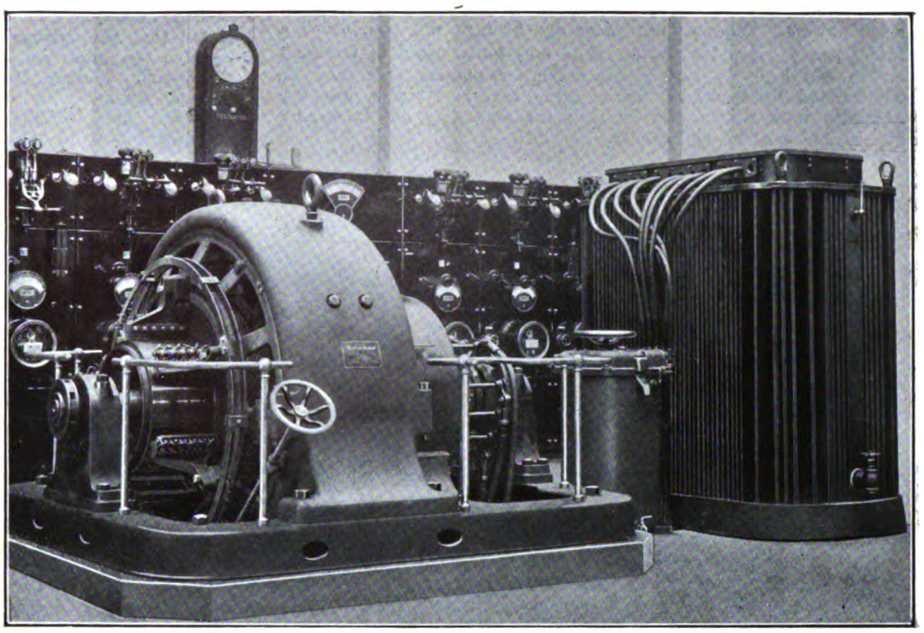

FIG. 1.—600 KW. WESTINGHOUSE ROTARY CONVERTER WITH SPECIAL STARTING DEVICE. CATHEDRAL STREET SUB-STATION, GLASGOW.

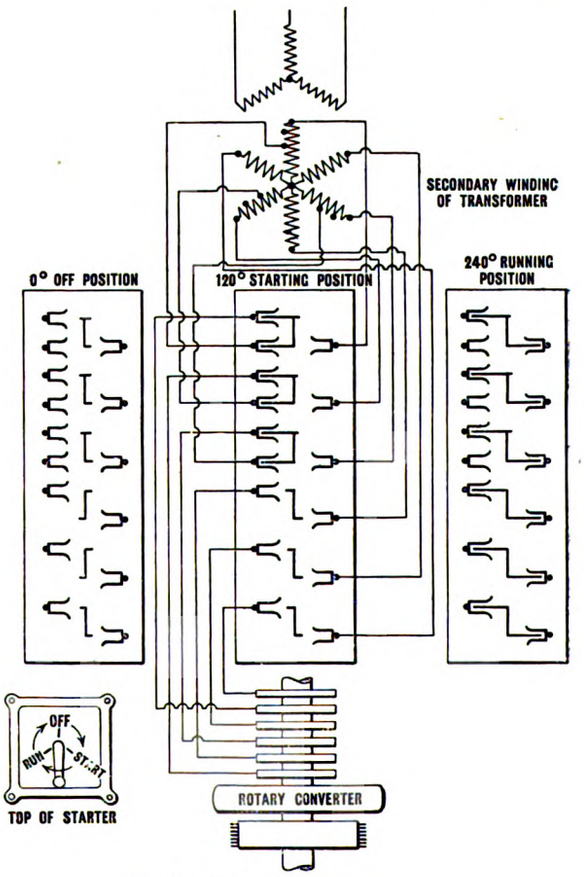
The machine is provided with an *amortisseur* specially designed to give a good starting torque. It is able to start and run up to synchronous speed with no more than one-fifth of the normal voltage on the slip-rings. This low voltage at starting, which is obtained from tappings on the transformer, is an important feature, as it enables the starting current to be kept down to the full load value, and there is no sparking or burning of the brushes during starting, such as commonly occurs when a high-voltage rotary is starting up from the alternating-current side.

The diagrams of connections in Fig. 2 shows the connections of the controller in the "off" position, starting position, and the running position. It will be seen that in the starting position only three phases at a reduced voltage are thrown on the slip-rings. The machine starts up, excites itself, and goes into synchronism. The controller is then thrown over to the running position, and if the polarity is reversed this can be rectified by momentarily exciting the shunt field from the station bus-bars.

The direct-current voltage can be varied over a range from 470 to 600 volts by means of the field-rheostat of the alternating-current booster, without affecting the power factor. The latter can be adjusted independently throughout the entire range of voltage by regulating the field resistance of the rotary. This booster consists of a small alternating-current generator, mounted between the slip-rings and the machine itself. No additional brush-gear or moving contacts are necessary, however, as the rotating armature of this generator is connected on one side to the slip-rings, and on the other side to the armature windings of the rotary. The fields of the booster are excited from the direct-current side of the rotary, and may be arranged with series turns to compensate automatically for load variations; or it may give a regulation curve similar to that of the generators with which it has to run in parallel.

The ability to vary the power factor and direct-current voltage independently is of great importance, as a leading current can be drawn from the line to compensate for lagging currents in other apparatus, or the power factor may be maintained at unity. This feature is only satisfactorily obtainable by means of the rotary converter or synchronous motor-generator. The rotary runs well in parallel with engine-driven direct-current generators, and will also act as a balancer on a three-wire system. The voltage-regulation is obtained simply by the adjustment of a field rheostat.



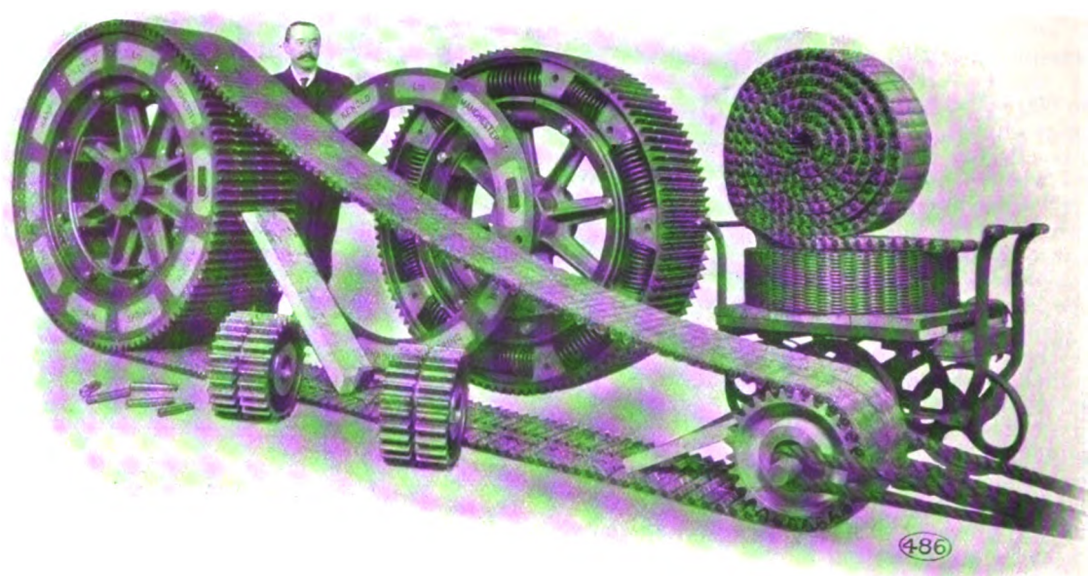


FIG. 2.—DIAGRAM OF CONNECTIONS.

A LARGE CHAIN DRIVE

THE accompanying illustration represents the component parts of a large example of chain driving on the system of Messrs. Hans Renold, Ltd., of Manchester, and gives an idea of the advance that has been made recently in chain driving for large powers. Whereas ten years ago 50 h.p. was considered a fairly heavy drive for chains, it is now quite usual to transmit up to 200 h.p. by this means. Higher powers still may be transmitted by standard chains using several strands, but the difficulty with this method is that the load may not be evenly distributed over all the chains.

COMPONENT PART OF 200 H.P. CHAIN DRIVE.

The illustration shows two drives, each designed for transmitting 200 h.p. by two chains, and an even distribution of the load is assured by the special type of driven wheel. This wheel is of the compensating type, and consists of three main parts, viz. :—A boss with eight arms, two rings bolted to the arms, and two outer toothed rings, one for each chain. The outer and inner rings have projecting lugs, between which are fitted suitable springs. The toothed rings are independent of each other, and act separately on their own sets of springs, so that if one chain tends to take more load than the other it simply closes its set of springs until the load is equalised. In addition to this compensating effect the springs absorb irregularities in the load, so that there is less wear and tear, not only in the chain gear, but also in the electric motor, as the latter is better protected from vibration than it would be by a train of spur gearing. The cover is shown removed from one of the wheels in order that its construction may be seen; it will be noted that the springs are of two sizes, which are placed alternately; the larger set transmit the power and the smaller soften the recoil. Messrs. Hans Renold, Ltd., say that these are the largest spring wheels that have ever been made for chain driving. Each weighs about two tons. The drives are part of an installation to transmit over 500 h.p. for a coaling plant supplied by Messrs. Head, Wrightson & Co., Ltd., of Thornaby-on-Tees, for a tidal dock in Japan. The chains shown drive hauling drums from electric motors, and will be in use about 140 hours per week. The pinions have 28 teeth, and are 15¾ in. diameter; the large spring wheels have 108 teeth and are 60 in. diameter; the width being 17½ in. The driver wheel makes 286 revs. per min., and the driven 74, so the ratio is practically 4 to 1, and the chain speed 1,170 ft. per min. The chains are 1¾ in. pitch and 8 in. wide, the centre distance being 11 ft. 5 in. Each chain has a breaking load of 70,000 lb., and the total pull on the drive is 5,650 lb., giving a factor of safety of about 25 with the two strands.

THE NEW 25-VOLT TANTALUM LAMP

THE accompanying illustration represents the latest addition to the various sizes of tantalum lamps which Messrs. Siemens Brothers' Dynamo Works, Ltd., have put upon the market. The new lamp, which is made for voltages of 24 or 25 volts in the 8 and 16 c.p. sizes, has a specially strong filament, and is equally suitable for alternating and continuous currents, and can therefore be used on installations where small transformers are employed to reduce the supply voltage, or for taking advantage in the case of small isolated installations of the simplicity both in plant and wiring which can be obtained with a low voltage. They are also specially suited to train lighting. Like all the tantalum lamps they can be used in any position. As shown in the illustration, the bulb is similar in shape to that of the ordinary carbon filament lamp, but it is rather smaller in size. The price is 2s. each.

Newcastle Local Section of the Institution of Electrical Engineers.—At the final meeting of the section on Friday, May 29th, the report was read, and the officers given in the list in ELECTRICAL ENGINEERING, May 28th, page 804, were elected. The membership of the section now numbers 209. An informal discussion was afterwards opened by Mr. C. Turnbull on the subject of overload. This is reported on another page of this issue.

Telegraphs in China.—An American Consular Report submits the following information with reference to the Imperial Chinese telegraph lines, gathered from reports recently published :—At the end of 1906 the administration had a system of 22,419 miles of telegraph lines, with 34,473 miles of wires and a submarine cable of 946 miles; 379 offices, of which 62 were open for day and night service, and 317 for day service only. The number of instruments in actual use was 768. The staff of the head office in Shanghai numbered 67 and the general staff 3,175, while inspectors, linemen, &c., totalled 2,400. In addition there are many provincial lines, usually constructed by the administration, but worked and managed independently by the provincial authorities. The telegraph companies having connections with China are the Great Northern, Eastern extension, German, Dutch, and Commercial Pacific, while the French cable connects Touraine with Amoy, a German cable Shanghai with Kiachow and Chefoo, and a third cable, partly Chinese, Chefoo with Port Arthur. China also has frontier connections with Burma, Indo-China, and Russian Siberia.

TEMPORARY RE-ESTABLISHMENT OF THE ANTWERP TELEPHONE EXCHANGE AFTER THE FIRE

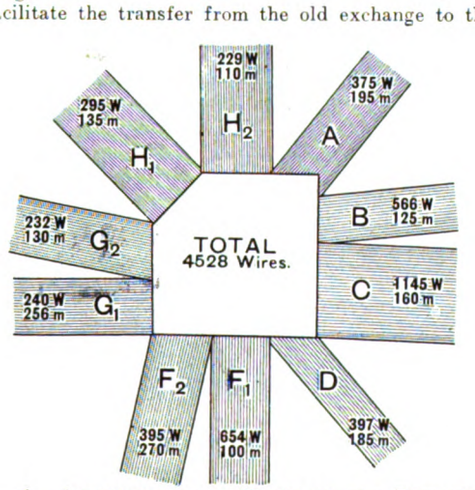
AN article published in ELECTRICAL ENGINEERING on November 7th last described the total destruction by fire of the Antwerp Telephone Exchange. At a recent meeting of the Société Belge d'Electriciens, Prof. E. Piérard, read an interesting Paper, in which he gave a full account of the damage done and of the prompt steps that were taken to re-establish the telephone service on a temporary basis pending the completion of a new telephone exchange.

The exchange that was burnt down was situated in the "linen market," near the cathedral, and its construction by the Belgian Bell Telephone Co. dates back to the end of 1886. It occupied a large corner building, with the exception of the ground-floor, which was let as shops. The offices were on the first-floor, the protective apparatus and workmen's quarters on the second, and the switchroom on the third.

The switchboards were of the single-wire series multiple type, built up in detached sections to suit space and lighting, as the building had not been originally designed for a telephone exchange. There were 47 local and trunk positions. The building was surmounted by a derrick of the type usually employed in Belgium, angle-iron frames braced together by thinner horizontal angle pieces, which carried the insulator bolts. On this derrick terminated 4,528 bronze wires of 1·4 mm. diameter (No. 17) and 30 per cent. conductivity. These wires were led off in ten main routes, as shown in Fig. 1. It will be seen that, owing to the position of the exchange relatively to the centre of the system, the derrick was very unevenly balanced; it was therefore found necessary to counter-balance the excess of pull in one direction by erecting a central derrick.

The ultimate capacity of this arrangement had been reached, and for some years past the Administration had contemplated a new installation. To this end, a complete system of underground glazed ducts had been constructed, and 50 miles of lead-covered paper cable had been drawn in, mostly of 350 pairs. The site for a central building destined to accommodate the new installation was chosen, and the Administration of Telegraphs erected thereon two large buildings, separated by a courtyard; one was for a central telegraph station, the other for the telephone exchange. This building is about 150 ft. wide, 72 ft. deep, and 88 ft. high.

To facilitate the transfer from the old exchange to the new,



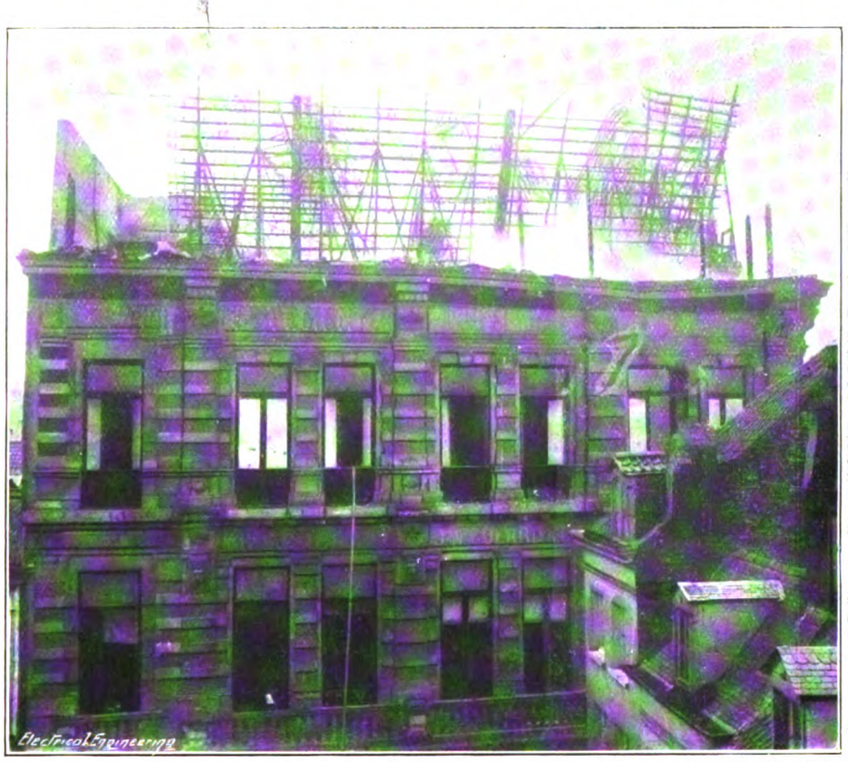


FIG. 1.—ARRANGEMENT OF WIRES ON THE DERRICK.
W = wires. m = metres.

distant about 1,000 yards as the crow flies, about 10,000 yards of 300 pair armoured cable had been laid underground.

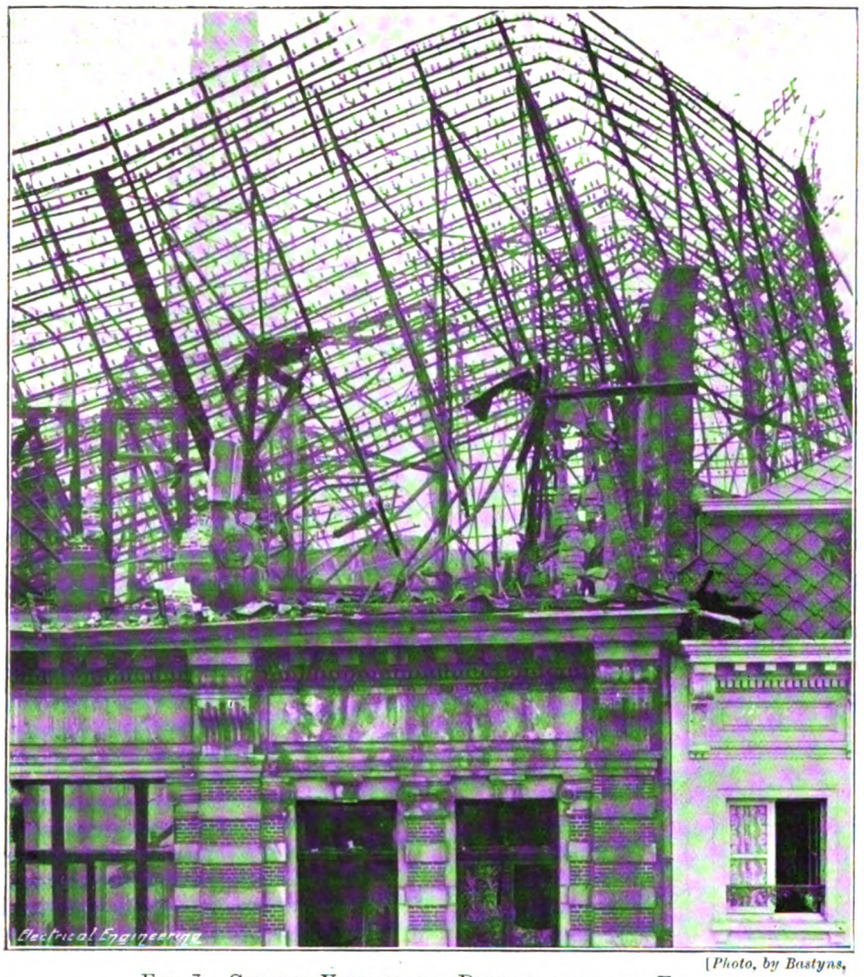
Affairs had reached this stage, and an easy and methodical change-over was reckoned upon, when, on the night of October 28th—29th, between midnight and half-past six, the central office was completely destroyed by fire. Although the firemen arrived a few moments after the outbreak, they only succeeded in saving the first-floor—and that only partially—the old paraffined cotton cables and even the switchboards themselves had fed the fire with first-class material.

Fig. 3 shows the appearance of the derrick at about six o'clock on the morning of October 29th. Cascades of bronze wire hung from the roofs, clung to balconies and to the tram-

[Photo. by Van Eck.

FIG. 2.—THE FIRE.

way trolley and guard wires, and were inextricably entangled in the streets. Some idea of the obstruction produced around the exchange may be gained from the fact that about 11 tons of bronze wire were recovered. Fig. 4 illustrates the contortion of the iron bars of the derrick, which, on becoming overheated, were most fantastically bent and twisted.



The first problem to be faced was the clearing of the main routes, and for this 146 men, collected from Antwerp, Brussels, and elsewhere, were set to work. As the streets could not be entirely closed to traffic, it is remarkable that no accident occurred in carrying this out. Around the central office the situation was even more dangerous. A stone pediment, surmounting one of the windows in the mansard roof, fell into the street and burst a gas main, thereby cutting off the supply from one portion of the town. Another work, not less important, consisted of immediately strengthening the nearest ridge-derricks, which, owing to the abnormal strain thrown upon them, threatened to give way and fall into the streets. These had to be securely stayed, and for this alone 2½ tons of iron-wire were used. From the main derrick 25 tons of iron were recovered.

The result of the fire was not only that the management found themselves suddenly deprived of their telephone exchange, but also that a gap of some 200 metres radius was left in the densest portion of the overhead system. On the same day it was decided (1) to erect close by an iron "ribbon" post from which wire stays could be run to the surrounding ridge-derricks, which had now become terminals; (2) to establish a provisional exchange in the large empty space on the first-floor of the new telephone building; (3) to set up central battery switchboards,

Digitized by Google

which the Bell Telephone Manufacturing Co., of Antwerp, were making for the intended new installation, but to adapt them to magneto earth-circuit working, so as not to interfere with the existing 4,400 telephone stations.

To convey the lines to the new building they had to be jointed at the terminal ridge-derricks to india-rubber wires or cables. On the necessary permissions being obtained, these

[Photo. by Bastyns.

FIG. 3.—GENERAL VIEW OF THE DERRICK AFTER THE FIRE.

were led into the lofts and connected to protectors, the latter being in air-tight cast boxes containing 50 or 25 pairs of 3-ampere fuses with mica-carbon lightning arresters and self-induction coils to protect the cables. From these boxes are run the armoured paper cables connecting with the existing underground work. The necessary armoured cable for this purpose was not, however, in stock and would have taken a considerable time to make. Arrangements were consequently made with Messrs. Felten & Guilleaume, the contractors for the cables for the new Antwerp underground scheme, to withdraw the cables already laid as described above, and this was done chiefly at night. In all 31 protection boxes of 50 pairs and two of 25 pairs were installed. The I.R. cables connecting these to the derricks have a total length of 1,900 metres, and the armoured cables going to the trenches measure 2,186 metres. Each of these cables contains 300 pairs, thus giving 600 single wires. They end on the second-floor of the central office on cable-heads, which had been fitted before the fire, whence I.R. wires run to the temporary distributing frame erected immediately underneath on the first-floor.

The cable-heads are composed of rectangular boxes, of which the two opposing vertical sides are of ebonite and the two others cast-iron, and inside which the wires are spread out after the cable has passed through an air-tight gland. The ebonite partitions of the box are provided with the necessary number of terminals, to which are joined the conductors of the cable, the whole being then filled up with melted paraffin and the lid closed. The terminals are connected externally by the wires going to the switchboards.

Naturally, it was not practicable to follow out the plan above described in the case of all the subscribers. An important group of these were situated immediately around the new exchange, and on the side farthest from the old one. It would, therefore, have been illogical to run back to the old exchange and return towards their starting point. Also, owing to the fortunate circumstance that the new office, being very high, overtopped the buildings around, it became easy to join up a large number of lines to three ridge derricks on the roof, carrying 945 wires. By cutting these wires, doubling the insulators, and running in to the exchange, 945 subscribers' circuits were obtained fully equipped. The wires ending on the opposite side were connected by aërial wires to circuits coming from the direction of the old exchange, and by this means 1,797 subscribers were easily joined up. As in the case above mentioned, these circuits were protected by 3-ampere fuses, lightning arresters, and 0·5 ampere heat-coils. The protection boxes are joined to four 300-pair cable-heads, from which start armoured cables ending in four similar cable-heads in the cross-connecting room. In view of the temporary nature of the installation, an intermediate distributing frame was dispensed with.

Prompt steps were taken to re-establish the inter-urban and international trunk lines, and this was accomplished in two or three days so far as the Post Office and other public offices were concerned.

Starting from the main distributing frame the Bell Telephone Manufacturing Co.'s work commenced. An ingenious plan was devised for utilising the metallic circuit central battery boards for earth-circuit magneto-call working, in such a manner that jacks, relays, and lamps should eventually form part of the final arrangement. This is illustrated in Fig. 5. From an ordinary magneto station the line L, after passing through the distributing frame, comes on to the multiple jacks J, and ends on the local jack j. The rings of all these jacks are connected together and to the cut-off relay R with earth-winding. The armatures V_1 V_2 of this relay are, when at rest, in contact with wires joining on one side V_1 to the armature V_3 of the line relay r, and on the other side V_2 to the long row of jacks j, J. When the subscriber turns the handle of his magneto, the relay r attracts the armature V_3, and this closes a circuit from the 11-cell storage battery B through the winding Rp of the pilot relay, the 120-ohm 12-volt line lamp, L, a 60-ohm resistance, the armature V_1, and the relay r. The latter retains

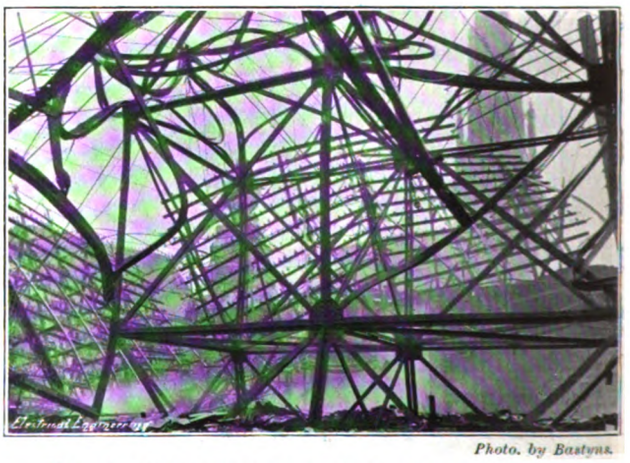


Photo. by Bastyns.

FIG. 4.—CONTORTION OF SOME OF THE IRON-WORK.

V_3 energised, at the same time that the line lamp L glows, announcing the subscriber's call. A current splits also by V_2 over the subscribers' line, but as it is constant it may be dis-

regarded. Between the pilot relay and the line lamp is another shunt circuit conveying the current to the 24-volt 120-ohm pilot lamp, the other side of which is joined to a switch C, which can be turned to earth (as shown) or to the earthed relay (lower position). It will be seen that, on the relay acting, the bell, S, is actuated by the ringing generator. Whatever the position of C the pilot lamp lights at the same time as the line lamp. The lamp and pilot relay are common to all the lines served by one operator. At Antwerp, 120 to 140 lines, according to traffic, terminate at the position. If matters rested here, the working would be imperfect and might even break down if a relatively large number of subscribers called simultaneously. The 30-ohm winding of the pilot relay is traversed at the first call by a current of more than 0·1 ampere, giving rise to a loss of voltage of 3 volts. With each supplementary call a fall of 3 volts results, so that very soon the lamps glow insufficiently and the relays do not work. This difficulty is overcome in the following manner:—When the calling current passes through the 30-ohm coil of the pilot relay, as we have just seen, the armature, V_4, being attracted, sends a current from the battery through the second (250 ohm) winding of the pilot relay. The latter in turn attracting its armature, V_5, shunts the 30-ohm winding by another of 0·38 ohm, so that the joint resistance falls to about one-hundredth of the original, and the loss of voltage between the battery, and L falls in the same proportion. This complicated triple-wound relay has recently been replaced by a simple single-wound one of 1·25 ohm minimum; the resistance being slightly greater, three are fitted per operator's position.

When the operator answers the call by inserting the answering plug F_1 (fixed on a three-way cord) into the local jack j, the tip 1 of the plug makes contact with the short spring 1, the barrel of the plug 2 with the long spring 2 joined to the line wire, and the sleeve 3 with the bush of the jack j. The sleeve is, by means of the flexible cord, connected to the negative pole of the battery through resistances of 40 and 83·5 ohms. A current, therefore, flows through the cut-off relay R, and its armatures are attracted; the relay r becomes inert, its armature is released, and the line and pilot lamps are extinguished. On opening the listening key Ce, the operator shunts the subscriber's line by a two-microfarad condenser, her receiver and one of the three windings of an induction coil (the other side to earth), the primary of which, containing the microphone m and a 165-ohm self-induction coil, is fed by the battery.

On receiving the number from the subscriber, the operator makes the "engaged" test in the usual way by touching the bush of the multiple jack of the wanted subscriber with the tip 1 of the calling plug F_2. If the number is engaged, the bush is connected to the negative pole of the battery and a current flows through the tip of F_2 and the key Ca, Ce to earth by the third winding of the induction coil, producing by induction a "click" in the receiver. If, on the contrary, the line asked for is disengaged, the bushes of all the jacks are at earth potential and the operator hears no sound. It will be noticed that a 260-ohm relay is inserted in one of the wires connecting the ringing generator to the ringing keys Ca. Its armature closes the battery circuit of a lamp, and this "calling pilot lamp" glows. If, owing to a break in the circuit, the lamp does not glow, the operator knows that the line is out of order. A drop indicator D, inserted in the speaking circuit, shows the finish of the conversation. By the combination of sections comprising ten operators' positions of 120 subscribers, 26 of 140 subscribers, a section for transmitting telegrams to and from subscribers, an intermediate section of three positions, and the one-third end sections are included in the suite.

Two batteries of eleven Tudor accumulators of 3,600 ampere-hours' capacity have been installed, which can be charged through a large white marble power-board from two groups of motor-generators, of which one is held in reserve. The motors are supplied with current at 220 volts by the Antwerp Electricity Co., and at full load take 110 amperes; the generators give out 600 amperes at 30 volts, and the voltage can be increased to 38 for charging the cells. The calling is done by means of two small induction motor-generators. One is fed from the accumulators at 22 volts, the other, serving as a reserve, is supplied at 220 volts by the Antwerp Co. Both give out 2 amperes at 75 volts with a frequency of 16.

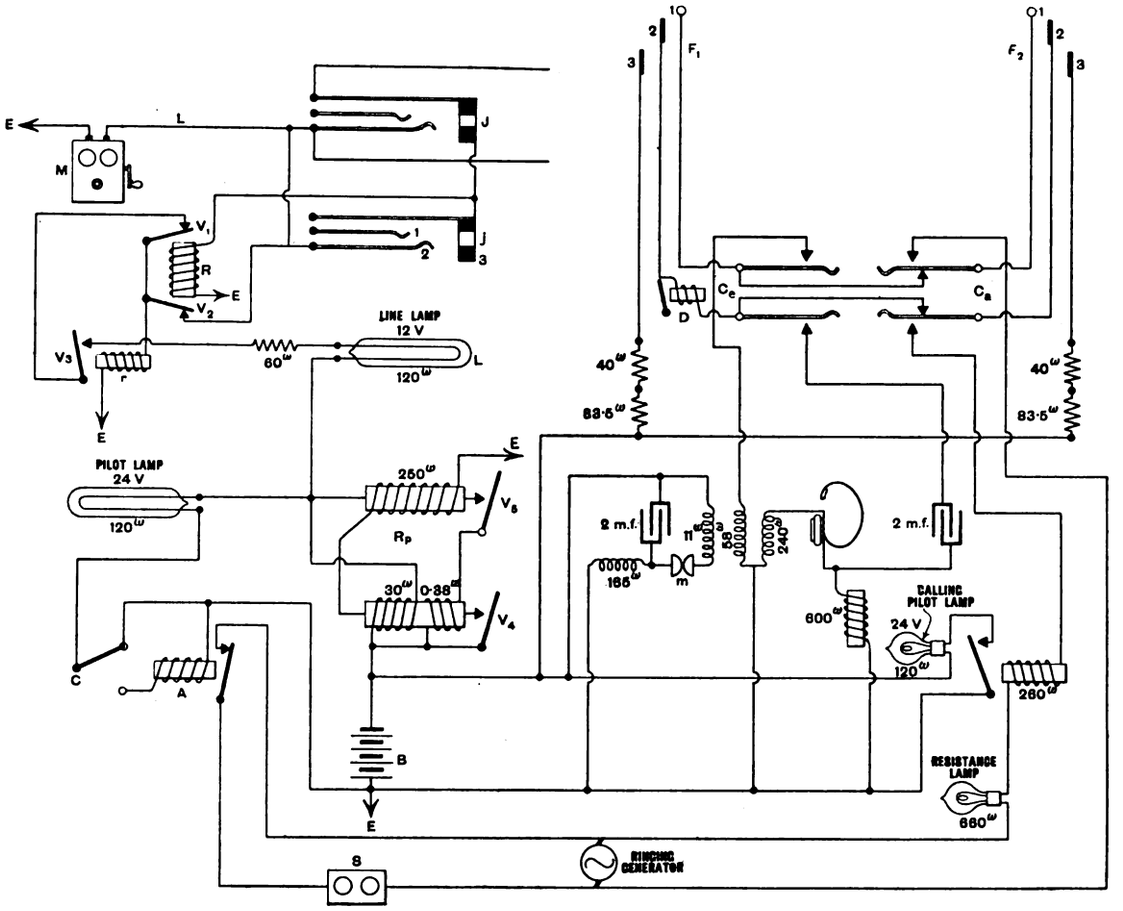

FIG. 5.—CONNECTIONS OF SUBSCRIBERS' BOARD.

The following figures give some idea of the extent of the work of mounting, testing, and adjusting. There are 77,400 jacks, 5,046 lamps, 1.219 keys, and 10,002 relays. The total length of cables between the distributing frame and the switchboards is 1200 metres that of the I.R. wires, 12,00 metres; 8,904 cable ends were cut and soldered, representing a length of 60,800 metres, and necessitating over 687,800 joints. The Bell Company had 150 persons working day and night. On Sunday, December 1st, the temporary exchange was brought into use without a hitch. The interruption to the service had lasted exactly 33 days, and the working of the system is found to be more satisfactory than that of the old exchange.

LONDON ELECTRIC POWER BILLS

OUR report last week ended with the proceedings of Tuesday, May 26th, when the case for the Stepney Borough Council against the Bill was being heard.

WEDNESDAY, MAY 27TH.—(FOURTEENTH DAY.)

STEPNEY (*continued*).

Mr. W. C. P. TAPPER, the Borough Electrical Engineer, was cross-examined, and he admitted that in comparing the price that the Administrative Company had proposed to charge Stepney with the prices chargeable under the present Bill, he had taken the maximum prices instead of the proposed charges to authorised distributors, but he was still of opinion that they would show a substantial loss to the Borough Council when the cost of distribution was added to the price paid the power company. Other questions by Mr. Clode were to the point that in his estimates Mr. Tapper had assumed that he purchased current at 25 per cent. load factor and sold at the same load factor, thus making no allowance for diversity amongst the various consumers' loads. Mr. Tapper said the load factor on the Stepney works was 25 per cent., to which Mr. Clode retorted that obviously the consumer's load factor was less.

ST. PANCRAS AND SHOREDITCH.

Mr. COURTHOPE MUNROE, in presenting the case for these two boroughs, dealt first with St. Pancras. He gave the history of the undertaking, in which the capital expenditure amounts to £500,000. Last year no less than £18,000 had been paid in relief of rates. The prices for power were 1d. per unit, or the original terms proposed by the Administrative Company, viz., £4 per kw., and 0·5d. per unit. There were 443 power consumers, and of the 6,670 h.p. in the borough the Council supplied one-half. One and a half million units were sold last year for power purposes, and the average load factor of the power consumers was 20 per cent.

With regard to Shoreditch, the average power consumer was 5 kw., and the load factor 15 per cent. The charges were £4 per kw., and 0·75d. per unit up to 75,000 units, and £4 and 0·5d. per unit for all consumption over.

In St. Pancras Messrs. Maple and Messrs. Chappell had been mentioned; but Messrs. Maple, who had a steam plant generating at 1¾d. per unit, had persistently refused an offer from the Borough Council at 1d. per unit, and Messrs. Chappell, on the other hand, were taking a supply from the Council at 1d., and in consequence of the Council's electricity department having materially assisted the company in the installation a letter of thanks was written. It appeared that Messrs. Chappell had signed the circular mentioned by Mr. Conradi (ELECTRICAL ENGINEERING, May 28th, p. 827), under an impression that they would get a supply at ½d. per unit. Counsel then mentioned a number of consumers who had elected to be charged at £4 per kw., and ½d. per unit, but, when their account was presented, they found that the cost worked out at very much higher than 1d. per unit on the flat rate. They had all been put back upon the 1d. scale. The whole secret of the matter was low-load factors, and such consumers would be no better off under the Bill. On the question of competition under the clause which allows 20 per cent. of the energy for power to be used for lighting, counsel said that this 20 per cent. for lighting at power rates had been offered to power users by the Council, with the result that the price for lighting had been considerably reduced. The firms in Shoreditch upon the list put in by Mr. Conradi had in all cases refused a supply from the Borough Council, even at £4 per kw. and ½d. per unit, for the reason that it would not pay them to scrap their plant. In Shoreditch, also, the 20 per cent. clause was in operation, and in some cases the price for lighting was reduced from 4d. to 1½d. per unit. In all these circumstances, he asked for a clause on the lines of that put in by Croydon, cutting St. Pancras and Shoreditch out of the area.

The CHAIRMAN asked Mr. Munroe if he had any observations to make in the event of the Kitson clause being in the Bill in substitution of the clause now in.

Mr. MUNROE thought it would only defer the competition. It would bring the Council before the Board of Trade in the case of every consumer. His argument was that the company should not be allowed to come in unless they were going to give a *bonâ-fide* benefit to somebody. His own view was that the Board of Trade, under the Kitson clause, would only have regard to the price.

Lord SAUNDERSON pointed out that the clause was wider than this, as it directed the Board of Trade to have regard to all the circumstances of the case.

Mr. SYDNEY BAYNES, Electrical Engineer to the St. Pancras Borough Council, confirmed the statements made by counsel. The average load factor of the power users there was 6 per cent., and only four had a load factor of over 20 per cent. Extensions at St. Pancras for generating plant cost about £10 per kw. without land or buildings, and on the overload capacity of the plant the cost was £7 10s. per kw. From his calculations, the Council would obtain no benefit by taking a supply from the power company. He placed no value on the figures of the promoters, because it would be about four years before the promoters could give a bulk supply. In this period, having in mind the fact that during the past four years the costs at St. Pancras had been reduced by ½d. per unit, it was reasonable to assume that some further improvement would be made during the next four years.

In cross-examination, Mr. Baynes stated that the total income of the undertaking was £72,000, of which about £7,000 was for power. With regard to competition, he thought it possible that the power company would be able to do the Council injury by offering transformed alternating current for power purposes, whereas the Council could only supply direct current. He stated that his total costs were 1·194d. per unit, and felt unable to give a reply as to whether it would pay the Council to take current from the power company at 0·5d. as he did not know what the distribution expenses would be. As a matter of fact, he thought that under no circumsances would the Council take a supply from any power company. His view of the creation of this company was that it would cause continuous dissatisfaction amongst their consumers.

Mr. C. NEWTON RUSSELL, Electrical Engineer to the Shoreditch Borough Council, said the capital expenditure upon the undertaking was £350,000, and the latest extensions at their new works cost £12 10s. per kw., including land and buildings. At present there were 6,067 h.p. of motors in the borough, and of this 64 per cent. was on the Shoreditch mains. The average size of the motors was 7 h.p., the smallest was ⅛ h.p., and the largest 120 h.p. The average load factor was 15 per cent. His opinion was that it would not pay them to take energy from the power company at the maximum prices, and although it might pay them at the present time to take at the estimated prices, it was to be remembered that the promoters could not give a supply for about three years, by which time the Shoreditch undertaking would be considerably improved. As a matter of fact, for the purpose of comparison, the promoters had taken figures relating to the boroughs which were nearly two years old whilst their own estimates were for three years ahead, so that there were five years between the two sets of figures which were being compared. Many firms in Shoreditch, he said, were under the impression they would get electricity for ½d. under the Bill.

In cross-examination, witness said the total costs at the present time were 1·19d. per unit. He admitted that if the Council were offered a supply at 0·45d. per unit, as business people they would seriously consider it.

In answer to the Chairman, Mr. Russell thought a sliding scale, limiting the amount which a power user might use for lighting would be a solution of the difficulty in connection with the 20 per cent. clause.

HAMMERSMITH.

Mr. SNOWDEN, counsel for the Hammersmith Borough Council, said that to get the supply of power to London concentrated in one spot was a dangerous position, and one which the London County Council did not permit, for instance, in regard to the Franco-British Exhibition. Here an auxiliary supply had to be taken from the Notting Hill Electric Lighting Co., and every alternate lamp was supplied from the second source.

Mr. G. G. BELL, the Engineer to the Council, said that the works occupied a site of four acres, but only one-third was occupied with buildings. The capital expenditure was between £200,000 or £300,000. At present the power supply amounted to 2,400,000 units, and the number of consumers was 176, but of this output, 1,900,000 units were supplied to fourteen consumers, and these were the very consumers which the power company would compete for. He criticised certain of the promoters' estimates. For instance, the amount for repairs he considered much too low, whilst in the second stage of the power company's undertaking, when the promoters had doubled the quantity of coal burned, they had only doubled the cost of repairs. Considering that the boilers would be worn to a considerable extent by then, this was not a correct estimate, and repairs would be much greater in proportion. On the question of charging on the basis of a sum per kilowatt of maximum demand, and so much per unit, Mr. Bell said this system had been charged in Hammersmith ten years ago, but, owing to friction with consumers, they had had to abandon it, and a flat rate was adopted. Mr. Bell had also prepared some tables to show that on the promoters' figures there would be no advantage in taking a supply from the power company, and these were handed in. The gross return on the gross liabliity of the undertaking was only 8 per cent., out of which renewals at the rate of 3·6 per cent. had to be deducted. He mentioned this as showing the small margin of profit upon which they were now working, and as indicating the weakness of their position for carrying on a keen competition with the power company.

Cross-examined by Mr. Clode, witness said the diversity factor in Hammersmith was about unity, and he thought this was about the diversity factor anywhere. He failed to see how it could be taken higher. At present their charge for power was 1d. per unit, irrespective of the load factor.

London County Council.

Mr. FREEMAN, K.C., speaking on behalf of the London County Council, said that the Council was extremely anxious that no Bill should be passed which had not a reasonable and sound chance of success and of solving this question once and for all. If such a Bill were introduced, the Council would not stand in its way as opponents, but would only desire to stand in their proper position as safeguarding the public interest on the one hand, and the interests of those who had already spent large sums of money in the business on the other hand. Mr. Merz's Bill of 1905 was an entirely new way of looking at this question, and had been a considerable surprise to all persons connected with the electrical industry. He might say that Mr. Merz's Bill came as a startling proposition, and was one which the London County Council was not then prepared to accept, but as the result of the Parliamentary inquiry which took place upon that Bill, everybody had come to the conclusion that the proposition to give a supply in bulk from one large central station was the only way of dealing with the problem.

Having given the history of Mr. Merz's Bill of 1905 and the two London County Council Bills of 1906 and 1907, Mr. Freeman dealt specifically with the London and District Electric Power Bill. In view of the report of the Select Committee of the House of Commons of 1906, and the subsequent attitude of the London County Council, he said that the Council felt that they could not take up a position of hostility, and that the proper thing was to consider the Bill carefully on its merits, the County Council was strongly of the opinion that further delay should not take place. But as the Bill now stood it was open to very considerable objections, and he would have to ask that it should be modified in numerous very important respects. He could not criticise the area, because it was the area suggested in their own Bills; he did not criticise the site of the generating station, because it was the same as that in the London County Council Bill of last year, and he did not criticise the engineering details because to all intents and purposes they were the same as their own. In fact, listening to the evidence of Mr. Hammond and Mr. Parshall, he was almost tempted to believe that they were dressed in Mr. Rider's clothes, because all their facts and evidence was based upon the information they had gained as engineers to the Council; but the County Council had no objection to this, because they wanted everything that was best for the public interest. With regard to the question of finance, the Council thought if the Committee were satisfied that the financial support of the Bill was such as would reasonably ensure the promoters getting their money on proper terms, and being able to carry out the work, they did not desire to stand in the way at all. At the same time he would remark that the financial evidence was a very long way short of that behind the Administrative Company's Bill, and behind that of a public authority. The Council was satisfied with the maximum prices in the Bill. Coming to the clauses he desired to criticise, in the first place the Council thought there should be strong provision in the Bill to prevent it acting as a block Bill to other schemes. The promoters said they could get their money easily and could push forward the scheme, and he would ask that a substantial amount of money should be obtained within twelve months, and a substantial commencement of works be made within two years instead of the five years in the Bill. In his cross-examination of the promoters' witnesses, he had mentioned the sum of £1,000,000 as being the amount which should be raised within twelve months, but, as the promoters had practically guaranteed capital to the extent of £600,000, he would be willing to accept that. Dealing next with Clauses 61, 62, 63, and 64, he pointed out that Clause 61 limited the standard dividend of 8 per cent. In Clause 62, if the profits exceeded the amount applicable to dividends, the promoters might invest the excess in an insurance fund, provided that that fund did not exceed one-twentieth of the paid-up capital. But there was no obligation upon them to make that fund, and if they did, it was not to exceed one-twentieth. By Clause 63 the promoters were enabled to create a reserve fund, to which there was no limit whatever, because they were able to put aside such as sum as they might think fit. If the insurance fund had to be created out of divisible profits before they paid their dividends, it would not have been open to the objection, but as the clause now stood the company could go on creating a reserve fund to any extent they pleased, which would act detrimentally to the public interests in certain circumstances which might arise. Clause 64 dealt, he said, with the surplus profit, and it divided them into three parts. One-third was to form a sinking fund, the second third was to go towards the reduction in the price of electrical energy, and the remaining third went towards increasing the authorised dividends on the capital of the company. This clause was an unusual clause, and in the opinion of the London County Council extremely objectionable. At the same time he admitted that it had appeared in one other Power Bill, but in one only—the Cleveland and Durham Power Bill. There was a perfectly well-recognised means of dealing with surplus profits, which occurred in gas and other Acts, and acted fairly as between the trading company and the public, namely, the well-known sliding-scale clause, by which the profits were increased in relation to the decrease in price. So far as the present clause was concerned, the company got one-third of the extra profits, and the consumer one-third instead of two-thirds, as in the gas Acts, whilst the remaining one-third went to the sinking fund, which ultimately came into the hands of the purchasers at the end of 42 years, in reduction of the price to be paid for the undertaking. In other words, the benefit which would immediately arise to the consumer under the sliding-scale clause would be taken away from him as regards a part, and held over ultimately for the benefit of posterity 42 years hence.

THURSDAY, MAY 28TH. (FIFTEENTH DAY.)

In answer to a question, the CHAIRMAN intimated that the Committee would hear the other two Bills before coming to a decision with regard to this one. We give below the text of the purchase clause as it now stands. It will be seen that it has been modified, but the negotiations with the London County Council for a compromise have fallen through.

THE PURCHASE CLAUSE AS MODIFIED BY THE PROMOTERS.

Clause 65.—The undertaking of the company shall be liable to purchase by any County Council or Joint Committee of County Councils, Body of Trustees, or other public authority or body who may be authorised by Parliament to purchase the undertaking (hereinafter called "the purchasing body"), subject to the following terms and conditions (that is to say):—

(1) (*a*) The purchasing body may, on giving not less than twelve months' previous notice in writing to the company of their intention to acquire the undertaking, purchase the same at the expiration of forty-two years from the thirty-first day of December one thousand nine hundred and eight, upon the terms of the purchasing body paying to the company a sum equal to the amount expended by the company upon the undertaking, and properly chargeable to capital account at the date of the purchase as certified from time to time by the auditor appointed by the Board of Trade under the provisions of the Principal Acts, together with such a sum (if any) as would be required to make up the aggregate amount of the dividends paid by the company up to the date of purchase to six per centum per annum upon the capital from time to time paid up after deducting from the aggregate of those sums the aggregate amount of the value of the investments and moneys representing the sinking maintenance and renewals, insurance, and reserve funds provided for by this Act; or

(*b*) The purchasing body may, on giving not less than twelve months' previous notice in writing to the company of their intention to acquire the undertaking, purchase the same at the expiration of any period of ten years, subsequent to the expiration of the said period of forty-two years upon the terms of the purchasing body, paying to the company a sum equal to the amount properly expended by the company upon the undertaking and chargeable to capital account at the date of the purchase, as certified from time to time by an auditor appointed as hereinbefore, provided after deducting therefrom the aggregate amount of the value of the investments and moneys representing the sinking, maintenance, and renewals, insurance, and reserve funds provided for by this Act;

(2) No allowance shall be made to the company for compulsory purchase, or for goodwill, or for the prospective or future value of the undertaking;

(3) In the sixth and in every succeeding year after the company commence to supply electrical energy under the provisions of this Act, they shall, before arriving at the profits of the undertaking available for dividend, set apart to form a fund (in this Act called the "maintenance and renewals fund") such sums as the said auditor may determine to be necessary to maintain the buildings, plant, mains, and apparatus of the company in an efficient and proper working condition, and to renew the same when necessary, and the company shall out of such fund maintain and renew the said buildings, plant, mains, and apparatus accordingly;

(4) If the company consider any determination of the said auditor to be incorrect or unreasonable, they may appeal thereon to the Board of Trade, whose decision shall be final;

(5) For the purposes of this section any sums so expended by the company in such maintenance and renewal shall not be deemed to be chargeable to capital account;

(6) The purchasing body shall also pay to the company for the materials and stores on hand at the date of purchase a price to be agreed on, or in the case of difference to be determined by an arbitrator to be appointed by the Board of Trade, and in addition the value of the debts due to the company the amount of the cash in hand or at the bankers, and securities for money other than those representing the sinking, insurance, maintenance, and renewals and reserve funds provided for by this Act, and the company shall discharge all debts due by the company at the date of purchase, and all liabilities with respect to any debenture stock or mortgage debt of the company;

(7) The expression "undertaking" shall, for the purpose of this section, include all rights of generating, purchasing, using, transmitting, transforming, distributing, supplying, and utilising energy, and all other rights, powers, authorities, and privileges of the company, and all such property real and personal (except investments and moneys representing the sinking, insurance, maintenance, and renewals and reserve funds provided for by this Act), and except, as aforesaid, all other interests

Digitized by Google

and rights into and out of the property real and personal, and obligations and things in action as may be in the possession of the company or belong to them immediately before the date of purchase, and all books, accounts, and documents relating thereto, but subject to all liabilities and obligations of the company other than the debts due by the company and the liabilities with respect to the debenture stock and mortgage debt of the company;

(8) As from the date of purchase the undertaking shall be transferred to and vested in the purchasing body, and such body shall have, and may exercise, all the rights, powers, authorities, and privileges of the company, and shall to the exclusion of the company, be subject to all the duties, obligations, agreements, and liabilities of the company in like manner as if they were the company, except the debts due by the company at the date of purchase and the liabilities with respect to the debenture stock and mortgage debt of the company.

Mr. FREEMAN, continuing his speech for the London County Council, next dealt with this purchase clause. He said that, although there had never been a legal decision, the purchase terms of the Electric Lighting Acts had a definite meaning which had been construed in analogous cases. Under the clause proposed by the promoters, the decision as to the purchase price was to be put upon the auditor, anterior to the period when the actual purchase would take place, in order to make certain that investors would get their money back; in other words, the auditor had to certify each year the capital expenditure, and this sum was to be the purchase price at the end of 42 years. Mr. Fitzgerald had stated that this introduced a clearness into the clause, but he thought this so-called clearness was a mistake, and it was much better to keep to the words of the Electric Lighting Acts, namely, "the then value," or some words equivalent, and if Mr. Fitzgerald preferred, words which would indicate the meaning of "then value" could be inserted. It had been stated on behalf of the promoters that no purchase clause had appeared in any other power Act, but it must be remembered that no such area as London existed elsewhere. All the provincial power Acts included large tracts of country which were mainly pure country, for the areas of the larger local authorities had been struck out. The first Bill dealing with London had a purchase clause, and the purchase clause at first proposed by the promoters of the Administrative Bill was very much on the lines of the present one, but asked for 50 years instead of 42. To this the London County Council strongly objected, and for very much the same reasons that they were objecting now, but the clause was altered to the one in the Electric Lighting Acts. The contention of the London County Council was that the clause in the Electric Lighting Acts was intended to avoid "scrap iron" value, and was meant to ascertain the value of the electrical plant, of the buildings, and of the whole concern ready *in situ* to carry on business, but that the purchase price was not to be multiplied by so many years in order to arrive at the prospective profits of the undertaking. The clause did not mean that the machinery should be valued at so much a pound as old iron, nor the buildings at so much a ton for stone and bricks. Analogous to the Electric Lighting Acts was the purchase clause of the Tramways Act of 1870, and the famous decision given in 1895 with respect to the London and also the Edinburgh tramways laid down the principle which he had just explained as the basis of the valuation. The decision of the House of Lords in this matter was that, having ascertained the value of the rails and the various component parts of the undertaking, an amount was deducted for depreciation, but then it was held to be fair to the company that they should be repaid for the Parliamentary promotion expenses, the amount paid to local authorities, and so on. An important difficulty would arise under the promoters' clause in dealing with plant which had been superseded by something so much better before the life of original plant could have been said to have expired. Mr. Maltby for the promoters has suggested that this should be placed to suspense account, but in the modifications suggested by the promoters in the purchase clause there was no suggestion of this sort. Mr. Maltby had also suggested taking expert advice with regard to arriving at the true capital expenditure and the necessary amount which ought to have been set aside for renewals, repairs, maintenance, &c., but inasmuch as the auditor would have to bear the expense of such expert advice himself, it was conceivable that he would not go to the highest authorities.

His next point was with regard to making up the dividends to 6 per cent. by the purchasing authority if this amount had not been earned during the life of the company. As he had pointed out in cross-examination, if the company had only paid 4 per cent., the sum necessary to make this up to 6 per cent. for 42 years would be £3,750,000, and Mr. Maltby, the promoters' witness, had admitted that this would almost amount to prohibition of purchase, and had expressed the opinion that in that event the purchase could be deferred for ten years when the dividends would not have to be so made up. If this was the intention of the promoters, he thought it a curious way of drafting the Bill, and not a proper way of presenting it to the Committee. Why should the promoters be secured 6 per cent.? It would open the door to all sorts of careless management. Dealing with the period of purchase, he suggested that a provision should be made that this might take place in 1931 when all the existing companies were purchasable, provided that the power company were properly compensated for their goodwill as between 1931 and the 42 years in the clause. Mr. Parshall had stated he did not see anything untair in this, and so far as he knew, the promoters did not dissent. As to the body which should purchase, at present this was left entirely vague, and he thought it would be much better that something definite should be put in the Bill. He therefore suggested that the clause should be altered to read that the purchasing authority should be the London County Council, or such other body as Parliament might authorise. If the clause remained as at present in this respect, there would be nobody to move Parliament in the matter, and further he pointed out that the suggestion that the London County Council should be the purchasing authority was in accordance with the Report of the Select Committee of 1906. He also suggested that whatever authority was entitled to purchase, should be allowed to purchase in stock or annuity, and not necessarily in cash, for the reason that it would be very inconvenient to have to raise such a large sum of money at one time. This method had worked with the utmost success in the case of the Metropolitan Water Board.

Mr. FITZGERALD pointed out that originally all the water companies, with the exception of the New River Co., were to be paid in cash, and that the arrangement to pay them all in stock was only arrived at after private negotiations.

The CHAIRMAN asked Mr. Freeman if he wished it to be optional on both sides.

Mr. FREEMAN said that he wanted it optional upon the part of the purchasing authority to pay in stock or cash.

The CHAIRMAN: Then you lay down the terms on which the purchase should take place.

Mr. FREEMAN then dealt with the Kitson clause. He said that, in the present case, the Kitson clause had been thrown over for one which it was claimed had a certainty, but it did not seem to have commended itself to anybody. All the local authorities were dissatisfied with it, and the London County Council did not appreciate or approve of it. The Council did not think that the Power Company should be allowed to supply the larger consumer without any consultation with the authorised distributor. Of course, they did not complain as to railways, canals, &c., which ran through a number of districts, but they did not see why a consumer within the district who required 250 kw. should be able to take a supply on different terms to a man below. The arrangement proposed by the promoters of allowing the authorised distributor to give a supply at an increase of 1 per cent. above the price offered by the power company for every 10 kw. below 250 kw. did not take into consideration the varying circumstances of the different authorities. This was a matter which could not be decided by any fixed rule, but could only be tested by reference to an absolutely impartial tribunal such as the Board of Trade. Therefore, the Council preferred the original Kitson clause, to which there was no valid objection so far as they knew. At the same time, there was a modification or addition which it was thought necessary in the public interest. By the clause the local authority were put in a position to take supply at a reasonable price, but it ought to go further and stipulate that having obtained it at a reasonable price, they should also distribute it at a reasonable price. This was very much in the nature of an addition which was in the County Council Bill, and was one which they considered would complete the clause. He would also suggest that, in the reference to the arbitrator in the Kitson clause, he should be specifically instructed to take into account the capital expenditure upon the undertaking of the authorised distributor.

The CHAIRMAN asked Mr. Freeman whether he had considered the difficulty or impossibility of obtaining the money for the scheme with a too stringent purchase clause. This he said was at the bottom of the whole matter.

Mr. FREEMAN replied that the County Council did not wish to interfere nor to make any suggestions which in their opinion would wreck the Bill. They thought they were not asking more than was necessary in the public interest, and that none of the suggestions made would make it impossible to raise the money.

Mr. FELIX CASSEL, K.C., chairman of the Parliamentary Committee of the County Council, confirmed the views expressed by Mr. Freeman in his speech. On the question of the terms of purchase, the Council objected to the repayment of the whole capital expenditure, for the reason that they might have to pay for some plant which either did not exist at all or which was practically of no value. A particular case in the mind of the Council was the horse tramways of London. In this case the whole cost of the horse track and rolling stock stood in the books, as well as the capital cost of the electric tramway, and, of course, there was no asset representing the cost of the horse tramways. The Council felt that it might have to pay, so to speak, for the inventions of the next 42 years.

The CHAIRMAN: Would not this involve raising new capital on the part of the company, and surely the point would arise during the discussion when the company came to Parliament for new capital powers?

Mr. CASSEL said this would not alter the terms of purchase, although some arrangement might be made then. But the Council felt safer with the terms of the Electric Lighting Acts.

Digitized by Google

In cross-examination, Mr. Cassel agreed that the Council desired a bulk scheme passed this session if possible, provided the interests of the authorised distributors were safeguarded, and also the interests of the public, as the purchasing authority.

Mr. Cassel's cross-examination was not concluded, as he had to keep an important public engagement, but subsequently, in view of the cross-examination of Mr. Haward, it was decided not to ask any further questions.

Mr. H. E. HAWARD, Controller of the London County Council, said he had had to advise the Council upon all questions of purchase in relation to tramways, &c. He had considered the purchase clause in the present Bill, and regarded the basis of purchase laid down as a very unsatisfactory one from the public point of view. He saw no means by which the decisions of the auditor under the clause could be upheld or enforced, and he thought it would be much more satisfactory if the purchasing authority had some voice in the matter. The same effect was produced under the Electric Lighting Acts; it frequently happened that the decisions of the Board of Trade auditor were not acted upon, and the Council in this matter also considered that there should be some means for enforcing the auditor's decisions.

Mr. FITZGERALD, for the promoters, said that on a question of dispute in the matter referred to, any person or body, such as the London County Council, could get the Attorney-General to make an application to the courts.

Mr. FREEMAN, for the County Council, said this would be a most clumsy and roundabout way of doing it; and, in addition, he was not at all sure that the County Council could move in the matter in the way suggested. The Council certainly had no statutory powers to spend money on setting the Attorney-General in motion.

Mr. HAWARD, continuing his evidence, supported generally the arguments adduced by Mr. Freeman. Incidentally he said that the view of the Council was that the terms of the Electric Lighting Acts were more favourable than those of the Tramways Act of 1870. As to the difficulty of raising capital if these terms were applied, he did not think this would be so, and mentioned that £12,000,000 had been raised by companies in London upon these terms, and £40,000,000 by companies throughout the country. Even assuming that there was a certain amount of capital which would not be repaid, a very small insurance fund would cover this. For instance, an insurance fund of 21s. per cent. would repay the whole of the capital in 42 years on the 3½ per cent. table, and assuming that this fund was not started until 12 years after commencement, a fund of 38s. per cent. would repay the whole of the capital. Assuming that one quarter of the capital expenditure would be lost—a large proportion—the sinking fund would be very small, viz., about 5s. per cent. if started from the commencement. With regard to payment in stock or cash, he was in favour of the purchasing authority having the option of either, and mentioned as precedents the purchase of the water companies, the purchase of the National Telephone Co., and also of the Indian railways. In the latter cases, purchase could take place by stock or annuities.

At the close of the examination in chief, the Chairman, having ascertained that the Council had advanced £5,000,000 to local authorities for electric lighting, asked what would be the fate of this sum if in a few years a new invention was made which rendered it advisable to scrap the whole of the present plant.

Mr. HAWARD said that, of course, the whole of the capital in question would not become obsolete, but, assuming that a large proportion would, the Council would probably allow the local authorities to charge to capital account the difference between the outstanding debt on the superseded plant and the cost of the new plant. This was on the assumption that the new plant would enable the undertaking to make a much larger profit than before.

The CHAIRMAN suggested that it might not necessarily allow a larger profit to be earned, although the price to the consumer would be less.

Mr. HAWARD did not care to express an opinion of what the policy of the Council would be in these circumstances. Certainly each case would have to be decided on its merits.

In cross-examination by Mr. Fitzgerald, witness admitted that, under the limitations now proposed by the County Council, no company had ever raised a penny of capital from the public. Another point in the same line of argument was that in the London County Council's Finance Committee's report on the Council's Bill of 1907, it was stated that money would be more easily raised by a public body, and yet it was later on stated that there was every probability of a loss upon the undertaking during the first few years. From this Mr. Fitzgerald argued that, with much more stringent financial conditions in the ordinary course, made more stringent by the proposals of the Council, it seemed to be expected that the company could raise capital and make the undertaking a remunerative one, where the Council did not expert to do so itself. Witness agreed that the terms upon which the existing companies had raised their capital were somewhat different to those now proposed to be put upon this company, but at the same time the power company had many advantages over the pioneer companies. They now had the benefit of the most up-to-date knowledge, and a better knowledge of the conditions in London. Mr. Fitzgerald put it that none of the existing companies had the sliding-scale clause limiting the dividends in relation to the price, and, further, in comparison with the existing companies, the power company would not have the advantage of what had hitherto been the most profitable form of supply to the companies, viz., lighting.

Mr. Fitzgerald then went to the point relating to the auditor obtaining expert advice in relation to the amounts set aside to renewals and so on, referred to the Electric Lighting Clauses Act, which lays it down that the whole of the expenses of the auditor should be paid by the undertaker. Mr. Haward did not think that the Clauses Act would allow the auditor to take outside advice at the expense of the undertaker.

Mr. FITZGERALD next dealt, in his cross-examination, with the statement that tramway purchases took place upon worse terms, if anything, to those of the Electric Lighting Acts. He asked Mr. Haward if he was aware that since the decision of the House of Lords in 1895, no tramway Bill had been promoted without different terms to those of the Act of 1870, owing to the inability to raise capital under the terms of that Act. Witness was not aware of this. Further, it was put to him that the Light Railways Act provided for no purchase at all. He replied to this that it was within the powers of the Light Railway Commissioners to insert a clause at their discretion, but Mr. Fitzgerald met this by reading the terms of such clause, viz.: "Fair market value as a going concern without addition for compulsory purchase."

Coming to the desire of the County Council to be the purchasing authority, Mr. Fitzgerald put it to witness that a similar suggestion had been made in regard to the water question, which was over a similar area, but it had not been carried out, mainly owing to the opposition of the local authorities outside London. He asked what would be his position if the London County Council now pressed this request and all the local authorities outside opposed it? Was he likely to get the Bill through Parliament at all? Mr. Haward thought he could hardly be expected to answer this question.

FRIDAY, MAY 29TH.—(SIXTEENTH DAY.)

The CHAIRMAN stated he would be glad if counsel for the local authorities would refrain from further arguments or evidence on the question of competition, and restrict themselves to any new points not yet put before the Committee.

Middlesex County Council.

Mr. ERSKINE POLLOCK, K.C., for the Middlesex County Council, in putting the case for that authority, objected, on general grounds, altogether to any portions of the County of Middlesex being included in the Bill, and he also strongly protested against the London County Council being the purchasing authority in the County of Middlesex. The view of the Middlesex County Council was that the existence of two power companies already in the county was a sufficient area for constituting Middlesex a separate unit for bulk supply. If, therefore, it was deemed necessary that further bulk supply powers should be granted over an area greater than London, then so far as Middlesex was concerned, these powers should be granted to the County Council or to a company with powers to the Council to purchase in 30 years. Another objectionable feature of the present Bill was the powers which the London County Council would have in the event of that body purchasing, for breaking up the roads and bridges in Middlesex in connection with laying mains. He knew of no precedent of one County Council having such powers in the area of another county. Further, in the event of the London County Council making a loss, the ratepayers of London would surely urge that this should be spread over both sets of ratepayers, to which Middlesex would strongly object. On the other hand, if the undertaking was very successful, the London County Council would only be entitled to relieve the rates in their own county. Middlesex would then rightly complain that the price of electricity was being kept up for the benefit of the London rates. Dealing with the policy which had decided the area, he denied that it was that the fringe of London was becoming the manufacturing area of London, and contended that the distance had been decided upon the economical limit of transmission. The portion of Middlesex taken in by the Bill, he said, represented three-quarters of the population, two-thirds of the rateable value, and about half the total area. Middlesex, if excluded from the Bill, would not be without a bulk supply, for the North Metropolitan Electric Power Supply Co. was supplying from Brimsdown and Willesden, whilst the Metropolitan Electric Supply Co., was also supplying from its Willesden station. The former company was giving a most important bulk supply to the Middlesex County Council tramways, and it was the existence of these two companies which weighed with the Middlesex County Council in urging upon the Committee that they were in a far different position to that of most of the opponents to the Bill. He also pointed to the fact that Parliament had never hitherto granted competing bulk supplies, and mentioned the Clyde Valley and Caledonian Power Bills, and the Tyneside and County of Durham Bills, in both of which instances, competition had been practically asked for, and had been refused.

In answer to a suggestion by Lord Welby, that the purchase difficulty might be got over by allowing the Middlesex County

Digitized by Google

Council to purchase the portion of the undertaking in that county, Mr. Pollock thought the complications would be too great to allow of a satisfactory solution.

The CHAIRMAN pointed out that as the Bill stood, the London County Council could not purchase without another Act of Parliament.

Mr. POLLOCK thought that rather than jeopardise their right of purchase without further reference to Parliament, the London County Council would prefer that Middlesex should be struck out.

Mr. CLEASE, for the London County Council, asked the Committee not to accept this view.

Mr. JAMES BIGWOOD, Chairman of the Parliamentary Committee of the Middlesex County Council, detailed the arrangements between the County Council and the North Metropolitan Electric Power Co., in relation to the tramways, whereby the roads were widened and the track laid by the Council, and the undertaking then leased to the Metropolitan Electric Tramways Co., which was supplied with current by the North Metropolitan Co. He expressed the opinion that the whole of Middlesex should be taken or no portion at all, but their opinion was that the county was sufficiently catered for in the matter of electric supply at the present time.

In answer to Lord Lytton, Mr. Bigwood agreed that their objections to the Bill, so far as purchase was concerned, would only arise in 42 years' time. Generally speaking, if Parliament saw fit to give bulk powers over the whole of Middlesex to another company, in competition with the two existing companies, the Council would have no objection, but they did not want the best portion of the county taken.

In answer to the CHAIRMAN, witness stated that although the County Council had no project in view for a bulk supply scheme, yet they would rather promote one than have the county cut into in the way proposed in the Bill.

The Committee adjourned at one o'clock.

MONDAY, JUNE 1ST.—(SEVENTEENTH DAY.)

WESTMINSTER CITY COUNCIL.

Mr. BLENNERHASSETT, opposing on behalf of the City of Westminster, pointed out that there was no municipal electrical undertaking in that area, but their opposition was for the reason of preserving the rights of purchase which the Council had in respect of the various companies supplying there. These rights were regarded as a very important and valuable asset, in view of the favourable terms of purchase under the Electric Lighting Acts. The Westminster Borough Council's purchase powers enabled them to acquire the generating station of the Central Electric Co., which was outside the area of Westminster, and he maintained that the objects of the Council could be obtained without any injury to the main objects of the Bill. The promoters' evidence was to the effect that the main business of the Bill was to supply in bulk to the authorised distributors if they desired it, and with this he did not propose to interfere. But the Council strongly objected to the power company being enabled to supply direct to power consumers, and he asked the Committee to say that under the exceptional circumstances of Westminster, the power company should have no powers to supply for power, except for railways and canals, without the consent of the local authority. By the Administrative Bill London was divided into an "industrial" and a "non-industrial" area, and Westminster was placed in the latter, to which the Kitson clause did not apply. Another clause which was of the utmost importance to Westminster was the clause which allowed of the transfer of electrical undertakings, subject to the sanction of the Board of Trade. In the event of one of the companies supplying in Westminster being acquired by the power company, the transfer should not take place without the consent of the local authority, for without this provision, the purchase rights of the Council would be rendered inoperative. Under the present Bill it was stipulated that no works, except those exclusively used for the supply in the local area, could be acquired by the local authority. This would give the power company the opportunity of so inextricably mixing up the whole matter, that it would be practically impossible to decide what works were exclusively used in Westminster, for instance. This could easily be done by scrapping the local generating stations and supplying from Barking, and the provisions of the Bill left it open for the existing companies and the power company to arrange matters so that the rights of the Westminster City Council to purchase would be absolutely negatived.

Mr. PHILIP PILDITCH, Chairman of the Law and Parliamentary Committee of the Westminster City Council, in confirming the views already expressed by Mr. Blennerhassett, said that the Council had powers to acquire the whole of the Westminster Co.'s undertaking, and also that of the St. James's & Pall Mall Co. They could, moreover, acquire the major portion of the undertaking of the Kensington & Knightsbridge Co., a small portion of the London Electric Supply Corporation's undertaking, the greater portion of the Charing Cross Co.'s undertaking, and a small portion of the Metropolitan Electric Co.'s undertaking; whilst, in addition, they had the right, under the Central Electric Supply Co.'s Act of 1905, to acquire that company's power station in Grove Road, although it was in Marylebone. The general view of the Council was not in opposition to the principle of bulk supply, provided the authorised distributors were not forced in any way to take a supply.

Questioned by Mr. Talbot, for the promoters, witness admitted that the question of purchase was already in a most confused condition, but the Council was hoping for legislation which would smooth the path. He also agreed it was within the bounds of possibility that the Council would be forced to leave out of the purchase question those companies which were only partly in the Westminster area, and to purchase only the companies which were supplying solely within Westminster.

Mr. JOHN HUNT, Town Clerk to the City of Westminster, also gave evidence. His cross-examination by Mr. Clode was directed to the fact that under the Administrative Bill of 1907, if the consent of the local authority to the purchase of a local company was unreasonably withheld, the Board of Trade should be appealed to. Therefore, the local authority did not have sole right of determining, as had been suggested by counsel, for Westminster. Further, although the Board of Trade had been objected to in respect of the Kitson clause, yet it had been accepted in the other instance.

In answer to Lord Lytton, Witness said that the inducement to the power company to buy up local companies was that when the local authority eventually purchased, the power company could, under the Electric Lighting Act of 1888, claim compensation for severance.

ISLINGTON.

Mr. GERALD SANDER, counsel for the Islington Borough Council, said the sum of £449,000 had been spent upon their electrical undertaking, and that the buildings had been erected which would accommodate 40,000 kw. He admitted that the cost per kw. was at present high, but as the plant was increased to the maximum capacity of the buildings, this would be reduced to £22 per kw., which, if he read the promoters' tables correctly, would be less than their figures, by £10 per kw. Of course, this was by reason of the expenditure already incurred on buildings. The average price of coal in Islington, also, was 11s. 7d. per ton, which was lower than the figures put in by the promoters. He challenged the contention of the promoters that the Electric Lighting Acts gave no monopoly, and argued that it was upon a reading of the Acts that a local authority should be immune from competition subsequently, that the large capital had been expended upon the electrical undertaking in Islington. Dealing with the canvassing which has been carried on in Islington, counsel stated that of the 317 power consumers in the borough, the Council now supplied 206, and of the total horse-power in the borough, viz., 3,448, the Council was supplying 1,804 h.p. There were no large consumers. He complained that after Mr. Parshall had stated that a large number of important witnesses were to be called from Islington to testify as to the unsatisfactory electric supply, not one had been called, and the only inference to be drawn was that no such dissatisfied consumers existed. On the contrary, he had letters from numerous consumers to the effect that they were quite satisfied. He would therefore ask the Committee to take no notice of this evidence for the promoters. Dealing with the tables put in by the promoters with regard to the Islington undertaking, he criticised the load factor assumed three years hence of 20 per cent. During the past 24 years, the load factor in Islington had only increased from 16·4 to 16·8, and what justification was there for assuming that there would be the large jump from 16·8 to 20 per cent. within the next three years. Again, the cost to the Islington Council would be about 2d. per unit, taking power from the power company, after adding the distribution costs.

Mr. ALBERT GAY, Electrical Engineer to the Islington Borough Council, was then called to confirm the statements made by Mr. Sanders. When the generating station was completed, the total cost per kw. would be £22 10s. per kw. and even allowing the promoters 25 per cent. for reserve above their 60,000-kw. capacity, their cost per kw., including transmission, would still be higher than the figure above-mentioned. The promoters, he said, had also taken the costs of Islington for 1906, viz., 1·6d. per unit, and compared with their figures, which were to apply three years hence. He estimated that the costs at Islington would in three years' time have dropped to 1d. per unit. The supply of power in Islington at 1d. paid very well, for they regarded power supply as a by-product. Seeing that the plant would be lying idle without the power supply, he calculated that the cost of energy for power supply was 0·35d. per unit. Therefore, he made a very good profit.

Under cross-examination, Mr. Gay said that the power business in Islington brought in a revenue of £5,000 per annum, out of £52,000 for the whole business. At present the quantity of coal per unit generated was 10 lb. The total costs per unit for 1907–8 were 2·52d.

EALING AND BARNES.

Mr. READER HARRIS, K.C. for these two authorities, asked for exclusion from the area of the Bill, although he was willing to allow the company's mains to pass through, or they might supply for railway purposes or to the local authority in either case. Both areas were purely residential, and no less than four-fifths of the land was restricted by covenants from being built upon for manufacturing purposes. Ealing was already in the bulk area of the Metropolitan Electric Supply Co., and the Bill of the electric lighting companies did not include it. The same

Digitized by Google

arguments he applied to Barnes, and summed up the position that the power company could be of no benefit to the districts on the one hand, and, on the other, that boroughs offered no inducement to the power company.

CITY OF LONDON.

Sir RALPH LITTLER, K.C., drew attention to the special circumstances of the City of London. They had never adventured into municipal trading, and while they expressed no opinion for or against, they believed that in their present position it was undesirable. The City had, he reminded the Committee, the option of purchasing the portions of the City of London and the Charing Cross Co.'s undertakings, relating to the area as early as 1914. Apart from the possible interference with these rights of purchase, counsel objected to the interference with the City streets which the laying of the mains would involve, and said that the small cost of going round the City instead of through it was no justification for the indescribable nuisance of breaking up the streets for laying mains. He did not merely ask that the Corporation should give its consent to the promoters' laying mains in the City, he put it higher than that, he wanted them absolutely excluded from the City of London.

Opposition by the Westminster, St. James's, Kensington, and Notting Hill Companies.

Mr. M. PRYOR, Chairman of the Sun Life Assurance Co., and a director of the St. James's & Pall Mall Electric Lighting Co., said he had gone into the financial aspects of the Bill. He said he did not think the time was favourable for raising large sums of money for such purposes, because the market had been very much perturbed by the unfavourable results of previous London enterprises, especially of the London underground railways. He was a member of the Committee which was formed to reorganise the finances of the Underground Electric Railways Co. of London. Very few issues of large amounts of money had been made during the past year without heavy underwriting, and he did not think the promoters could start their undertaking without resort to underwriting at the hands of a well-known firm, and, so far as he could discover, no well-known firm was behind the promoters. Generally, he thought that London enterprises were not in favour at present in the money market.

In cross-examination, Mr. Pryor agreed that in certain circumstances a bulk supply scheme for London would be useful, and that the money market was improving.

In answer to the Chairman, witness expressed the opinion that if all three Bills were passed the tendency would be for the existing companies to refrain from issuing new capital until they saw what the power company was doing. In the event of the latter failing to carry out its obligations, this might be a serious matter for the user of electricity.

Asked for his opinions upon the purchase clause, Mr. Pryor said that repayment of the capital expenditure was not the way to encourage thrifty management. One of the great difficulties in the way of raising capital which the existing companies had had to encounter was the likely effect of the terms of purchase under the Electric Lighting Acts. This had discouraged investment, and the public were obliged to pay very much more for electric light than they would have if the companies had had reasonable security to offer. As a comparison between the purchase terms proposed by the promoters for 42 years and 52 years, the former of which provides for making the dividends up to 6 per cent. and the latter do not, he characterised them as improvident and very liberal respectively.

TUESDAY, JUNE 2ND.—(EIGHTEENTH DAY.)

Sir ALEXANDER KENNEDY, F.R.S., Consulting Engineer to the Westminster Electric Supply Corporation, expressed the opinion that the Bill of the London and District Electric Power Co. could confer no benefit upon the non-industrial district in the West End of London. The four companies which he represented had expended the sum of £650,000 upon their distributing mains and low-tension feeders. The power company apparently did not intend to supply power consumers in that district, as he saw no provision in the promoters' estimates for dealing with distribution in the West End of London. The companies therefore asked to be excluded from the Bill, just as they had been cut out of the industrial area of the Administrative Bill. That Bill had only taken powers to supply the authorised distributors in bulk, but the present Bill proposed to supply local authorities, so that there would be competition with the West End companies for street lighting. Dealing with the clause which provides that the authorised distributors should supply at 1 per cent. above the price of the power company in respect of each 10 kw. below 250 kw., Sir Alexander took the case of a 240-kw. consumer. The Bill laid it down that such a consumer should be supplied at 1 per cent. above the price charged by the power company, but in the case of the Westminster Co. the cost of distribution, not including management or directors' fees, but merely upkeep and maintenance of mains and meters, and also depreciation, was 20 per cent. of the total revenue of the company. He failed, therefore, to see how the 1 per cent. mentioned in the Bill could cover this. Criticising the figures of the promoters, Sir Alexander Kennedy said he had prepared tables upon the assumption that Mr. Hammond had substantially over-estimated the future generating costs to the West End companies if their works were extended. On the other hand, Mr. Hammond had under-estimated the cost of generating the heavy peak load, which, it was suggested, the companies should take from the power company in, say, 1915. The result was that the estimated saving of £19,000 was altered to a loss of about £800. Generally, he regarded the idea put forward by the promoters, of the authorised distributors either scrapping their plants or only working them during the peak load, was an impracticable one in the present position, at any rate, of the West End companies. His view was that the large number of small stations which now existed in London gave a greater security of continuity of supply, for, apart from the danger of a breakdown on the system of one large bulk undertaking, the general policy of such a power company was to load up its plant to the maximum throughout the whole day, and so to reduce the reserve to a minimum, whereas, under the conditions obtaining in small local areas, the stand-by had necessarily to be considerable, and thus continuity of supply was ensured.

In his cross-examination by Mr. Talbot, K.C., Sir Alexander Kennedy agreed that the attitude now taken by the companies in past years in respect of Power Bills had been uniformly ignored by Parliament. On the question of competition, he said that the companies which he represented had over 1,000 consumers for heating, whose maximum demand was about 1 kw., and, under the 20 per cent. clause, a very considerable amount of private lighting could be undertaken. Mr. Talbot next put to witness the statement of the Chairman of the St. James's Co. at its Annual General Meeting, that if the power supply of that company increased considerably beyond the present limits of about 12 per cent. of the total output, the price would have to be raised, but Sir Alexander disagreed with this statement, and pointed out that the Chairman of the St. James's Co. was not an engineer. There was certainly no intention of raising the price for power. On the question of the possibility of dealing with large power consumers without affecting the lighting consumers, Sir Alexander Kennedy said that in the West End there was only one consumer over 250 kw., and he was thrown on and off without affecting the lighting in the least. There had been no complaints. Mr. Talbot said he thought they were getting into a rather personal question, but he personally could not give evidence. (The inference was that Mr. Talbot privately is upon the Westminster mains, and that the pressure regulation is not all that could be desired.) Sir Alexander suggested that if Mr. Talbot had made a complaint, he could cross-examine the Manager of the Westminster Co. upon the point.

In answer to the Chairman, witness said he wished to have the Kitson clause modified, so as to prevent the power company from supplying for lighting to a power user.

Under continued cross-examination, Sir Alexander Kennedy argued that the promoters in their estimates had not taken any account of extra capital expenditure between now and the time when the power company would be supplying, say, during the next five years. Further capital must be incurred by the authorised distributors in order to cope with the increasing demand, and the capital charges on this plant would have to be met, and must be taken into account when, and assuming, the bulk supply was taken.

Mr. TALBOT pointed out that the margin of plant now available would be sufficient to carry the companies on until the bulk supply was ready, but Sir Alexander dissented from this view.

In re-examination, Sir Alexander said that the introduction of metallic filament lamps largely increased the number of small power users, who could obtain all their lighting from the power company under the clause which allowed a supply of 20 per cent. for this purpose.

Mr. L. H. HORDERN, Manager of the Westminster Co., dealing with the 20 per cent. clause, said that this allowed the use of eight 8 c.p. lamps for each kilowatt of power, and, of course, two or three times as much candle-power with metallic filament lamps. The connections for power on the Westminster Co.'s mains were actually greater in 1907 than the connections for lighting, viz., 1,722 kw. for power, against 1,296 for lighting. Under the 20 per cent. clause, if the power company secured the power load they would get almost the whole of the lighting supply to the power users. Ninety-four per cent. of the Westminster Co.'s power users were under 10 kw. He regarded the system of charging so much per kw. per annum and something per unit as an impracticable one for small consumers. The consumers would not know until the end of the year what his bill would be, as it depended upon the maximum demand. Under the Power Bill a consumer taking one kilowatt would have to pay £4 10s. per annum, whereas the average receipts from such a consumer was 18s. per annum. The number of units sold by his company per £1 of capital expenditure was only 12, so that economy of supply depended more on economy of capital expenditure than reduction in generating costs, and the consolidation of the existing interests was the best way to bring about this result. The investment of a further £6,000,000 in the business would not tend to decrease the cost to the consumer.

Digitized by Google

In cross-examination, Mr. Hordern stated that he was not afraid of competition on fair lines.

The HON. SYDNEY HOLLAND, addressing the Committee on behalf of the four companies mentioned above, said that the promoters had to prove that the supply of electrical energy in London was unduly expensive, and that the demand had been thereby restricted. In presenting the case for the promoters, too much stress had been laid upon the fact that two Committees of Parliament had already decided that it would be a good thing to have a central bulk supply scheme. But the conditions had vastly improved since the introduction of Mr. Merz's Bill in 1905, at which time undoubtedly the existing companies had devoted themselves mostly to the supply of light. Since then they had developed the supply for power enormously, and he thought his claim that the conditions had changed was strengthened by the absence of any of the promoters of the Administrative Bill, either in the promotion of another Administrative Bill—there was now a clear field without the intervention of the County Council or in co-operation with the promoters of the London and District Bill. Further, where was the evidence of any dissatisfaction on account of the high price? There was absolutely none: the only evidence put forward, viz., the support from the firms, the list of which was put in by Mr. Conradi, was dependent upon modifications in the Bill, to which the promoters have given no indication of agreeing. Dealing with the finance, Mr. Holland compared this with the finance of the Administrative Bill. There were 64 gentlemen of the highest standing supporting the latter Bill, but none of the promoters of the present Bill were gentlemen of the standing which was required in launching an undertaking of the magnitude proposed by the Bill. On the general provisions of the Bill, he commented upon the limitations under which the existing companies suffer, from all of which the power company was to be exempt. The power company was under no obligation to supply, and he suggested, if the Bill was passed, that the power company should be obliged to supply the small consumer at the prices in their tables, and also be obliged to lay distributing mains. If this were done, the whole scheme would fail, because there was no money in the estimates for doing this. With regard to the suggestion that the existing authorities should scrap their stations, he doubted whether their liability to their debenture holders would enable them to do this. He asked that the areas of the companies which he represented should be struck out of the Bill.

The "Eight Company" Opposition.

The joint opposition of the Brompton & Kensington, Charing Cross, Chelsea, City of London, County of London, London Electric, Metropolitan, and the South Metropolitan Light & Power Companies was then heard.

Mr. JAMES FALCONAR, Chairman of the Mersey Railway Co., and Chairman of the Company which promoted the Administrative County of London & District Electric Power Bill, was first called to explain the reasons why this Bill had not been proceeded with in the present session. He explained that he had no interest in any of the Bills; he had taken no part in the present proceedings, and had not even seen any of the three Bills now under consideration. The reason why they did not proceed with a Bill this session was that after a full consideration of the conditions they were satisfied that there was no reasonable prospect of a commercial success even if they should succeed in getting a Bill. The situation in regard to the supply of electric power had changed materially since 1905, from the commercial point of view, when the average price charged for power was about 2d. per unit. The original conclusions of the Administrative Co. was that they could supply power profitably at about ¾d. per unit, and at the same time compete effectively with the existing authorities. But circumstances had now altered in this respect, so far as the authorised distributors were concerned, viz., they were now prepared to supply power at 1d. per unit, and this struck the promoters of the Administrative Bill as being a much more effective competition than in 1905. They also knew that many of the existing companies had made agreements with the best consumers for long periods of years, and therefore the best business would not be available to the power company for some time. The situation in regard to bulk supply had also altered materially. The agreements with the companies and local authorities in the 1905 Bill were upon terms which could not be repeated at the present time. These terms guaranteed that the price should be lower than the then generating costs. In 1905, these were perfectly safe terms by reason of the high average costs of generating, but in the intervening three years the authorised distributors had greatly improved their methods of generation, and their costs of generation were now so low that it would not be safe for the Administrative Co. to come under an obligation to supply upon terms more advantageous than the present costs. Consequently, the company had been wound up, it having been decided that there was no business available for such a company under existing conditions. He agreed that there was a large field in London for the supply of electric power, but the whole difficulty to-day was the competition with the existing authorities.

Under cross-examination by Mr. Talbot, witness stated that he was asked by Sir Alexander Kennedy a few days ago to give evidence. The promoters of the Administrative Bill had considered the question in August, and again in October, last year, before deciding unanimously not to proceed further. Mr. Talbot suggested that the meetings were not quite unanimous, and that Mr. Samuel Insull, of the Chicago Edison Co., was in favour of going forward. Mr. Falconar admitted that Mr. Insull regretted having to drop the project, and said he was unaware that Mr. Insull had authorised two of his assistants—and had provided them with materials—to come to London to give evidence in favour of the present Bill.

Mr. TALBOT: Was there any suggestion at the meetings that it would be better to wait until next year? One promoter certainly expressed that opinion, in the hope that the political difficulties would disappear, but the reason which prevailed was the want of business.

Replying to the Chairman, Mr. Falconar said that if only the political situation had been under discussion, he thought they would have proceeded.

Mr. JOHN CONACHER, General Manager of the Metropolitan Electric Supply Co., examined by Mr. C. A. Cripps, K.C., said that the capital invested in all the electric supply companies in London was £14,686,706, and councils £5,755,000. He detailed the restrictions under which the existing companies now work, and made special reference to the purchase clause.

The CHAIRMAN inquired whether in their own Bill the companies proposed to modify the purchase terms of the Electric Lighting Acts.

Mr. CRIPPS said that so far as the Joint Committee undertaking was concerned, they asked that the terms should be modified, but so far as the individual companies were concerned, the terms of the Electric Lighting Acts would apply.

Mr. CONACHER, continuing his evidence, said that the London companies, in conjunction with the local authorities, had made a careful canvass in order to ascertain the amount of power in the area, and instead of there being 500,000 h.p. or 600,000 h.p., as suggested by the promoters of all power Bills, there were only 209,000 h.p., and of this 46 per cent. was already being supplied by the existing electrical undertakings. Mr. Conacher also drew attention to the effect of metallic filament lamps, which he said were unknown in 1905, and therefore this was a factor which came before the Committee for the first time since the electric power problem in London came up for consideration.

LOCAL NOTES

ABERDEEN: *Sale of Incandescent Lamps.*—In consequence of a communication from the Electrical Contractors' Association, who represented that it was against the provision of the Aberdeen Electricity Act, the sale of incandescent lamps by the Corporation is to be discontinued.

M.E.A. Meeting.—It has been decided that no official representatives be sent to the Nottingham Convention of the Incorporated Municipal Electrical Association.

ACCRINGTON: *M.E.A. Meeting.*—The Electricity Committee have authorised a delegate to attend with the Engineer the annual Convention of the Electrical Association at Nottingham in June.

AUSTRALIA: *N.S.W. Tramways.*—The report of the Chief Commissioner, Mr. T. R. Johnson, upon the working of the New South Wales Government railways and tramways for the quarter to March 31st, 1908, shows that the revenue upon the tramways amounted to £264,318, an increase of £28,180 over the quarter of last year, and an expenditure of £196,256, an increase of £28,449. The number of passengers carried was 45,000,000, an increase of nearly 5,000,000.

Broken Hill (N.S.W.).—A poll of the ratepayers is to be taken to decide whether electric lighting shall be introduced into the streets or not.

BATH: *Tramways.*—Notice is given of an intended application to the Light Railway Commissioners by the Bath Electric Tramways, Ltd., for an Order under the Light Railways Act, 1896, to amend the provisions of the Bath and District Light Railway Order, 1901, with regard to fares, rates, tolls, and charges which may be charged, demanded, or collected in respect of the company's light railway or some part thereof, to increase such fares, rates, tolls, or charges, or some of them, and to authorise the company to fix stages upon the light railway in respect of which fares may be taken.

BELFAST: *Cavehill and Whitewell Trams.*—At the monthly meeting of the Corporation, the 1st inst.—Sir Robert Anderson, Lord Mayor, presiding—the question of the agreement with the Cavehill and Whitewell Company was discussed at considerable length, and finally the resolution of the Committee, which agreed to give a through service from Glengormley to Castle Junction, all fares on the city lines to go to the Corpora-

Digitized by Google

tion, and all collected on the company's lines to go to it, was approved of by a majority, and the details were left to the Committee. The Corporation reserved the right of purchasing the undertaking at any time within five years, at a sum not exceeding £60,000.

BLACKBURN: *Electric and Tramway Accounts.*—The Blackburn Electricity and Tramways Department issued their annual reports on Saturday. The latter undertaking had made a net profit of £804, nearly £300 more than in 1907, up to which period there had been a loss since the undertakings were taken over by the municipality in 1899. Out of the profits and a sum of £2,000 transferred from the rates, the deficiencies of the two previous years were wiped out, and for the first time there was a surplus of £517. During the year 10,877,155 passengers travelled on the cars, the receipts amounting to £56,748 6s. 2d. The parcel system had steadily grown, the receipts being £220 more than 1907. Two cars had been fitted with top covers at a cost of £130 each; improved destination indicators and mechanical bells had been fixed on the cars for £467,; roller shutters had been fixed to six new single-deck cars at a cost of £60; and the sum of £110 had been incurred in erecting an open car-body, the cost and renewal of trolley wire on Preston New Road being £80. This expenditure comes out of revenue, whilst £544, the amount expended in heating the shed and erecting the new boiler-house, along with £700, the cost of depôt extension, and £4,045, paid on account of contract for new cars, had been capitalised. In respect to the mileage run in Accrington, the Blackburn Corporation have received £817 15s. 10d., and the arrangement was working satisfactorily, and was beneficial to both Corporations. The Electricity Department's revenue reached £35,000, an increase of £2,700, representing an advance of 8 per cent., effected by the concession of £320 made to the Street Lighting Department; whilst the capital expenditure had only increased by 4 per cent. during the same period. The expenditure, exclusive of capital charges, showed an advance of £25,000, accounted for by the increased price of coal and maintenance of buildings, machinery, and mains. The advance of approximately 25 per cent. in the price of coal represented an increase in annual expenditure of about £1,200. Still, the actual coal cost per unit has remained at the same figure, due to the employment of extensions sanctioned by the Committee, and to further economies. The number of units sold for all purposes reached 4,142,011, an increase of 8 per cent. on the previous year's sales. The net profit for the year was £1,483, compared with £1,528 in 1906-7 and £277 in 1905-6.

New Type of Tramcar.—A new single-decked tramcar, built by the Corporation's own workmen upon the underframe of the old water-sprinkling car. It was given a trial trip on Friday last. It is of the "toast" rack type, open at both ends, with a light covering, and will accommodate 46 passengers.

The question whether Corporation officials should be permitted to take paying pupils has again been discussed by the Blackburn General Purposes Committee. The practice has never been formally sanctioned by the Town Council. Objection was recently raised to Mr. Wainwright, electrical engineer, taking a pupil of the kind, and the matter has been in abeyance since. It was decided that the practice should be sanctioned to the present officials, but that it will be understood that new officials should not enjoy this privilege.

BRADFORD: *Tramways.*—A deputation from the Leeds Corporation Tramway Committee is to meet a special sub-committee of the Bradford Corporation Tramways Committee, in order to further discuss the through running of tramways between Leeds and Bradford.

BRAY: *Electricity Accounts.*—In our last issue (page 831) reference was made to a statement that the electricity undertaking was working at a loss of £1,000 per annum. That this is incorrect would appear from the following figures taken from the accounts for the last year. The total cost of working is given as £2,923, excluding capital charges. The net revenue was returned as £3,463. As, however, £929 was required for sinking fund, &c., the final loss for the year was £390. It should, however, be pointed out that no allowance has been made in these figures for depreciation, but it is stated that the plant has been fully maintained out of revenue.

BRIDLINGTON: *Electricity Accounts.*—The annual report records an increase in output of 29,391 units and of revenue of £412, making a total of £4,462, in spite of the extensive adoption of metal filament lamps. The gross profits have increased from £2,076 to £2,175, although the price paid for coal had risen from 8s. 6d. to 11s. 6d. per ton.

BRISTOL: *Damage by Lightning.*—It is reported that during a severe thunderstorm at Bristol on Saturday, a gas main in the earth was struck by lightning, split, and set fire to.

DURHAM: *Cables Across the Wear.*—The River Wear Commissioners have granted an application from the Durham Colliery Electric Power Co., to place two steel wire-armoured electric cables across the river Wear near North Biddick Colliery.

EALING: *Tramways.*—The Town Clerk is summoning another conference of local authorities with regard to the noise of the tramcars.

EASTBOURNE: *Electricity Accounts.*—It was stated at a recent meeting of the Council that the gross profits on the undertaking for the past year were £24,695, as compared with £22,404 for the previous year, in spite of an increase in the expenditure of about £2,000, mainly due to the increased price of coal.

EPSOM: *Proposed Extension.*—The Urban District Council, at its last meeting, was informed that loans amounting to £35,440 had been expended in mains extensions, &c., and in order to meet liabilities and provide for further extensions, the Lighting Committee recommended that application be made to borrow £1,500. Of this sum, it was stated, £1,200 would be available for future extensions. After some discussion the question was referred back.

EXETER: *Tramway Accounts.*—The annual report records an increase in the total passengers carried of 5,655,000 to 3,754,030. The year's working has resulted in a deficiency of £132 after meeting all capital charges. £78 had been spent during the year on the car-shed. The receipts have declined from 10d. to 9½d. per car-mile.

GLASGOW: *Telephone Deficit.*—At the meeting of the telephone sub-committee last week a statement was presented showing that the deficit on the telephone undertaking, including interest due to the Corporation loans fund, amounts to £16,000. Treasurer Stevenson moved that the preliminary expenses in connection with the telephone department be paid out of the common good, and that the balance of the deficiency be made out of the police assessments. An amendment that the whole of the deficiency be made out of police assessments was seconded, and the original motion carried. When the minutes came before the joint meeting of the City Finance Committee and the Special Committee on Telephones, an amendment that the whole of the deficiency in connection with the transfer of the telephone undertaking to the Government be paid out of the revenue of common good was carried, and it was agreed to recommend that the liquidation of the deficiency be spread over a period of five years.

Tramways.—The traffic returns show that from June 1st, 1907, until May 25rd, 1908, the number of passengers carried upon the Corporation tramways was 221,934,616, as against 220,405,902 in the corresponding period of the preceding financial year. The receipts amounted to £886,932, an increase of £14,066. The system now comprises 89½ miles of double track.

GLOUCESTER: *Electricity Accounts.*—The City Council has agreed to the recommendation of the Finance Committee to transfer £1,200 from the waterworks account toward making up the debit balance of £1,412 on the electricity revenue account.

GREYSTONES (IRELAND): *Electricity Supply.*—The following resolution has been passed by the Wicklow County Council:—"That the Greystones Electric Light and Power Company, not having complied with the conditions required with the leave given provisionally by the County Council at last meeting, this council hereby withdraws the leave and permission then given."

KENDAL: *Electricity Accounts.*—The accounts of the municipal electricity department for the year ending March 31st, 1908, show a deficit of £749. The total receipts were £1,077, and the expenditure was £1,826, including sinking fund and interest.

LANCASTER: *Tramways.*—During April there was a profit of £28 upon the municipal tramways undertaking. This is the first time there has been a balance over ordinary working expenses since the system started.

LEYTON: *Electricity Accounts.*—The report of the District Auditor upon the electricity undertaking, presented at the last meeting of the Urban District Council, shows that the gross profit on the year's working was £11,106, and the amount charged as interest on loans and repayment of principal, £10,170, leaving a profit as shown by the books of £936. The auditor refers to one or two matters of detail in connection with the administration. As to coal the auditor says it is invoiced to the Council at colliery weights, and the consumption of coal per unit generated, which is given as 6·22 lbs., is based upon these weights. If calculated upon the actual weights the consumption is about 6·44 lbs. per unit, which appears to be very high. In regard to the results of the working of the undertaking, the auditor points out that no account has been taken of interest and redemption of debt accrued, but not payable during the year. There ought to have been charged to the tramway revenue account, in addition to the accrued charges for tramway loans, a proportion of the accrued charges for loans for purposes of street widenings. The cost of these widenings has been charged when payable on a uniform basis of one-third to tramways and two-thirds to district fund. A gross profit of £3,801 was shown on the year's working of the tramways undertaking; £9,814 was charged for redemption of loan debt and interest, leaving a loss, as shown by the books, of £6,012. The deficiency on the working of the undertaking from its acquisition to March 31st, 1907, was £9,326. In commenting on the report the engineer remarked that the consumption of coal per unit was not a criterion of its economical use: the true criterion was the cost per unit.

The Electrical Engineer presented a report as to the breakdown which occurred at the electricity works on Good Friday.

Digitized by Google

owing to one of the new armatures burning out. As the other set was running also, the burn out temporarily disabled it in an unusual and unexpected manner. After a little time had been spent in trying to get the armature to work again, the engineer coupled up with West Ham and Walthamstow, in order to get the tramcars moving. The supply was off for about two hours. Ultimately the trouble was located and rectified.

LONDON: *New Electric Ambulance Station in the City.*—A new electric ambulance station was opened last week at the new city police quarters in New Street, Rose Alley, Bishopsgate. One ambulance vehicle, similar to that described in ELECTRICAL ENGINEERING, Vol. I., page 653, is at present in use at the station, but accommodation is provided for two.

London County Council Tramways.—The new line from Hammersmith to Harlesden, which passes the Wood Lane entrance to the Franco-British Exhibition, was opened for traffic last Saturday. This line is the first to be worked on the overhead trolley system by the Council.

Camberwell New Tramway Route.—The Tramways Department of the London County Council has notified the Borough Council of its intention to commence at once with the construction of the tramways lines from the present terminus at Dulwich Library in Lordship Lane to Dartmouth Road, Forest Hill. The lines will be constructed upon the conduit system.

Paddington.—The negotiations between the Metropolitan Electric Supply Co., and the Borough Council, with regard to the proposed removal of the company's generating station, and the suggested reduction in the price charged for current were in abeyance for some time in consequence of the company's assessment appeal being pending. Since the decision in the appeal, however, negotiations have been reopened, and the General Purposes Committee of the Borough Council state that they hope soon to be able to present a report upon the matter. From a report issued by the Guardians it appears that the total expenditure on lighting last year was £1,356, divided as follows:—£802, gas; £554, electric light. In the preceding year the figures were £805 gas, £507 electric light. The other figures since electric light was introduced were as follows:—1898-9 (1) gas, £697; (2) electric light, £219; 1899-0, (1) £754, (2) £245; 1900-1, (1) £779, (2) £431; 1901-2, (1) £794, (2) £478; 1902-3, (1) £731, (2) £533; 1903-4, (1) £819, (2) £540; 1904-5, (1) £765, (2) £515; 1905-6, (1) £733, (2) £471.

MAIDSTONE: *Municipal Electrical Association Convention.*—Mr. E. E. Hoadley has been appointed the official delegate to attend the convention of the Incorporated Municipal Electrical Association, to be held from June 30th until July 3rd, in Nottingham.

Tramway Routes.—The Light Railway Committee of the Corporation held a conference last week with a number of traders in the town with reference to an extension of the tramways in the north ward, to which considerable objection has been taken. The traders along the line of route proposed by the Council object to the proposal so strongly that they have urged the construction of a new street to take the tramways, on the ground that the cost of this would be considerably less than widening the thoroughfare originally decided upon. After considerable discussion, and as no agreement could be come to, the meeting was adjourned for a week.

MANCHESTER: *Tramway Staff Medical Inspection.*—The Tramways Committee has decided that applicants for appointment on the general traffic staff of tramways undertaking must undergo medical examination, and Dr. Stuart, of Newton Heath, has been appointed medical officer to the department.

MEXBROUGH: *Tramways.*—A good deal of excitement was caused in Mexbrough on Monday by a tramway stud which had remained "live," by which two horses and a dog received severe shocks.

NOTTINGHAM: *Electricity Supply.*—The report of Mr. H. Talbot, which was submitted to the City Council last Monday, records extensions to the mains during the year of 1·68 miles, making a total of 55·94 miles. The lamp connections have increased during the year from 321,240 to 349,699, and the motors connected have increased by 99 h.p., being now 841 in number, with an aggregate output of 3,418 h.p. 11,116,855 units have been sold, of which 4,112,648 were for lighting, 1,799,208 for power, and 5,294,979 for traction. This shows an increase of 1,586,739 over last year's figures. The total costs, including capital charges, have declined from 1·70d. to 1·63d. per unit sold, notwithstanding an increase of 25 per cent. in the price of coal.

SUNDERLAND: *Tramways.*—The net profit upon the Corporation tramways for the year ended March 31st, 1908, amounted to £10,101. The traffic receipts were £68,797, a decrease of about £4,000 over the receipts of the previous year. The sum of £3,348 has been put to the relief of rates.

WALTHAMSTOW: *Electricity Supply.*—A report presented by the Electrical Engineer to the Urban District Council shows that during April the units generated totalled 271,453 (lighting, 165,388; traction, 106,070), this being an increase of 23,011 units as compared with the corresponding period of last year. In March there were 249,442 units generated (lighting, 168,749; traction, 80,693), an increase of 18,056 units as compared with the quantity generated during March, 1907. During the current year 1⅞d. per unit is to be charged for current used by the tramways undertaking. This is subject to revision at the end of the year.

WARSAW: *Tramway System.*—Electric trams are being substituted for the horse-driven trams, which were introduced in 1881. The system includes a power-house with three turbo-generators of 1,800 h.p. each, and 180 tramcars. The syndicate which manages the system is to pay the city £40,000 per annum and 5½ per cent. on the invested capital of £700,000. The remaining profits are to be divided equally between the city and the syndicate. The concession to the syndicate extends up to the year 1922.

WEST BROMWICH: *Electricity and Tramway Accounts.*—The annual report of the electricity undertaking states that there has been a decrease of £61 in the total revenue, which now stands at £12,971. The number of units sold was 1,824,887, an increase of 25,534 over last year's figure. The gross profit is given as £6,914, leaving a net surplus of £2,030 after deducting capital charges. The figure shows a decrease of £593 from last year. In the Tramway Department, a surplus of £309 has been produced, which is available to reduction of the outstanding deficit to £1,092.

YORK: *Electricity Accounts.*—The accounts of the electricity department for the year ended March 31st, 1908, show a balance of £7,697. To this sum has had to be added £19 in order to make up the amount due for sinking fund and interest. The deficit upon the electricity undertaking to date, £4,927; the total capital expenditure is £125,254. The receipts during the past year amount to £15,824, and the expenditure, not taking into account interest and sinking fund, was £8,127.

TENDERS INVITED AND PROSPECTIVE BUSINESS

ACCRINGTON.—The Electricity Committee have discussed the making of a reservoir for condensing water, and the Borough Surveyor has been instructed to prepare plans and estimates for early consideration.

BECKENHAM.—A recommendation by the Education Committee that electric light should be installed in the boys', girls', and infants' schools at a cost of £225, has been adopted.

BLACKBURN.—The Board of Education have approved of the erection of two higher elementary schools on the Blakey Moor site of Blackburn, to accommodate 300 boys and a similar number of girls. Both will be lighted with electricity.

Messrs. J. Parkinson & Sons, Ltd., builders, of Blackpool, have received the contract for the rebuilding of the Blackburn Theatre Royal, which will be lighted by electricity.

BRADFORD.—Tenders are invited for the electric lighting installation at the Town Hall extension. Particulars from City Architect, Whitaker Buildings, Brewery Street, Bradford. Tenders by June 10th to Town Clerk.

CARLISLE.—Tenders are invited for an electric lighting installation at the Carlisle Girls' New Secondary School. Full particulars from the Consulting Engineer, Mr. W. J. Hide, 42 Produce Exchange Buildings, 8 Victoria Street, Liverpool, and tenders to the Secretary, Education Department, The Courts, Carlisle, by June 5th.

CLEETHORPES.—Tenders are invited for the erection of a wireless telegraph station. Particulars from District Surveyor of Coastguard Works, 28 Pavement, York, or Director of Works Department, Admiralty. Tenders by June 12th.

COLNE.—Tenders are invited for (1) induction motor generator and high-tension transformer; (2) high- and low-tension switchgear; (3) high-tension lead-covered paper insulated cable. Full particulars from Mr. A. G. Cooper, the Electrical Engineer (fee £1 1s., returnable), and tenders to the Chairman of the Electrical Committee by June 15th. (See an advertisement this week.)

COPENHAGEN.—H.M. Consul at Copenhagen has forwarded a copy of the conditions and specifications relating to tenders for the supply of 4,000 to 5,000 electrical meters. Delivery to take place between August, 1908 and 1909. Tenders should be marked "Tilbud paa Maalere," and should reach Direktøren for Belysningsvaesnet, Raadhuset, Copenhagen, before midday on June 10th next.

DEVONPORT.—Mechanical stokers are to be installed at the Corporation's power station.

ILFORD.—Tenders are invited for surface condensing plant and cooling tower, steam and feed pipes, boiler feed pump, &c.,

Digitized by Google

and extensions and alterations to main switchboard. Full particulars from Mr. A. Shaw, Electrical Engineer to the Council, Electricity Works, Lea Street, Ilford, and tenders to the Chairman of the Urban District Council by June 10th.

LONDON: *Fulham.*—In order to improve the lighting of the South Branch Library, the Borough Electrical Engineer has been instructed to change all the 8-c.p. lamps in the reading-room and lending department to 16-c.p. lamps, to instal three 35-watt metal filament lamps in the reading-room, suspended over the reading tables, 12 to 15 ft. from the floor, and to fix one drop pendant with one 50-c.p. lamp in the entrance hall in place of the present three-light fitting.

Poplar.—In order to meet an increased demand from the London and India Dock Co., the Borough Council is to lay new cable and ducts, at an estimated cost of £357. Existing cable, &c., of the value of £215 is to be reclaimed, so that the net capital cost will be £121. It is proposed to erect a new sub-station in East Ferry Road, on a site to be leased from the Millwall Dock Co.

Stepney.—Tenders are to be invited for annual supplies of meters, demand indicators, time switches, and arc lamp carbons, and for about 12,000 tons of coal—a proportion of Welsh smokeless and a proportion of hard bituminous steam coal (large and small).

MAIDSTONE.—The erection of an Entz reversible booster and a battery for the supply to the tramway has been decided upon. The existing battery at the electricity works is to be replated with larger plates.

MALVERN.—Tenders are invited for the supply, delivery, and erection of a 50-kw. steam alternator exciter, &c. Particulars from Mr. W. J. Baker, Engineer and Manager, and tenders to the Clerk by June 29th. (See an advertisement this week.)

MYSORE.—The steam pumps at the Mysore Waterworks are to be converted to electric driving.

NORWICH.—Tenders are invited for: (1) Supply and erection of a water tube boiler, with mechanical stoker, economiser, &c.; (2) wiring supplies (not cables). Particulars from the City Electrical Engineer, and tenders to the Chairman of the Electricity Committee by June 9th.

SPAIN.—*The Gaceta* of May 22nd contains a copy of a law authorising the Spanish Government to call for public tenders for the construction and installation of the new submarine telegraph cable from Cadiz to Teneriffe, thence to Gran Canaria, Palma y Gomera, from the latter island to Hierro, from Gran Canaria to Fuerteventura and from thence to Lanzarote. Tenders are to be invited during the course of the present year, and the total cost, not to exceed 5,000,000 pesetas (about 172,413*l.*), is to be distributed over two years. Local representation is necessary.

ST. HELENS.—An application is to be made to the Local Government Board for sanction to borrow £10,426 for extensions to the electricity undertaking.

WEDNESBURY.—The sanction of the Local Government Board has been received to the following loans:—(*a*) £275 to defray excess expenditure on electricity meters up to March 31st, 1907, a period of five years being allowed for the repayment; (*b*) £1,346 to defray excess expenditure on electricity mains up to March 31st, 1907, a period of 25 years being allowed for repayment; (*c*) £1,200 to meet prospective expenditure on electricity mains and services, a period of 25 years being allowed for repayment.

WIGAN.—It has been decided to re-model the Wigan and Pembroke electricity station in accordance with the recommendation of the Electrical Engineer, and application is to be made to the Local Government Board for sanction to borrow £36,345.

WILLESDEN.—Tenders are invited for the supply and erection of a 300-kw. converting plant. Full particulars from Mr. J. G. Bruce, the Council's Electrical Engineer, Salusbury Road, Kilburn, and tenders to the Chairman of the Electricity Committee by June 18th. (See an advertisement this week.)

TENDERS RECEIVED AND ACCEPTED

ACCRINGTON.—At a meeting of the Town Council on June 1st, the Mayor reported having visited the Brush Company's works in company with the Town Clerk and Electrical Engineer, and after inspecting workmen's time sheets and wage lists they had unhesitatingly placed the order for the two single-deck cars. During the progress of construction of these cars, the Council foreman, Mr. Pilling, was instructed to pay periodical visits to the works at Loughborough, for supervision and inspection.

AUSTRALIA.—The Australian *Mining Standard* states that the Adelaide Tramway Trust has accepted the tender of Messrs. Smith and Tymms for the construction of 54 miles of permanent way, forming what is known as the "inner system" of the Adelaide Electric Tramway Service. The amount of the tender has not been officially disclosed; it is said, however, to be over £160,000, though slightly below the estimate made by the engineer. The contractors undertake to complete the first section, namely, the North Adelaide service, by the end of November, and the whole system within 18 months from date of the contract. The total amount of works in contemplation, and for which tenders will be called in sections, will cost about £600,000, the present being, so far, much the largest amount in one tender.

The New South Wales Postmaster-General's Department has accepted the following tenders:—1,000 common battery wall telephone sets, at £2 9s. 6d. each, R. B. Hungerford, Sydney; 100 common battery table telephone sets, at £2 11s. 9d. each, James Paton & Co., Sydney; 440 yards cable telephone, brass sheathed rubber, 208 pairs, £480, the Union Cable Co., Ltd., Sydney; 8¼ miles of cable, paper insulated, 104 pairs, lead-covered, 12½lb. conductors, £309 per mile; 10 switchboards for 100 metallic circuits, at £45 18s. 7d. per switchboard, R. B. Hungerford, Sydney; 4 miles of cable, paper insulated, 52 pairs, lead-covered, 20lb. conductors, £252 per mile; 3¾ miles, 39 pairs, £193 per mile; 5½ miles, 26 pairs, £149 per mile; 2½ miles, 13 pairs, £90 per mile, British Insulated & Helsby Cables, Ltd., Melbourne.

BEXLEY.—Following tests of sections of the steam pipes at the Urban District Council's electricity works is to be carried out, in order to effect improvement, at an estimated cost of £425. Messrs. Babcock & Wilcox are to substitute new piping for the whole of the piping on the superheated range, and a Sugden superheater is to be substituted for one of existing Schmidt superheaters, the cost estimated being made up of £280 for steam piping, &c., and £145 for the new superheater. At the last meeting of the Urban Council a complaint was made that the work should have been put out to public tender, but it was explained that the Electric Lighting and Traction Committee was informed that if that were done the cost would be a great deal more. It was also stated that no firm would tender owing to the odd lengths and sizes required. The estimated cost was based on Messrs. Babcock & Wilcox's quotation. Twelve pairs of destination indicators, costing £6 per pair, are to be obtained for use in connection with the tramways to Woolwich.

DERBY.—The tender for the supply of bitumen cable, at £471, of Messrs. Johnson & Phillips, has been accepted subject to the approval of the Council.

LEYTON.—At the last meeting of the Urban District Council the Electrical Engineer reported that it was necessary to increase the plant at the generating station. In order to get in another traction dynamo without the costly expedient of another traction set, he proposed to set back the large Willans engine of the lighting side of the station, and interpose a traction dynamo of 440 kws. capacity between it and its present dynamo. This would enable the engine to be used either on traction or lighting. The Lancashire Dynamo and Motor Co. had offered to divert a dynamo of suitable size to the Council's use, and to complete and erect it in working condition by July 24th, for £550. The British Westinghouse Co. also offered a dynamo for £672, but this machine is too large to go in the space available. The Council has accepted the offer of the Lancashire firm, and of Messrs. Bertram Thomas, at £86 7s. 3d., for a switch panel and extension of the switchboard.

As a result of experiment with mechanical furnaces for burning slack coal, one made by the Underfeed Stoker Co., Ltd., is to be purchased for £454, and the company will take payment monthly, according to the saving effected, agreeing to restore the boiler to its present position if no saving is effected.

In connection with the conversion of public arc lamps, the Oliver Arc Lamp Co. will allow 17s. 6d., without the globe, for each old type arc lamp of their make displaced by their flame arc, and will allow 2s. 6d. for each globe returned to them. They will undertake without charge to enlarge the magazine of the six flame lamps of their make which are already in use. The cost of a lamp, with weatherhood, contact gear, and winch, including the 17s. 6d. allowance, will be £10 8s. 6d. The Engineer having reported that the flame arc lamps erected on trial by the Oliver Co. were burning reliably and steadily, the Council has decided to use the lamps of this company for the conversion of 24 lamps in the High Road, Leyton.

The Urban District Council received the following tenders for the supply and maintenance of telephonic communications and electric call bells to firemen's residences (25 bells and 4 telephone circuits):—National Telephone Co., £54 10s. per annum; Stuart & Moore, £48 10s. per annum; Headland & Headland, installation of new system, £220 15s., maintenance, £11 per annum, existing system maintenance, £18 per annum. The Council has decided to enter into a seven years' agreement with Messrs. Stuart & Moore, the system to be handed over to the Council at the end of seven years in thorough working order.

LONDON: *Bermondsey.*—The Borough Council has received the following tenders for plant extension at the electricity works:—Boiler: D. Adamson, £2,455; Babcock & Wilcox (provisionally accepted), £2,025. Ed. Le Bas, £1,290. Steam Dynamo: tenders were received from fourteen firms, all of them submitting a number of alternative tenders. The tender of Siemens Bros.' Dynamo Works for a Siemens' dynamo, with

Digitized by Google

Howden engine, at £4.828, was provisionally accepted. Messrs. Deane & Beal's tender for £3,374 for an evaporative condenser was accepted provisionally, although several firms tendered lower prices for condensers with cooling towers.

St. Pancras.—The Board of Guardians has accepted the tender of J. C. Christie, Mansell Street, Aldgate, E.C., for the supply of one gross of incandescent electric lamps at 8s. 6d. per dozen. Two other quotations were obtained at 9s. 6d. per dozen respectively.

Southwark.—The Borough Council has received the following tenders for an induced draught plant (which is to be installed at the electricity station, in order to overcome difficulty experienced in maintaining steam—especially during the period of maximum load—in consequence of which the Electrical Engineer has been unable to get the boilers blown down for cleaning and repairs during the winter months):—James Howden & Co., (1) fan £325, (2) motor £347, (3) total £672; Sturtevant Engineering Co., (1) £255, (2) £235, (3) £470; Davidson & Co., (3) £395; Musgrave & Co., (1) £140, (2) £264 15s., (3) £404 15s.; General Electric Co., (1) £125, (2) £219 10s., (3) £344 10s.; Crompton & Co., (1) £177 10s., (2) £278, (3) £455 10s.; Buffalo Forge Co., (1) £125, (2) £222 10s., (3) £347 10s.; Pooley & Austin, (1) £155, (2) £242, (3) £397; Baxter & Gaunter, (1) £168, (2) £261 10s., (3) £405 10s.; Electrical Ordnance Accessories Co., (3) £485; Electrical Construction Co. (provisionally accepted), (3) £330; Lancs. Dynamo & Motor Co., Ltd., (1) £180, (2) £263 15s., (3) £443 15s.; Bumsted & Chader (1) £188 10s., (2) £266 10s., (3) £455; Mathews & Yates, (1) £152, (2) £222 10s., (3) £374 10s.; Mather & Platt, (1) £160, (2) £295, (3) £455; Siemens Bros. & Co., Ltd., (3) £417; J. Crawford, (1) £164 10s., (2) £303, (3) £467 10s.; Heenan & Froude, (1) £194, (2) £225, (3) £419. The Electrical Engineer's estimate for plant was £475, including the necessary structural work and flue connections. It is proposed to carry out the necessary fixing and fitting of the machinery and cutting away and building up of brickwork, at an estimated cost of £145, with the staff of the electricity station, under the Engineer's supervision.

MIDDLESEX.—At the meeting of the County Council on May 28th, the Light Railways Committee reported that the contract for the construction of the tramway, High Road and Church Road, Willesden, had been completed by Messrs. Dick, Kerr & Co., the contractors, at a cost of £54,926. The estimated cost of the works was £46,500. The additional expenditure of £8,426 was made up of extras in respect of excavation, and concrete works to drains, special works to properties (compensations), &c., &c. By far the largest items were for extra concrete to secure good foundations for the track work and roadway. When the works were in progress it was found necessary to fill in concrete to a much greater depth in certain portions of the road than was anticipated, owing to bad foundations.

WALTHAMSTOW.—The Urban District Council has accepted the following tenders for the supply of plant for the generating station:—Siemens Bros.' Dynamo Works, Ltd., two engines and dynamos, £5,595; Babcock & Wilcox, Ltd., boiler-house plant, £7,420; Ledward & Beckett, Ltd., condensing plant, £2,270 10s.; Alphons Custodis Chimney Construction Co., chimney, £856; Johnson & Phillips, Ltd., switchboard, £641 15s.; Paterson Engineering Co., Ltd., water softening and purifying plant, £425. Tenders for the two sets of engines and dynamos, in addition to the tender of Siemens Bros.' Dynamo Works, Ltd., were received from the General Electric Co., Ltd., British Thomson-Houston Co., Ltd., Electric Construction Co., Ltd., and Dick, Kerr & Co., Ltd. The Light Railways Committee has decided to accept the tender of Estler Bros. for the supply of 14 sets of patent block system signals, with lamp attachments, at £19 10s. per set.

COMPANIES' MEETINGS AND REPORTS

ANGLO-PORTUGUESE TELEPHONE.—The annual report records a gross revenue of £39,695, and expenses amounting to £21,506. Royalties to the extent of £1,105 were paid to the Portuguese Government, leaving a gross profit of £17,085, out of which, after payment of debenture interest, sinking fund, and income tax, there remained a net profit of £15,089, which, with the addition of £3,655 brought forward from last year, gives £16,745 available. An interim dividend of 3 per cent. was paid last November, and a final dividend of 5 per cent. is now recommended. £5,000 is to be placed to reserve, and £3,745 carried forward. A continuous improvement of the company's business is reported.

CAVEHILL & WHITEWELL TRAMWAYS.—The report for the year ended December 31st last, states that the unfavourable weather conditions and the strike of dock labourers and carters in Belfast have had an adverse influence upon the traffic receipts. The total receipts, including the profit from the Belle Vue Gardens, amounted to £4,430, and the working expenses (including £1,151 paid to the Corporation for current at 2d. per unit) amounted to £3,377, leaving a profit on working of £1,053, from which must be deducted debenture and other interest, leaving a net profit of £139, which it is proposed to carry forward. The revision of fares which was put into operation in October last has had satisfactory results. In May, 1907, the directors entered into an agreement for the sale of the company's lines to the Corporation subject to the Corporation obtaining the necessary powers to purchase. The promotion of an Act of Parliament for that purpose was approved by a large majority of ratepayers, but the Bill was successfully opposed in the House of Commons. The directors are now endeavouring to arrange with the Corporation for the much-needed through service of cars. The report concludes with the statement that the statutory powers possessed by the company confer upon it inalienably for ever the sole right of running tramcars along the route occupied by its lines, without power to the road or any other authority at any time either to purchase the line or impose a rent.

DURHAM COLLIERIES ELECTRIC POWER.—The report for the two years from March 31st, 1906, attributes the losses shown by the profit and loss account, to interest on debentures, and temporary loans required in consequence of the subscribed share capital being insufficient to meet the cost of completing the undertaking. £150,000 five per cent. first mortgage debentures were issued last year. Agreements have been entered into with the Newcastle-on-Tyne Electric Supply Co., by which that company is to operate the undertaking for a period of 42 years, but in order to carry this into effect the frequency of the plant has had to be changed from 40 to 50 cycles per second, which entailed great expense in alterations to both the generating plant and the consumers' plant. The Newcastle company, however, paid £6,000 as compensation for the delay. The gross profits for the two years have only amounted to £2,200, and after payment of prior charges the debit balance is £11,900. The fact, however, that the Newcastle company are now working in harmony with the undertaking, and not as competitors, is favourable to future developments. A considerable sum of money is required to enable the company to discharge its present liabilities, and extensions of mains and plant are required. It is therefore proposed that an issue of £100,000 six per cent. second mortgage debentures should be created, and that £50,000 of these should be issued with the least possible delay. Mr. A. W. Tait has been elected to a seat on the board. At the meeting held on Tuesday, Sir Douglas Fox, who presided, referred to the arrangements for working in harmony with the Newcastle Co., and said that at the present time the load was between 10,000,000 and 11,000,000 units per annum, and was increasing rapidly. The report was adopted, and the resolution to issue further capital was approved at an extraordinary meeting which followed.

FELTEN & GUILLEAUME LAHMEYERWERKE.—According to the balance-sheet for the year 1907, the gross revenue from manufacture, shares in other companies, and other resources amounted to 15,444,748 marks, as against 15,022,820 marks in the previous year. The net profit was 6,585,622 marks, which is allotted as follows:—308,204 marks to reserve fund; 10 per cent. dividend, absorbing 5,275,000 marks; workmen's fund, 90,000 marks; officials' pension fund, 150,000 marks; directors' share in profit, 327,215 marks; carried forward to next account, 435,202 marks. Last year's dividend was 11 per cent. The contracts and orders obtained exceeded considerably those in the past year, this being due to the cable works, as the amount represented by the dynamo works had diminished slightly. On the other hand, the machinery and plant delivered and installations erected was 16 per cent. higher than in the preceding year, and the improvement showed particularly in the dynamo works; there was a 10 per cent. increase in the cable works and 33 per cent. in the dynamo works. The latter was due to the large number of orders obtained in the previous year, and still uncompleted in the year under review, so that the number of orders on hand at the conclusion of last year is somewhat smaller. During the year under review 9,330 machines were made at the dynamo works, with a total output of 385,000 h.p., as compared with 8,070 machines with 265,000 h.p. in the preceding year. The reason that a diminution of 1 per cent. has been made in the dividend is partly that the profits from associated companies have fallen off and partly due to a three-weeks' strike in the spring of last year at the dynamo works, in addition to which the uncertain industrial future and the money market conditions were also taken into consideration. The number of officials and workmen rose from 10,470 at the end of 1906 to 11,760 at the end of 1907. Of these 6,535 are employed at the cable works and 5,225 at the dynamo works. The report states that the price of raw materials, especially of metal, diminished considerably in the year under review. On the other hand, new contracts made by the company show that there is a considerable deterioration in the condition of the markets. The tariffs in foreign countries continue to occasion difficulties, and special reference is made to the preferential treatment accorded by some of the British colonies to Great Britain. Other difficulties are anticipated on account of the new British Patents Act, and the possibility that the Government of the United States may pass a similar measure.

HONG KONG ELECTRIC.—The annual report gives the balance at credit of profit and loss accounts as $159,637, of which $3,000 is absorbed by directors' fees. A 10 per cent. dividend and a bonus at 2 per cent. is recommended, and it is

Digitized by Google

proposed to write off $71,920 for depreciation, to pay a bonus to the staff amounting to $5,395, and to carry forward $9,321. The lamp connections are given as over 47,400 8-c.p. lamps, and 85 arc lamps and 24 electric lifts are being maintained by the company. Two new 300-kw. Diesel alternators have recently been erected.

MADRAS ELECTRIC SUPPLY.—The report states that the construction of the generating station is not so far advanced as the Board expected, owing to delays in obtaining the necessary bricks and other materials. The plant, machinery, and appliances are, however, ready for installing in the station. The mains in the compulsory area have been laid as required by the terms of the license, with the exception of a small length, the materials for which were diverted to extensions required for the supply of some intending consumers. The contracts for the tramway generating plant, the feeders, and the erection and equipment of the sub-station, necessary for the supply to the tramways, have all been let, and it is hoped that the commencement of tramway supply will be made at the beginning of next year. There are a number of consumers already connected with the mains, with an equivalent of 3,686 lamps of 8 candle-power. These are being supplied from the small temporary plant, and it is not considered advisable to make further connections until the permanent machinery is at work. Applications have been made to the Government for extensions of the license to enable the company to supply current in Fort St. George, and to the Port Trust in Madras. The meeting will be held on Wednesday, June 10th.

SAO PAULO TRAMWAY LIGHT AND POWER CO.—The annual report records an increase of net earnings from $1,368,162 to $1,395,873. $100,000 has been placed to contingent account. The quarterly dividends of 2 per cent. and one of 2½ per cent. have been paid.

URBAN ELECTRIC SUPPLY.—The report of accounts for the year ended December 31st, 1907, shows a gross profit of £36,433, and, after deducting the London expenses, there is a balance of £34,640, which has been carried down to net profit and loss account. After adding £633 interest received on deposit, and deducting other items, amounting together to £12,761, there remains a profit balance of £22,512, which falls short by £9,987 of the amount of £32,500, also appearing, required to meet the 5 per cent. guaranteed dividends on the issued capital of the company. This deficit, being the debit balance as shown in the accounts, has been duly provided by Edmundsons' Electricity Corporation, Ltd., under their contract. A provision has been made of £1,612 for depreciation of stock of wiring goods and fittings, and also of £462 7s. 6d. for depreciation of plant and machinery under the terms of the agreement with the contractors. At the meeting yesterday the report and accounts were adopted.

WEST AFRICAN TELEGRAPH CO.—The report and accounts, referred to on page 797 of our issue of May 21st, were adopted at the general meeting last Thursday. Lord Tweeddale, who presided, said that there had been a considerable falling off in the receipts from Portuguese traffic, and a further diminution of the amount received, due to diversion of traffic owing to interruption of the lines of other companies. A portion of the St. Thomé, Loanda, cable has been renewed during the year. A final dividend of 2 per cent. is to be paid, making 4 per cent. for the year.

WEST INDIA AND PANAMA TELEGRAPH.—The half-yearly report for the year ended December 31st last records an increase of revenue from £34,203 to £37,262, and a rise in expense from £21,611 to £23,028. By the inclusion of £1,014 brought forward and interest on investments, there is an available balance of £16,995. A dividend of £1 6s. per share on account of dividends accrued to December 31st, 1907, is proposed, leaving a balance of £557. The cable-ship, *Henry Holmes*, has been overhauled during the year.

The Institution of Civil Engineers.—The Council of the Institution of Civil Engineers propose to award annually a prize to be called the Indian Premium to the Author, being a corporate member of the Institution in practice in India, of the best Paper received during the year on a subject connected with Indian engineering. This special award, which, when made, will be irrespective of any other recognition of the merits of such Paper which the Council may accord to it in the ordinary course, is derived from the proceeds of certain trust funds conveyed to the Institution on the closing of the Royal Indian Engineering College, and will be of the value of about £33 annually. The Council further propose that the income of a legacy of £1,000 bequeathed by the late Mr. L. F. Vernon-Harcourt to the Institution be applied, in general accordance with the testator's wishes, to provide for a biennial lecture on some subject relating to rivers, canals, or maritime engineering to be delivered before meetings of students of the Institution in London, and before such of the provincial associations of students as the Council may determine from time to time. The Council recently have accepted, on behalf of the Institution, a legacy of £1,000, bequeathed by the late Mr. F. W. Webb, to be applied to establish a "Webb Prize," to be awarded by the Council once in every three years, or oftener, as the Council may think fit, for the best Paper submitted to the Institution on "Railway Machinery," or upon some branch of railway machinery which may be prescribed by the Council.

ELECTRIC CABS IN BERLIN

A RECENT issue of *Motor Traction* contains an article in which some information is given regarding the petrol and electric cabs in Berlin. According to this article there is in Berlin a practically uniform rate of pay for the drivers of the different companies, and a uniform rate for both petrol and electric cabs. The large electric cab companies are paying to their drivers 1s 6d. per day as pay, and twenty per cent. of the revenue of the day. Experience with electric cabs in Berlin has shown that only very large and well-managed companies are profitable. Electric cars of several types are running, including N.A.G., Kriéger, Scheele, Löhner-Porsche, B.E.D.A.G., Maxim, and Hagen cars. The average daily receipts are about 35 shillings, which corresponds to a distance of about 68 miles.

The electric cabs of the B.E.D.A.G., Maxim, and Siemens Schuckert types have a weight of 30 to 36 cwt. empty. On an average 290 watts per mile are discharged from the battery, which weighs about 12 cwt. It has been found that the accumulator efficiency is under 70 per cent. (mostly about 62 per cent.), and that therefore about 450 watts per mile are used. The following table of expenses per annum is given :—

	£	s.	d.
Charging current according to the Berlin Supply Tariff	74	5	0
Cost of battery maintenance and renewal (150 discharges before renewal of plates is necessary)	82	10	0
Tyres	115	10	0
Repairs to electric gear	20	0	0
Repairs to chassis (including boxes damaged by acid vapours)	7	10	0
Re-varnishing of body (which by the constant charging of battery suffers more heavily than the body of a petrol cab)	7	10	0
Time of drivers during repairs	36	0	0
Cleaning of car	6	0	0
Garage (dearer on account of battery rooms)	20	0	0
Oil	1	0	0
Insurance	15	0	0
Taximeter expenses	5	0	0
Sinking fund on price of car (£500), including two batteries	50	0	0
Interest on capital	20	0	0
Total ...	£458	5	0

The practically level streets of Berlin, 90 per cent. of which are asphalted, are very favourable to the efficient driving of electric cabs, but in spite of this it remains a fact that only good drivers with first-class economical cabs, belonging to large companies, are at present successful.

Board of Trade Standard Ampere.—A note appeared under the heading, "Electrical Science" last week giving an account of a comparison that Messrs. T. Mather and F. E. Smith had made between the Ayrton-Jones standard current weigher at the National Physical Laboratory and the Board of Trade standard ampere. Electrical engineers will be interested to know that in the original Royal Society Paper in question it was also stated that the Board of Trade standard ampere is equal to the international ampere as defined by silver deposit within one part in 10,000—that is, within 1/100 part of one per cent. In view of the approaching International Congress, in which the discrepancies between units and standards may be discussed, this is of even greater importance than that the difference between the Ayrton-Jones ampere standard and the Board of Trade ampere is 1/30 of one per cent.

Proposed Electrification of Railways in Alsace and Lorraine.—According to the *Elektrotechnischer Anzeiger*, the Metz Chamber of Commerce has presented a memorial to the railway authorities in Strassburg, concerning the electrification of the railways. The memorial recommends the introduction of a more frequent service of light trains on all the branch lines. Of the twenty-two lines concerned, about two-thirds run through the valleys of the Vosges Mountains, which contain many textile, woodwork, and other factories. The remaining railways connect the valleys of Lorraine with the main line. The service is particularly suitable for electric traction, as a quick and frequent service is required, and the distances between stops are short. In Alsace plenty of water-power is available, and in Lorraine cheap power could be generated from blast-furnace gases.

MISCELLANEOUS CITY NOTES

BRUCE, PEEBLES & CO.—It is reported in the *Financial Times* that a scheme for the reconstruction of Messrs. Bruce, Peebles & Co. has been approved by a committee of creditors and shareholders, and will be presented to the court for sanction. Under the scheme holders of the £75,000 of debentures of the company will rank first, then the unsecured creditors will receive 7s. 6d. in the £ in new debentures (ranking after the old debentures) and 12s. 6d. in the £ in fully-paid shares of the new company to be formed. The present preference shareholders are to be asked to take three new shares of £1 each for every £5 they hold in the old company, and to pay 10s. per share in cash, they receiving the £1 shares fully paid. The Ordinary shareholders are to be asked to take one new share of £1 for every £5 held in the company on condition that they pay 10s. per share in cash, the £1 share being then issued to them as fully paid.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—A prospectus has been issued offering for subscription 250,000 seven per cent. cumulative participating preference shares of £1 each. The directors and their friends have already applied for 50,000 shares of the present issue on the terms of the prospectus. There are no debentures. The preference shares are entitled to a cumulative preferential dividend of 7 per cent. per annum, and after payment of a dividend of 10 per cent. per annum on the ordinary shares, the holders of the preference shares have the right each year to participate *pari passu* with the ordinary shares in any surplus profits which it shall from time to time be determined to distribute. The preference shares carry equal rights of attending meetings and voting with the ordinary shares, and the right to rank in priority to all other shares for the repayment of capital, and *pari passu* with all other shares in any excess after repayment of capital. A good deal of information as to the operation of the company was given in the last annual report, which was printed at some length in ELECTRICAL ENGINEERING of April 30th (page 665). The money to be raised by the issue of the participating preference shares now offered for subscription is required, among other purposes, for the further development of the Marconi system, for working capital, and in particular to meet the expenditure and engagements that have been necessary and which have still to be incurred for the final completion of the Transatlantic stations at Clifden (co. Galway) and Cape Breton (Canada), by means of which wireless telegraph communication is now carried on between the United Kingdom and America. It is intended at once to bring up to the same level of efficiency as the Irish-Canadian stations mentioned the two long-distance stations at Poldhu in England and Cape Cod in the United States of America. Up to the present the Transatlantic Wireless Telegraph Service has been conducted at speeds varying up to 24 words a minute, but with a comparatively inexpensive modification of certain parts of the existing apparatus, an average speed of at least 30 words a minute should be attained, and, further, it is expected that it will be possible to send and receive simultaneously at this speed, so that 60 words per minute may be dealt with.

There have been considerable extensions in the maritime service, and the net receipts by the Marconi International Marine Communication Co., Ltd., and its associated companies from this source for 1907 is given as £37,504. The Poldhu station has been supplying a daily press service to such of the Atlantic liners as are fitted with long-distance apparatus. The receipts of the Poldhu station from this source alone during the two years ending February 29th, 1908, amounted to over £13,000. The agreements with various British, Colonial, and Foreign Government departments, &c., have resulted in considerable sales of apparatus, and involve payment to the associated companies of sums representing a fixed minimum of £13,444 per annum. Mr. Marconi has agreed to act as chief engineer to the company for not less than three years. It is stated that in May, 1908, 10,000 fully paid up £1 shares were allotted to Mr. Henry Cuthbert Hall in consideration of the relinquishment and discharge of the company from all claims and demands, whether for salary, commission, or otherwise, which were then in dispute.

WESTERN TELEGRAPH CO.—The directors have declared the third quarterly interim dividend of three shillings per share, free of income-tax, for the year ending June 30th, 1908, being at the rate of 6 per cent. per annum. The dividend will be payable on June 24th.

A Combined Trolley and Battery Automobile.—According to the *Electric Railway Review*, experiments are being made, under commercial conditions in Pittsburg, with a five-ton electric delivery which can be propelled either by its own batteries or when running along tramway routes by taking current from the overhead line by means of an ordinary trolley. The vehicle is provided with four 2½ h.p. motors which are used in series on the trolley line or in parallel on the 42-cell battery. The gearing permits of a speed of 22 miles per hour when on the tramway track, which is fast enough not to interfere with the tramway traffic, and the battery can propel the car at 8 miles per hour. A smaller car on the same principle has been in use for parcels delivery for two years.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C. inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted Tuesday night, was £59 5s. to £59 15s. per ton (last week £59 to £60 per ton).

DISSOLUTION OF PARTNERSHIP.—Joseph D. Jones and Bennet J. Boddington, carrying on business as electrical engineers at 150 Finchley Road, N.W., as J. D. Jones, Boddington & Co., have dissolved partnership. Debts by J. D. Jones at 150 Finchley Road, N.W.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—Ernest Goacher, Gateford Road, Worksop, Electrical Engineer, has been adjudicated bankrupt.

A meeting of the Industrial Storage Battery Syndicate, Ltd., will be held at 20 Mildmay Chambers, 82 Bishopsgate Street, London, E.C., on July 1st, at 12 noon, to hear the liquidator's account of the winding up.

Albert Lord, trading as an electrical engineer, under the title of Lord Brothers, at 134 Deansgate, Manchester, has been adjudicated bankrupt.

The liabilities of Ernest Albert Gresham, of 6 Harehills Avenue, Leeds, late of Westborough, Scarborough, Yorks, electrical engineer, are stated at £103 16s. 8d., and the assets are estimated at £19 1s. 9d.

Walter Wardle, electrician, of 14 Osborn Road, Levenshulme, Manchester, has been adjudicated bankrupt.

LONDON ELECTRICAL FITTINGS CO.—The name of the London Electrical Fittings Co., of 15 and 16 Newman Street, Oxford Street, has been changed to "Galsworthy, Ltd."

APPOINTMENTS AND PERSONAL NOTES

Mr. H. R. Forbes Mackay, the new City Electrical Engineer at Sydney, Australia, was, says the *Australian Mining Standard*, welcomed on his arrival last month by a dinner, which also partook of the nature of a farewell to the retiring Electrical Engineer, Mr. T. Rooke.

Mr. F. Spencer, late manager of the Halifax Corporation Tramways, has been presented with a roll top desk by members of the Town Council as a mark of appreciation of his services.

NEW PUBLICATIONS

"Telephones: Their Construction, Installation, Wiring, Operation, and Maintenance." By W. H. Radcliffe and H. C. Cushing. (London: Crosby, Lockwood & Son.) Price 4s. 6d.

"Radio-Telegraphy." By C. C. F. Monckton. (London: Archibald Constable and Co., Ltd.) 6s.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the annual general meeting on Thursday:—*Associate Members:* G. B. Barham, W. T. Bower, W. Buchanan, H. Burge, E. C. Churchward, E. H. Cockshott, J. G. Doran, J. I. Gear, J. W. Hogg, G. E. Mason, J. A. O'Brien, W. B. Packham, F. E. Saunders, W. P. Scott, W. A. Scott, F. G. Sherwood, H. E. Sutton, A. S. Tresilian, E. B. Trimmer, W. E. Vidal.

Bournemouth Tramway Disaster.—The inquest on the victims of the tram disaster of May 1st was resumed on Wednesday, May 27th. A report of the proceedings at the inquest on May 13th and 14th was given on page 764 of our issue of May 21st. The inquest was then adjourned until the 27th on account of the illness of the driver. As the driver is still unfit to attend, the coroner, Mr. F. Lefroy, after mentioning that the conductor, ticket inspector, and all the drivers who were on duty on May 1st would be called as witnesses, further adjourned the inquest until June 11th.

Water-power Stations in Spain.—Three water-power stations at Leizaran, Quintana, and Puentelarra respectively, the first two with a capacity of 4,000 h.p. and the last 8,000 h.p., supply the town of Bilbao on the Bay of Biscay with electric energy for light and power. The four three-phase Siemens-Schuckert generators at the first-mentioned station are driven by 1,000 h.p. Pelton-wheel turbines running at 375 r.p.m. They generate at 3,000 volts 50 cycles, and this pressure is raised to the transmission pressure of 30,000 volts by four groups of single-phase transformers, the three in each group of which are connected in star. The second station contains four 1,000 h.p. Francis turbines and the third contains four 2,000 h.p. units. The stations are respectively 49, 38, and 35 miles distant from Bilbao, in which town a sub-station with a capacity of 6,800 k.v.a. has been built. The town of Basconia has a 1,700 k.v.a. sub-station, and smaller sub-stations are situated at St. Sebastian, Vitorio, Arrigorriogo, and Mirando.

PARLIAMENTARY INTELLIGENCE

EDINBURGH CORPORATION (TRAMWAYS, &c.) PROVISIONAL ORDER CONFIRMATION BILL was read a third time, and passed in the House of Lords on Tuesday.

GREAT NORTHERN, PICCADILLY & BROMPTON RAILWAY.—This Bill came before the Unopposed Committee of the House of Lords on Wednesday, and was ordered to be reported for third reading. As already announced, the Bill deals with the re-arrangement of the capital of the company. At present, under an agreement, the profits in respect of each half year available for dividends may be applied first in payment of the 4 per cent. accumulated preference dividend on £3,200,000 capital, and, secondly, in payment of a 4 per cent. accumulated dividend on the remaining capital. Any balance is to be divided amongst the holders of the two classes of shares. It is now proposed to cancel this agreement, and to convert a certain number of £10 shares into 4 per cent. preference shares, and to convert the remainder of the £3,200,000 capital into preference shares at any time.

METROPOLITAN ELECTRIC TRAMWAYS.—All opposition to this Bill has been withdrawn. It has been referred to the Unopposed Committee of the House of Commons.

Electric Lighting Provisional Order Confirmation Bill, No. 2, was read a third time and passed in the House of Commons on Friday.

PROGRESS OF ELECTRICAL BILLS.—The South Wales Electrical Power Distribution Bill was read a third time in the House of Lords on Tuesday, and a first time in the House of Commons on Wednesday last week.

The Bristol Tramways Bill was read a third time in the House of Lords on Tuesday, and a first time in the House of Commons on Wednesday last week.

The Wolverhampton Corporation Bill was read a first time in the House of Lords on Tuesday.

The Doncaster Corporation Bill was read a third time in the House of Commons on Tuesday, and a first time in the House of Lords on the same day.

Electric Lighting Provisional Order Confirmation Bill, No. 1, was read a first time in the House of Lords on Tuesday.

Electric Lighting Provisional Order Confirmation Bill No. 2 was before the Unopposed Committee of the House of Commons on Thursday, and was ordered to be reported for third reading. We gave particulars of this Bill in our issue for May 14th.

Electric Lighting Provisional Order Confirmation Bill No. 1 was read a first time in the House of Lords on Monday.

TELEGRAPH (CONSTRUCTION) BILL.—On the order for the second reading of this Bill, objections were raised to the powers the Bill would confer upon the Post Office which might result in the marring of rural scenery. The Postmaster-General said that the object of the Bill was that the Post Office authorities should have power to obtain way-leaves for telephone and telegraph lines against the obstructing of unreasonable individuals. He would consider later an amendment relating to the lopping or falling of trees. The Bill was then read a second time.

NEW COMPANIES

BANKFOOT POWER CO.—This company was registered on May 28th, with a capital of £40,000 in £1 shares, to erect a generating station at Bankfoot, near Crook, Durham, for utilising the gases and waste heat produced by coke ovens, to be erected by Pease and Partners, Ltd., and for generating electrical energy for distribution and sale; to adopt agreements with Pease and Partners, Ltd., and the Newcastle-upon-Tyne Electric Supply Co., Ltd., and to carry on the business of suppliers of electrical energy in all its branches. The subscribers are:—A. Pease, F. Stobart, T. Y. Greener, J. A. Parker, F. S. Newall, J. T. Merz, R. P. Sloan, and M. Short. No initial public issue. The number of directors is not to be less than three nor more than six; the first are J. T. Merz, F. S. Newall, and R. P. Sloan (nominated by the subscribers for the "Newcastle" shares), and A. F. Pease, F. Stobart, and T. Y. Greener (nominated by the subscribers for the "Pease" shares). Remuneration as fixed by the company. 20,000 shares are issued to the Newcastle-upon-Tyne Electric Supply Co., Ltd., and 20,000 to Pease and Partners, Ltd. Registered office: Collingwood Buildings, Collingwood Street, Newcastle-on-Tyne.

OXFORD TRAMWAYS SYNDICATE.—This company was registered on May 21st, with a capital of £55,000 in £1 shares, to adopt an agreement with the City of Oxford Electric Tramways, Ltd., to acquire, hold, or deal with any stocks, bonds, debentures, shares, or securities in the said company, or any other company formed for the purpose of constructing, financing, or working all or any of the tramways authorised by the Oxford and District Tramways Act, 1907, and to carry on the business of railway and tramway owners, electric light and power suppliers, electrical engineers, metal workers, contractors for the supply of electrical plant, manufacturers of and dealers in apparatus used in connection with the generation, distribution, accumulation, and employment of electricity, &c. The subscribers are:—W. J. Park, P. R. Reeves, S. Jordan, A. W. R. Stuart, C. J. Lissenden, W. Eacott, R. Bott. No initial public issue. The number of directors is to be four; two to be appointed by the National Electric Construction Co., Ltd., and the remaining two by the City of Oxford and District Tramways Co., Ltd. The first are B. Bernheim, 41 Lansdowne Road, Kensington, and W. B. Cownie, 4 Queen Anne's Chambers, Westminster, appointees of the Construction Co., and Sir Robert Buckell, of Oxford, and Colonel R. F. Webb, 6 West Cromwell Road, Kensington (appointees of the said Tramway Co.). Registered office:—Queen Anne's Chambers, Westminster.

REX ELECTRIC & GENERAL SUPPLIES, LTD.—This company was registered on May 23rd with a capital of £3,000 in £1 shares, to carry on the business of electrical and general engineers, contractors, manufacturers of electrical and mechanical appliances for lighting, power, and traction, importers and exporters of economic, domestic, scientific, curative, and pastime electrical appliances, dealers in electrical goods and accessories, &c., to acquire the goodwill of the Wholesale Electrical Supply Department of D. Santoni & Co. (1906), Ltd., formerly carried on at 15-17, Beauchamp Street, Brooke Street, E.C., and to adopt an agreement with D. Santoni. The subscribers are:—D. Santoni, F. Welti, W. Harbutt, J. Mortimer, R. Muirhead, L. Gros, A. Brown. No initial public issue. The number of directors is not to be less than two nor more than five; the subscribers are to appoint the first. Qualification, £1. Remuneration, £25 each per annum (chairman, £75).

SANTONI ARC LAMP AND ENGINEERING CO.—This company was registered on May 15th, with a capital of £3,000 in £1 shares, to carry on the business of electrical and general engineers, contractors, manufacturers of electrical and mechanical appliances for lighting, power, and traction, importers and exporters of economic, domestic, scientific, curative, and pastime electrical appliances, dealers in electrical goods and accessories, and to acquire the business of the arc lamp department of D. Santoni & Co., Ltd., formerly carried on at 15-17 Beauchamp Street, Brooke Street, E.C. The subscribers are D. Santoni, G. A. Knapton, E. E. Tasker, A. Brown, L. Gros, K. Fredler, W. McIntosh Whyte. No initial public issue. The number of directors is not to be less than two nor more than five; the first are D. Santoni (managing director for ten years) and others to be appointed by subscribers. Qualification, £1. Remuneration, £25 each per annum (£50 extra for managing director).

SCAMPTON & CO.—This company has just been registered with a capital of £2,000 in £1 shares, to adopt an agreement with J. A. Scampton, and to carry on the business of advertising contractors and agents, dealers in electrical or other contrivances for advertising, stationers, printers, &c. The subscribers are:—J. A. Scampton, R. A. White, J. N. L. Peacock, S. G. Wood, A. E. Theaker, F. Lloyd, H. J. Hillier. No initial public issue. The number of directors is not to be less than two nor more than five; the first are J. A. Scampton and F. Lloyd (both permanent, subject to holding £100 shares). Registered office:—4-5 Warwick Court, Holborn, W.C.

SUN POWER CO. (EASTERN HEMISPHERE).—This company was registered on May 27th, with a capital of £500,000 in 1,500 founders' shares of 1s. each, and 299,925 ordinary shares of £1 each, to acquire any inventions relating to the utilisation of solar heat, and apparatus used in connection therewith, in particular to acquire the rights for the Eastern Hemisphere relating to certain inventions of F. Shuman, of Philadelphia, U.S.A., to adopt an agreement with the said vendor, as president, and on behalf of the Sun Power Co., of Tacony, Philadelphia, to manufacture and deal in sun or solar engines, and plant, works, apparatus and machinery of all kinds, including machinery and apparatus for refrigerating and ice-making, and for the production or supply of liquid air, electricity, light, heat, and power, to manufacture, create, generate, produce, and deal in and with ice, liquid air, electricity, light, heat, and power of any kind, &c. The subscribers are:—F. Shuman, F. Goswin, G. Despret, W. Seyrig, E. N. Shackle, V. Wilson, A. S. Pleus. No initial public issue. The number of directors is not to be less than three nor more than eleven; the first are F. Shuman, G. Despret, F. Goswin, W. Seyrig, and E. N. Shackle. Qualification, one founder's or £100 ordinary shares or stock. Remuneration (except managing director), £300 per annum, dividend. Each founders' share confers the right to participate in the profits of the company, to the same extent as 100 fully-paid ordinary shares.

Telegraph Traffic.—The Gibraltar-Tangier cable was put into working order again on May 20th, and on the same day communication between Rome and Constantinople was renewed. The cable between the Dardanelles and Constantinople was, however, interrupted for the purpose of carrying out repairs. The Ottoman Government announced similar restrictions to those in force during the Chio-Tenedos cable breakdown. The cable was, however, repaired on the 27th ult., and again interrupted on the 1st inst. On May 28th the cables between Sierra Leone and Accra and between Accra and Lagos broke down, but the former was quickly repaired on May 31st. The West India and Panama Telegraph Co. have been more fortunate recently in regard to interruptions to their cables, but the spell has been broken by the giving out of the cable between Demerara and Trinidad on the 30th ult. The last interruption of this cable took place in February, there being no other known break in any of the company's cables.

PRIVATE TELEPHONE LINES CASE

Judgment Reversed

AN important case was heard last year (ELECTRICAL ENGINEERING, Vol. I., page 567), in which a large class of private telephone lines were judged by Mr. Justice Swinfen Eady to be liable to Post Office royalties. This judgment was appealed against (ELECTRICAL ENGINEERING, March 19th and April 16th, 1908), and judgment was given on Wednesday last week, reversing Mr. Justice Swinfen Eady's decision.

The decision affected those lines which, although known as private lines, are used for business purposes connecting up two or more firms, but not leading to the telephone exchange. It appears that until 1897 the National Telephone Co. paid royalties of 10 per cent. of the rental of these lines to the Postmaster-General in the ordinary course, but that, after that date, payment was refused by the company, who desired to test whether those lines were really subject to royalty. As the decision stands at present, they are not subject, but of course there will be an appeal to the House of Lords, and even if the case then goes against the Post Office the opinion is expressed in some quarters that there will be legislation to alter the law to meet the case in favour of the Postmaster-General's monopoly. Even if Parliament did amend the Telegraph Act in such a way, this could not be retrospective, so that the company was well advised to fight the case and appeal from the decision in the lower court, as the royalties which have accumulated in respect of such lines since 1897 would mean a very substantial sum. The question is not simply the construction of the Telegraph Act of 1869, and the famous case of the Attorney-General *v.* the Edison Telephone Co. in 1880, by which it was laid down that telephones are "telegraphs" within the meaning of the Act; for it is argued on behalf of the Post Office that even if such lines as these do come within the Postmaster-General's monopoly, the National Telephone Co. has contracted to pay royalty on them by the terms of their licence.

The case is now known in telephone circles as the A to B case, as this term has been used very much in the proceedings. The private lines may be divided into two classes, the first A to A lines, in which the subscriber has a line or lines connecting two or more instruments all for his own business, and used by himself or his employees, and the second class known as the A to B, in which private lines are employed by, say, two firms, A and B, for use between them for business purposes. In the latter category are lines connecting, for instance, the ticket agency of Keith, Prowse & Co., Ltd., with a number of theatres and hotels; private lines to fire brigade stations also come in this class, and there are a number of these in London to connect large buildings, &c., with fire brigade stations.

In the Telegraph Act the following cases are excepted from the Postmaster-General's monopoly :—

"(1) Telegrams in respect of the transmission of which no charge is made, transmitted by a telegraph maintained or used solely for private use, and relating to the business or private affairs of the owner thereof; and

"(2) Telegrams transmitted by a telegraph maintained for the private use of a corporation, company, or person, and in respect of which, or of the collection, receipt, and transmission or delivery of which, no money or valuable consideration shall be, or promised to be, made or given."

An interesting point is that, although the Appeal Court has reversed Mr. Justice Swinfen Eady's decision, it was not unanimous; the Master of the Rolls was of opinion that the decision should not be reversed, and Lord Justice Fletcher Moulton and Lord Justice Buckley held the opposite view.

Mr. Swinfen Eady, in giving his decision, had been guided almost entirely by the terms of the Telegraph Act, and the words, "for private use" in the two exemptions cited above, and had held that these words meant solely for the private use of the owner of the telephone, his family, and employees.

The MASTER OF THE ROLLS, in giving his decision, said that neither of the exceptions as given in the Telegraph Act were strictly grammatical, or easy to construe, but, contrary to Mr. Justice Swinfen Eady, he thought that the second exception met the present case. He attached importance, however, to the terms of the Telephone Co.'s licence, in Clause 2 of which leave is granted to use and work telephones "for the purpose of enabling any person with whom the company agree in that behalf to transmit direct from and receive at any office to and from any other person at any other office by means of spoken words (but not otherwise), and with the aid of such telegraphs as aforesaid telegraphic messages relating to the business or private affairs of such persons respectively or one of them." These words, he thinks, clearly and accurately give a description of an A to B line, and expressly exclude an A to A line.

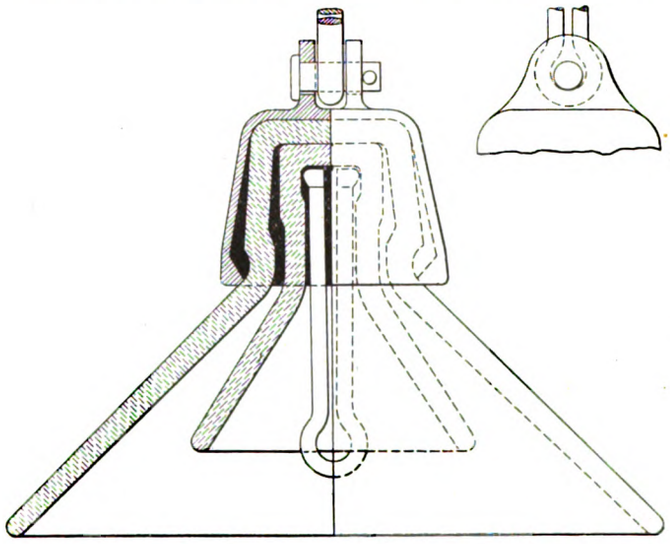
In Clause 7 (1) the company agree to pay a royalty of 10 per cent. of the gross amount payable by any person in respect of the purchase, or hire, or maintenance, or working, or user, or right of user, of, or permission to use, "any telegraph or telegraphs of the kind or description hereby licensed." He was, therefore, of opinion that, although the lines were, under the Act itself, exempt from the Postmaster-General's monopoly, the company had agreed by the terms of their licence to pay royalty on them.

LORD JUSTICE FLETCHER MOULTON, dealing first with the exceptions in the Telegraph Act, said that the first insists that the messages must relate to the business or private affairs of the owner of the telephone, but does not insist that no "consideration" shall be given for the collection, receipt, or delivery of the message; whereas the second exception does not insist that the telegram shall relate to the business or private affairs of the owner, but requires that no consideration shall be given for the collection, receipt, or delivery. He is, therefore, of opinion that so far as the Telegraph Act is concerned, the owner of such lines is at liberty to deal with such messages when received just in the same way as he could with a message sent by himself without the intervention of the telegraph, provided the message is sent by himself, and that no charge is made for transmission. He may also permit this telephone to be used for the conveyance of other messages, but in that case no charge must be made for the collection, receipt, or delivery. He thinks, therefore, that a private telephone between, say, a firm and their bankers or customers, for the convenience of their business, in which no charge is made for the messages, is within the exception, and he thinks it makes no difference whether the lines actually belong to the users or are leased by them. Incidentally, however, Mr. Justice Fletcher Moulton divided the A to B private telephone into two classes, one of which he thinks does not come outside the exemption in the Act: "If A establishes a private telephone to B for the purpose of B's business, and B only uses it for the purposes of A's business, or by gratuitous permission of A to contribute nothing towards the construction, hire, or maintenance of the line so as to give himself a right to use it, the arrangement is within the exemption. But if A and B jointly maintain a telegraph for the purpose of communication between one another on the business or private affairs of either of them, each having thereby the right so to use the telegraph, it is outside the words of the exemption." As, however, the particular cases in the present instance do not come within this latter description, he is of opinion that they are all exempted from the monopoly, and the only question to decide, therefore, is whether royalty is due on them under the terms of the licence. In the licence there is a sub-clause (No. 7, sub-section 3) providing that where money is payable to the company, partly for telephones exempted from the Postmaster-General's monopoly, and partly for those not exempted, the Postmaster-General may apportion the sum so payable between two classes. It is clear, said Mr. Justice Fletcher Moulton, that the Post Office is only to receive the latter portion, and he cannot conceive that there should be a provision of this kind unless it had been the intention of the parties that only those telephones which require licences should be held to be licensed, and only the money payable in respect of them should be payable for such licence. He was, therefore, of opinion that the judgment of the Court below was erroneous, and that the appeal should be allowed.

LORD JUSTICE BUCKLEY concurred with Lord Justice Fletcher Moulton, being of the opinion that the National Telephone Co. were not accountable to the Postmaster-General for royalties in respect of the lines in question.

The appeal was accordingly allowed.

A *verbatim* report of the judgment, occupying about four columns, will be found in *The Times* of last Thursday.



"Liconite" Cable.—In connection with the article on the new leadless cable published in our last issue, we are requested to state that Messrs William Geipel & Co., Vulcan Works, St. Thomas' Street, S.E., will be pleased to give information with regard to the cable in question to anybody desiring to have it. We are also informed that a two yard length, cut off the 40-yard length of cable with "reinforced" liconite insulation mentioned in our article, was tested after the visitors had left, and only broke down at 54,000 volts. This piece had been bent round an 18 in. drum three times in each direction, prior to being tested. The thickness of the insulation, which consisted of alternate layers of liconite elastic and impregnated paper, was 0·5 in., excluding the braiding. The insulation resistance was 86 megohms per mile. Liconite, and liconite cables are being exhibited by Messrs. Geipel & Co. at Stand No. 260 in the Machinery Hall at the Franco-British Exhibition.

200,000-VOLT SUSPENSION INSULATORS

WE have received some particulars of the development of the suspension type insulator manufactured by the Locke Insulator Manufacturing Co., of Victor, New York, from Messrs. W. Geipel & Co., who are now sole agents for these insulators for the Continent of Europe and the Colonies.

The underhung insulator as first developed consisted essentially of several conventional type line insulators, and these, when tested, gave such excellent results that it was quickly recognised as the proper method of insulating extra high potential lines. Since lines erected in this manner are usually of considerable importance, the matter of mechanical weakness was first under consideration, and as the conventional type line insulators have no great amount of strength in tension, some new development was necessary. This feature was first taken care of by using a single shell of porcelain on the outside of which was cemented a metal cap and on the inside of which was cemented an eye-bolt. Mechanically, the device was very nearly ideal, since mechanical strength in excess of 20 tons could be readily obtained, but electrically the device is not a success when built in this manner, since the condenser effect causes a piling-up of potential around the end units, and if

Leakage distance ... ... 24 inches.
Striking ,, ... 4½ ,,

Scale—One-quarter full size.

made of reasonable size, will be found not to have dielectric strength comparable with the flash-over potential. These insulators behave exactly like line condensers in series, and if the approaching wave be steep and coming with great rapidity, the first unit has to stand a very high potential. For this reason it was found necessary to introduce two pieces of porcelain which could be made thin and of good quality, and would permit of approximately 100,000 volts being applied upon the unit. Also, it added materially to the leakage distance of the whole device. It is the custom to test the shells of this underhung insulator to flashing-over potential for about five minutes before assembling, and after assembling, to test the unit to 100,000 volts for a period of five minutes. A mechanical test of 5,000 lb. is then applied to the device in order to ensure that the porcelain and cement have been properly put together and are of good quality.

The mechanical features of this insulator are not without interest. As shown in the accompanying sections of one unit, each of the shells is recessed on the inner side, and that inner connection is made by means of a "U" bolt which springs out in the recess, and then the annular space is filled with neat Portland cement, which is allowed to obtain its permanent set under water. Analysing for a moment the mechanical strains which fall upon this sort of a joint, it will be seen that from the upper end of the "U" bolt strains may be transmitted at 45° through the porcelain and cement to the expansion cap which supports the whole device through throwing the porcelain into compression, and permitting of the development of any desired mechanical strength. The device shown has a mechanical strength, ultimate, of something in excess of 14,000 lb., though for this excessive value the cement should be allowed to set for several weeks under water.

The insulator is normally used in a vertical position, about 25,000 volts per unit, four units being allowed for a 100,000-volt star connected line. For corners it will, of course, be necessary to use the insulators in a horizontal position to by-pass the line wire.

It may be noted that these insulators are even safer in a horizontal position than vertically, for if the arc does leap over the surface, it is immediately blown out by its own heat and away from the insulator, whereas, in the conventional type of insulators, if an arc plays over it, sufficient heat is usually liberated underneath the shells to destroy it.

HULL MUNICIPAL TELEPHONE ACCOUNTS

THE accounts of the municipal undertaking for the year ended March 31st, 1908, show a capital expenditure during the year of £1,882, making a total of £54,747. The revenue amounted to £9,567, and the expenditure to £5,596, and after deducting sinking fund and interest charges, there is a net profit of £1,055.

Details of the revenue are as follows:—Exchange rentals, £8,792; private line rentals, £222; public telephones, £309; tolls (toll services), £141; trunk fees and telegrams, £95; and sundry sales, £8. Total, £9,567.

In maintenance and repairs £1,429 was spent; establishment charges, including salaries and wages, amounted to £2,392; royalties, £966; rents, rates and taxes, £668; and wayleaves, £140. Total, £5,596.

In accordance with a resolution passed in April, 1907, the balance on net revenue account at March 31st, 1907, has been applied as to £214 for writing down preliminary expenses from capital account, and the balance of £1,578 has been transferred to reserve fund, which now stands at £1,633.

In a report by Mr. T. Holme, Engineer and Manager, it is stated that the total underground conduits now laid amount to 34 miles 1,671 yards, and the underground mileage is equivalent to 7,157 miles of single wire. The overhead wires have an equivalent length of 1,037 miles of single wire. The cost per telephone station now stands at £22·36, against £24·04 last year, and this amount will further decrease as the spare cable and plant become occupied.

At the meeting of the Telephone Committee on Wednesday last week, at which the report and accounts were adopted, the Chairman, Mr. Alderman J. Brown, said that it was a matter for great congratulation to Mr. A. R. Bennett, the consulting engineer, that what he foretold was being carried out, and he also complimented Mr. Holme and the staff. Mr. Alderman F. Larard, J.P., in seconding the resolution, complained that they had not had more assistance from the Post Office, who had received £966 during the past year in royalties.

CATALOGUES AND PAMPHLETS RECEIVED

INSULATED WIRES.—A new price list of guttapercha, indiarubber, silk, and cotton-covered wires has been issued by the Indiarubber, Guttapercha, and Telegraph Works Co., Ltd. The list includes single and twin bell wires, telephone cords and flexibles, silk and cotton-covered copper and German-silver wires for instruments, dynamos, &c., guttapercha insulated wires, special shot firing cables, and a very complete list of jointing materials and jointers' tools.

SWITCHGEAR.—A leaflet from Messrs. A. Reyrolle & Co., of Hebburn-on-Tyne, describes a simple form of isolating link, operated by a hooked pole, which the company have introduced to comply with the Home Office stipulation that it shall be possible to isolate all parts of a switchboard for cleaning purposes, inspection, &c. Another leaflet describes a special experimental switchboard at the Central Technical College, South Kensington.

CONDUIT FITTINGS.—A new catalogue from the Armorduct Manufacturing Company gives particulars of various fittings for interior conduit wiring on the "Witton Grip" system for ensuring electrical continuity, which was described in ELECTRICAL ENGINEERING, February 13th, page 244. It will be remembered that a conduit fitting of the ordinary non-screwed type, and of the size ordinarily used, is slotted to part of its diameter, and a claw grip metal band, which is fitted with sharp projections or teeth, so as to engage the tube firmly, when the binding screw is tightened home. In the closing and scraping movement which naturally results, the enamel, which would otherwise prevent electrical continuity, is automatically removed. A mechanical contact of great strength is secured, and electrical continuity is ensured.

SUMMARY

The contractors for the gas generating plant in Johannesburg are credited with the intention of putting this in working order again, as they claim to have arrived at the causes of its non-success in the past. (Page 876.)

The automatic signalling system which is being installed on the Metropolitan Railway between Praed Street and Aldgate is similar to that in use on the District Railway, except that the actual points and signals are electrically driven through an oil transmission instead of by compressed air. (Page 877.)

An article on the accounts of the Hull Telephone Department for the year ended on March 31st last shows that the total cost of working, including capital charges and Post Office royalties, but with no allowance for depreciation of plant, averaged about £3 14s. per telephone station. These results are about the same as last year, the only notable exception being that the exchange repairs have risen from 1s. to 2s. per telephone station. The capital expenditure per telephone station stands at £22 7s. Although the Corporation's licence, which was obtained in 1902, expires in 1911, and the loans for the construction of the system were borrowed for periods of 25 years, no depreciation fund has been set aside, and the reserve fund stands only at £1,633, out of a total capital expenditure of £54,747. (Page 878.)

Some notes are given on the equipment of the two overhead trolley lines of the London County Council at Woolwich and from Hammersmith to Harlesden respectively. Span wire construction is used, with a grooved trolley wire, and special arrangements are made at the crossings of the Hammersmith line with the lines of the London United Tramways Co. (Page 879.)

The following books are reviewed in this issue:—"Modern Views of Electricity and Matter," by Sir Oliver Lodge (Third Edition); the Deinhardt-Schlomann Series of Technical Dictionaries in Six Languages, Vol. II., "Electrical Engineering"; and Whittaker's "Arithmetic of Electrical Engineering for Technical Students and Engineers." (Page 880.)

When Lord Cromer's Committee of the House of Lords adjourned on Thursday for the Whitsun recess, the case for and against the London and District Electric Power Bill had been concluded, the Hon. J. D. Fitzgerald, leading counsel for the Bill, having deferred his reply, by arrangement, until he comes to oppose the Bill of the eight electric lighting companies. Evidence was given on behalf of the companies against the Bill by Mr. J. Conacher, of the Metropolitan Electric Supply Co.; Mr. H. B. Renwick, Secretary of the County of London Electric

Digitized by Google

Supply Co.; Mr. E. W. SEALE, Secretary of the Charing Cross, West End & City Electricity Supply Co.; Mr. A. F. HARRISON, Secretary of the City of London Electric Lighting Co.; and Mr. C. P. SPARKS, Engineer to the County of London Electric Supply Co. In this evidence, stress was laid upon the fact that the companies have carried out a canvass of the whole of the County of London in order to ascertain the amount of power, electrically driven or otherwise, in existence. It will be remembered that during the proceedings upon the Administrative Bill of 1905 it was stated that there was over 500,000 h.p. in the area, of which only about 7 per cent. was driven electrically. The canvass of the electric lighting companies showed that the total in London is only about 208,000 h.p., and that the existing supply authorities, both companies and municipalities, are supplying 35·38 per cent. of this. Whilst Mr. Sparks was being cross-examined at some length upon the basis of his tables, showing that the existing companies could generate as cheaply as the proposed new company, and that there would be no benefit to them in taking a supply in bulk, the Chairman intervened with the remark that the Committee had heard sufficient examination and cross-examination upon this point, and he asked Mr. Balfour Browne to commence his speech in reply. In his speech Mr. Balfour Browne argued that to set up a new competition such as was proposed under this Bill would be a breach of Parliamentary bargain, and would introduce competition under conditions not contemplated at the time of the passing of the Electric Lighting Acts nor by Major Marindin's report. He severely criticised the finance of the Bill, but it was apparent by the Chairman's interruptions that the Committee did not share his views. Mr. Balfour Browne's argument was that none of the promoters were committed to finding a single penny of the capital, whereas the Chairman said he thought that £500,000 was tolerably assured. The Committee adjourned until Tuesday, 16th inst., when Mr. Balfour Browne will open the case for the Companies' Bill. (Pages 881-884.)

THE Heysham-Morcambe-Lancaster lines of the Midland Railway form the first example of single-phase traction in England. The length of single road now electrically equipped is about 21 miles. The overhead line works at 6,600 volts, 25 cycles, and is supported from cross gantries mounted partly on wooden poles and partly on lattice steel bridges by means of specially designed catenary suspension, presenting some novel features. Three-car trains are employed, at present equipped some on an all-electric and some on an electro-pneumatic multiple unit system, but arranged to be interchangeable. Power is taken from an existing gas-driven station at Heysham, where an extra generating set and some motor generators have been put down. (Page 885.)

THE Felten Guilleaume Lahmeyer Co. have recently introduced an interesting new design of starter for large rolling mill motors. (Page 891.)

A LONG letter from Mr. A. A. VOYSEY, elicited by our editorial note on street lighting last week, points out the futility of cut-throat competition, and puts forward a plea for greater harmony of working between conflicting commercial interests. (Page 892.)

WE give the full programme of the Nottingham Convention of the Incorporated Municipal Electrical Association, which will be held from June 30th until July 3rd, inclusive. The Presidential Address will be delivered on June 30th, and will be followed by a Paper by BAILIE WIGHTMAN. The second day will be devoted to an excursion. On Thursday, July 2nd, the Annual General Meeting will be held in the morning, and two Papers on generating stations, by Mr. H. Richardson and Mr. C. M. SHAW, will be read and discussed in the afternoon, the annual dinner being held in the evening. The final meeting will be held on Friday morning, July 3rd, when Papers by Mr. A. M. TAYLOR and Mr. H. A. RATCLIFF, dealing with A.C. accumulator sub-stations, and testing departments respectively, will be discussed. (Page 893.)

A SINGLE-PHASE goods locomotive, equipped with three 350 h.p. compensated repulsion motors of the Winter-Eichberg type, has been constructed for the Prussian State railways, and is now being used on the experimental line at Oranienburg. The locomotive is constructed in two halves, and weighs 59·5 tons complete. The maximum speed of the locomotive is about 37 miles per hour. (Page 893.)

IT is officially announced that the International Congress on Electrical Units and Standards in London will be opened on October 12th. A memorandum has been prepared of the proposals to be laid before the Congress, the chief object of which is to consider and advise as to the steps to be taken to bring about agreements in the definition of electrical units forming the basis of legislation in different countries, and in the methods necessary to give effect to these definitions. (Page 894.)

IN a Paper read before the Cape Town Local Section of the Institution of Electrical Engineers, Prof. H. BOHLE investigated the problem of giving, with a suitably designed reflector, a uniform illumination over a wide area from a single source of light. (Page 894.)

AT the Edinburgh exhibition, some electrically driven laundry machinery and coal-cutting machinery, both presenting points of interest, are exhibited. (Page 897).

A NEW graphical method of determining the mean spherical intensity of a lamp has been devised by Mr. A. E. KENNELLY. (Page 898.)

UNDER "Electrochemistry and Electrometallurgy" is described a process for the electrical refining of silica. An abstract is also given of a Paper by Dr. A. Frank, read before the Faraday Society, on the commercial production of cyanamide. (Page 899.)

UNDER "Electrical Science" is included a note on the radioactive deposits from actinium. In the Papers abstracted in the Continental section, HEMSALECH describes the results of two methods of investigating harmonics in spark discharges, and SCHAMES shows how to determine permeabilities with alternating currents. (Page 900.)

AMONG the Patent Specifications published on Thursday last is one by S. Z. DE FERRANTI, in which some forms of polyphase electric furnaces are described. Heating by chemical combustion is combined with electrical heating, circulating, and mixing arrangements. A process for rendering soft petroleum pitch sufficiently dense and ductile to be of use for filling cable trenches is the subject of a Patent by T. MARRIOTT. A specification of SIEMENS BROS.' DYNAMO WORKS, LTD., relates to that system of alternator compounding in which a small rotary converter mechanically coupled to the alternator, and supplied with current from a series transformer, governs the excitation of the alternator. By the use of additional brushes on the rotary converter, the alternator is compounded for both watt- and wattless components of the load current at all power factors. This system can also be applied to the excitation of boosters in connection with buffer batteries on alternating-current systems. A load-equalising system for use on alternating-current circuits is described in a specification by P. M. LINCOLN, and another specification by B. KAUFMANN relates to the manufacture of metallic paper or tinfoil substitutes, as are used for electrical condensers. (Page 901.)

ONLY one tender has been received by the Buenos Aires Corporation for the construction of tube railways

Digitized by Google

in that city, namely, from the French Thomson-Houston Co.—The Croydon Corporation electricity accounts for 1907-8 show a net surplus of £12,242, against £8,927 for the previous year.—In consequence of the East Molesey Council refusing to consent to the erection of overhead telephone wires, the Postmaster-General has decided to defer the telephone extension in the district until the Council changes its attitude.—A proposal was made last week to the Edinburgh Corporation that it should instal a competitive telephone system with the National Telephone Co., but as a licence would only be granted until 1931, the proposal is not to be entertained.—The Glasgow tramways receipts for the past year amounted to £907,494, an increase of £20,113 over those of the previous year.—A statement has been prepared by Mr. S. E. Fedden, engineer and manager of the Sheffield Corporation electricity undertaking, by which it is shown that, whereas in 1899, when the company's undertaking was acquired in Sheffield, there was not a motor connected to the mains, at present there is the equivalent of 9,674 h.p. connected, the average price for the supply to which is 0·943d. per unit. (Pages 903–906.)

THE Manchester Corporation require direct-current motors, direct-current motor starters, ampere-hour and watt-hour meters, and fuse boxes.—The London County Council require tramway feeder pillars.—The Sheffield Corporation contemplate an expenditure of £20,000 upon the electrical undertaking. (Page 906.)

THE report and accounts of the Birmingham and Midland Tramways Co. for 1907 show a net profit of £44,236; a 4 per cent. dividend is recommended upon the preferred ordinary shares. At the annual meeting of the Anglo-Portuguese Telephone Co., last week, it was stated that during the year extensions of the switchboards at Lisbon and Oporto have been carried out, giving an increased capacity for 900 subscribers in the former, and 240 subscribers in the latter.—The accounts of the Brush Electrical Engineering Co. for 1907 show a net profit of £10,229, after paying debenture and other interest. No dividend is declared. The output of the works during 1907 has been the greatest in the history of the company, but the company has been suffering from inadequacy of working capital, necessitating temporary loans from bankers and others at a high rate of interest. (Pages 907–8.)

A DISCUSSION took place in the House of Commons on Wednesday last week with regard to the increasing number of fatal and non-fatal accidents in factories. There was considerable criticism on the present methods of appointing factory inspectors, objection being taken to the examination system, which, it was alleged, did not provide for any practical knowledge on the part of the candidate. Mr. Herbert Gladstone, Home Secretary, replied that he was perfectly ready to change the system as soon as he was convinced that it did not produce the right men for inspectors. Although the present system had been ridiculed, no case of failure or shortcoming had been brought to his notice, but nevertheless he would welcome an impartial inquiry, either by departmental or select committee. (Page 909.)

A SHORT article gives some of the principal figures from the accounts of the National Physical Laboratory. (Page 909.)

A CONSULAR Report contains some figures relating to the consumption of electrical energy and the application of electric driving in Berlin, and some statistics showing the foreign trade of Germany in electrical machinery and apparatus for the year 1907. The imports, as would be expected, are very small in comparison with the exports. (Page 910.)

Mr. C. W. MALLINS has been appointed general manager of the Liverpool Corporation Tramways. (Page 910.)

THE group of Lancashire lines of the Midland Railway, which have recently been converted to electric traction, will be watched with great interest by electrical and railway engineers, as being the first example of single-phase traction to be actually put to work in the country. The running of these lines electrically must of course be regarded to some extent as experimental, for upon their working will depend the more extended adoption of the system upon which they are equipped on the main line railways of Great Britain. From a technical point of view, however, the work can hardly be classed as experimental, founded, as it is, upon the results of experience with varieties of the system in use on the Continent and in America. Although based to a considerable extent on such experience, the equipment is not a case of merely following after the work of others, but shows points of originality—notably in the 6,600-volt catenary suspension designed by Mr. J. Sayers—which would appear to mark advance rather than imitation. Although the line is only a comparatively short section, with a frequent service of small trains, there is much in the equipment, especially as regards the overhead work, which is practically the same as would be adopted for heavy main lines, and it is in the bearing of the experiment on the conditions of main line traffic that much of the interest lies. The question of power supply was, of course, different, and the methods adopted must be viewed rather as expedients to utilise an existing generating station, than as an example of what would be done on a large scale, when the problems of cheap generation by large units, overload capacity, feeding and transformation, would require different solutions. A glance at the description of the generating plant and overhead equipment in another column will show the thoroughness with which the engineers to the Midland Railway have considered the conditions, and the running of a well-equipped line such as this should do more to define the conditions for which the single-phase and continuous currents are suitable than the wordy warfare which has been waged on paper by the partisans of the two rival systems of electric traction.

THE programme of the annual summer meeting of the Incorporated Municipal Electrical Association, which we publish to-day, shows that, as usual, pleasure and business will be combined, and this excellent arrangement conduces to the maximum individual benefit to members attending the Convention; for many men derive as much useful information from informal talks and comparison of experiences with their fellow engineers as from the discussions on the actual Papers. In Nottingham it is particularly wise to have arranged a whole day and an afternoon for excursions and visits to works, for, owing to the smallness of the hotels, the members will be more or less scattered all over the town, so that each member will meet fewer of his friends in the hotel smoking-room. It will be noticed that there is no Paper on electric traction this year. Papers on this subject are getting fewer at the Municipal Electrical Association meetings, owing to the rival claims of the various tramway associations, and this year it is not surprising that tramway matters should be left to the meeting of the Municipal Tramways Association, that will be held in Nottingham in the autumn, under the presidency of Mr. JOHN

Digitized by Google

ALDWORTH, General Manager of the Nottingham Tramways. On the first day (Tuesday, June 30th) BAILIE WIGHTMAN'S "experiences" will doubtless give rise to an instructive and entertaining debate, which will be allowed a wide range; on the Thursday afternoon the design of generating stations will be discussed, in connection with Papers by Mr. H. RICHARDSON, of Dundee, and Mr. C. M. SHAW, of Worcester; and on Friday Mr. A. M. TAYLOR will justify his title, "Alternating-Current Accumulator Sub-Station," probably with one of his usual energetic displays of curves and tables, while Mr. RATCLIFF will describe the system of testing and standardising employed at Manchester. Upon metallic filament lamps and street lighting there is no Paper, but this will not prevent a useful interchange of ideas upon these two subjects during the week.

A PAPER, read by Prof. H. BOHLE before the Cape Town Local Section of the Institution of Electrical Engineers, published in an abbreviated form in this issue, should be regarded rather as an exercise in the theory of illumination than as a designer's guide for those practically engaged in electric lighting, whether for room or street illumination. Theoretically, uniform illumination, seldom obtainable in daylight, at any rate in cities, will still less be attained by any means of artificial lighting. For interior illumination, any calculations on a definite basis might be entirely upset by a change of wall-paper, or by an alteration of the positions of the furniture in a room, while for street lighting the idea of absolutely uniform illumination is Utopian. We do not wish in any way to depreciate the excellent work that Prof. Bohle has put into his Paper, and we are glad to see such painstaking contributions as this coming from one of our two "oversea" Local Sections, but we think it necessary to sound a note of warning lest the rules he gives should, without any saving clause, find their way at once into pocket-books of engineering formulæ and become ineradicably crystallised and copied from pocket-book to pocket-book, as is wont to happen in such cases. Caution must also be used in adopting the "A.E.G." figures of candle-power per sq. ft. for various purposes. Like Sir WILLIAM PREECE'S convenient 1 watt per sq. ft. for illumination with carbon-filament lamps, there are cases in which half the rating may be excessive, and others where double the figures given may still give insufficient light.

THE graphic method devised by Mr. A. E. KENNELLY for finding the mean spherical candle-power of a source of light from a polar curve is an interesting application of the involute and evolute, and may be found to be practically useful in certain cases. There is something attractive about the production of a mere straight line of definite length when a single quantity is sought, but in his natural satisfaction in discovering this novel construction Mr. Kennelly perhaps does some injustice to the Rousseau diagram, to which he favourably compares it. Engineers need not be told that the area of a diagram must be measured "either by a planimeter or by counting little squares on suitably squared paper"; there are more expeditious ways for such purposes as this, where great precision would be a waste of time. Mr. Kennelly claims a somewhat higher accuracy for his construction than for that of Rousseau, but it seems that in the time required for his rather intricate work a Rousseau diagram with a larger number of radii could be constructed and evaluated, and that nothing would be gained in accuracy. Besides this, Mr. Kennelly's method seems to demand considerable care, for any errors are cumulative.

ARRANGEMENTS FOR THE WEEK

FRIDAY, JUNE 12TH.

Physical Society.

8 p.m. Meeting in the Physics Laboratory of the Royal College of Science, South Kensington. Included in the agenda are the following Papers:—(1) "Experiments on a Directive System of Wireless Telegraphy," by Messrs. Bellini and Tosi; (2) "On the Resistance of a Conductor of uniform thickness whose breadth suddenly changes, and on the Shapes of the Stream Lines," by Prof. Lees; (3) "On the Self-Inductance of two Parallel Wires," by Dr. Nicholson.

WEDNESDAY, JUNE 17TH.

Dynamicables.

7.15 for 7.30 p.m. Dinner at the "Old Welcome Club," Hungarian Exhibition, Earl's Court.

THURSDAY, JUNE 18TH.

Faraday House Old Students' Association.

7.0 for 7.30 p.m. Annual Dinner at the Queen's Hotel, Leicester Square, London, W., Mr. Gerald Partridge in the chair.

THE GAS GENERATING PLANT AT JOHANNESBURG

THE *British and South African Export Gazette* states that the electrical power supply problem continues to attract much attention in engineering circles in Johannesburg, the chief new feature during the past month being the prominence accorded to Mr. W. A. Harper, who, as consulting engineer to Messrs. W. Beardmore & Co., Ltd., the guarantors for the gas-engine contract, has been discussing the whole matter with the municipality. According to a statement made by him, it is Messrs. Beardmore's intention to put the gas plant in working order immediately, their principal reason being that they have supplied exact replicas of those installed at Johannesburg, and in all cases they have worked satisfactorily. He is of opinion also that the gas-producing portion of the plant is everything that can be desired, with slight modifications in details to suit the use of Transvaal coal. He adds that the engines have been considerably damaged by "this dirty, tarry gas," but that they can be made as good as new at a very small expenditure, and, if a modern and suitable cleaning plant is added, he sees no reason why they should not be as successful in other parts of the world. The Council's attitude in the matter, however, is not known at the time of going to press, but we understand that further negotiations are now proceeding through the post.

London Tube Railways.—The announcement is made of the introduction of through booking between the Central London Railway and the Great Northern, Piccadilly and Brompton Railway.—As a counter-proposition to the proposal to push forward with the construction of the Cricklewood-Victoria tube railway, some of the frontagers along Edgware Road seem to prefer tramways in the thoroughfare. It is pointed out that the Royal Commission on London Traffic recommended the continuance of the existing tramways from Cricklewood down Edgware Road to Victoria, where they would join the present tramways from Victoria and Vauxhall Bridge to South London.

Telegraph Traffic.—The Eastern cable between Accra and Lagos was restored on June 3rd, while the cable between Cadiz and Tangier became interrupted on the same day. The via Hanekin route suffered a breakdown between Diarbekir and Bagdad and Alep and Bagdad, but it was put into working order again on the following day. Telegrams may now again be sent to all inland offices in Hayti, West Indies. It will be remembered that owing to a revolutionary outbreak, telegraphic correspondence was confined to the coastal towns only. Some delay exists on the Saigon-Bangkok line. On the 8th inst. the lines between Tauris and Teheran were interrupted. The cable between Cayenne and Salinas is still down, and the cable between Guam and Manila, belonging to the Commercial Pacific Cable Co., was down on May 25th last. The cable steamer owned by the company is not now at Honolulu, but the cable has since been repaired. The cable between Dardanelles and Constantinople broke again on June 9th, and the cable between Djedda and Suakim followed suit.

AUTOMATIC SIGNALLING ON THE METROPOLITAN RAILWAY

THE Metropolitan Railway Company have been for some time considering the adoption of a complete system of automatic signalling on the parts of their lines where the traffic is more dense, and the announcement that a contract had been placed with the McKenzie, Holland, and Westinghouse Power Signal Co. for the provision of an automatic signalling system on that part of the Inner Circle between Praed Street and Aldgate and also up to Bishop's Road, did not come as a surprise. With the system in use, excellent though it is, 28 trains per hour is about the maximum that can be conveniently handled. The new system which is being installed is, however, designed for a headway of 1½ minutes or a maximum of 40 trains per hour, so that the increase in the carrying capacity of the line available will be very considerable. We are not at present able to publish full details of the apparatus which is to be installed, but a few notes on the general working and scope of the system and the important points wherein it differs from the signalling system in use on the District Railway may be of interest.

As already stated, the system is to be installed on that portion of the Inner Circle from Praed Street to Aldgate, and on the short length from Bishop's Road to the Praed Street junction, where the Great Western line branches off from the circle. This stretch amounts to about 5½ miles, mostly in tunnel, with 10 intermediate stations. The important junctions are at Praed Street and Aldgate, but sidings used for special purposes are provided at Edgeware Road and Farringdon Street. The company are already using a simpler form of automatic signalling to some extent between Praed Street and South Kensington, where, as we shall see below, the conditions are somewhat different, so that when the installation we are considering is completed, the ordinary working of the whole of the Inner Circle will be automatic.

The system is similar in many respects to the Westinghouse signalling equipment of the District and new tube railways, but has the important difference that, instead of compressed air being employed under electrical control, the working is "all-electric"; that is to say, electricity is used as the motive power for the points and for working the signals, as well as for detecting the positions of the trains. The general principle of working, whereby the completion of the rail circuit of the train itself sets the signals behind the train at danger is the same, and the arrangement of the track circuit and its relays is practically identical; but, as we shall see, the method of actuating the points and signals is entirely different.

The general principles of track circuit working were dealt with at some length in a Paper read before the Institution of Electrical Engineers in December, 1906, by Mr. H. G. Brown, who is now engineer to the McKenzie, Holland, and Westinghouse Power Signal Co., and under whose direction the contract is being carried out (see ELECTRICAL ENGINEERING, Vol. I., page 27); it is therefore unnecessary to deal with this part of the subject at any great length. The only alterations to be made to the track rails are their subdivision into sections corresponding to the length of the "blocks" by means of insulating joints, bonding the rails and making the necessary connections, all of which is being done in practically the same way as on the District Railway. The relays will be of the same polarised type arranged one near each end of every section with their contacts in series, so that any accidental movement of one due to extraneous currents will not affect the signals. The actual track circuit is supplied from a 60-volt continuous-current signal main running the whole length of the line. This main will be supplied at three points from motor-generators, taking current from the three-phase supply, which are being installed in the Baker Street, Charlton Street, and Moorgate substations, and will also be used for the power supply for actuating the signals, although, as will be seen hereafter, a separate supply at a higher voltage will be provided at the junction for working the points, &c.

The whole 60 volts is, of course, not placed across the track, but there is a resistance between the main and the rail in the usual way, across which most of the potential is dropped, leaving only some three or four volts actually between the rails. The most suitable proportioning of these resistances and the sensitiveness of the relays is a subject of considerable interest, and reference may be made to the Paper already mentioned for a discussion of the matter. These relays and resistances are contained in cast-iron boxes alongside the track.

The signals in the tunnels are of very simple character. Each consists of a case containing two electric lamps controlled by a relay and placed, one behind a green and one behind a red Fresnel lens. The tongue of the lamp relay normally rests by gravity on the contact closing the circuit of the "danger" lamp, but is drawn up by its magnet when the track relay allows a current to flow. Thus any failure of current always causes the danger signal to be given. In the parts of the line outside the tunnels electrically-worked semaphores will be used, and the method of working these is similar in principle to the moving of the points, and is one of the most interesting features of the system. For this purpose an intermediate gearing between the electric motor and the signal arm, known as the Johnson oil motor, is employed. In the form used in connection with the semaphore signals this consists primarily of a cylinder containing a piston which actuates the signal arm. When it is required to lower the arm, oil is pumped into the cylinder by a rotary pump worked by a small electromotor through a non-return valve, and when it is desired to put the signal to danger, another valve is opened, and the oil released, when the counterweight causes the arm to rise. This release-valve is normally held open, but is closed by a solenoid when a "line clear" signal is required at the same moment that the pump motor starts. Thus a failure of signal current opens the release-valve and causes the signal to fly back to danger, even if the pump continues to work, and avoids overloading and damage to the motor.

The point motor is somewhat different as, of course, a power movement is required in both directions. In this case a pivotted vane inside a fan-shaped chamber is used in place of the piston or cylinder, and the oil is pumped in on one side or the other, according to the direction of motion of the motor-driven rotary pump. The pump is provided with a by-pass kept normally closed by a valve, so that in event of a point fouling or a vehicle standing on the locking-bar, the pressure, as soon as it rises above a certain value, is released, and the motor simply circulates the oil through the by-pass. This is a very important feature of the apparatus, and gives it a sensitiveness very difficult to obtain by mechanical gearing. The appliance was the invention of Mr. A. H. Johnson, the Signal Engineer to the London and South-Western Railway.

It must, of course, be understood that the working of the Praed Street and Aldgate junctions is what is known as semi-automatic—that is to say, the points are set and the signals to proceed are given by the signalmen in the cabins at these points. The track-circuit arrangements, however, automatically place the

Digitized by Google

signals at danger as soon as the train passes, and the electrical interlocking prevents any signal or point relating to an occupied section being moved in error.

At these junctions a special supply of 120 volts is provided for working the point motors and other appliances. This supply is entirely distinct from the 60-volt signalling main, and taken from batteries and motor-generator in the Baker Street and Moorgate sub-stations respectively. We are not able, at the present time, to give a detailed description of the arrangement of the locking frames, but we understand that some recent improvements are adopted whereby, when a complicated movement is to be made it is not necessary to pause between the pulling over of the various levers until the completion of the movement of the point or signal actuates the check-lock, although an equally efficient locking is secured. This will result in a considerable saving of time. The Aldgate frame will have 30 levers, but that at Praed Street will be of smaller size. All the stop signals will be provided with automatic train stops, similar to those used already by the Metropolitan Railway.

The existing hand-worked frames at such places as Edgeware Road and Farringdon Street, where there are junctions and sidings used for special purposes and not for the ordinary traffic, will be retained, and fully-qualified signalmen will be in attendance, although their duties will probably be combined with inspectors' work. Thus when special shunting, &c., is to be done, a signalman will enter the box, and will, by an appropriate arrangement, so to speak, isolate the section from the automatic system, and proceed to handle the movement in the ordinary way, restoring the automatic working when he has finished. Except on these occasions, the whole ordinary working between the Praed Street and Aldgate cabins will be fully automatic. The block sections will vary in length from about 750 to 1,000 feet. The work is being pushed forward with all speed, and the equipment of the Praed Street junction is already in an advanced state.

The system we have just outlined must not be confused with the automatic system which the company have been using now for some time between Praed Street and South Kensington. This latter is not a track-circuit system, but simply works by means of treadles and contacts controlling electrically-actuated signals. The arrangement is a good deal simpler and cheaper than track-circuit signalling, and has been found to answer admirably for this part of the line where there are nothing but electric passenger trains. It was not, however, considered to fulfil all the requirements of a line where there is also goods traffic, as in the possible event of a goods train parting into two the same security as given by the track-circuit is not afforded.

In conclusion, we wish to acknowledge the help given to us in the preparation of these notes by Mr. W. Willox, Engineer to the Metropolitan Railway, and Mr. H. G. Brown, of the McKenzie, Holland, and Westinghouse Power Signal Co., both of whom gave us information as to the system to be used.

HULL CORPORATION TELEPHONE ACCOUNTS

THE accounts of the Hull Corporation Telephone Department were briefly alluded to in our last issue, and we are now able to give some fuller information with regard to them. In his general report for year ending March 31st, 1908, Mr. T. Holme says:—

The gross receipts amount to £9.567, compared with £8,989 for 1907, being an increase of £578. The working and maintenance charges amount to £5,596, compared with £4,842 for 1907, being an increase of £754. The increase is chiefly accountable by two new items of Income Tax and advertising, and also a rise in the maintenance charges on the exchange, instrument and line plant. With regard to the exchange and instrument plant, the cost per station has now reached a normal figure, and no increase is expected in the future apart from the general increase due to additional subscribers. The maintenance of the line plant is regulated largely by the building alterations and other works in the City, and this year is estimated to be above the average. The total amount carried to loan repayment account is now £3,185, to reserve fund £1,652, and to temporary sinking fund, &c., £651, being a total (including this year's surplus of £1,055) of £6,525 after three years' working.

The capital account totals £54,747, compared with £52,864, being an increase of £1,883, which has been expended on extending the plant under the main headings of underground, overhead, exchange, and instrument construction.

Underground Construction.—The amount expended during the year has been incurred in laying 494 yards of conduits and extending the cable system by cables containing 151 miles 1,024 yards of metallic circuit. The total conduits laid now measure 34 miles 1,671 yards, and the underground mileage equals 3.578 miles 1,064 yards metallic circuits, or 7,157 miles of single wire.

Overhead Construction.—The amount expended during the year has been incurred in joining up additional subscribers and extending the overhead routes in the area by the erection of 91 poles, 54 being required in extending to Coniston and Skidby, where public telephone offices have been opened on extra mileage rental charges. The total overhead mileage is now 518 miles 1,223 yards of metallic circuit, or 1,037 miles of single wire.

Exchange Construction.—The amount expended during the year has been incurred in slight additions to the Central Exchange

Instrument Construction.—The expenditure during the year has been incurred in joining up additional telephones, also private branch exchanges, extension bells, and sundry apparatus.

Cost per Station.—The cost per station now stands at £22·56, compared with £24·04 last year, and this amount will further decrease as more of the spare cable and plant becomes occupied.

Revenue.—The amount carried forward for unexpired rentals equals £4,250, compared with £4,391 last year. At first sight it would appear that the revenue would decrease, but this difference is due to proportioning the whole of the Corporation telephone rentals to March 31st, and the revenue due for this year has already exceeded £10,000.

The capital expenditure on the system now stands at £54,747, made up as follows:—

	During the Year.	Total.
	£	£
Exchange buildings	—	1830
Exchange switchboards, fittings, &c.	83	4554
Underground construction	709	25718
Overhead construction	640	12155
Instruments	402	9094
Consulting engineer, commission ...	49	2255
Furniture	—	177
Preliminary expenses	—	964
Total	1883	54747

The expenditure out of revenue was as follows:—

	£	£
Maintenance and Repairs:		
Exchange repairs	236	
Line maintenance	653	
Instrument maintenance	512	
Roof repairs	28	
	——	1429
Establishment:		
Salaries	350	
Wages		
Office staff and canvassers	255	
Operators	1384	
Charges	284	
Printing and stationery	100	
Petty expenses	20	
...	——	2393
Royalties, Rents, and Rates:		
Royalty	966	
Rents, rates, and taxes	668	
Wayleaves	140	
	——	1774
		5596

The income statement is as follows:—

Exchange rentals	8792
Private line rentals	222
Public telephones	509
Tolls (toll services)	141
Trunk fees and telegrams	95
Terminal fees	1
Sundry sales	7
	9567

Digitized by Google

Of the balance of £3,971, £2,916 has to be allotted to capital charges, leaving a nett profit of £1,055. None of this has yet been allotted to a reserve fund or a depreciation fund, but a balance of £1,792 brought forward from previous years has been divided into £1,578, as the nucleus of a reserve fund, and £214 towards writing off the preliminary expenses. The reserve fund now stands at £1,633, £55 interest having accrued during the year. This is still but a small proportion of the total capital expenditure of £54,747, when it is remembered that the system is in competition with one of the National Telephone Co., and that its licence expires on December 31st, 1911. The mistake has been made in the case of more than one municipal telephone department that a substantial reserve or depreciation fund is not built up to meet the contingency of the licence not being renewed, necessitating a compulsory sale of the undertaking below its book value.

The total number of telephone stations is 2,445, the number of junctions 158, and the number of exchanges 8. The average number of calls received per day per subscriber is 9·79.

The increase in the number of telephone stations is 288, and, in calculating the following averages, we have taken the average between 2,445 and 2,157 as the average number of telephone stations during the year.

The exchange repairs have cost about 2s. per telephone station, as compared with 1s. last year; the line and instrument maintenance (including roof repairs) about 10s. 4d. per station as compared with 8s. 8d. last year; the total working expenditure, excluding Post Office royalties and capital charges, £2 per telephone station, compared with £1 19s. last year; and the total working expenses, including royalties, but not capital charges, £2 9s. per station, as against £2 8s. last year. Including capital charges, but not depreciation or the contribution to the sinking fund, the total costs have been £3 6s. per station, without royalties, or £3 14s. with royalties, as compared with £3 6s. and £3 15s. last year. As stated in Mr. Holme's report, the capital cost per station now stands at £22 7s., as compared with £24 last year.

THE OVERHEAD TROLLEY TRAMWAYS OF THE LONDON COUNTY COUNCIL

ALTHOUGH the extensive system of tramways of the London County Council is almost entirely on the underground conduit system, full details of the equipment of which have already appeared in ELECTRICAL ENGINEERING from time to time, there are two lines now working which have been equipped by the Council on the ordinary overhead trolley system, and a few notes on the principal features of their arrangement may be of interest. The first overhead L.C.C. tramway line to be opened was that between Beresford Square, Woolwich, and Wickham Lane, and the second was the new line from Hammersmith to Harlesden, which started running on May 30th, and passes the Franco-British Exhibition.

The overhead equipment of both of these lines is similar. A grooved trolley wire is employed of No. 4/0 size, with a simple form of mechanical ear, and this is arranged with a minimum clearance above the track of 21ft. at all points, except where the lines pass under bridges, where it is sometimes necessary to reduce the clearance to 17 ft. The wire is specified to have a breaking stress of 23·5 tons per square inch, and an elongation of 3 per cent. The construction is on the span wire principle throughout, with side poles. The medium-weight British standard pole is employed at all parts of the line, except at curves, where poles of the heavy type are used. The span wires themselves are of 7/12 stranded wire, and are carried on bobbin insulators at each end. Every pole is earthed to the rails by a 7/14 galvanised steel wire, or, in cases where a guard wire is attached to a pole, by a copper wire in accordance with the requirements of the Board of Trade. The overhead equipment of both lines was carried out by Messrs. Dick, Kerr & Co.

There are practically no special features in the Woolwich line. As already stated, it runs at present from Beresford Square, Woolwich, through Plumstead, to Wickham Lane, but the route will shortly be extended to Abbey Wood, a further distance of about one mile. The power supply to this line is taken from the Woolwich Borough Council, as it was not considered worth while to erect a special substation for the supply of so small a service from the London County Council's own generating station at Greenwich. The line is at present quite isolated from the main part of the L.C.C. tramway system.

The new Hammersmith-Harlesden line, which runs from Hammersmith Broadway to Harrow Road, Harlesden, is supplied from a small substation at Hammersmith, which is connected to the nearest substation at Wandsworth by two small feeder cables. The machinery in the substation consists of one 150 kw. motor-generator, and two 500 kw. motor-generators, all manufactured by the Electric Construction Co. The high and low tension main switchboards were supplied by Messrs. Johnson & Phillips, and the low-tension track board by Messrs. Spagnoletti & Co. The high-tension cables were made by Messrs. Siemens Brothers & Co., and the low-tension cables by the Western Electric Co. The general arrangement of the substation equipment closely resembles that of the Council's other tramway substations, except that the switchgear is somewhat simpler. One point of difference is that the brick partitions separating the high-tension cells actually form part of the outside wall of the building.

The trolley wires, span wires, poles, &c., are similar to those on the Woolwich line, but there are one or two special features necessitated by local conditions, as, for example, where bridges are encountered, under which the trolley wire is taken in the usual inverted trough construction. Special poles are also used in the Shepherd's Bush Road, with provision for carrying the arc lamps of the Hammersmith Borough Council.

An interesting feature of the line is the way in which the level crossings over the lines of the London United Tramways Co. are arranged at Goldhawk Road and Uxbridge Road. In both lines section insulators are placed in the trolley wire close to the nearest poles at each crossing, so that in each case a section of about 40 yards is isolated, these sections being connected to each other at the four points where they actually cross. The isolated double cross thus formed can be fed either from the Council's or the tramway company's system, and for this purpose two-way change-over switches are provided in special boxes in the bases of the poles. The wires from these switches feeding the section are run inside the poles. On each system jumper cables are used to run past the isolated section, and these are also carried down inside the poles. It is probable that the line will be continued from Hammersmith Broadway to Putney Bridge on the overhead system as soon as the necessary powers are obtained, instead of on the conduit system, for the construction of which the Council already hold powers. The cars in use are of the latest form of double-deck top canopy type, similar to those familiar on the conduit lines, except that they are fitted with the usual form of trolley instead of the plough collector. In conclusion, we should acknowledge our indebtedness to Mr. A. L. C. Fell, Chief Officer of Tramways to the London County Council, for information upon which these notes are based.

REVIEWS OF BOOKS

Modern Views of Electricity and Matter. By Sir Oliver Lodge, F.R.S. Third edition. 518 pp., 4¾ in. by 7¼ in.; 67 figures. (London: Macmillan & Co.) Price 6s.

THE title of this book, "Modern Views of Electricity," was an attractive one when the first edition was published in 1889, and three years later, when the second edition was called for, on account of the merits of the work, the title still held good, but for how long can this continue? It is true that this third edition has been revised, and more than one quarter of the book consists of additional lectures. The scientific reader will welcome these and all other writings by Sir Oliver Lodge on physical science. But the general reader of electrical literature, who, during the last five or six years, has been bewildered by modern views of electricity, is inclined to leave the subject alone until the half-baked hypotheses are offered to him in a digestible form. He may wonder whether this author was a prophet, that he has little or nothing to correct, and whether he deals with other people's modern views as plausible speculations or as serious theories. An hypothesis begins to lay claim to rank as a theory when inductions from dissimilar observations converge, and when results predicted on theoretical grounds are verified by experiment. It was a happy title, modern "views"—a non-committal expression. The electron theory (grudgingly as some people may concede the status) claims many converging "proofs," and its enthusiastic students hail a result as confirming a prediction if it comes within 3 or 4 in the powers of 10.

It is interesting to see how the author has stitched the admittedly new material into the old garment. It was not the worse for wear if there were a hole or two—call it a lacuna—a little editorial darning, or perhaps a patch "added 1906," or a chapter, "most recent views concerning the ether (1907)," brings it up to the fashion of the day—to be accurate, the preface is dated "April, 1907." To say that the old garment was not the worse for wear is perhaps an understatement, for there are many people who even to-day appreciate the mechanical models which illustrate so vividly the magnetic field, current conduction, and current induction. If the day should come when the electrical theories pictured by these models are as dead as the corpuscular theory of light, the student of "ancient views of electricity" will nowhere obtain a better idea of those old theories than by reading the first nine chapters of one of the first three editions of "Modern Views." These models are only analogies. They contain no new information, they do not contain complete information, but the value of such analogies is the presentation to the mind of an easily imaginable arrangement by which it is guided to conceive one which is less easily imaginable.

The exponents of the latest "views" of electrons are necessarily mathematicians, and some of them do not stop to imagine anything, though they will occasionally try to let outsiders know what they are doing. It is safe to say that eighteen out of twenty men having a general acquaintance with elementary science after reading these first nine chapters will succeed in grasping a large part of that which the author offers, but of twenty such men who heard the memorable lecture on "The Modern Theory of Electrical Conductivity of Metals," delivered before the Institution of Electrical Engineers in February, 1907, it is safe to say that eighteen came away bewildered and unconvinced, and perhaps those younger students suffered less disappointment than any other section of the audience, who gave the thing up as hopeless after the first quarter of an hour, and simply enjoyed the delivery and personality of the lecturer. That this was no fault of the exponent is clear to those who try to study the modern electron theory. The explanation seems to be that it is at present unfit for presentation to general readers, for even Sir Oliver Lodge, who has written elsewhere on electrons, does not attempt in the present volume to affect any reconciliation between two theories so deadly hostile. No intelligent man can set aside the electron theory as nothing but speculation, and most scientific men will agree with the author when he writes: "We in England have not been lacking in veneration for Clerk Maxwell, nor in admiration for Lord Rayleigh, but I think that we may say that we feel that the mantle of those extraordinarily brilliant predecessors has descended worthily on their successor, and that his researches . . . have brought lustre not only upon the Cavendish Laboratory but upon the general pursuit of physical science in these islands."

The preface to the first edition began with the words, "The doctrine expounded in this book is the etherial theory of electricity," but this is not reprinted in the present volume. The general reader of to-day wants to know if the ether theory of Maxwell is dead and shelved, and the electron theory is to be recognised as a substitute, or does the latter supplement the former? The preface to the third edition clearly states the author's present view that it is noteworthy that few actual corrections have had to be made showing that new discoveries are of a supplementary rather than of a revolutionary character. Supplementary, in fact, it is, so far as new pages are concerned, but the plain man wants to know if there is room in the universe for that which these admirable mechanical models illustrate, and for the "electrons, isolated charges . . . flying along without any body to them, disembodied electricity, the pure spirit of electric charge." When we have mastered the idea of "line of slip," the purely skin-deep current in a perfect conductor, the "spin" of magnetism, and thus are prepared for the Heaviside and Poynting distinction between the paths of flow of electricity and of electric energy, what "is the good of" electrons? The answer probably is that certain phenomena are more readily explained by the electron theory. Be it so; but how much is there so excellently explained in the first edition of "Modern Views" that nobody has yet attempted to explain by electrons? The electron is the creature of the mathematician. More hard thinking is needed before it is ready for the general reader. It is a step, but it seems to be a step sideways, not one in advance. "I am convinced," writes the author in the last page and a half of Chapter III., identical with that of the first edition, and worthy to be quoted in full if space permitted, "I am convinced that it is unwise to drift along among a host of complicated phenomena without guide other than that afforded by hard and rigid mathematical equations."

The word "electron" is not to be found in the index of the first edition, but a statement of the action between a magnet and an electric charge in relative motion, reprinted almost verbatim, and not containing the word, is indexed now under "electron." The nimble electron having flitted in, the infection of radium naturally follows, and, of course, α-, β-, and γ-rays. Helium and transmutation cannot be kept out, and the unhappy general reader who wants modern views of electricity, and would not mind ancient and modern views, is presented with perspective views of branches of physics and of chemistry not yet fit for the treatment which made the first edition so remarkable. New chapters on the ether, and on Hertz's experiments and their consequences, are more in keeping with the professed subject of the work, but the verbatim reports of lectures should have been re-written; the author's style is so vivid and attractive that it gains nothing from the use of the present tense and of

the first person singular. "By the kindness of Prof. Silvanus Thompson I have a few slides to show the principle of the invention." No doubt the audience at the Royal Institution enjoyed them, but since they are not reproduced they need not have been mentioned.

The Deinhardt-Schlomann Series of Technical Dictionaries in Six Languages. Vol. II. Electrical Engineering, including Telegraphy and Telephony. Edited by Charles Kinzbrunner. Pp. 2,100, 7 in. by 4 in.; about 4,000 illustrations. (London: Archibald Constable & Co.) Price 25s. net.

THE second of the series of Deinhardt-Schlomann of six-language technical dictionaries deals with words connected with electrical engineering, including telegraphy and telephony. This volume is edited by Mr. C. Kinzbrunner, and in general respects, except as regards its greater size and price, follows the lines of the first volume devoted to mechanical engineering published some little time ago. A subject matter arrangement of the contents is adopted, and each page is divided into a number of sections. In the left-hand column of each section are the German, English and French equivalents of the idea in question, while the corresponding Russian, Italian, and Spanish words or phrases are to be found in the right-hand column. The space between the two columns of text is devoted to suitable explanatory drawings or diagrams. The latter part of the volume contains alphabetical indices of the words. The first index gives the English, French, German, and Italian words all together in alphabetical order, but owing to the differences of alphabets the Russian words are contained in a separate index. Naturally, the index portion is of some length, occupying about one-third of the whole volume. An idea of the range dealt with is best obtained from the following list of the sections into which the classification divides the ideas dealt with:—Cells and batteries, boilers and prime-movers, electric machinery, switch apparatus, electric supply stations, mains, house installations, lighting, various applications of electricity, telegraphy, telephony, electrochemistry, electromedical apparatus, units of measure, electrophysics, and a miscellaneous appendix, each of these sections being divided into several subsections. Electric traction is not dealt with, as this part of the subject is to be included in a forthcoming volume on railway engineering. The choice of the illustrations is a little amusing at times, as, for example, the representation of a book to explain what is meant by a telegraph code and the miniature reproduction of a German telegraph form to illustrate the word telegram. On the other hand, the diagrams of the connections of the different wireless telegraph systems accompanying their names are distinctly suggestive, and the equations and chemical formulæ in the electrochemical section are certainly of use. Some of the pictures of apparatus are helpful, but it is hardly necessary to illustrate such homely articles as a jug for filling up accumulators with electrolyte. With regard to completeness, prolonged use can only suggest omissions, although we notice on p. 18 that the Osmium lamp is mentioned, but not the Osram. On the whole, however, the tendency is to over-completeness, as vast numbers of unnecessary expressions are included, the meaning of which is quite obvious from the separate words therein which one would naturally refer to first. Inaccuracies also can only be traced by a very detailed examination, but it hardly speaks well for the accuracy of the proof-reading to notice that in the very first name in the list of contributors and revisers the intials of a gentleman with whom we are acquainted are given incorrectly.

Whittaker's Arithmetic of Electrical Engineering for Technical Students and Engineers, containing 72 worked Examples and 300 Exercises. 159 pp. 7½ in. by 5 in. (London: Whittaker & Co.) 1s.

THIS little book deals exclusively with the simpler problems met with in continuous-current work, and will be found of use to beginners, as it contains, besides 72 worked examples, some 300 exercises with answers. Many sentences in the text are, however, very liable to mislead a beginner, and in some cases the statements are incorrect. For example, in the section on Electro-chemistry, the author states that "each atom of H requires 8 atoms of O for combination to form water." Again, in the same section, he speaks of "The amount of an ion liberated." In the chapter on Electromagnetism it is stated that "Currents of electricity radiate magnetic force," and when dealing with electromagnets the following statement is made:—The *energy* corresponding to a given magnetisation is proportional to the square of the flux-density, and, like the lifting power or tractive force of electromagnets, is given by

$$P = \frac{B^2 A}{8\pi} dynes.$$

The author's attempt to explain the laws of electromagnetic induction by considering the linkage between a conductor and the magnetic flux instead of the more usual coil and flux method appears rather confused. In the last pages of the book the very serious mistake is made of denoting the output of a dynamo as so many *units*, meaning so many kilowatts. These and other similar cases of looseness of expression considerably take away from the value of the book.

LONDON ELECTRIC POWER BILLS

OUR report last week ended with the proceedings of Tuesday, June 2nd, when the case for the eight electric lighting companies against the Bill was being heard.

WEDNESDAY, JUNE 3RD.—(NINETEENTH DAY.)

Mr. CONACHER'S evidence in chief was continued. He referred to the efforts of the London companies to do away, as far as possible, with small local generating stations, and as an instance referred specifically to the action of the Metropolitan Electric Supply Co. in erecting their Willesden station, in consequence of which five local stations were discontinued, and only that in Paddington was retained as a stand-by. As showing the possible dangers arising from the concentration of large supplies in one central generating station, and the need for duplicate mains, he mentioned that on one occasion a bargee had driven his spike accidentally into one of the duplicate mains which the Metropolitan Company had laid along the banks of the Regent's Canal from the Willesden power station, and but for the existence of the duplicate mains the supply to the district served by the company would have been seriously interfered with. Mr. Conacher next dealt at some length with the comparative failure of the bulk supply companies in Great Britain, and especially those without distributing powers, special reference being made to the South Wales Electrical Power Distribution Co. Coming to the effect of the passing of a bulk supply Bill in London upon the financial position of the existing companies, witness expressed the opinion that the existence of such a company, with its possible competition hanging over the heads of the existing authorities, would seriously prejudice the raising of further capital. Even now, the £5 shares of the Metropolitan Company, which had stood at 10, were at 4¾.

Lord WELBY reminded the witness that recently there had been such a serious decline in the price of all stocks, that great caution must be taken before coming to any conclusion as to the cause of this.

Mr. CONACHER agreed, but still thought the uncertainty created by the promotion of these power Bills for London was a contributory cause.

In cross-examination, Mr. Conacher agreed that the Paddington power station was bound to be kept working under an agreement with the Borough Council.

Mr. FITZGERALD: And but for that, you would not keep it there as a stand-by?

Mr. CONACHER: I cannot say that, but the station is there now.

Questioned as to the possible effect of competition, Mr. Conacher agreed that in spite of competition the dividends of the company had increased, but he wished to draw attention to the fact that the force of the competition depended upon the equality of conditions. The competition of the proposed bulk company would not be upon the same terms as those now imposed upon the existing companies, and furthermore, when Parliament had sanctioned competition between distributing companies in London, the terms had always been less favourable to the new comer.

Mr. FITZGERALD then questioned Mr. Conacher as to one or two matters connected with the working of the Willesden station in order to test Mr. Conacher's general statement that the Metropolitan Company could supply as cheaply as the promoters. Witness said the capital cost per kilowatt was about £40, but this included much land, buildings, &c., capable of dealing with a much greater capacity. Asked as to the lbs. of coal per unit and the total costs, Mr. Conacher said he had not these figures, and he was not sure that the engineer to the company, who had the figures, would give evidence.

Mr. FITZGERALD protested against this, and urged that he was entitled to this information.

Digitized by Google

Mr. C. A. CRIPPS, K.C., said that Mr. Sparks, an engineer, was to be called.

Mr. FITZGERALD again complained on the ground that Mr. Sparks was not the engineer to the Metropolitan Company.

The CHAIRMAN said that the Committee could not take it from Mr. Conacher that the Metropolitan Company could supply as cheaply as the power company, unless he could substantiate the statement.

Lord SAUNDERSON said that in the Board of Trade returns, the charge for power by the Metropolitan Company was 1·96d. Witness would not suggest that the company overcharged, and therefore the costs must be in the neighbourhood of 1d. per unit, as suggested by Mr. Fitzgerald.

Mr. CONACHER replied that this was an average charge, and many of the consumers were supplied at less than the average price in the Board of Trade returns.

The CHAIRMAN thought that the discussion upon the details need not be continued. If Mr. Conacher could not give details such as were reasonable to substantiate his statement, the Committee must wait for further evidence before accepting his statement.

Mr. FITZGERALD then read a long list of the places in the western area of the Metropolitan Company, in which a bulk supply may be given, but he said only Acton was being supplied. Mr. Conacher said he believed the price to Acton averaged 1·5d. per unit.

With regard to the Marylebone undertaking, Mr. Conacher could not remember what terms were offered for a bulk supply.

Mr. FITZGERALD pressed the question on the ground that Mr. Conacher must know this. Receiving no satisfactory answer, Mr. Fitzgerald said that he had extracted the figure from Mr. Conacher with some difficulty on another occasion, and the price offered averaged 1·7d. per unit. With such prices as these for a bulk supply, he was not surprised that the Metropolitan Company had not secured many bulk supply customers.

The cross-examination of Mr. Conacher was next directed to the other London companies, some particulars of which had been given in tables handed in to the Committee; but witness replied in almost every case that he had no knowledge of the particular circumstances of these, answers which called forth another complaint from Mr. Fitzgerald.

Mr. FITZGERALD then came to the purchase clause, which was included in the unfair conditions under which Mr. Conacher said there would be competition. Mr. C. A. Cripps, K.C., for the London companies, objected to the questions on the ground that this would all come up again on their Bill. Mr. Fitzgerald persisted, however, and the Chairman allowed the questions to be put.

Mr. CONACHER admitted that the purchase clause in the companies' Bill was substantially the same in principle as that in the present Bill, viz., that the new capital was to be redeemed by the purchasing authority, but there was an automatic provision for wiping out the capital at the end of 42 years.

Mr. FITZGERALD pointed out that this sinking fund would only be created after the payment of interest, when the sinking fund came in as surplus profits.

The CHAIRMAN having intimated that he thought Mr. Fitzgerald was going rather far, and in view of the later opportunity which he will have on the companies' Bill, this point was then left.

Mr. FITZGERALD concluded his cross-examination by a reference to the speech of Mr. Fladgate, the Chairman of the Charing Cross Company, who, he said, had obtained the sanction of his shareholders to the promotion of the companies' Bill, by telling them that there was no intention of spending the one million of money authorised by the Bill. Mr. Conacher said he had no opinion to offer on this.

In re-examination, Mr. Conacher said his main point on the question of bulk supply was that where this had been separated from the distribution business, the result has been a failure.

Answering Lord Welby, witness said that the sinking fund in the companies' proposed purchase clause came after the interest on the new capital, but not after the payment of dividends on the ordinary capital of the individual companies.

Mr. H. B. RENWICK, Secretary and General Manager of the County of London Electric Supply Co., gave evidence as to the amount of power in London. He said the figures put forward by Mr. Merz had always been regarded as over-estimated by the London companies, the figures being 456,415 h.p. in the "industrial" area and over 500,000 h.p. in the whole area of the Bill, whilst it was said that only about 7 per cent. was driven electrically. The committee of the chief officials of the London Electric Supply Companies had appointed a sub-committee to go into this matter, and it was decided that a systematic and careful canvass should be made in the whole of the areas of the 13 London companies. The result of this canvass, which lasted from July, 1906, until the spring of 1907, was that in the area of the companies there were 47,299 h.p. of electric motors, and 55,591 h.p. of other forms of power, making a total of 120,890 h.p. In making these calculations, it was thought that the local authorities should be approached, and a further canvass of the local authorities' areas showed that there were 26,591 h.p. of electric motors, and 79,325 h.p. of other forms of power, a total of 105,916 h.p. The total in London, therefore, was only about 208,000 h.p., and the existing supply authorities were supplying 35·38 per cent. These figures related to 1906, and as an indication of the progress made since, he mentioned that during the past year the County of London Co. had increased its motor load by between 4,000 and 5,000 h.p.

A question by the Chairman elicited the information that the figures given related only to the County of London, and not to the whole area covered by the Bill, whereas the evidence of the promoters that there were between 300,000 and 400,000 h.p. related to the whole area of the Bill.

In the course of his further evidence, Mr. Renwick dealt with the difficulty of getting power users, and mentioned a case in which the County of London Co. quoted 0·45d. per unit for power to a paper mill in Wandsworth, and then did not get the business. He thought there had been a good deal of misapprehension as to the amount of canvassing and "pushing" that had been carried on by the existing authorities, for no less than £69,656 had been spent in this way by the County Company practically since 1900. In one case they had purchased a private installation for £4,000 in order to get the consumer on to their mains; they put in electric motors free on trial, without charging for current, and they hired out motors when consumers decided to retain electric driving after a trial. In fact, in one case they gave a consumer a motor absolutely free. The general effect of the promotion of these Powers Bills was that possible consumers were inclined not to go in for electric driving, in the hope that they would be able to obtain their power at ¾d. or ½d. per unit later on.

Mr. TALBOT cross-examined to the effect that, having heard the companies had carried out a canvas of power users, they had tested it by communicating with a large number of power users, and had received many replies that no canvass had been made of their particular firms. Mr. Renwick said that, in a large number of cases, the electric supply authorities had records of many power users, and these were not personally canvassed.

Mr. E. W. SEALE, secretary of the Charing Cross, West End and City Electricity Supply Co., said he adopted much of Mr. Renwick's evidence as to the efforts of the London companies to secure business. The total amount of power installed in his company's area was 11,488 h.p., and of this the Charing Cross Co. supplied 38 per cent. With regard to efforts made to induce the local authorities along the line of route of the mains from their Bow station to take a bulk supply, he mentioned that West Ham had been offered a supply at £4 per kw. per annum and 0·5d. per unit; Poplar, £4 and 0·33d.; Stepney, £3 and 0·4d.; and Bethnal Green, £4 and 0·5d., and subsequently a flat rate of one penny per unit. But none of the offers were accepted. As to the effect upon the present companies and the continual promotion of bulk supply Bills, he said he had got out figures which showed that since Mr. Merz introduced his first Bill in 1905, the depreciation in the value of the companies' securities amounted to no less than £186,000. This, he thought, indicated entirely that the Stock Exchange did not regard these Bills as in any way supplementary to the existing supplies, but as confiscatory measures. The Power Bills forced the companies to keep reducing their prices, which lessened the dividends, and thereby the market value was reduced.

THURSDAY, JUNE 4TH.—(TWENTIETH DAY.)

Mr. WILLIAM FORBES, General Manager of the London, Brighton and South Coast Railway Company, gave evidence as to the contract which has been entered into with the London Electric Supply Corporation for the supply of energy in connection with the electrification of the London Bridge—Victoria line, a distance of 8 miles 51 chains. The Electric Supply Company had been put under very severe penalties, and he was satisfied on the score of continuity of supply. Personally, he thought that an extension of the application of electricity to their lines would be necessary very shortly, at any rate to the extent of 40 miles.

Cross-examination by Mr. Fitzgerald gained the information that the agreement with the London Electric Supply Corporation was for seven years, and there were heavy penalties for failure of supply, running up to £150 per day. The agreement also provided for duplicate mains. At the end of seven years, the London Electric Co. were to have first option of a renewal. At first witness said he preferred not to mention the price, but subsequently said that for the first supply, which would be on a low load factor, the price varied from 1d. per unit to ¾d. per unit, but there was a guarantee that when the load factor reached 35 per cent., the price would be ½d. per unit. Mr. Fitzgerald drew attention to the fact that under the Bill the supply of transformed alternating current, which was the supply to be taken by the London, Brighton, and South Coast Railway, at a 35 per cent. load factor, would be ·474d. per unit, but Mr. Forbes replied that he had not observed this.

MR. E. W. SEALE, Secretary to the Charing Cross Company, continuing his evidence, referred to Clause 73, which gives the power company authority to acquire undertakings, and sug-

Digitized by Google

gested that if by the operations of the power company the market value of the existing companies was depreciated, these could be very easily acquired, and thus a dangerous monopoly would be set up. In a general reference to the effect of metallic filament lamps upon the electric supply industry, Mr. Seale said that since the introduction of these lamps the income of the Charing Cross Company had decreased by £2,000 per annum in consequence.

In cross-examination, Mr. Fitzgerald suggested that the fact that the company's dividend had fallen from 8 per cent. in 1906 to 5 per cent. in 1907, was the cause of the depreciation of the market value of the shares. Further, the evidence put before Parliament on behalf of power bills had shown that the prices being charged were too high, and consequently reduced prices had entailed reduced dividends. Mr. Seale replied that it was the possible competition from a bulk company under unfair conditions that had been mainly responsible for the fall in market value. Mr. Fitzgerald next pointed out that the Charing Cross Company's business had been built up on competition, and in fact the company had invaded the City of London, where there was already another company, on the ground that they could suppiy cheaper, and Mr. Seale's answer was that this competition was an altogether different thing to that proposed under this Bill.

In answer to other questions, Mr. Seale admitted that the terms quoted by the Charing Cross Company in 1905 for bulk supply to the West Ham Corporation was 2d. per unit, on an agreement for 42 years. With regard to the suggestion that the power company could acquire all the electrical undertakings in London, Mr. Fitzgerald pointed out that when the Administrative Bill was under consideration, Mr. Seale made the same suggestion, but Lord Camperdown had stopped cross-examination on the ground that the Committee would take the suggestion for what it was worth. Mr. Seale's reply to this was that when the Bill was before the House of Commons provision of the kind asked by him was made.

Mr. Fitzgerald's comment on this part of Mr. Seale's evidence was that he was glad to have such an estimate of the financial standing of the promoters that they could not only raise the £6,000,000 for the power company's business, but a further £10,000,000 for buying up existing companies.

Lord LYTTON suggested that if the offer to West Ham was for 42 years with a specified price, the local authority would not have the advantage of subsequent reduction in cost of generation.

Mr. Seale agreed that it would not have been a good bargain for West Ham in the light of subsequent events, but there was a clause in the agreement providing for a revision of prices at certain periods.

Mr. A. F. HARRISON, Secretary to the City of London Electric Lighting Company, who gave evidence in the absence of Mr. J. Cecil Bull, one of the managing directors, said that the output for power supply was 27 per cent. of the total. There were four power users whose maximum demand was over 250 kw., and the revenue from those consumers was £11,879. During 1907 the revenue from street lighting and public buildings was £14,990, and for railway purposes, mainly lighting, £2,427. All of this revenue the power company could compete for; it was equal to 4 per cent. on the ordinary capital, and as the dividend last year was 6 per cent., assuming the power company secured this business, the dividend would be reduced to 2 per cent. A recent investigation showed that the City Co. was supplying 84 per cent. of the total amount of power in the company's area, their total number of power consumers being 1,048.

Mr. HARRISON produced a map showing the very complete way in which the power field in the City of London is being catered for, and Mr. Fitzgerald, for the promoters, commented that this was rather inconsistent with the argument of Sir Ralph Littler, who stated that there was no power demand in the City at all.

Mr. FITZGERALD then put some questions on the general working of the City Co.'s undertaking, all of which witness said were engineering questions, and that he could not answer them. At the same time, he was not aware that the engineer to the City Co. was to be called to give evidence.

Mr. C. P. SPARKS, Engineer and Manager of the County of London Electric Supply Co., criticised the promoters' tables of the advantage to the existing authorities by taking a bulk supply, and handed in tables which showed there would be a substantial loss instead of a profit, a result brought about by the fact that the promoters had insufficient knowledge of what the companies had been doing during the past few years. The promoters had estimated that the cost of generating additional units over the present output in the future would be 0·5d. per unit, whereas in the case of his own company he estimated it at 0·36d. per unit. In fact, since 1905, the London companies had generated an additional 22,000,000 units at an extra works cost of 0·18d. per unit; and this took no account of any possible saving which would be effected under the linking up scheme under the companies' Bill. As to the diversity factor assumed by the promoters, viz., 1·5d., he regarded this as quite wrong, having in view the proportion of the load which was to go to the authorised distributor, and the experience of the companies, after having examined the records of the authorised distributors, was that the diversity factor which ought to be taken was, if anything, below 1·1; he would prefer to put it at 1·05. The effect of this would be that the capital of the new company would have to be increased before any supply to railways and power users could be given, for, upon the revised diversity factor, the plant proposed would only be sufficient for the supply to the authorised distributors.

The CHAIRMAN asked Mr. Sparks if he agreed there was no common standard for calculating diversity factor.

Mr. SPARKS said "Yes"; but he had had much more experience of electric supply in London than either Mr. Hammond or Mr. Parshall, and therefore his opinion, which was based upon that experience, must be more valuable.

The CHAIRMAN said that as there was no common standard for calculating diversity factor it was not surprising that different results were obtained, and he thought they might leave the question open.

Mr. Sparks' cross-examination was largely taken up with a discussion of the basis upon which his tables had been calculated, a particular item in dispute being the generation expenses of the Charing Cross Co. It appeared that although a certain sum for these had been certified in the accounts, and had been taken by the promoters as applying solely to generation, they represented the cost of the energy delivered at the sub-stations; Mr. Sparks had consequently deducted a proportion, and so considerably altered the result arrived at by the promoters. All through, the Committee has expressed itself more or less uninterested in the effect upon the authorised distributors of taking a supply in bulk, for the reason that they are not bound to take it, and therefore, after allowing the cross-examination to continue for some time, the Chairman intimated that they had heard sufficient examination and cross-examination, and said the Committee would be glad if Mr. Balfour Browne would commence his speech.

Mr. BALFOUR BROWNE, K.C., addressing the Committee on behalf of the eight companies, said that no evidence had been produced that electricity in London was so expensive as to limit its use. The existing companies had invested no less than £13,482,000 in the enterprise which, although originally confined to lighting only, was now distributed over lighting and power, and, in fact, power was becoming a very important part of their business, and they had succeeded as well as anybody could have expected in London. Where the field was left for the new company he did not know, in view of the evidence which had been given of the large proportion, in various districts, of the power which was supplied electrically. There had been a popular superstition since Mr. Merz introduced his Bill in 1905 that London was badly catered for in the matter of electric power supply. Mr. Merz's statement that only 5 per cent. of the total power installed in the area of the Bill was supplied electrically, and only about 4 per cent. in the industrial area, had been accepted all round, and it had even penetrated to the House of Lords, for Lord Onslow, in moving in the House this session that the London Power Bills should be referred to a Joint Committee of Parliament, had stated that it was a scandal that power users in London had not the advantage of a cheap power supply, and in the House of Commons Mr. Lloyd George, when opposing the motion of the House of Lords that the Bill should go to a Joint Committee, also stated that it was a scandal that cheap supply was not available, and that something should be done immediately to remedy the defect. But in spite of this, not one witness had been called by the promoters to say that they required a supply of electricity upon reasonable terms and could not get it. On the contrary, the evidence had shown that no less than 35·38 per cent. of the total power in the area was supplied electrically by the companies and local authorities combined, whilst in various areas the proportion was considerably greater; for instance, it was 84 per cent. in the City. He contended: (1) that to introduce a new power company into London would be a breach of a Parliamentary bargain; (2) the proposed scheme was one which would largely go far to take away the best consumers of the existing distributors; (3) it was competitive in a further sense that it covered practically all the ground that was proposed to be covered by the companies under their Bill. In view of the evidence that had been given, especially that of Mr. Falconar, he doubted whether the company could ever be a success, and if this was so, no interest would be paid except that out of capital, and this would have to be repaid by the purchasing authority at the end of the term. The problem of the supply of electricity in London, instead of being solved by the Bill, would be shelved for years, and the opportunity of doing what the companies proposed in their bill, namely, to link up the larger generating stations, and to use the smaller ones as peak stations, would be frustrated. In this matter he disagreed with the promoters that the Bills were not competitive. If both Bills were passed and both sets of promoters went into the money market for money, it would be exceedingly difficult for either of them to succeed. At the same time, he did not say it would be impossible for the companies to raise the £1,000,000 proposed by their Bill, because it was to be 4 per cent. guaranteed stock; it might cost a little more to raise it, and this would reflect upon the consumer; at the same time, he did not believe the new company would get their money at all. The position the existing companies took up was that they were creatures of Parliament under serious restrictions, which had to a certain extent crippled their in-

Digitized by Google

dustry very seriously, and, being creatures of Parliament, they claimed the protection of Parliament, unless there was some overwhelming advantage to the public that the concessions granted should be revoked. They were quite prepared for competition with the existing companies, because the conditions were the same. At present they could not even supply one another in case of emergency, but the promoters of this Bill gave themselves the utmost freedom: freedom which the companies sought to have conferred upon them by their own Bill. The general feeling of Parliament on the question of competition between companies dealing with a commodity such as electricity, gas, or water, was that there should be no competition on account of the unnecessary duplication of capital, and, generally, the opinion was held that where combination was possible, competition was impossible. As an instance, he mentioned the division of London into districts in respect of water and gas. He urged that if there was to be competition it should be upon fair terms. It was quite clear from Major Marindin's report that the Board of Trade did not contemplate competition, except between holders of Provisional Orders.

The CHAIRMAN: Do you ask us to go to Major Marindin's report or elsewhere for an interpretation of the legislature?

Mr. BALFOUR BROWNE: No; I ask you to make up your minds solely from the wording of the Act.

Continuing, he said the Act of 1888 quite clearly contemplated that competition should only be between the holders of Provisional Orders, and the practice had been that when an Order was passed in London it had to expire in 1951, *i.e.*, at the same time when the original Orders expired, and thus it had a shorter life. It would be a serious thing for finance generally if it came to be understood that Parliament, having granted concessions, altered the terms indirectly by sanctioning competition under an Act of Parliament such as this. The average dividends of all the electric lighting companies in London since the commencement was only £3 18s. 2d. per cent., and they had, in addition, to provide sinking fund to pay off the capital by the end of their term of 42 years. Dealing with the prospects of the London and District Power Co., he pointed out that Mr. Hammond, on behalf of the Bill, had stated that they must have the authorised distributors, but it would be the height of folly for the authorised distributors, knowing that the London and District Co. would never get on its feet unless they took power from it, to enter into agreements with it, for by so doing they would be placing the power company in a position to compete with them for the other class of business, namely, large power users, &c. In fact, the whole evidence showed the determination of the authorised distributors not to take a supply from the power company. Another point against the passing of the Bill was in respect to competition between power companies; if the promoters' principle were carried out, their Bill should not have been introduced. The promoters' witnesses had stated that there should not be competition between power companies, but he claimed that the existing companies were power companies, in addition to which the North Metropolitan had extensive bulk powers, whilst the Metropolitan and Charing Cross Companies also had bulk powers, and the County of London Co. had power to supply railways for traction purposes. A good deal of evidence had also been brought to show that bulk supply to local authorities without powers for distribution had in no case been successful. The North Metropolitan had distributing powers, the Newcastle Co. also had distributing powers, whilst the Yorkshire Power Co., the Chairman and Engineer of which the promoters had called, were acquiring a large number of Provisional Orders. With regard to the clause in the Bill which authorised the acquisition of undertakings, Mr. Balfour Browne said this was a very dangerous power, and mentioned that if by any means the power company could buy up, say, the London Electric Supply Corporation, they would then be in a position to compete with nine companies and three local authorities. Coming to the finance of the Bill, he regarded this as of the shadiest character, and was nothing more than mere suggestions. The evidence of Sir Hugh Bell did not bind him to find a penny and constituted no guarantee whatever. Mr. Owen Hugh Smith likewise did no more than say that he would be prepared to endeavour to find a certain amount of capital, whilst the letter of Lord Fitzwilliam to the Chairman, which, if he might say so, was a little irregular, was of the same character.

The CHAIRMAN pointed out that the attitude of the London County Council on the question of finance was that the promises of the promoters with regard to the first £600,000 were sufficient for them if a provision was put into the Bill that this sum was provided in twelve months.

Mr. BALFOUR BROWNE replied that the London County Council was in a most awkward position in this matter of electric supply in London, for having violently opposed the Bill of Mr. Merz, they themselves promoted one, somewhat audaciously, on the same lines, so that anything the County Council said on the matter was of the utmost indifference.

Mr. CLEASE, on behalf of the London County Council, stated that the position of the Council was that it was extremely anxious that the Committee should be fully satisfied, not only as to the amount which the promoters would guarantee, but that the whole capital would be raised.

The CHAIRMAN said that quite naturally the County Council wished to throw upon the Committee the responsibility of seeing that the money was found.

Mr. BALFOUR BROWNE then continued his criticisms of the finance of the Bill.

The CHAIRMAN interrupted with the remark that he thought at any rate £500,000 was tolerably assured.

Mr. BALFOUR BROWNE, with respect, differed, and said that Sir Hugh Bell was not pledged to one penny.

The CHAIRMAN: I do not think we need labour this matter.

Mr. BALFOUR BROWNE, in some further criticisms of the Bill, said that seven-tenths of the power business was already supplied by the existing authorities, and the remaining three-tenths was of such a class that it might never come on to the mains at all. With regard to the purchase clause, he would rather leave his comments on this until the clause stage was reached, if it was reached. As to the modified Kitson clause, he agreed that this was a better clause for the power company than the original Kitson clause, and would enable them to compete more effectively with the existing authorities. He did not think the promoters of the companies' Bill wanted the Kitson clause or the modified clause proposed in the present Bill, because it would not fit in with the scheme of their Bill.

The Committee then adjourned until June 16th, when Mr. Balfour Browne will open the London Electric Supply Bill. Mr. Fitzgerald's reply to the case against the London and District Electric Supply Bill will be embodied in his speech in opposition to the existing companies' Bill.

At the conclusion of the sitting the Chairman threw out a hint that it would be a desirable thing if the promoters and the London County Council could renew their negotiations with regard to the purchase clause. He said he supposed it was too much to hope for that the rival promoters could come to some agreement.

Power Supply in the South of France.—The following notes relating to the "Sud Electrique" power distribution system are taken from a description which was recently published in the *Bulletin de la Société Internationale des Electriciens*. The system includes the towns of Nimes, Avignon, Sommières, Bollène, Montpellier, Marsillargues, and other smaller towns. The main stations are situated at Sommières, Saint Victor, and Bollène. The first-named station receives three-phase current at 30,000 volts from the 28-mile distant Madières waterpower station of the Soc. de forces motrices de la Vis, which is situated in the Cevennes. The second station receives three-phase current at 50,000 volts from the 62 mile distant water-power station Brillanne-Villeneuve in the Alps, but has a steam reserve of four 1,000 kw. Curtis turbo-generator sets. Besides this reserve there are smaller steam stations on the system with a total capacity of 6,000 h.p. The main distribution pressure is 13,500 volts, and the power is distributed locally at 120 volts for lighting, and 500 volts for power. On the high-tension lines iron poles, between 30 and 40 feet long, are used.

Rome Electric Power Supply.—According to the *Times Engineering Supplement* a comprehensive scheme for the supply of power to the city of Rome, which has been worked out by Mr. Giorgi, Engineer to the city, has been approved of by the authorities, and is already being partly carried into effect. The scheme consists in building a 30,000 kw. steam generating station in Rome, and water-power stations at Aniene and Nera of 5,000 kw. and 7,000 kw. capacity respectively. For the present a steam station of 10,000 kw. in Rome, and the water power station at Aniene of 5,000 kw., are to be taken in hand. The Nera station and the extension to the steam station will be considered when the extension of the city renders it necessary. The steam plant is to consist of eight boilers and four three-phase turbo-generators with a capacity of 2,500 kw. each. The works at Aniene will include a canal some eight miles long, carrying 460 to 530 cubic feet of water per second, and giving a fall of about 200 feet. The power station will contain four 2,600 h.p. turbines, coupled to 1,800 kw. three-phase alternators generating at 6,500 volts, 50 cycles. The pressure will be raised to 30,000 volts for transmission by four 2,200 k.v.a. oil insulated, water-cooled transformers. The length of the transmission line from the power station to the sub-station in Rome will be 23·5 miles. This will consist of two three-phase circuits, each capable of transmitting the whole of the power if necessary. Rigid iron poles will be used in the mountainous sections, and elastic poles on the "Semenza" system on the plains. At the sub-station, four 2,100 k.v.a. oil-insulated, water-cooled transformers will reduce the pressure from 30,000 volts to the distributing pressure of 6,000 volts. The main distributing system will consist of eight cables, the total length of which will be 56·5 miles. The secondary distributing system will extend over practically the whole area of the town. The total cost of the plant and distributing system has been estimated at £742,400, of which £150,400 is allocated for the hydraulic works and central water-power station on the Aniene, £28,800 for the transmitting line, £140,400 for the central steam generating power station, and £258,800 for the main and secondary distributing system in town. For the further extension, which is contemplated, of the steam central station (to give an additional 20,000 kw.) there are to be installed four turbo-generating sets, each of 5,000 kw. capacity.

ELECTRIC TRACTION ON THE MIDLAND RAILWAY

Single-phase Equipment of the Heysham, Morecambe, and Lancaster Lines

THE electrical equipment of the Heysham, Morecambe, and Lancaster lines of the Midland Railway, parts of which were opened for traffic under electric traction on April 13th last, is of particular interest as presenting the first example of the single-phase system of main-line electric traction to be put to work in this country. We are now enabled, through the courtesy of the officials of the Midland Railway, and of the manufacturers of the electrical equipment, to give full details of the equipment, which will be seen to embody distinctive features of its own, as well as a combination of some of the leading points of Continental and American designs.

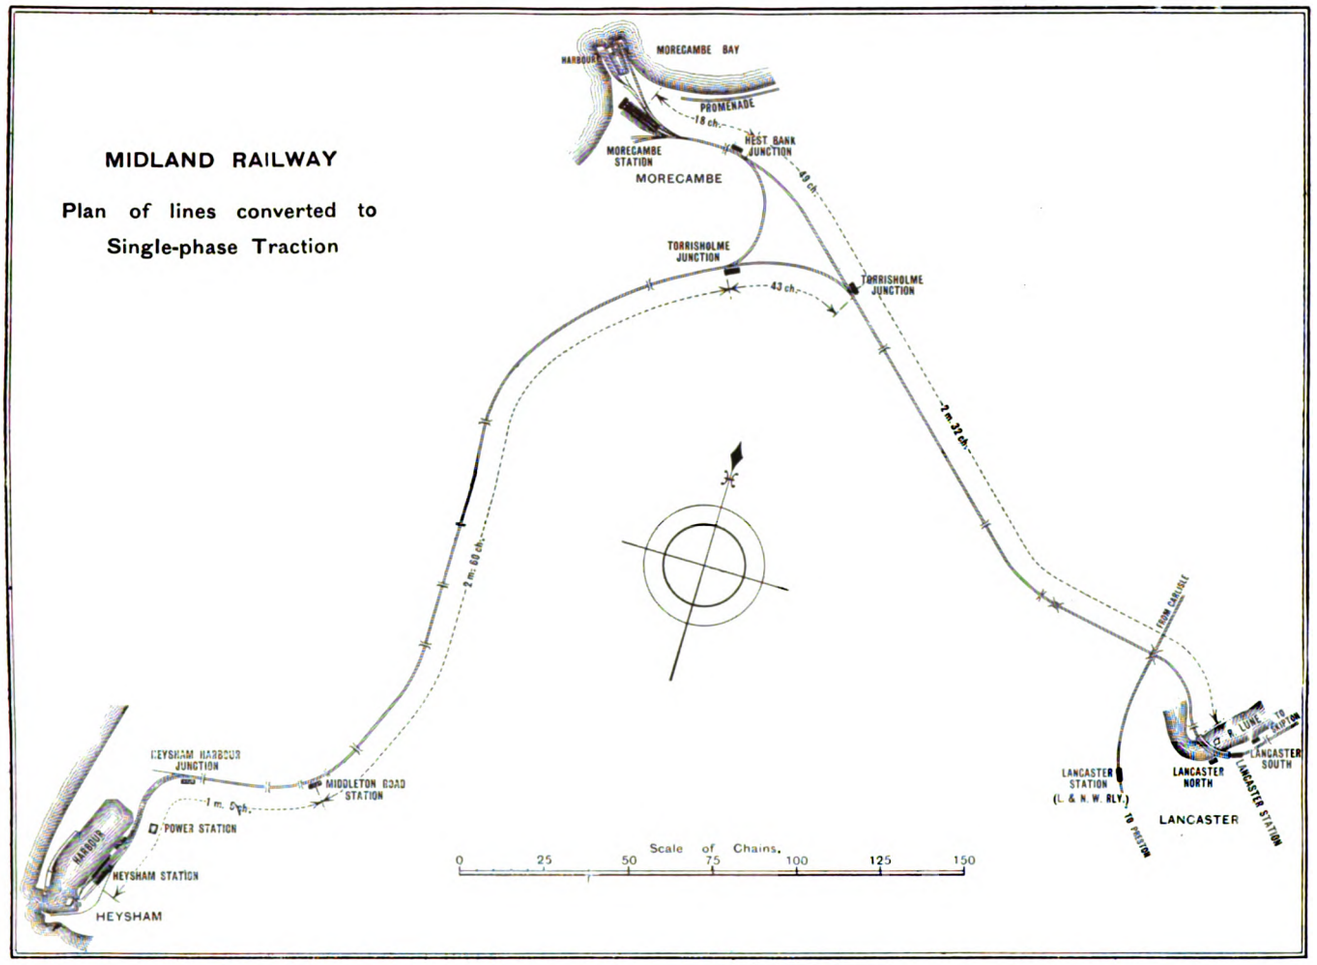

FIG. 1.—SKETCH PLAN OF HEYSHAM-MORECAMBE-LANCASTER LINES.

A map of the route is shown in Fig. 1. The distance from Heysham to Morecambe is five miles, and from Morecambe to Lancaster four miles. There will be practically no direct running from Heysham to Lancaster. There is also a short extension of about three-quarters of a mile from Lancaster Green Ayre to Lancaster Castle. The distances, except the last-mentioned one, have all been increased by about a quarter of a mile since the scheme was decided upon, by the alteration in position of the new station at Morecambe as compared with the old. The services for which the trains are contemplated to be capable is a 20 minutes' continuous service between Heysham and Morecambe and a 15 minutes' service between Morecambe and Lancaster, using a single train in each case. The trains will, however, not be worked up to anything like this service throughout the day.

There are no gradients of any importance on any section of the line, except between the two Lancaster stations. There are, however, a number of speed restrictions near each of the three terminals of the line.

The rolling stock consists of three trains, there being three motor-cars, two with equipments by Siemens Brothers, and one equipped by the Westinghouse Co. One of the Siemens trains is shown in Fig. 2. It may be mentioned here that the determining cause of the order being thus divided was purely that Messrs. Siemens were supplying all-electric control, which was preferred by the Railway Co., whereas the Westinghouse Co. preferred to adhere to their electro-pneumatic control apparatus, otherwise the proposals were equally acceptable. In addition to the motor-cars, four trailer cars have been specially built, while one or more old bogie coaches will be utilised for carrying workmen, luggage, &c., particularly between Morecambe and Heysham. Each end of the trailers and of the motor-cars is equipped with driving apparatus, this being necessary, as the trains will vary considerably in length owing to the traffic being very variable from season to season, and also as the coaches are liable to reversal in the way they head, owing to the triangular junction, near one apex of which Morecambe station lies.

Before proceeding to a detailed description of the

Digitized by Google

overhead equipment and rolling stock, we propose to give a few particulars of the power supply to the line.

The line is supplied from the existing power station, situated at the Heysham end of the line, which has had added to it the necessary additional machinery to increase its capacity, and to enable it to supply single-phase current, as its original equipment was all for direct current. The transmission system is simplicity

FIG. 2.—THREE-CAR TRAIN WITH SIEMENS EQUIPMENT.

itself, as there are no feeders other than the two contact wires. The existing power station was originally provided for working the cranes, capstans, lifts, and other machinery, together with lighting, of the harbour at Heysham.

This station is gas-driven and works from "Mond" producers, supplied by the Power Gas Corporation. There are two producers of about 750 to 1,000 h.p. capacity each, with the accessory blowing, steam producing, cooling, and cleaning apparatus. The engine-room (a general view of which is given in Fig. 3) contained three 250 h.p. three-cylinder British Westinghouse Co.'s engines, each driving a 150 kw. direct-current, 460-volt generator. There was also installed a battery having a capacity of 100 kw. for five hours, with the usual corresponding rates for shorter and

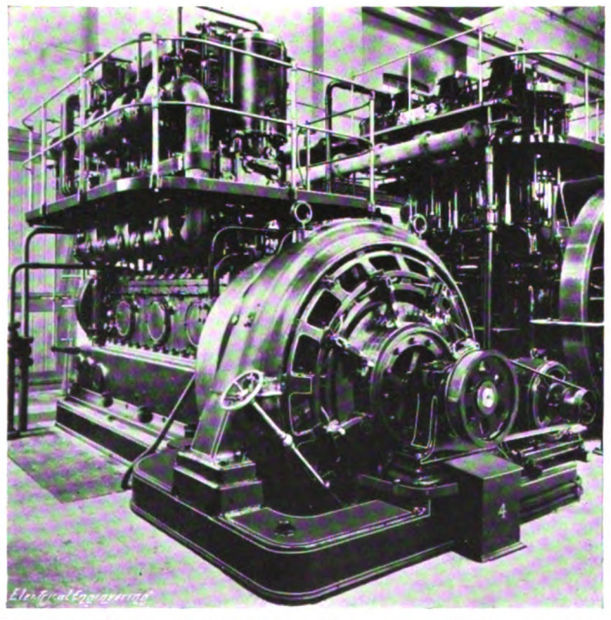

FIG. 3.—NEW GENERATING SET IN HEYSHAM POWER STATION, DRIVEN BY WESTINGHOUSE SIX-CYLINDER TANDEM GAS ENGINE.

longer periods. The existing load on the station, consisting chiefly of fast-speed powerful electric cranes, is very variable, and the battery has been used, in conjunction with a British Westinghouse Co.'s automatic reversible booster, for taking up the "peak" loads.

In connection with the traction scheme, an additional 350 h.p. 235 kw. Westinghouse Co.'s engine and generator, also generating 460 volts direct current, has been added. The single-phase current is obtained through two direct-current alternating-current motor-generators, by the Electric Construction Co. (shown in Fig. 4).

From the nature of the traffic the demand on the station will be one of a very "peaky" character and with very heavy "peaks." During these "peaks" the whole possible output of the machinery at work in the station must be utilised, and the intention is for the engines, whatever the actual load they be working on previous to heavy loads coming on, to work up to their full overload capacity, which is about 20-25 per cent. in the case of the old, and 10-15 per cent. in the case of the new sets, before the battery is called upon to discharge heavily. The latter will, however, be called on to work up to its full one-hour rate of 750-1,000 amperes. The old battery booster not being large enough for these discharges, a new one has been installed, built by the Lancashire Dynamo & Motor Co., whose machine is particularly suited for this method of working. A difficulty was, however, found in that the generators were working on a very falling portion of their characteristics, and their pressure dropped badly as their loads increased, this having been com-

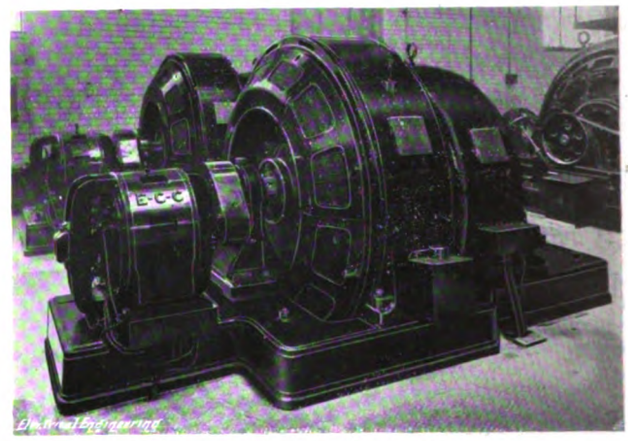

FIG. 4.—TRACTION MOTOR-GENERATORS IN HEYSHAM GENERATING STATION.

pensated for by hand regulation of their excitation, or else during "peaks" they continued to work at their previous loads, and the battery supplied the excess, both courses being inadmissible under the new conditions.

Compound winding in the usual way was an extremely expensive remedy, since, as the copper necessary for full excitation was already on the fields, new series coils would be excessively large and heavy, added to which was the trouble of entirely dismantling the machines. A very simple solution was found in fitting exciters, each mounted on the engine bed-plate, and belt-driven from a pulley fitted on the generator shaft, the compound windings being fitted on these exciters and varying their voltage, and consequently that on the main generator fields, so that the existing copper on the latter was fully utilised. This not only proved a very much cheaper arrangement, the exciters being only of 3 kw. capacity, and of fairly high speed, but enabled the whole change to be made in the course of a week, obviating any dismantling or any serious stoppage of the generating sets.

As regards the new machines, the Lancashire Dynamo & Motor Co.'s booster is of their standard three-wire type. With a comparatively low continuous rating it satisfactorily commutates the "peak" discharges up to 750-1,000 amperes; and it can be set

Digitized by Google

to make the engines work up to their overloads as above, or to work under practically any other conditions without any serious drop on the bus-bar voltage.

The new Westinghouse Co.'s generating set is driven by one of the latest type of Westinghouse gas engine. This has three cranks, with three sets of cylinders, two in tandem in each case. It runs at 300 r.p.m., and is fitted with "forced" lubrication. The Engineers to the Midland Railway consider its design and construction sound and thoroughly mechanical, and have informed us that its performance has so far proved it to be an excellent engine, and as reliable as any steam engine.

The motor-generators deserve special mention, not only because they form that part of the generating station most directly connected with the traction installation, but because there are many noteworthy points about them. They are in many ways exceptional machines and working under exceptional conditions, bearing the heavy "peaky" nature of the load, which varies from nothing to upwards of 1,000 kw. in very short periods, in mind.

The specification called for the machines to be each capable of a continuous output of 150-200 kw., with a temperature rise of 80° Fah., but they were also called upon to be capable of safely carrying output overloads of 900 kw. instantaneous, 600 kw. for half a minute, 500 kw. for three-quarters of a minute, and 300 kw. for 2½ minutes, and were required to be also tested under a regular cycle of these overloads, with underloads in between, for eight hours. The internal driving losses were also required to be kept down, while on the alternating-current side they were required to regulate within 6 per cent. on throwing off a non-inductive load equal to the full continuous load, and within 20 per cent. on throwing off a similar but inductive load of 0·8 power factor. Further, they were required, with the assistance of external means if necessary, to restore the pressure to normal within seven seconds of the coming on or throwing off of loads up to 600 kw. at 0·8 power factor, or 300 kw. at power factors down to 0·3. Widely varying proposals were received in connection with these machines, but the Electric Construction Co.'s machines were finally selected, partly on account of their being very compact and requiring a small amount of driving current, as well as having a high efficiency.

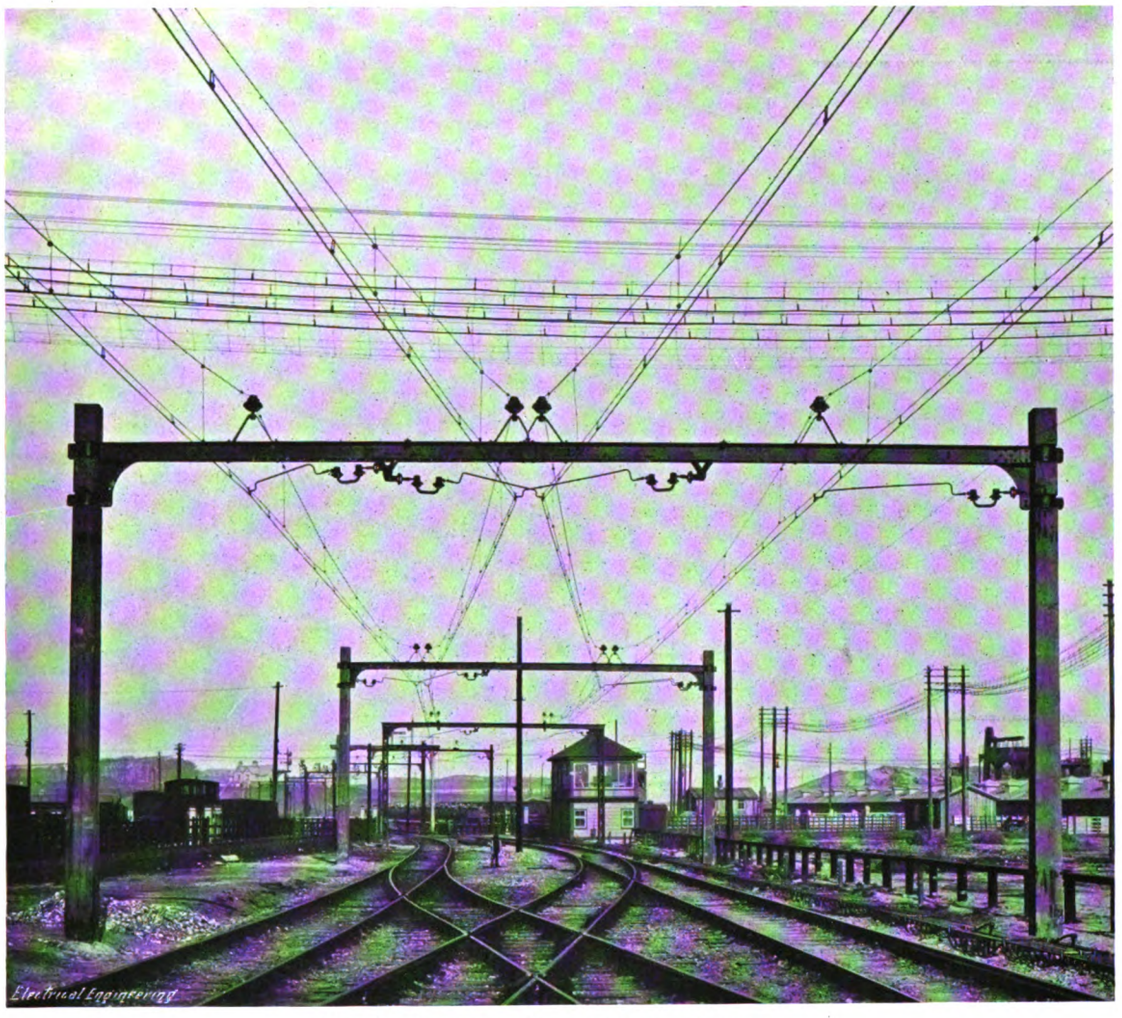

FIG. 5.—OVERHEAD CONSTRUCTION AT JUNCTION.

The makers' specification was 175 kw. on continuous rating, the machines on test being well within the specified temperature rise, but not excessively so. We understand that the running of the trains at Heysham experimentally, each of the sets have several times been subjected to loads up to 900 kw. input without the slightest commutator trouble, and smaller overloads of 600 kw., 500 kw., &c., have been very frequent, and have been carried with equally satisfactory results. The alternating current regulation is also fully up to the specified requirements, and on an average after the switching on or throwing off of a heavy load the voltage is restored to its normal of 6,600 volts within three seconds, while the voltage even then only varies about 300 volts each way; nothing could, in-

Digitized by Google

deed, be more satisfactory than the performance of these machines.

The direct-current motor is compound wound with commutating poles, the series winding being a very slight one, and put in principally to assist the two sets to run in parallel satisfactorily, which they do. The alternator has a three-phase star winding, so that if one winding breaks down, the other two may be used for the single-phase supply, otherwise no use is made of the three-phase connections. The machine is of the standard internal revolving field type, and is excited from an exciter, which is carried on the end of the bedplate and spur-geared up to about 1,100 revolutions. This exciter has laminated fields, and is compound wound, its series winding carrying a portion of the main motor current, so that (so far, at least, as varying loads of equal power factor are concerned) the tendency of the alternator to drop in volts is thus compensated for.

Compensation for varying power factors is effected by means of a regulator, designed and constructed by the Electric Construction Co., and the first of its kind, which inserts or extracts resistance from the circuit of the shunt field of the exciters by the action of solenoids, which are respectively excited as the voltage exceeds, or is less than, the normal. As shown in Fig. 4, the direct-current motor armature and the revolving field alternator are carried on the same shaft without any intermediate bearing. There are only two main bearings on the machines, and these are ball bearings. These bearings have so far given every satisfaction, and have proved very advantageous in reducing the starting current, which at 460 volts is only about 75 amperes, and the no-load loss, which is about 23 kw., with the exciter and alternator fully excited.

The switchboard has been designed and constructed by the Railway Company, the instruments being of the Westinghouse Co.'s make. Each of the motor-generators is supplied from the low-tension bus-bars through a no-voltage and overload circuit-breaker. The shunt circuit is excited through a separate double-pole knife switch, with kicking contacts and resistances. Starting resistance is cut out by means of a set of knife switches. By means of a throw-over switch, these can be used to start either set of the machines, a heavy triple-bladed knife switch being thrown in finally when the machines are fully started up, connecting them direct to the bus-bars.

On the alternating-current side each alternator is connected up to the bus-bars by a hand-operated oil switch, and the current passes from the bus-bar through duplicate automatic circuit-breakers to duplicate feeders passing out to the overhead lines. All the circuit-breakers, both high and low tension, have time-limit devices. The exciter shunt fields of the alternators are also connected through double-pole switches with non-inductive contacts and resistances. The instruments used consist of an ammeter, on each of the direct-current motor circuits, and a voltmeter, ammeter, and watt-hour meter on each of the alternator circuits, all, of course, operated through transformers. The incoming wire from the rails is, of course, at " earth " potential. There is also an indicating watt-meter between the bus-bars and the out-going feeders, and the regulator is connected to the same transformer.

The high-tension apparatus is contained in a lock-fast

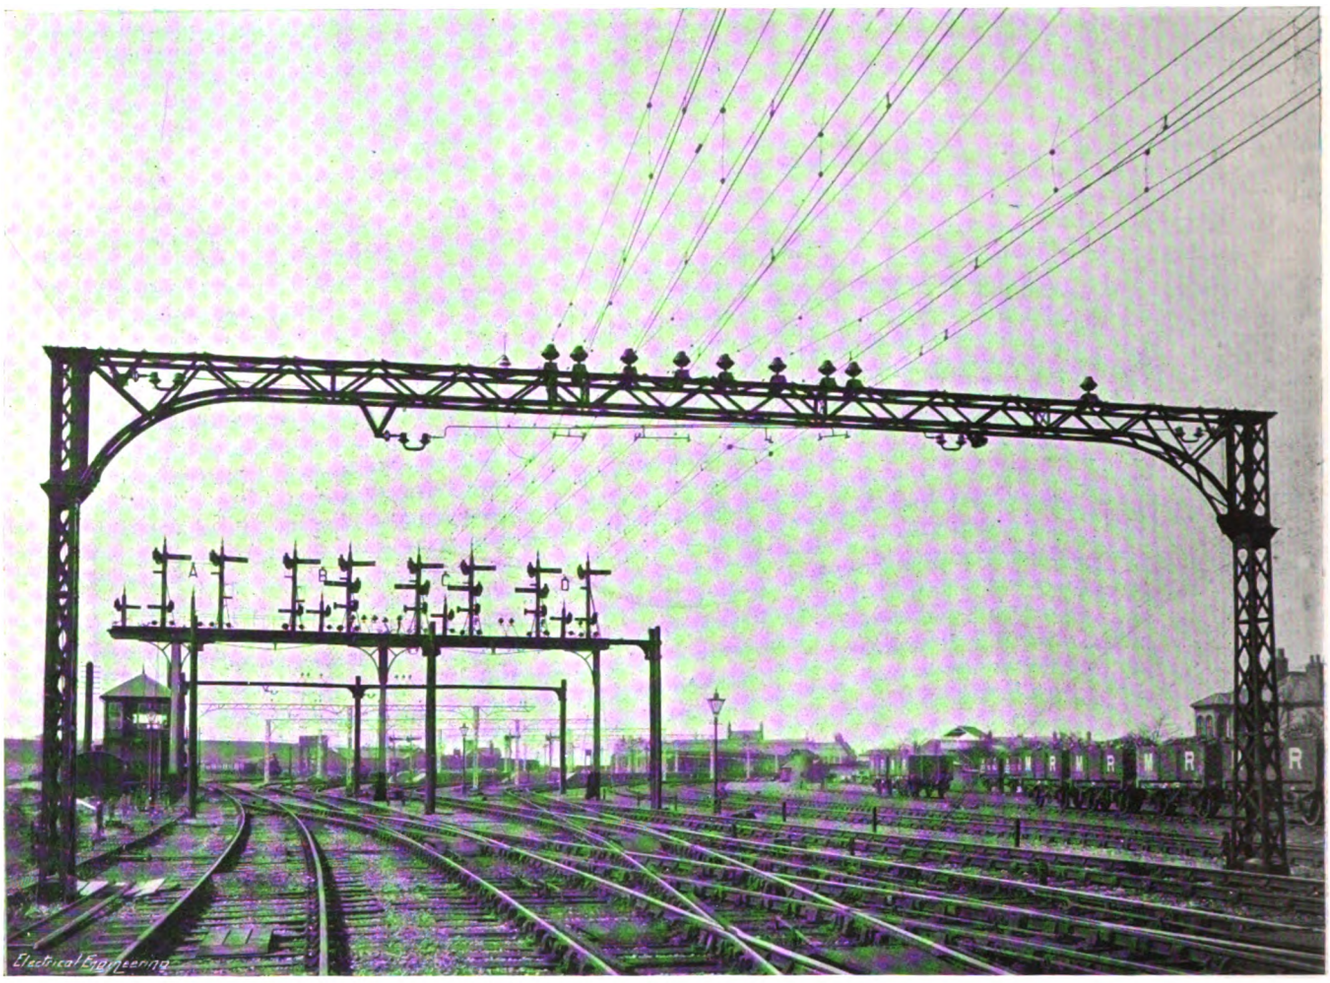

FIG. 6.—OVERHEAD CONSTRUCTION AT MORECAMBE.

Digitized by Google

expanded metal chamber placed over and at the back of the actual switchboard, the switches being operated from the handles of the latter through rodding. The door of this high-tension chamber is interlocked with the holding-up coil of the motor circuit-breakers, so that, unless the door is closed, neither motor-generator set can be started, while if it is opened during running, everything stops.

The overhead construction has been designed and carried out under the direction of Mr. W. B. Worthington, the Chief Engineer of the Midland Railway Co., by Mr. J. Sayers, the Telegraph Engineer of the company, and Mr. Argyle, the Northern Divisional Engineer. It is similar as regards the type of suspension to that adopted for the electrification of the Hamburg-Altona Railway, the patents for which in England are held by Siemens Bros.' Dynamo Works, Ltd. The chief difference lies in the new type of suspension of the catenary wire, which is the design of Mr. Sayers.

The length of line electrified comprises the double roads between Heysham and Morecambe, Morecambe and Lancaster Green Ayre, and the single line from Lancaster Green Ayre to Lancaster Castle Station, the total length of single road being about 21 miles. A diagram plan is attached. From Fig. 1 it will be seen that the line passes under a large number of overbridges, mostly of the arched shape, and the clearance of these bridges has been a matter of considerable interest. The use of a single bow for travelling in both directions necessitates the bow being symmetrical about the centre line of the coach, and this brings the bow necessarily very close to the structure of the bridge. In order to get through at all, it is necessary to take the contact wire well out towards the centre of the arch, so that it may come down low, but yet will be clear of the loading gauge, so that the other side of the bow may clear the structure properly. In addition to the bridges, the Lune viaduct presented a special problem, as it is on a nine-chain curve, and terminates at the end of Lancaster Station, which is also on a curve.

The contact wire is of the figure 8 section, and is run in lengths of from 800 to 1,000 yards. One end of each length of the contact wire is fixed through insulators to a terminal gantry, and the other end is attached through suitable pulleys, &c., to a weight equal to about 1,200 lb. The fixed end is always that at which the train enters, and the weighted end that at which the train leaves; the tendency of the bow is, therefore, always to straighten the contact wire. It is worthy of note with regard to the contact wire, which is 70 sq. mm. section, that the strain at first put on was equal to 800 lb., and the horizontal stagger was made equal to four feet—that is, two feet from the centre line of the coach—but the experimental trials which went on for some months before passenger trains were run showed that the total friction of pull-offs, &c., was such as to make it necessary to increase the tension to about 1,200 lb. for a 1,000 yards length, and with this tension the strain goes fairly evenly throughout the whole length. It was also found that a four-feet stagger for a bow which measured from tip to tip 7 ft. 1 in. was too much for practical purposes for running at high speeds. The line is situated in a country swept by very violent gales, experiencing the worst of weathers, and it is now considered that a stagger of two feet is a more practicable figure, though part of the line is actually run with three-feet stagger at present.

FIG. 7.—ARRANGEMENT OF OVERHEAD CONSTRUCTION UNDER BRIDGE.

The height of the contact wire from rail level varies from 18 ft. 3 in. in the open to 13 ft. 3 in. under bridges. It is suspended by short loops about 4 in. long from a steel cable called the auxiliary wire. The loops are fixed to the contact wire, but are movable on the auxiliary wire. The auxiliary wire again is held by the main catenary cables, of which there are two, the main catenary span being thus broken up into six short spans on the auxiliary. The two catenary cables are clipped together throughout their length, except for about three feet on either side of the insulator, where they divide to pass through the grooves of a ring, the said grooves being on opposite sides of the insulators. The catenary is, therefore, free to move for this distance, and this equalises the strains in the spans due to unequal loading; at the same time, it is secure in the case of the breaking of the wire, as has actually been proved by experience.

Section switches are provided so as to isolate the up and down lines, or to isolate the different branches. These switches are of the double-break air pattern, and

Digitized by Google

are fixed on the top of the poles supporting the gantries. Each section switch is, in addition, duplicated, and the connection from one contact wire to the section ahead of it is accomplished by means of a short section of switch wire, which requires to be connected to the two contact wires before the line is switched through at this point. This arrangement was adopted in order to get a duplicate break, and, what is more important, a short length of line into which a car can run without bridging two sections by means of its bow, if it is required to be isolated. The switches are provided with padlocks. A similar type of switch is in use at the various stations to enable the station staff to earth the overhead wiring in case of emergency.

The gantries are connected together by a separate overhead steel cable, which is earthed every half mile, the same earth-plates being used for lightning arresters of the horn type, the object being to diminish the number of earth-plates requiring attention, and thus to give better security from danger due to the poles being charged by a leaky insulator. This earthed steel cable has been erected in every case between the contact wire and the telegraph wires, which are open on one side of the line, and it is believed that its presence has had a great effect in reducing the electrostatic induction from the contact wire to the telegraph wires.

It was the object of the company to avoid, if possible, cabling their telegraph and telephone wires, and, so far, the results are favourable to the idea that it will not be necessary to put all such open wires underground when high-pressure traction systems are erected overhead. At the same time, it will certainly be necessary to provide some sort of high-resistance leak on any wire parallel to such a system, as circumstances may arise, as, for example, in the case of a wire thrown out of work by disconnection at the test-board when there might be high electrostatic potential produced between.

Figs. 5, 6, and 7 show the various forms of construction employed. The poles used have been mostly straight creosoted wooden poles, as shown in Fig. 5, but at Morecambe Station and at one or two other points it has been necessary to erect lattice steel poles and lattice girder gantries, owing to the big spans, as shown in Fig. 6. Where wooden poles are used, the gantries are made of two angles, brought together at the ends, but kept apart for the greater part of their length by distance pieces one inch thick, enabling the bolts from the insulator saddles to drop in the gap, so giving a great range of adjustment of the insulator position without any necessity for drilling.

The design of the insulators is shown in Fig. 8. Before getting out the dimensions, the company's staff took advantage, by the kindness of Messrs. Siemens Bros.' Dynamo Works, Ltd., of experiments this firm undertook to ascertain what was the minimum distance at which a 6,600-volt, 25-cycle circuit would maintain an arc in the heaviest weather from an insulator shed. It will be noticed that the steel bolts supporting the insulators are encased with ebonite—a

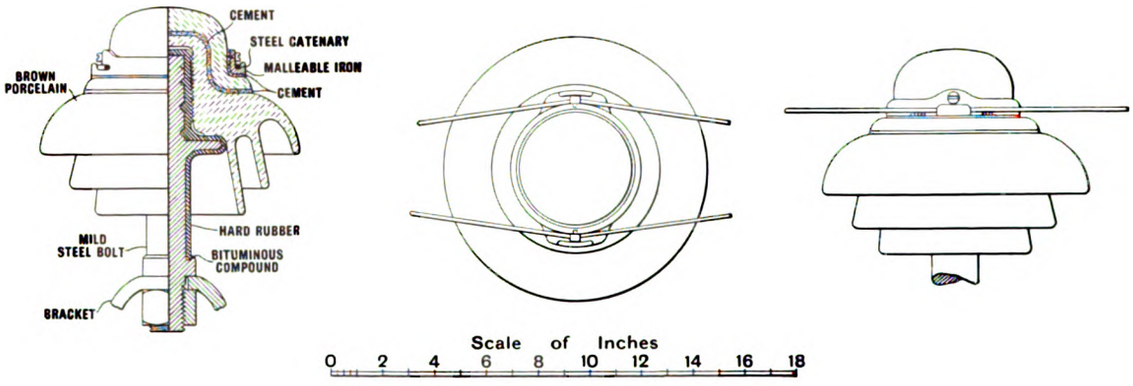

FIG. 8.—SPECIAL INSULATOR FOR OVERHEAD LINE.

similar arrangement to that adopted by Messrs. Siemens on the Hamburg line, with a view to getting practically double insulation with one insulator. In addition to this, however, the Midland company preferred to make the insulator itself in two portions, and to make it very massive. The line is very likely to suffer from damage from stone-throwing at the large number of level crossings, and, in addition, will suffer from very bad weather conditions. It will be seen that the design of the insulator in combination with the twin catenary cable brings the side strain of the overhead gear below the level of the inside bolt, and there is no point at which the catenary cable itself is being deformed by the pressure of any clamp of any sort, and no point at which the mechanical waves tend to break the wire at a point of reflection.

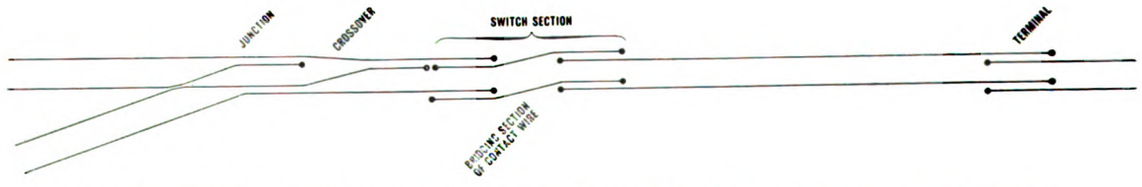

FIG. 9.—DIAGRAM OF WIRING AT JUNCTIONS, CROSSOVERS, SWITCH SECTIONS, AND TERMINALS.

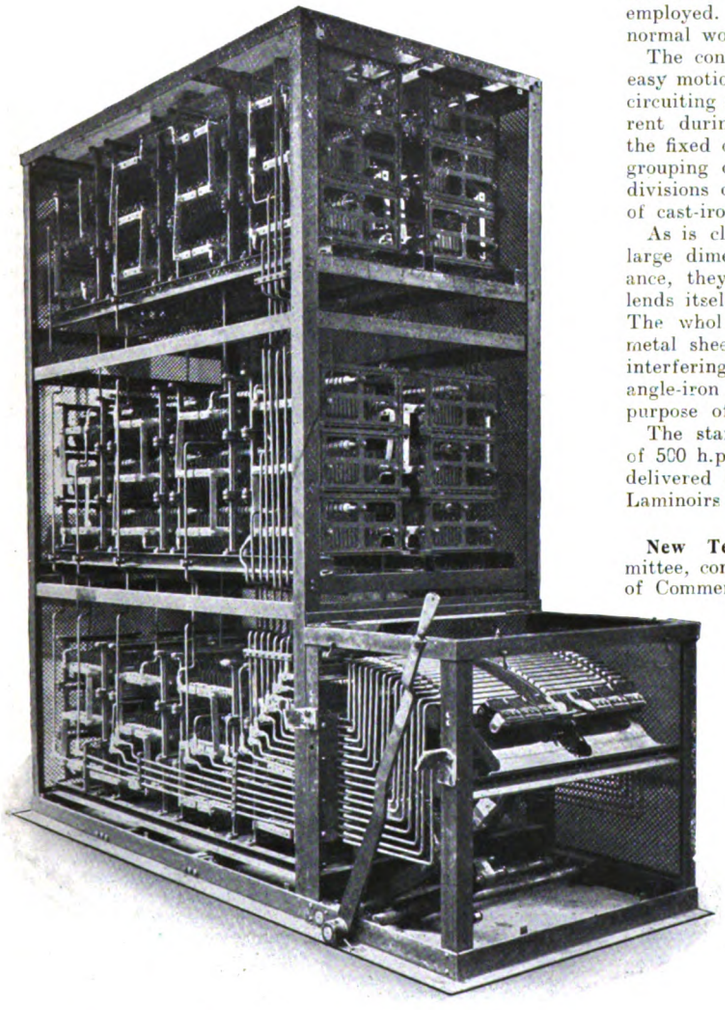
The outer rail on each line is bonded throughout its length with bonds of the Forest City type, in duplicate, placed under the fish-plates. At crossings and junctions all rails are bonded together, and these bonds and those used for cross bonding are ordinary copper cable bonds. Very great care was exercised in bonding the line to prevent any moisture getting into the drilled holes or on to the bond plugs during the process, and in very wet weather the work was abandoned. By means of protective devices, however, it was found possible to go on with bonding in moderately wet or damp weather, but the tests carried out, when the whole of the work was finished, of the resistance of each bond showed in an interesting manner that.



Digitized by Google

although the bonds were quite satisfactory, those which were carried out in perfectly dry and fine weather were quite distinguishable, by resistance test, from those which were carried out in damp or misty weather. It will be interesting to note, as time goes on, whether this difference in resistance is intensified.

The rails are earthed at Heysham Harbour in the sea by duplicate copper earth-plates. At Morecambe they are earthed at the end of the Midland Railway Pier, these plates being of copper again, but for protection they are dropped into a large cast-iron caisson recovered from an old Midland bridge. At Lancaster the rails are earthed to the cast-iron columns of the bridge, where they rest in the bed of the river, where water is always flowing. Recording ammeters have been put in these various earths, with a view of indicating the proportion of current which returns by these routes. The arrangement of wiring of junctions, cross-over switch section and terminals is shown in Fig. 9. A full description of the rolling stock will be given in our next issue.

STARTER FOR LARGE ROLLING MILL MOTORS

DIFFICULTIES are presented in the design of starters for large direct-current rolling mill motors on account of the heavy currents which have, as a rule, to be dealt with. The contact surfaces must be large, and the resistances of considerable carrying capacity, while means should be provided of preventing the operator cutting out the resistance too rapidly. The accompanying illustration shows a starter embodying the above-mentioned points, designed and constructed by the Felten & Guilleaume-Lahmeyerwerke A.-G., of Frankfort-on-Main. The fixed contacts are arranged to form the segment of a cylinder, and are divided into two parallel rows, thus increasing the certainty of good connection between the fixed and moving contacts. The latter comprise a number of units for each half of the contact way, and are of the roller type. As a result of the duplication of the fixed contacts, the resistance is also divided into two portions, the arrangement of which may be seen in the figure.

STARTING SWITCH AND RESISTANCE FOR 500 H.P. CONTINUOUS-CURRENT ROLLING MILL MOTOR.

The operating lever is connected to the contact arm through a ratchet gear, and the lever must be moved through a complete cycle to and fro to advance the contact arm one step. The necessary slow-starting is thus ensured. In switching out, however, the operating lever returns the contact arm to its off position in one rapid motion. To prevent arcing, the last contact on opening the circuit, a powerful magnetic blow-out is fitted to each half of the contact way. The contact bars are supported on an angle iron framework, but only at their ends; they are thus entirely free and open to the circulation of air, and the possibility of dirt or metallic dust lodging between them and forming an electrical connection from one to another is avoided. The first bar is broader in the case of one half of the contact way than in the other, and consequently the first to-and-fro movement of the operating lever closes the circuit through one half of the resistance only, and the rush of current from the network amounts only to one-quarter of the full-load current of the motor The next movement of the contact arm connects the second half of the resistance in parallel with the first, and the current rises to one-half of the normal working current. The effect of broadening the first step of one half of the contact way is therefore to add an extra step, doubling the resistance in circuit without increasing the amount of material employed. The remaining steps are so calculated that the normal working current of the motor is at no time exceeded.

The contact arm is fitted with a balance weight to ensure an easy motion, and on reaching its final position it closes a short-circuiting switch, so that the roller contacts are only under current during the actual time of starting. The arrangement of the fixed contacts renders possible a very orderly and accessible grouping of the conductors between them, and the successive divisions of the resistance, which is built up in the usual way of cast-iron elements.

As is clear from the illustration, in spite of the necessarily large dimensions of the actual starting switch and the resistance, they are combined to form a compact apparatus, which lends itself to inexpensive erection with a minimum of labour. The whole apparatus is protected on all sides by perforated metal sheets, which prevent disturbance of any part without interfering with the ventilation, and are so fastened to the angle-iron framework that they may be easily removed for the purpose of inspecting the contacts or resistances.

The starter controls a rolling mill motor having an output of 500 h.p., at 240 volts and 200 to 250 revolutions per minute, delivered by the Felten & Guilleaume-Lahmeyerwerke to the Laminoirs de Thy le Château Charleroi.

New Telephone Charges.—The permanent telephone committee, consisting of representatives of municipalities, Chambers of Commerce, and Chambers of Trade throughout the country, which was formed in connection with the new scale of charges introduced by the Postmaster-General and the National Telephone Co., has now got to work, and a meeting was held in London on Thursday. The proceedings were private, but it is announced that Mr. J. S. R. Phillips, editor of the *Yorkshire Post*, has been elected a member of the committee, as representing the Newspaper Society.

Tramway Rating.—The dispute between the Blackpool and Fleetwood Tramroad Co. and the local authorities through whose areas the lines run, with regard to rating, still continues. The company argues that, being a tramroad and not a tramway running on the highways, their undertaking comes within the category of a railway, and as such is entitled to a reduction of three-quarters of the net assessment. The Council of Bispham-with-Norbrech have differed from the Lancashire justices on the point, who have held in favour of the company, and last week they sought a mandamus in the High Courts, ordering the justices in question to issue a distress warrant against the company for the full assessment. Sitting as a Divisional Court, the Lord Chief Justice and Justices Darling and Sutton decided against the Council.

CORRESPONDENCE

STREET LIGHTING IN THE CITY OF LONDON.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The publication of the results of some of our work on the City lighting makes me wonder whether it will be the occasion of more antagonism between those who are interested in gas and those who are interested in electricity. Personally I am a greater advocate of going to bed when it is dark than of either gas or electric light, and as I desire above all to promote unity among men rather than discord, I will ask you to allow me to say a word to both parties in this discussion.

When one observes the terrible waste of human life and material that is taking place, a waste that does not arise so much from the want of technical knowledge as from its neglect, when one looks upon this terrible farce which is proceeding once more before a Committee of Parliament, and when one carefully "examines" the cause of these dreadful things, one is led irresistibly to the conclusion that they arise from want of unity among men. Instead of adding one to one and making two, we are everlastingly subtracting one from one and making worse than nothing. This madness has proceeded so far that recovery is probably a very difficult matter; we are like people bound by some magic spell. Yet delivery from this spell must come sooner or later, and when trade is bad is the best time to stop and think, for when trade is good, few of us will "ever think of what we are really doing."

Now both gas and electric light people are public servants fulfilling the same task in different ways. It is quite easily ascertainable, as a matter of fact, and not as an opinion, that electricity can be under most circumstances cheaper for lighting, and gas cheaper for heating, but even supposing this were not so, and that the facts were quite different, why should not both unite to do that which is best, and find some reasonable basis of agreement by which both should get a fair return for the services they render. Of course, the suggestion of a combination between the gas and electric light people is enough to make the hair of the average trader stand on end, and justly so if a superficial view of the case is taken.

As buyers, we all know the apparent advantages of price-cutting, but try and trace out the whole system of trade competition, and we shall find that we gain one penny in one pocket and lose twopence out of the other, and that the whole thing is madness, which is bringing us to destruction.

If we are going to admit that one man will not properly serve another man unless a third man is waiting to eat him up if he does not, then disaster is already complete. But I will not believe it, and I say the time is now ripe for men to take a more serious and simple view of what is proceeding, and endeavour to stop the madness that is now destroying us.

I venture to send you a short piece from a Report about the Electric Supply Bills for London. The unity that I ask for among all parties interested in the electric supply of London I would like to see extended to those interested in gas, and as a practical man having the good of all the people of London at heart, I do not believe that there would be a great deal of difficulty in preparing a scheme which would be satisfactory to Parliament, if we all tried to be reasonable.

Your obedient servant,

Dorking, June 6th, 1908. A. A. VOYSEY.

P.S.—It may be thought that there is an argument against what I have urged in the fact that the gas mantle, the metal filament lamp, and the flame arc lamp have possibly been developed as the result of competition between gas and electricity, but it is no argument against me. Do we not all know that the great discoveries which have advanced the consciousness of man have been made for the love of truth, and not for the love of self? Is not my own experience like that of all men, that the less I think of the size of my salary the better my work becomes? If we were not madly trying to eat each other up, we might now be considering a scheme for the partial conversion of gasworks to join with the electric light works in endeavouring to give London the cheapest possible light with a reasonable profit, instead of wasting our money over propositions for further waste and chaos. A. A. V.

The following is the extract from Mr. Voysey's Report on the London Power Bills referred to in his letter:—

"London wants the cheapest possible electricity. Engineering properly *is* economics, and on economics fundamentally depends the solution of this problem. Unfortunately, the slate is not clean—it is covered with incoherent writing which cannot all be rubbed out, and the question is how much can be rubbed out, how can what remains be best used, and can it be usefully altered and added to? Those are the questions that have to be answered. It is obvious that these questions cannot be answered properly till they have been put and carefully considered. It is also obvious that if men wish to attain any given object they should unite with that one object in view. But in this matter of London's electric supply the real object has been left out of sight altogether, the true fundamental questions have never been asked. The Parliamentary Committee sit without any independent technical adviser, but if they had one it would not make matters much better, for the real object is not presented to them at all, only the conflicting interests of various parties. Parliament cannot pass propositions which are not before it. Those that have written on the slate strive to perpetuate or increase their writing, while those who may inherit the slate or part of it strive for their little bit of prospective interests, and fresh parties come forward wanting to write all over the slate and make it much bigger, and in the midst of this strife the slate is seized upon by political parties who try to bang each other's heads with it. It is one of the most dreadful fallacies by which men are deceived, and by which we are now being destroyed, that the strife of men with men is good for men. The progress of animal life is through strife, the progress of human life through unity. I am not moralising, but writing plain common sense, which ought to be practically applied and might quite possibly have been applied if serious attention had been given to this matter. I hope my words may be accepted in the earnest sense in which they are offered, for I am speaking of that which involves vast questions of waste in life and material.

"I will now proceed to consider the Bills more in detail. Mr. Lloyd George has pointed out the necessity for agreement among the interested parties, which is precisely what I have from the beginning been urging an endeavour to bring about. Mr. Lloyd George at the same time thought the Bills ought to be considered by committees, but both the Bills are just of that kind which has caused all the strife of the past. I do not know by what peculiar process of reasoning it can be supposed that what is opposed to unity can promote unity, unless Mr. Lloyd George is thinking of the confectioner and his assistants, but even so, the case is not parallel, for the confectioner himself pays for the sickening process, whilst in this case the public ultimately bears most of the cost.

"The main truth about the public and the electric supply business may be shortly re-expressed as follows:—There was a certain rich and wasteful man, and many sought to serve him. He hired servants according to their clamouring and without thinking of his real needs; he had no idea of the relation of the work of one to the work of another, and he made no proper arrangements for controlling, directing, or dismissing them. Some of the servants were bad and tried to rob the master. But the master, not able to dismiss the bad ones, got still more servants to look after them and help to do their work. The old servants tried to drive out the new ones, but finding they could not they agreed with each other against the master. The waste and extravagance was terrible, and the pinch began to be felt. Then came others to the master, wishing to serve themselves, and they said their services would be good for the master and would put everything right, but some of the old servants said that if they could work together things would be better. Neither master nor servants saw that first of all the master had not understood his own needs, and then that the servants had not worked for the master but for themselves, and that all the trouble lay in this. The cure lies in the recognition of the truth in the study by the master of his needs with the aid of the servants, in the resolve of the servants to care more for the needs of the master and of the master to care well for his servants, and in the resolve of all to work together for the good of all. The time is rapidly approaching when men will look with horror on the waste that is wrought of strife and when reasonable agreement will more and more be regarded as a better way of life. Let us take time by the forelock."

INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION

Full Programme of the Nottingham Convention

WE have now received the full programme of the thirteenth Annual Convention of the Incorporated Municipal Electrical Association, which will be held in Nottingham from June 30th to July 3rd.

On Tuesday, June 30th, the Association will meet at the University College at 10.30 a.m., when the Mayor (Mr. Councillor Spalding) and the Sheriff (Mr. Councillor Carey) will be present to welcome the Members. Mr. H. Talbot, the Chief Electrical Engineer to the Nottingham Corporation, will deliver his Presidential Address, after which the following Paper will be read and discussed: "The Experiences of a Convener in the Establishment of an Electricity Undertaking," by Bailie Wightman, Convener of the Govan Electricity Committee.

Luncheon will be served at the Mechanics' Large Hall by invitation of the Chairman (Sir J. Turney), and members of the Electricity Committee, and at 2.30 p.m. special tramcars will leave for the Trent Bridge car shed and repair shops, and later for the St. Ann's power station, where tea will be provided.

The works of the Brush Electrical Engineering Co., at Loughborough, will be open for inspection during the Convention, as will also the generating station of the Derby Corporation.

Wednesday, July 1st, will be devoted to a whole-day excursion to Dovedale, a special train leaving Nottingham at 8.40 a.m. for Matlock, Bath.

The Annual General Meeting will be held at 10 a.m. in the University College, Nottingham, on Thursday, July 2nd, and at 2.30 p.m. a meeting will be held at University College, when the following Papers will be read and discussed: "Some Considerations on the Design of a Generating Station," by Mr. H. Richardson (Chief Electrical Engineer, Dundee), and "The Reconstruction of an Electric Lighting Scheme," with observations on the working of a combined steam and water power plant, by Mr. C. M. Shaw (Chief Electrical Engineer, Worcester).

The Association Annual Dinner will be held at the Exchange Hall, Nottingham, at 7.30 for 7.45.

The final meeting of the Convention will be held at 10 a.m. in the University College on Friday, July 3rd, when the following Papers will be read and discussed: "Alternating-current Accumulator Sub-stations," by Mr. A. M. Taylor (Assistant Electrical Engineer, Birmingham), and "The Work and Equipment of a Testing and Standardising Department," by Mr. H. A. Ratcliff (Superintendent of the Testing Department, Manchester Corporation Electricity Works).

Obituary.—We regret to have to record the death at Cherbourg, at the age of fifty-six, of Mr. L. G. Mouchel, of the firm of L. G. Mouchel and Partners, who have done so much in introducing ferro-concrete construction into this country. It was in 1898 that Mr. Mouchel acquired from Mons. F. Hennebique the sole agency for his system of ferro-concrete construction, and since that time he has devoted himself entirely to this branch of engineering, having carried out some 600 buildings and engineering works of this nature in Great Britain. About a year ago he took Messrs. J. S. E. de Vesian and T. J. Gueritte into partnership.

Protection of High-pressure Circuits.—An interesting form of water-jet protective device has been recently patented in Germany by the A. E. G. of Berlin. A fine stream of water falls parallel to a plate connected to the line. On a rise of pressure, the stream is attracted to the plate and the system is momentarily earthed. The top of the plate and the pipe from which the stream of water falls are horn shaped so as to extinguish the arc formed. No continual discharge to earth takes place as in former water-jet lightning protectors.

1,000 H.P. SINGLE-PHASE LOCOMOTIVE FOR THE PRUSSIAN STATE RAILWAYS

IN the latter part of last year a large goods locomotive was built by the Allgemeine Elektricitäts-Gesellshaft for use on the experimental single-phase line of the Prussian State Railways at Oranienburg. This locomotive is now in use, and the following description is abstracted from a recent article in the *Elektrotechnische Zeitschrift*.

The locomotive consists of two two-axle units coupled together. Three of the axles are driven by single-phase motors of the Winter-Eichberg compensated repulsion type, but there is room for a fourth motor on the remaining axle if this is considered necessary. Each motor is rated at 350 h.p. on the one hour 75° C. basis, and with this load runs at a speed of 450 r.p.m. On account of the forced draught cooling, the continuous capacity is as high as 250 h.p. or 70 per cent. of the one-hour rating. The speed at this load is 500 r.p.m. It is stated that these motors differ only in a few constructional details from the 350 h.p. motor experimented with in the year 1906. This was a six-pole, 25-cycle motor, and weighed 5·5 tons without gear, or 35 lb. per horse-power. (With this figure should be compared the weight of the Metropolitan District continuous-current motor of 240 h.p. on the one-hour rating, which weighs 2·51 tons without gear, or 23 lb. per horse-power, and runs at a speed of 530 r.p.m.) The electrical and constructional design of these large 350 h.p. motors is similar to the other well-known Winter-Eichberg motors, a smaller size (115 h.p.) of which is being used for the motor-cars of the London, Brighton and South Coast suburban line. Returning to the locomotive in question, the motors are geared to the axles with a gear-ratio of 1 : 4·21, and the driving wheels have a diameter of 4·6 feet. Thus at the rated output (one hour, 75° C.) of the motors a speed of 17·5 miles per hour is attained with a total drawbar pull of 22,000 lb., and at the continuous capacity of the motors a speed of 19·5 miles per hour is attained with a drawbar pull of 14,300 lb. The maximum speed of the motors is about 955 r.p.m., corresponding to a maximum locomotive speed of 37 miles per hour. The total weight of the two units is 59·5 tons, or about 15 tons per axle. The locomotive is supplied with current at 6,000 volts 25 cycles by means of two bow-collectors fitted on one of the units. The bow presses upwards on to the contact wire with a pressure of about 9 lb., and reverses automatically on a reversal of the direction of motion. The framework carrying the bow can be raised or lowered by compressed air or by hand, but can only be raised if the door of the high-tension compartment is closed. In the same half of the locomotive are situated the high-tension oil switch, lightning protection apparatus, and the main transformer which transforms down from 6,000 to 1,000 volts. This transformer is cooled by a forced draught from the same fan which blows air through the motors. The control-gear, contactors and fuses, as well as the regulating and instrument transformers, are also situated in this half of the locomotive.

In the other unit are the fans for the forced draught, the compressor for the brakes, collector, sand distributors, and whistles, and the compressed air chamber. The fan is driven by a 30 h.p. Winter-Eichberg motor, which is started by means of a series choking coil. The coil is automatically short-circuited when a speed of 700 r.p.m. is reached. In order that the air blown through the motors and transformer may be free from dust it is drawn through coke filters at the two sides of locomotive, just under the windows. The air-compressor is driven by a 7 h.p. Winter-Eichberg motor, and is automatically started when the air pressure in the air chamber is less than 6 atmospheres, and stopped as soon as the pressure reaches the value of 8 atmospheres.

At each end of the locomotive is a driver's compartment, shut off from the rest of the interior. The main controller, which has four starting positions and four running positions, is situated on the left side of the compartment. A simplified controller operating the motors on the lowest voltage only is placed on the right side of the compartment for use in shunting operations, when the driver may require to be on that side of the cab. The three motors are operated in two independent groups, and the various operating steps are obtained by running off different taps on the secondary of the main transformer. The lead to the motor is connected to the centre of a choking coil, and the ends of the choking coil are connected to two adjacent tappings on the transformer, so that in changing from one tapping to another the motor circuit is never broken. The contactors are operated with current taken from the main transformer at a pressure of 300 volts. The compressed air brake acts simultaneously on all eight wheels, and can be operated by hand, if necessary, from the driver's compartment.

INTERNATIONAL CONGRESS ON ELECTRICAL UNITS AND STANDARDS

AS announced on page 686 of our issue for May 7th, it has been decided to hold an International Congress on Electrical Units and Standards in London in October next, and invitations to send representatives have been issued to the foreign Governments interested in the subject and also to the self-governing Colonies. The Board of Trade have appointed a Committee consisting of Mr. G. R. Askwith, K.C., Sir John Gavey, C.B., Dr. R. T. Glazebrook, F.R.S., Major P. A. MacMahon, F.R.S., Major W. A. J. O'Meara, R.E., C.M.G., and Mr. A. P. Trotter, with Mr. M. J. Collins, of the Board of Trade, as Secretary, to prepare a programme for the consideration of the delegates at the Congress, and to make the necessary arrangements for the reception and assembly of the delegates.

The Committee have fixed Monday, October 12th next, as the date for the assembly of the Congress, and they have also prepared the following memorandum which sets forth the proposals to be laid before the Congress as a basis for their deliberations :—

Memorandum as to the proposals to be laid before the Congress on Electrical Units and Standards to be held in London in October next.

The general object of the International Congress on Electrical Units and Standards, which is to meet on the invitation of His Majesty's Government in London in October, 1908, is to consider and advise as to the steps which should be taken to bring about agreement in the definition of electrical units which form the basis of legislation in different countries, and in the methods of constructing and employing the electrical standards necessary to give effect to these definitions.

It is hoped that the delegates to the Congress may find themselves able to embody their conclusions in draft Articles which might be commended to the several Governments represented as a basis for uniform legislation and administration in relation to electrical units and standards.

The fundamental units of electrical measurement are the ohm, the ampere, and the volt. Of these two are primary units, being independent, and the other secondary or derived. It is generally agreed that the ohm should be accepted as one of the primary units. There is some difference of opinion as to whether the ampere or volt should be the second. This point will be one for the Conference to consider.

Again, the ohm is realised by means of the resistance of a column of mercury of definite dimensions, the ampere by means of the electrolytic deposition of silver, and the volt by aid of a standard cell.

If this method of realising the units be accepted by the Congress, specifications for the ohm and ampere will call for consideration, while the standard cell must be selected and the method of setting it up prescribed.

In view of the scientific questions raised in connection with each of these matters, including also the choice of the two primary units, it will be suggested at an early meeting of the Congress, should such a course appear to be desirable, that the Congress should appoint a small Technical Commission of experts to discuss the question, and report thereon to the Congress.

The Congress will also be asked to consider the best methods of securing uniformity of administration in the future, and for arriving at a decision on any questions left undecided at the close of the Congress.

It is desirable to have some definite questions before the Congress, and with this object the following propositions embodying conclusions arrived at by the representatives of the various National Standardising Laboratories which met at the Reichsanstalt in 1906, and which are also generally in accordance with the decisions of the Chicago Congress held in 1893, will be brought forward as a basis for discussion.

1. That the ohm shall be the first primary unit.
2. That the ampere shall be the second primary unit.
3. That in consequence the volt shall be treated as a secondary or derived unit.
4. That the international ohm be defined as the resistance at the temperature of melting ice of a column of mercury of uniform cross section terminated by planes at right angles to its length 106·3 centimetres in length and 14·4521 grammes in mass.
5. That the international ampere be defined as the unvarying electrical current which when passed through a solution of nitrate of silver in water deposits silver at the rate of 0·001118 gramme per second.
6. That the International volt be defined as that electromotive force which when applied steadily between the ends of a conductor of resistance 1 international ohm produces a current of 1 international ampere.
7. That the Weston cadmium cell be adopted as a convenient standard of electromotive force, having at a temperature of 17° C. an e.m.f. of . . . international volts, but that it is undesirable that the number representing the e.m.f. of this cell should be the subject of legislation in any country.
8. That specifications dealing with the methods of setting up mercury standards of resistance, of realising the ampere by the deposition of silver and of preparing standard cells, be issued with the authority of the Congress, and that for this purpose a Technical Commission be appointed to prepare these specifications.
9. That the Congress consider and advise as to the best method of securing uniformity with regard to the fundamental electrical standards for the future.

SOME NOTES ON ILLUMINATION

AT a meeting of the Local Section of the Institution of Electrical Engineers at Cape Town, on February 10th, a Paper on the above subject was read by Prof. H. Bohle. The author divided his Paper into four sections. The first section dealt with the fundamental laws of the distribution of light, the second with the illumination of buildings, the third with outdoor illumination, and the fourth with illumination photometers. The following is an abstract of the Paper :—

Fundamental Considerations.—The illumination of a surface by rays falling obliquely from a source of light is expressed by the equation :—

$$E = \frac{I \cos \theta}{R^2}.$$

E will be the illumination in candle-feet* if I is the intensity of the source of light in British standard candles, θ the angle of the incident rays with the normal to the illuminated surface, and R the distance in feet of the source of light from the surface. If the source L be at a vertical distance h from the surface, the illumination at a point P on the surface is expressed by the equation :—

$$E = \frac{I \cos \theta}{a^2 + h^2} = \frac{Ih}{(a^2 + h^2)^{\frac{3}{2}}}$$

* In the original the author expressed the illumination in Lux. The Lux is generally defined as one candle-metre, but the German Lux is a Hefner-candle-metre, and the French Lux a Bougie-candle-metre. The author used a Lux of the value of one British-candle-metre. As the candle-foot is the accepted unit of illumination in England, the author's formulæ and figures have been converted to suit this unit. Thus one candle-foot is equal to 10·74 Lux (British-candle-metres). —ED. E.E.

where a is the distance, on the surface, of the point P' from the trace of the normal from L on to the surface. E will again be expressed in candle-feet if I is in candles and a and h in feet. This holds for any plane, whether the same be vertical, horizontal, or inclined.

Consider a symmetrical source of light, *i.e.*, a source from which uniform illumination along the same latitudes on an imaginary hollow sphere surrounding the source is obtained. By measuring its distance h from the illuminated surface and the distance a of any point P from the projection of the source upon this plane, we are able to plot, with the aid of the above equation and the polar curve, giving the distribution of intensity along a meridian, the well-known illumination curve. This has been done for an ordinary arc lamp, and is shown in Fig. 1, which represents the illumination in candle-feet along a horizontal plane at right angles to the axis of the lamp. The points of similar illumination caused by a single symmetrical source lie on a circle, as is illustrated in Fig. 2.

Suppose a lamp has to illuminate a given circular area, say a table, so that the illumination is a maximum at the circumference of the table. At what height should the lamp be suspended above the table? For the above condition, the illumination curve must rise to a maximum at a distance a from the centre of the area, where a is the radius of the circular area: and, from the above illumination equation, we find that for this to be so h must be equal to $0{\cdot}7a$. The illumination from the centre towards the circumference of the table varies considerably, but it can be made more uniform by fixing a shade above

Digitized by Google

the source of light. The shape of the shade or reflector is of great importance in determining the uniformity of illumination. By the application of properly designed reflectors, the polar curves of most lamps may be varied more or less at will. Given the values of h and a, and the natural polar curve of a lamp, a reflector can be made which will alter the polar curve to the necessary shape for uniform horizontal illumination over the given area.

From the fundamental equation for the illumination from a source of uniform intensity we get :—

$$I = \frac{E(a^2+h^2)^{\frac{3}{2}}}{h}.$$

If the illumination along a horizontal plane is to be uniform and equal to E^1, the equation of the polar curve of the source of light necessary to give this is given by :—

$$I = \frac{E^1(a^2+h^2)^{\frac{3}{2}}}{h}.$$

Consider the particular case of a circular area of radius $a=60$ ft., which has to be uniformly illuminated to the extent of one-tenth of a candle-foot by a single lamp suspended at a height of 30 ft. above the centre of the area. Making use of the above equation, it will be found that the polar curve must have the shape given in Fig. 3. The curve resembles that of an arc lamp with vertical carbons, and may readily be obtained with the use of a suitable reflector.

In most cases the illumination by a single lamp is insufficient and a number of lamps are required. The area which can be effectively illuminated by a single lamp depends upon the size of the lamp, its height above the surface to be illuminated, and the illumination required. For incandescent lamps the ratio a/h for effective illumination is, on the average, limited to 1·5, for arc lamps to 3·0. In other words, the radius of the area which can be effectively illuminated by an incandescent lamp is about one and a half times the height of the lamp above the ground, and the equivalent radius for an arc lamp is about three times the height of the arc above the ground. To obtain the illumination given by two lamps suspended a certain distance apart, the illumination curve for each lamp is plotted, and the resultant illumination along the surface between the lamps is obtained by adding the ordinates of the two curves. If a space has to be uniformly illuminated by a number of lamps, the best results are obtained by arranging the lamps at the corners of equilateral triangles, or parallel to the boundaries of the space, in such a way that they are equidistant from each other in all horizontal directions. It must be remembered that flame arcs and carbon incandescent lamps are not quite symmetrical, and also that the uniformity and degree of illumination is considerably affected by the reflection from the surrounding walls.

Illumination of Buildings.—The methods described above enable us to determine the illumination of any given room or space. With an illumination of 5 candle-feet we can read as easily as in daylight, but in no case should the illumination be less than one candle-foot for reading purposes. For a general illumination 0·7 to 1 candle-foot is sufficient. The illumination is generally required in a horizontal plane about 3 ft. above the floor. In picture galleries, however, most of the light is required on the surrounding walls, and the fixing of the lights and the calculation of the illumination should be made accordingly. For a uniform distribution it is advisable to employ a large number of small lamps spaced equidistant over the whole ceiling, but a very uniform illumination is obtained by the use of inverted arcs. With this indirect method, however, 20 to 30 per cent. of the light is lost through absorption of the reflecting surfaces. When the illumination takes place with lamps arranged in clusters, we may treat these as single lamps with a mean spherical candle-power equal to the sum of the individual candle-powers, less a certain percentage on account of the fact that one lamp screens off part of the light from the other lamp. For clusters of two lamps about 12 per cent. should be deducted, for three lamps 16 per cent., and for four lamps 18 to 20 per cent. For purposes of calculation the polar-curve of the whole cluster should be plotted. The horizontal illumination from clusters consisting of more than two lamps is practically uniform. It is, of course, impossible to pre-calculate correctly the illumination of any room, since a great deal depends upon the nature and colour of the walls, ceilings, and furniture.

Some idea of what the illumination should be may be gathered from the following figures, recommended by the A.E.G., which give the necessary candle-power of the lamps to be used expressed in candle-power per square foot of floor space :—(1) For private houses : drawing-room, 0·4 to 0·5; dining-room, 0·3 to 0·35; bedroom, 0·15 to 0·2; kitchen, 0·1 to 0·2. (2) For shops : counter, 0·4 to 0·7; stores, 0·3 to 0·35; offices, 0·5 to 0·6. (3) For hotels : concert rooms, 0·9 to 1·3; meeting rooms, 0·5 to 0·7; private rooms, 0·2 to 0·4. The height of lamps in rooms less than 15 ft. high is usually 6 to 8 ft. For rooms more than 20 ft. high the convenient height is 0·4 times that of the room. For factory yards a good figure is 0·03 to 0·05 candle-power per square foot of floor space, for railway stations 0·05 to 0·1, for market halls 0·15 to 0·25, and for factories 0·2 to 0·3. In shops, factories and workshops, two kinds of illumination are wanted : a general illumination best supplied by arc lamps, and a concen-

trated illumination at the bench or machine which can be supplied by glow lamps.

Outdoor Illumination.—Outdoor lighting can best be judged by measuring, as above, the illumination in a horizontal plane, and, as it is inconvenient to test the illumination on the ground, the author proposes that the illumination should be determined in a plane one metre or about 3 ft. from the ground. The illumination should be judged by the average value, and the cost of the illumination should be stated per candle-foot per 1,000 sq. ft. of road surface. The uniformity of the lighting is expressed by the ratio of the maximum illumination to the mean illumination, and the ratio of the minimum illumination to the mean illumination. The more nearly these two factors approach unity, the greater is the uniformity of the illumination. Large squares and wide streets are best illuminated by arc lamps fixed 40 to 50 ft. above the ground. The best height would be 0·7 times the distance between adjacent lamps, but in this case we should require standards about 100 ft. high. In squares the lamps are best arranged at the corners of equilateral triangles; for streets, above the middle of the road. The average illumination for main thoroughfares should not be less than one-tenth of a candle; for side streets it is often less than one-tenth of this.

The determination of the average illumination may be accomplished by plotting illumination curves in various directions and taking the mean value. The method proposed by Dr. Bloch (*Elektrotechnische Zeitschrift*, 1906, page 493) is, however, much simpler. The street, according to this method, is divided up into a number of equal squares, so that each square receives one lamp bracket placed in its centre. The equivalent circular area of each square is taken, and it is assumed that no other lamp takes part in the illumination. If the average illumination over this circular area is then calculated, the value obtained must be multiplied by a factor κ, which is given by Dr. Bloch as $\kappa = 1{\cdot}2 - 0{\cdot}1\lambda$ where λ is the ratio of the distance between the lamps to the width of the street. The distance between the lamps is measured in the direction of the street, even if the lamps are staggered.

The problem is thus resolved into finding the average horizontal illumination over a circular area, due to a single source of light suspended over the centre of the area, and we can express this as follows:—If S_+ represents the circular area illuminated, and α_1 the angle subtended by the *radius* of the area (see Fig. 4), then the average mean horizontal illumination of the circular area is expressed by—

$$E_a = \frac{1}{S_+}\int_0^{\alpha} \frac{I\cos\alpha}{R^2} dS = \frac{2\pi\Sigma_0^{-1} I\Delta(\cos_\infty)}{S_+} = \frac{2\pi}{S_+} \times \psi_1.$$

The value of the integral alone is the mean spherical candle-power, that is, the mean candle-power taken over the solid angle of 4π, if we place π instead of α as the integration limit. To obtain the value of the integral from the polar-curve, we proceed as follows:—With the source L as centre, describe a quadrant with the radius $LK = 1$ (see Fig. 4). For each angle α we obtain then, on the vertical, the corresponding $\cos\alpha$, if we project upon LK the point of intersection R of each ray LP with the quadrant. Thus LS will equal $\cos\alpha$ since $LR = 1$. Now divide LK into, say, ten equal parts, so that each part represents $\Delta(\cos\alpha)$ or 0·1. For each angle α corresponding to the middle point of each zone, we can take the corresponding value of the luminous intensity I from the polar curve. By multiplying $\Delta(\cos\alpha)$ by I we get $I\Delta(\cos\alpha)$ for each of the ten zones, and by adding the separate values from below upwards we obtain $\Sigma\ I\Delta(\cos\alpha) = \psi$. These values of ψ have been plotted as a curve with LK as abscissa on the left of Fig. 4. This curve may be called a luminous flux curve, since any ordinate of the curve is proportional to the luminous flux within the corresponding angular region. In Fig. 4 the angle of 90° was divided into ten parts, and the mean value of the intensity I was taken for each part. The sum of these values for any number of parts is proportional to the total luminous flux in the corresponding solid angle. The values of ψ from the curve are equal to these summations of the intensities divided by the number of parts taken, in this case ten. The maximum value of the curve is the sum of the intensities of all the parts divided by the number of parts, or, as the polar curve is symmetrical about the vertical axis, the mean hemispherical candle-power, which in this case is 1,000 candles. Having determined this curve, we plot along LK a line LH proportional to h the height of the lamp above the testing plane, and perpendicular to this, HP_1 proportional to a_1 the radius of the illuminated area S_1. The angular region is then defined by $\alpha_1 = HLP_1$. The line or outermost effective ray LP_1 cuts the quadrant at R_1. Projecting this point R_1 towards the luminous flux curve, we obtain on the latter the value—

$$\psi_1 = \int_0^{\alpha_1} Id\cos\alpha$$

and, since $S_1 = \pi a_1^2$, the mean horizontal illumination is expressed by $E_a = \frac{2\pi\psi_1}{S_1}$.

The method possesses the advantage that the luminous flux curve has to be derived once only from the luminous intensity, or polar curve, and that we can obtain from it the value of ψ for any lamp height h and any radius a of any circular area to be illuminated. It may even be applied for lamps of different intensities as long as their distribution of light (or the shape of the polar curve) is similar. The values of ψ taken from the curve have then simply to be multiplied by a known ratio. It is advisable to plot for different types of lamps luminous intensity (polar) curves and luminous flux curves always ready for use. When the mean horizontal illumination and the area are specified, we find $\psi_+ = \frac{1}{2\pi} E_a S_+$ which is the necessary value of ψ_+ for an average illumination of E_a. For the radius a_+ corresponding to the given area and the given or assumed height, the angular region or the value of α_+ is obtained, and then the value of ψ on the mean candle-power curve of Fig 4, is found. The curve of Fig. 4 is for a lamp of 1,000 mean hemispheral candle-power, so, from the ratio of the calculated value of ψ_+ and value from Fig. 4, we can deduce the required intensity of the lamp. The following two examples show the use of this method:—

Example I.—A street 60 ft. wide is to be illuminated by arc lamps 150 ft. apart. The polar curve of the lamp used is as given in Fig. 4. The lamps are fixed 45 ft. above the road surface, or 42 ft. above the testing plane. We require to find the mean horizontal illumination.

The area to be illuminated by each lamp is 60×150, or 9,000 square feet. To this corresponds a circular area with a radius of 53·4 ft. Plot the height of 42 ft. in a suitable scale vertically, and the radius of 53·4 ft. horizontally, thereby determining the angle α_1 of 51° 50′. For this angle we obtain from the luminous flux curve of Fig. 4, the value $\psi_1 = 500$. The value of λ is $\frac{150}{60} = 2{\cdot}5$ and therefore $\kappa = 1{\cdot}2 - 0{\cdot}1 \times 2{\cdot}5 = 0{\cdot}95$, and so—

$$E_a = \kappa \times \frac{2\pi\psi_1}{S_1} = \frac{0{\cdot}95 \times 2\pi \times 500}{9000} = 0{\cdot}33 \text{ candle feet.}$$

Example II.—A street 54 ft. wide is to be given an average illumination of 0·4 candle-feet. The lamps are to be ordinary arcs with polar curves similar to the one in Fig. 4. They are to be fixed on standards 33 ft. high and 135 ft. apart. What must be the mean hemispherical candle-power of the lamp used?

From the formula $E_a = \kappa \times \frac{2\pi\psi_+}{S_1}$ we obtain

$$\psi_+ = \frac{S_+ E_a}{\kappa \times 2\pi} = \frac{54 \times 135 \times 0{\cdot}4}{0{\cdot}95 \times 2\pi} = 488.$$

The ratio λ was 2·5 as before, and the value of κ 0·95. The angle α_+ is determined as before by the ratio of the height of the lamp above the testing plane (30 ft.) to the radius of the equivalent circular area to be illuminated, which in this case is 48·15 ft., whence $\alpha_+ = 58°$. The value ψ_+ from Fig. 4 corresponding to this angle is 590, consequently, as the lamp of Fig. 4 has a M.H.S.C.P. of 1,000, the M.H.S.C.P. of the lamp which must be installed in this case is $1000 \times \frac{488}{590}$ or 830 candles.

In a similar manner we can find for given area, illumination and M.H.S.C.P., the height at which the lamps must be fixed; or, for a given street, height of standard and illumination, we can determine the distance between adjacent lamps. In the above determinations, reflection of light from the surrounding buildings has been entirely neglected. The average illumination will consequently be somewhat larger than that calculated, the amount depending upon the reflecting powers of the walls.

Illumination Photometers.—A photometer for measuring illumination must be portable, self-contained, easily set up, and suitable for comparing light of different colours. Illumination photometers may be divided into two classes: (1) Diffused reflection photometers, and (2) Diffused transmission photometers. In the former the light rays which are compared with those of the standard source are obtained by reflection from a white surface, and in the latter the light rays are directed straight from the source to the photometer screen. A photometer of the reflection type is that known as Prof. Weber's Photometer. This consists of a standard benzine lamp arranged

Digitized by Google

in a box at the end of a horizontal tube. In this tube, and capable of sliding in it, is a translucent screen of opal or ground glass. The light from the standard lamp, coming through this screen, is reflected by means of a Lummer Brodhun prism into an eyepiece. A vertical tube capable of being placed at any angle transmits the light from the white screen through the prism into the eyepiece. The two screens are thus viewed together. Equality of illumination is obtained by altering the position of the sliding screen. The range of the Webb photometer may be increased by the application of Nicol prisms or opal glass discs of different degrees of transparency. It is extremely transportable, the complete weight being about 22 lb.

Brothun's Street Photometer is based upon the fact that when light is obstructed by a rapidly rotating disc with a sectorial aperture, whereby the light is allowed to pass at definite intervals, the intensity of the emerging ray is reduced in the ratio of the angle of the opening to the total angle of 360°. The observer views through an eyepiece the rays from the standard lamp and the rays (reduced in intensity) from the source to be compared. The comparison standard lamp and the motor are fed from a six-cell battery, which causes the whole apparatus to be somewhat bulky.

Trotter's Photometer (see ELECTRICAL ENGINEERING, Vol. I., p. 849) consists of a fixed electric lamp, a pivotted screen, an index connected with the screen by a cam, giving a uniform scale, and a slotted screen receiving the illumination. The pivotted screen is seen through the slot. The total weight of this apparatus is about 10 lb.

The author then described some methods for measuring the mean horizontal candle-power and the mean spherical or mean hemispherical candle-power of lamps, with a single measurement. One form of photometer, known as Ulbricht's Integrator or Spherical Photometer, and used for measuring the mean spherical candle-power, consists of a hollow sphere about six times the diameter of the globe of the lamp under test. The inside of the globe is painted with sulphate of barium, which gives a suitable white surface which does not crack with the heat. A light placed inside is diffused in such a manner that the resultant illumination is uniform over the whole surface. Consequently, by measuring the intensity of the reflected light in any part of the spherical surface, and screening from this the direct light emitted from the source, we obtain a value which is proportional to the mean spherical candle-power of the lamp. The sphere is provided with a frosted glass window, the illumination of which is measured with a suitable photometer. The sphere is celebrated in the first place with a large incandescent lamp, the M.S.C.P. of which has been determined by the point to point method.

SOME EXHIBITS AT THE EDINBURGH EXHIBITION

THERE is a great dearth of electrical exhibits at this exhibition; indeed, the whole machinery section is very small. Much of the available space is taken up with demonstrations of baking, &c., although, as one would expect of an exhibition in Edinburgh, printing machinery is very prominent, washing and drying machinery for laundries is also well represented. The drying machines, called hydro-extractors, consist of two concentric cylinders about a vertical axis; the walls of the inner one are pierced with holes, and this cylinder, which contains the articles to be dried, is made to revolve at a speed varying from 1,000 r.p.m. to 1,500 r.p.m. There are one or two difficulties connected with the driving of these machines. For instance, when full of wet clothes, it is pretty certain to be unequally balanced, and this causes the whole thing to oscillate when running at a high speed. Again, owing to their large moment of inertia, it takes some time to get up speed, and when it is belt driven from a shunt-wound motor, the motor is found to take a most unreasonably big starting current, and utterly to ruin any lighting taken off the same mains. In a particular case it took 2½ minutes before the starting switch of such a motor could be got to its "full on" position. If it was put on any quicker, it melted its fuse or pulled down the voltage to an abnormal extent.

One of these machines is shown with an electric drive by Messrs. Watson, Laidlaw & Co., Glasgow. The motor is fixed on a framework above the extractor, and its shaft is in the same vertical axis with the extractor spindle, which it drives through a centrifugal friction clutch. The motor, which is enclosed, is series-wound, and is started by simply shifting a lever on the machine to the "on" position. The motor is thus started up "light"; it rapidly gets up speed, the extractor following until both are running at the same speed. Unloaded, the extractor takes two minutes to attain its full speed, which is 1,000 r.p.m. loaded. The starting lever, which works a single-pole switch, also puts on a brake, and this rapidly stops the machine when moved over to the "off" position. On the machine shown the motor is 6 b.h.p.; it is supplied at 460 volts, and it is built by the Lancashire Dynamo Co. The whole thing is delightfully simple and foolproof. There is no chance of oil or dirt working down into the extractor from the motor.

Messrs. Watson, Laidlaw & Co. show other examples of these machines arranged for direct driving from a water-motor or for belt driving.

Mr. Alexander Orr also shows laundry machinery. Most of his machines and pulleys are built of wood (maple), which has proved quite satisfactory in laundry work, and is both light and cheap. A washing machine consists of two concentric wooden cylinders on a horizontal axis; the inner one is made to rotate at a speed of 160 revs. per min., but is automatically reversed every four revolutions. The articles to be washed are put in this cylinder, which is pierced with holes, and steam and hot and cold water can be admitted at will. A machine with a capacity of "60 shirts" is belt-driven by a one h.p. motor. The unit of capacity for all these machines appears to be one shirt!

Mr. Orr also shows various electrical fittings, including a small fan that can be put on an ordinary lamp-holder; the motor is contained in a case 6 in. by 2 in., and takes 230 volts and about 0·2 ampere.

A patent electrically-driven carpet-beating machine at this stall is an example of the diverse uses to which electric motors are applied.

One of the most interesting exhibits is an electrically driven coal-cutting machine shown by Messrs. King & Co., Leith. This machine is exhibited in position in a model coal-seam; it is of the disc type. The particular machine shown is intended for use in narrow seams, and occupies a head-room of only 23 inches. The holing is made at the floor level. A disc of cast steel is employed, carrying twelve cutters bolted to its circumference; it is carried by a bracket, also of cast steel, and is geared with a cast steel bevel wheel. The frame is provided with levelling screws, and travels on rails. The feeding gear is particularly ingenious (Wilson's patent), and is regulated by hand, by means of a friction brake, from its maximum to zero, quite independently of the motor speed. To protect the gearing from falling coal and dirt, it is all covered with sheet steel. The motor is for a 500-volt continuous-current supply, has four poles, and is of a capacity of from 25 to 30 h.p. The armature is of the slotted-drum type, with former-wound coils. Carbon brushes are used. The magnet coils are compound wound. The two poles on the horizontal axis of the field contain the shunt winding, and the two poles on the vertical axis contain the series winding. This arrangement is to keep the head-room as small as possible, the series windings taking up much less room than the shunt windings.

The starting resistance consists of carbon packed between iron plates. When starting up, the switch is put on to the first contact, and kept there whilst the carbon warms up and its resistance falls; after this it can be passed over the remaining contacts, which cut out the resistance altogether quite quickly.

The switch is of the rotating drum type and wholly enclosed; both poles can be instantaneously broken by a push button switch. This switch has been adopted after a trial of many types, including a tramway controller. The machine can be worked in either direction, it being necessary to interchange two connections to reverse. This is done by breaking two screw joints with removable rubber covers. The trailing cable consists of two rubber insulated leads bound together with double braiding. The depth of holing is about 3 ft. 5 ins., and the width of cut about 3½ inches.

This machine, as at present in use, cuts from 160 to 180 yards in seven hours, and may do more under favourable conditions. Machines such as this rarely get the chance of a continuous run for any length of time. They are principally used in the East of Scotland pits, which are not gassy.

Messrs. Babcock & Wilcox show a model of one of their water-tube boilers with superheating pipes, &c., and Messrs. D. Thomson, Ltd., have a working model of a Stirling boiler made of glass, and heated with a Bunsen flame. It shows the water circulation well, this being least in the tubes and drum furthest from the fire, where the gases are coolest, and in practice this is where the greatest amount of scale is formed.

Digitized by Google

The Ingersoll-Rand Co. show several of their electric air drills. These are percussion drills, and combine in a very happy way the advantages of compressed air for the actual drill with the ease of transmission of electrical energy. The arrangement consists of two parts: the drill itself, which is mounted on a tripod, is very simple; it consists of a piston (to the rod of which the bit is attached) working in a cylinder; there are no valves, springs, &c. Two hose-pipes are attached to two openings into the cylinder, one at each end. These pipes are led to the second part of the apparatus, which consists of a compressor, driven by an electric motor, and the whole is mounted on a truck made for the gauge of the mine track. The compressor consists of two vertical cylinders, in which work two pistons, driven by cranks from a shaft, and the shaft is geared to the motor. The two cylinders are connected by hose to either end of the drill cylinder. The air is thus alternately compressed and expanded on either side of the drill piston. There is no exhaust. The motors shown are 220-volt 3-phase induction motors of 3 h.p. The controller switch can be worked by the man operating the drill by a cord. The length of drill is 42 inches, the length of stroke seven inches, approximate strokes per minute 460, diameter of hole drilled $4\frac{3}{4}$ inches. The makers arrange for two speeds with alternating current motors and four speeds with direct current motors.

The Simplex Co. have a stall in the industrial hall, and show their well-known conduits, as well as electric kettles, flat-irons, &c.

Practically all the working exhibits are electrically driven by continuous current motors, whilst among the amusements the figure 8 railway (easily the most popular side-show) and the "flying machine" are also electrically driven. The water chute lift is worked by a gas engine.

A GRAPHIC METHOD FOR DETERMINING THE MEAN SPHERICAL INTENSITY OF A LAMP

MR. A. E. KENNELLY, in a recent article in the *Electrical World* of New York, describes a new method of determining graphically the mean spherical intensity of a lamp. The following is an abstract of his article:—

There is a well-known graphic method, generally known as the "Rousseau diagram"* method for determining the mean spherical intensity of a luminous source, when the curve of mean luminous intensity in altitude, or, briefly, the polar curve, has been obtained. The Rousseau diagram has been much used by photometrists, and has been frequently referred to in photometrical literature, so that no detailed description of it is needed here.† The diagram requires to have a surface measured, either by planimeter or by counting little squares on suitably squared paper. The mean spherical intensity on the diagram is essentially a surface or two-dimensional quantity.

The new method described in this article has the advantage of yielding the mean spherical intensity as the length of a certain vertical straight line, or as a one-dimensional quantity. This dispenses with the use of a planimeter or equivalent surface measuring device. It consists essentially in determining graphically from the given polar curve an evolute, and the involute of the same, and then projecting this involute upon a vertical line. Half the length of the projection is equal to the mean spherical intensity, to the same scale as the original polar curve. The entire process requires only an angle protractor and a pair of compasses.

The new graphical method may best be explained by reference to Fig. 1, which shows its application to the particular case of a simple circular polar curve *OAHB*. This polar curve roughly corresponds to the distribution of intensity from an inverted incandescent lamp, having its base at *V* and tip at *V'*, except that the tip candle-power does not usually fall off so much as the curve between *B* and *O*. The mean horizontal intensity would be *OH*, the diameter of the circle, and corresponding, say, to 10 candle-power. In Fig. 1 the construction is adapted to zones of 30°. Find the radii of the midzones; *i.e.*, at +75°, +45°, +15°, −15°, −45°, −75°. Mark these by the dotted lines *Ot*, *Os*, *Or* *Or'*, *Os'*, *Ot'*, respectively.

With radius *Or* and centre *O*, describe the arc *hra*, through an angle of 30°. Draw the radius *Oa* at the end of the arc. Measure from *a*, along *aO*, a distance *ab*, equal to *Os* the second midzone radius. With centre *b*, and radius *Os*, describe the arc *ac* through an angle of 30°, so that *bc* makes an angle of 60° with the horizontal *OH*. Draw the line *bc* at the end of this arc. From *c* toward *b* mark off a distance *cd* equal to *Ot* the third midzone radius. With centre *d* and radius *Ot* describe the arc *ce* through an angle of 30°, so that *de* makes an angle of 90° with the horizontal *OH*. Draw the line *de*.

Extend the arc, *h a' c' e'* from the horizontal to the vertical beneath in the same manner as above, by steps of 30°, with centres *O*, *b'*, and *d'* and radii, *Or'*, *Os'*, and *Ot'* respectively. The curve *e c a r r' a' c' a'* will now be continuous and complete. Draw a vertical line *QQ'* through the convenient point *H*, and project horizontally the points *e*, *c*, *a*, *a'*, *c'* and *e'* upon the same. Then half the distance *QQ'* between the end projections will be equal to the mean spherical intensity of the lamp. The length *HQ* is the upper hemispherical intensity. The length *HQ'* is the lower hemispherical intensity. Their arithmetical mean is the mean spherical intensity. Since in this case the upper and lower hemispheres are symmetrical, $HQ = HQ' = \frac{QQ'}{2}$ = mean spherical intensity. By measurement, this half length is found to be 7·78 units. The lamp would thus have an apparent mean spherical intensity of 7·78 candles, and a spherical reduction factor of 0·778.

If, therefore, the geometrical construction were perfect, and could be read off with sufficient precision, the mean spherical intensity, with 30° zones, would be 7·7645 candles.

In Fig. 2, the new diagram is constructed for zones of 10° instead of 30°. We therefore arrive at a more nearly correct result by the same process, but with nine steps in each hemisphere

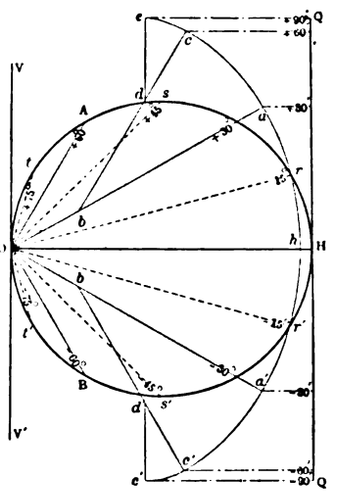

FIG. 1.—NEW DIAGRAM OF CIRCULAR MEAN INTENSITY DISTRIBUTION ON A VERTICAL MERIDIAN THROUGH A LUMINOUS SOURCE. MEAN HORIZONTAL INTENSITY $OH = 10$.

Rectification by 30° zones. Apparent mean spherical intensity $= QQ' \div 2 = 7{\cdot}78$
Theoretically correct value, 7·854.

instead of three steps. As before, with centre *O* and radius *O*+5°, we lay off an arc of +10°, and join *Oa*. Along *aO*, from *a*, we mark off the distance *ab*, equal to the second midzone radius *O*+15°, and carry the arc to *c*, such that *bc* is inclined 20° with *OH*. Proceeding in this way we draw the continuous curve *H a c e g i k m o q*, by successive steps of 10°. This curve may be called the involute. We also obtain the broken line *O b d f h j l n p*, which may be called the evolute. In fact the successive tangents *bd*, *df*, *fh*, &c., on the evolute, lie upon successive normals *ba*, *dc*, *fe*, &c., to the involute. If pins be inserted at the points *b*, *d*, *f*, &c., on the evolute, a string fastened at the point *O* and extended without slack to *q*, so as to carry a pencil at *q*, would, when unwound toward *H*, describe and draw the involute *q o m.....aH*.

A similar construction and condition apply to the involute and evolute of the lower hemisphere. When both involutes are completed, their horizontal projection on the vertical through *H* gives the distance $QQ' = 2 \times 7{\cdot}88$ by scaling.

For many purposes the mean spherical intensity of such a polar curve can be satisfactorily secured by rectification in 30° zones, and a high degree of accuracy can, for practical

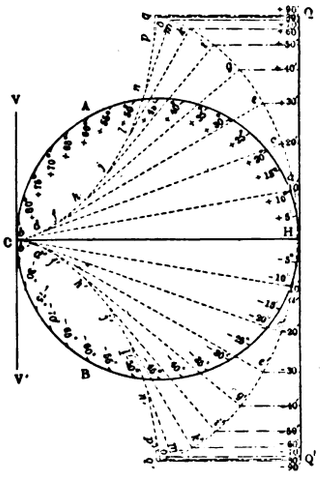

FIG. 2.—NEW DIAGRAM OF CIRCULAR MEAN INTENSITY DISTRITION ON A VERTICAL MERIDIAN THROUGH A LUMINOUS SOURCE.

Mean horizontal intensity $OH=10$. Rectification by 10° zones. Apparent mean spherical intensity $QQ'/2=7{\cdot}88$. Theoretically correct value $7{\cdot}854$.

purposes, be secured by rectification in 10° zones. For most purposes 20° zones are recommended as giving practically satisfactory results.

As another example of the new diagram, Fig. 3 shows the

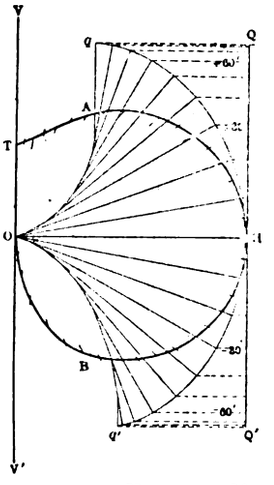

FIG. 3.—NEW DIAGRAM OF VERTICAL MERIDIAN INTENSITY DISTRIBUTION FOR A SAMPLE OF REGULAR OVAL ANCHORED FILAMENT INCANDESCENT LAMP, RECTIFIED BY 10° ZONES.

Mean horizontal intensity $OH=1$. Mean spherical intensity $=QQ'/2=0{\cdot}83$. See Bulletin of Bureau of Standards, December, 1907, vol, 4, No. 1, p. 106, Fig. 7.

rectification of the polar curve for a sample of regular oval anchored filament incandescent lamp as published in the *Bulletin of the Bureau of Standards*.* The rectification is effected for zones of 10°. The mean horizontal intensity OH, being taken as unity, the mean spherical intensity $\frac{QQ'}{2}$ appears as 0·83 from the diagram, and this is therefore the apparent spherical reduction factor for the lamp under consideration. The spherical reduction factor mentioned in the paper is 0·826.

A further example of the use of the new diagram is shown in Fig. 4. On the right-hand side of the vertical VV' is the polar curve for a certain 16-c.p. incandescent lamp.† The mean spherical candle-power of this lamp is indicated by rectification to be 13·2, representing a reduction factor of 0·825. Of the total light emitted by the lamp, $\frac{12{\cdot}95}{26{\cdot}4}$ or 49 per cent. is indicated as emitted in the hemisphere DCH to which the lamp base belongs, and 51 per cent. in the hemisphere ABH containing the lamp tip. On the left-hand side of the vertical VV' is

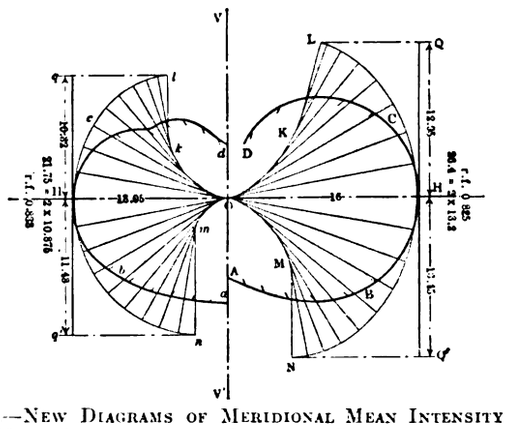

FIG. 4.—NEW DIAGRAMS OF MERIDIONAL MEAN INTENSITY OF A NEW 16 CANDLE-POWER LAMP, ON RIGHT SEPARATELY AND ON LEFT AFTER BEING ENCLOSED IN A 6-IN. FROSTED GLOBE.

Mean spherical candle-power 13·2 and 10·875, respectively. Rectification by 10° zones. See Transactions of the Illuminating Engineering Society, April, 1907, Vol. 2, No. 4, p. 216, Fig. 7.

the polar curve given for the same lamp after being enclosed in a 6-in. frosted globe. The mean spherical candle-power of the combination is found to scale $\frac{VV'}{2}=10{\cdot}875$, representing a spherical reduction factor of 0·833, and a diminution in mean spherical candle-power, and in total light flux, by 17·7 per cent., due to absorption of light by the frosted globe. This deduction assumes that the globe and enclosed lamp radiated light as a virtual point-source. If a globe or reflector attached to a lamp causes the light to radiate otherwise than from a virtual central point as viewed from the photometer screen, it is needless to say that neither the term candle-power nor zonal candle-power properly applies to the combination except as apparent values under the particular conditions of observation. Neither the Rousseau diagram nor the new diagram applies without modification to such a case.

The new graphic method for evaluating the mean spherical intensity of a lamp directly from its polar curve, above described, expresses the result as a straight line. It performs the same function as the Rousseau diagram; but dispenses with the planimeter, requiring only compasses and protractor. It possesses theoretically at least as great a degree of accuracy as the Rousseau diagram, for a given number of zones. It gives at a glance the upper and the lower hemispherical intensities, the mean of which is the mean spherical intensity. It further enables the luminous flux through any zone, per radiar of azimuth, to be read off directly from the line of projection. It has been found practically useful.

ELECTROCHEMISTRY AND ELECTROMETALLURGY

MESSRS. LUDWIG, BOLLE & CO., whose British Patent, No. 5,764 (1907) was published last month, have invented a process and apparatus for electrically fusing, refining, and moulding refractory substances such as quartz. Silica is fused by heating it electrically in a horizontal or vertical carbon tube which forms one electrode in an electric furnace. The tube is surrounded by powdered carbon or other resistance material, and this is contained in a wide carbon tube which forms a second electrode, the whole apparatus being cased in refractory bricks. One end of the inner carbon tube is closed by means of a movable carbon plug, the other by a plunger which can be lowered into the melted material. The silica may be compressed into the form of a solid block, or it can be pressed against the walls of a carbon tube so as to form a hollow cylinder, depending upon the shape of the plunger. The plunger may also be made hollow, and then steam or compressed air can be forced through it into the carbon tube. At the end of the operation the plug at the bottom of the tube may be removed, then the plunger can be employed to eject the silica.

At a meeting of the Faraday Society held on the 9th, Dr. Albert Frank contributed a paper "On the Utilisation of the Atmospheric Nitrogen in the Production of Calcium Cyanamide and its Use in Agriculture and Chemistry." The Paper commenced with an historical introduction. The chief difference

Digitized by Google

between the process of Birkeland and Eyde, and that of Caro and Frank, is that the former is endothermic, *i.e.*, heat is absorbed, whereas when nitrogen is fixed by means of carbide heat is given out, therefore the reaction is exothermic. Neither process is actually electric or electrolytic; they are both thermal, but, generally speaking, when high thermal effects are required, electrical energy is the most satisfactory method of producing the thermal effect—often the only method. When barium carbide is heated to 700 or 800° in the presence of nitrogen barium cyanide, $Ba(CN)_2$, is produced, but also at the same time barium cyanamide is produced. It is, however, found that by heating in presence of a flux, such as potassium carbonate, the whole of it can be converted into cyanide. With calcium carbide, on the other hand, the main product was calcium cyanamide, and by paying attention to the conditions, calcium cyanamide alone could be produced,

$$CaC_2+2N=CaCN_2+C.$$

When this was discovered, Messrs. Siemens and Halske, and the Deutsche Bank of Berlin, founded the Cyanid Gesellschaft in order to develop the process. One of the uses of calcium cyanamide, apart from agricultural purposes, is its employment for case-hardening of steel, in place of the generally employed yellow prussiate. As to the method of manufacture, the carbide made in the electric furnace is ground, charged into retorts which are in the older plant heated by gas firing, but more recently a special electric method of heating has been devised. Air freed from oxygen by liquefaction and fractionation, and subsequent passing over heated copper, is then passed over the heated carbide. When the action of a valve shows that nitrogen is no longer absorbed, the cyanamide is removed, allowed to cool out of contact with air, and is ground up, when it is ready for use. The product comes on the market under the name of *nitrolim*. Most carbide works give a yield of two tons of carbide per kw. year, and the two tons of carbide will unite with about 500 kilog. of nitrogen to produce nitrolim. Two kw. or $2\frac{3}{4}$ h.p. per year is required to fix one ton of nitrogen. For the other operations about $\frac{1}{3}$ h.p. is required. If, therefore, nitrolim were to be entirely substituted for nitrate of soda, no less than 800,000 h.p. would be required, that is, provided the demand for fertilisers remained constant, whereas we know it is continually increasing. The first large industrial plant was started about $2\frac{1}{2}$ years ago at Piano d'Orta, in Central Italy, for an annual production of 4,000 tons; the capacity is now being increased to 10,000 tons. Another plant is ready to start in Terni, and yet another is in course of erection in San Michel, in the Val d'Aosta. In Austria-Hungary large works are in course of erection by the Societa Generale of Rome, one in Sebenico, with a capacity of 4,000 tons, and also one in Istria. At Almissa a water-power plant of 50,000 h.p. is being erected, also one in Dalmatia. In France the Société Française des Produits Azotés have works at Nôtre Dame de Briançon, with an output of 4,000 tons. In the Rhône Valley, in Switzerland, the Société Suisse des Produits Azotés have also opened works. In Germany the works at Westeregeln and Brühl on Rhine are producing 10,000 tons of nitrolim annually. There is also an installation near Bromberg with an output of 2,500 tons, and the large works of the Cyanid Gesellschaft have been built to deal with 15,000 tons at Alz-Fluss in Bavaria. In the United States the American Cyanamide Co. are constructing works on the Canadian side of Niagara to deal with 5,000 to 6,000 tons per annum, and it is intended later on to enlarge these so as to have an output of 40,000 tons. The chief British enterprise is the North-Western Cyanamide Co., Ltd., with a capital of £120,000, which was incorporated in the middle of the year 1906, to acquire and work licences from the Societa Generale. The works are erected at Odda, near the head of the Hardanjer Fjord. The present capacity of the works is 12,500 tons, and the works are so arranged that they may eventually be enlarged to 50,000 tons. The nitrogen is produced by the largest Linde pump ever erected, which has a capacity of 375 cubic metres per hour, and the latest electrical furnaces have also been installed there. A comparison was made between the atmospheric oxidation process of Birkeland & Eyde, which employs from 25,000 kw., whereas for an equivalent amount of nitrogen in the form of nitrolim only 5,000 to 6,000 kw. are used.

ELECTRICAL SCIENCE

British and American

The Active Deposit from Actinium.—The radioactive material known as actinium produces radioactive deposits on solids kept near it just as the other radioactive materials do. As a rule, the deposits from the various radioactive substances take place most heavily on metallic conductors kept negatively charged to a somewhat high potential. For example, if two wires be inserted into a vessel containing thorium emanation, one charged positively, the other negatively, the amount of active deposit obtained on the negative wire is more than one hundred times that on the positive, if the enclosed gas in the vessel is at about atmospheric pressure. If the pressure of the gas is reduced to a few millimetres of mercury, the disproportion is, however, not so great. If the same experiments be performed on actinium, the latter of the above effects is reversed; that is, though the active deposit on the negative wire is twice that on the positive wire at atmospheric pressures, the negative wire gathers twenty times as much as the positive at a pressure of a few millimetres. This effect is investigated by S. Russ in a Paper in the *Philosophical Magazine* for June. Two brass wires connected to the ends of a 320-volt battery were led through insulating ends into a wide, horizontal, closed brass tube, which was connected to the middle point of the battery. The actinium was placed at about the middle of the horizontal tube, and the wires exposed in the chamber for about two hours. The activities of the deposits on the wires were estimated by measuring the saturation current each produced when placed in a cylindrical ionisation chamber connected with an electrometer. Gas pressures varying from an atmosphere to two millimetres of mercury were employed in the depositing tube, and the ratio of the activities of the negative and the positive wires obtained at each pressure. This ratio was about 2 at 76 cm. of mercury, about 60, its maximum, at 5 cm., and 22 at 0·2 cm. The author next arranged that the plus and minus electrodes could be moved together towards and away from the actinium, the apparatus taking the form of a vertical cylinder with the actinium resting on the bottom. Several remarkable results were obtained. As distance from the actinium increased, while the gas was maintained at atmospheric pressure, the deposit on the negative plate steadily diminished, while that on the positive plate increased to a maximum and fell again. The ratio of the two deposits fell continuously. If the gas were kept at a pressure of 2 millimetres of mercury the deposit on the positive electrode diminished slowly, and that on the negative plate increased steadily. To account for the effects observed at atmospheric pressure the author suggests that the positively charged active deposit particles may become neutralised, and in fact even become reversed in sign in their passage through the gas. To account for the increase in the ratio at low pressures it must be remembered that at the moment of formation the active deposit particles have a high velocity; a certain number of collisions may be necessary to reduce their speed, so that the existing electric field may be capable of directing them to the electrodes. Hence it may be expected that if the distance of the plates from the actinium were made sufficiently large at the lower pressure similar results to those obtained for the atmospheric pressure would be observed. The author found this expectation borne out on using a larger cylinder.

Continental

Harmonic Oscillations of Spark Discharges.—The difficulty of obtaining pure sine waves from spark discharges is further illustrated by G. A. Hemsalech's latest contribution to the subject in the *Comptes Rendus* for May 25th. He uses both the photographic method and the air-blast method. The photographs, in which the spark is placed on the other side of a slit, and the plate is moved at a high speed, show striæ accompanying each discharge, much as they do in photographs of lightning flashes taken on moving plates. These striæ occur at equal intervals, and therefore immediately suggest upper partial discharges. Battelli and Magri attribute them to the subsequent projection of metallic vapour. This objection is answered by Hemsalech by saying that he, too, finds traces of metallic vapour, but that these traces, proceeding with a slower speed than that of the harmonic discharges, show a perceptible curvature. The air-blast breaks up the spark into a series of minute arcs, which show the band spectrum of nitrogen. A magnetic field deflects the discharge, but does not affect the vapour jets. Decided harmonics are obtained with a coil 100 cm. long and 20 cm. wide, wound in two layers. A flat coil with the same wire in 25 layers gives no harmonics.

Alternate-Current Permeabilities.—L. Schames, in the *Physikalische Zeitschrift* for May 1st, points out a peculiar anomaly in the determinations of magnetic permeability for alternating currents. Such permeabilities, determined for various frequencies and damping ratios, are usually deduced from complicated conditions, and always result in values which represent the mean taken over the current curve. Such values cannot be directly compared with direct-current permeabilities. The author gives a method of obtaining the true permeabilities over a half-period. It gives the mean value, 1,520, for soft iron, which has a permeability 1,300 for direct current. The two curves showing the permeability as compared with the field for direct and alternating current respectively intersect at $H=2·8$. Below that value the direct-current permeability is the higher by 20 per cent. In the strongest fields the two curves will approach again asymptotically.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 4th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.
Names in brackets indicate communicators of inventions from abroad.

1907 Patents

8,255. S. Z. DE FERRANTI. The object of this invention is to improve the quality of steel produced in the electric furnace, and at the same time to hasten the process. Heat is produced in the furnace by chemical combustion as well as by electrical means, and to ensure that the metal is brought into intimate contact with the various reagents it is actively circulated electrically. Both the heating and the circulation of the metal are produced inductively by means of alternating currents. A three-phase furnace is described in the specification, in which the three laminated iron cores pass right through the bath; the metal then circulates round the three limbs, and a large current is induced in the metal, heating it to a very high temperature. In another arrangement, the three-phase magnetic circuit is situated below the bath only, by which means effective circulation with little heating is obtained. The energising coils are wound with a tubular conductor, through which a cooling liquid circulates. Additional heating is obtained by injecting combustible gases on to the surface of the metal. Ten claims, eight figures.

10,699. T. MARRIOTT. A process for rendering soft petroleum pitch ductile like the best grades of natural bitumen. The product is suitable for filling cable trenches, as it is not only ductile but is not so susceptible to heat as untreated soft pitch, and will not easily deteriorate. Kaolin or some other high-grade clay is added in the form of fine powder to a soft petroleum pitch, in the proportion of 3 to 4½ per cent. of kaolin. This mixture will not crack on sudden changes of temperature, and is not brittle. Two claims.

20,202. SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens-Schuckerterke Ges.*). An alternator may be compounded, by adding additional field windings, and supplying these with continuous current from the rotor of a small rotary converter coupled mechanically to the alternator so as to rotate synchronously with it, and in a definite angular position to it. The rotor of the rotary converter is supplied with alternating current by means of slip-rings, the said current being obtained from the secondary windings of a series transformer, the primary windings of which are traversed by the load current. The continuous-current voltage generated by the rotary converter will be proportional to that component of the flux (produced by the alternating current in the rotor) which is at right angles to the axis of the brushes on the commutator. Thus the compounding effect will be proportional to the watt-component only of the alternating current. If the brushes are shifted the compounding effect is correct for a certain power factor only. In the latter case also a compensating winding could not be used. According to the present invention, the commutator of the converter is supplied with two pairs of brushes for each pair of poles, and two separate continuous currents are taken from the converter to excite two compounding windings on the alternator. One of these currents will be proportional to the watt-component and the other to the wattless component of the alternating current, as the axes of the two pairs of brushes are set at right angles. The stator of the rotary converter may or may not have any field coils, as the alternating current supplied to the rotor excites the field. Compensating windings for each of the two continuous currents should be provided, and the windings compensating along one axis must be excited with the current taken from the brushes in that axis. Two continuous currents obtained by the above method can also be utilised for the excitation of boosters in connection with buffer batteries in single- or polyphase plants. Four claims, four figures.

25,967. P. M. LINCOLN. A load equalising arrangement for use on alternating-current distributing systems in which the generators are subject to sudden and heavy load variations. A rotary converter and a booster generator are coupled together electrically and mechanically. The booster generator is connected to the alternating-current mains through a transformer, and the continuous-current side of the rotary converter is connected to a storage battery. The E.M.F. of the booster generator is in phase with the E.M.F. of the rotary converter and also with that of the mains, and the booster generator thus directly opposes or directly assists the mains according to its field excitation. Under normal conditions the fields of the machines are so adjusted that the cells are being neither charged nor discharged. By means of a piece of apparatus operated from a series transformer in the main circuit, the fields are so automatically altered on a variation of load that the cells are charged on light loads, and discharged when the load is heavy, assisting the main generators in the latter case by supplying current through the rotary converter, booster generator, and transformer. Two claims, one figure.

1908 Patent

1,231. B. KAUFMANN. In the manufacture of metallic paper or metal foil substitute, such as is used in the manufacture of condensers (see ELECTRICAL ENGINEERING, May 14th, page 741), the paper is passed through an ordinary coating machine, which lays on the metallic film. It was found that certain papers could not be used with the ordinary rollers, but this objection is overcome by using rollers with a very finely engraved surface. Two claims.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.
Summaries of the more important of these patents will appear in our next issue.

LOCAL NOTES

ABERDEEN: *Tramway Accounts.*—The financial year of the municipal tramways undertaking ended last week, and the receipts amounted to £71,087, a decrease of £699 compared with those of the previous year. The total, however, is above the estimate, the receipts for the preceding twelve months having been greatly augmented by the exceedingly heavy traffic in consequence of the University celebrations. The number of passengers carried was 16,634,304, a decrease of 236,227.

Supply to Tramway Co.—At the last meeting of the Corporation some correspondence was read between the Town Clerk and the Secretary to the Aberdeen Suburban Tramways Co. with reference to the supply of energy by the Corporation. The company suggested that the whole matter should be referred to arbitration, but no decision has yet been come to by the Corporation, the letter being remitted to the Electricity Committee.

Underground Telephone System.—Work has been commenced upon the underground telephone system in Aberdeen by the Postmaster-General's department. Some 21 miles of streets will be opened for the purpose of the new telephone system by which overhead wires will be abolished.

BATH: *Sale of Electrical Undertaking.*—As we have already announced the Corporation has decided to sell its electrical undertaking to a company. Official notice is now given of the intention to transfer the undertaking, subject to the consent of the Board of Trade, to the Bath and District Electric Supply Co. for 30 years, the consideration being a sum of £162,939, of which £22,500 has been paid as a deposit and the remainder will be paid by 30 annual instalments covering principal and interest of 3½ per cent. per annum on the balance remaining unpaid reserved as rent during the period of the lease.

BATLEY: *Electricity.*—For the financial year just ended the profits upon the Corporation electricity undertaking were £212, compared with £434 last year. The decrease is accounted for mainly by the increase in the price of coal and in rates, and also by payments made out of revenue which have formerly been paid out of capital.

BIRMINGHAM: *Electricity Accounts.*—At the last meeting of the Corporation the report dealing with the accounts of the undertaking for the year ended March 31st, 1908, was presented. The Chairman of the Electricity Committee, Mr. Ellaway, said that the chief features of the report were the growth of output and the further decrease in the works costs. The increase in the supply for tramways had been exceeded by about one million units, whilst there had also been a noticeable increase in the supply for private lighting and power. In the previous year there had been an increase of 30 per cent. in the output; during the past year the output had increased by 37 per cent. in units and 25 per cent. in money value. The increase in motor connections amounted to 3,491 h.p., and he drew attention to the fact that whereas two years the h.p. of motors connected was just over 3,000, the total was now over 9,000. The works costs last year came out at 0·766d. per unit, compared with 1·06d. in the previous year, and the reductions would have been larger but for the fact that coal cost £2,000 more, owing to the rise in price. These works costs compared satisfactorily with other large towns, for in Nottingham they were 1·01d.; Manchester, 0·83d.; Liverpool, 0·79d.; Bradford, 0·73d.; Leeds, 0·69d.; Sheffield, 0·68d.; and Salford, 0·65d. None of these figures include capital expenditure, so that the comparison was on the same basis. The undertaking had now paid off nearly £100,000 of capital, it had a reserve fund of £70,000, and they were replacing obsolete plant to the extent of £30,000. In answer to questions as to the writing off of the value of obsolete plant at the Dale End station to the extent of £20,000 out of revenue, Mr. Ellaway said the Electricity Committee had no alternative but to do this, for the Local Government Board would not grant a loan for the new plant, and, at the same time, allow them to keep the £20,000 on the books as part of their capital.

Tramway Accounts.—The report of the Tramways Committee shows a capital expenditure upon permanent way, to date, of £577,320, or a cost per car mile of single track of £6,800. Street widenings have cost £234,644, of which £80,000 have been transferred to the Public Works Department. The overhead equipment has cost £50,798, or £1,500 per mile of single track, but this includes the wiring of the depôts. Traffic expenses during the year, which is the first complete one of municipal work, came to £76,069, whilst the general expenses amounted to £27,089, which latter sum includes law charges and compensation to the extent of £6,879, this being largely made up by compensation paid in respect of the Warstone Lane accident. The total expenses amounted to £168,444. The receipts from Corporation cars amounted to £324,898, from the Birmingham and Midland Tramways Joint Committee, in respect of the company's cars running over the Corporation's lines, £31,069, and sundry traffic receipts, £718, making a total of £356,685. From this has to be deducted £70,430, payable to other authorities in respect of Corporation cars running over their lines, leaving the net traffic receipts at £286,254. After meeting interest and sinking fund, &c., it is proposed to carry £37,000 to reserve and contribute £35,000 towards the relief of rates. The average fare paid per passenger was 0·9d., and the cost per passenger, including interest and sinking fund and a fair amount for depreciation, was 0·74.

BLACKPOOL: *Electric Lighting Accounts.*—The accounts of the Electricity Committee for the financial year just ended show a revenue of £36,565, and an expenditure of £16,140. There are now 1,126 consumers upon the electric lighting mains. The number of public arc lamps is 278, and public incandescent and Nernst lamps number 726. During the year an extra capital expenditure was involved of £9,279, making a total to date of £199,052, of which £42,423 have been paid off. The reserve fund stands at £6,153.

BOLTON: *Electric Driving.*—The Musgrave Spinning Co. are introducing electric power in their three large mills here. Messrs. Dobson & Barlow, the well-known textile engineering firm, have put down motors in their new works at Bradley Fold, near Bolton. They have been supplied by the British Westinghouse Co., Ltd., of Trafford Park, Manchester, the power being obtained from the Lancashire Electric Power Co.

BUENOS AYRES: *Tube Railways.*—The *Review of the River Plate* states that the only tender received for the construction of tube railways in Buenos Ayres was presented by the Consortium d'Entrepremeurs du Metropolitain de Paris, associated with the French branch of Thomson Houston, both represented here by Supervielle & Co. The tender gives three proposals:—(1) Construction of two lines 1·67 m. gauge, with tunnels lined with brick, $18,520,598 gold. (2) Gauge 1·44 m., tunnels lined with brick and iron rings, $17,529,929 gold. (3) Gauge 1·44 m., lining brick, $16,412,045 gold. The offer lays down numerous conditions and to finish the work in 3½ years. A fine or bonus of $10,000 a week for delays or advancement in finishing the work is also proposed.

BURSLEM: *M.E.A. Convention.*—The chairman of the Electricity Committee and the Electrical Engineer have been appointed to attend the annual convention of the Incorporated Municipal Electrical Association at Nottingham.

BURY: *Tramwaymen's Holiday.*—The Tramways Committee have decided to grant their employees a week's holiday with pay, yearly, under certain conditions. There was some opposition in the Council to the concession, which, it is stated, will cost the Corporation about £250 per year.

COLCHESTER: *Tramway Deficit.*—The Tramway Manager's annual report states that for the year ended March 31st there is a deficit upon the tramway undertaking of £2,929 against £2,089 last year.

CROYDON: *Electricity Accounts.*—The report of Mr. A. C. Cramb, the Borough Electrical Engineer, on the eleventh year of working of the electrical department shows a total capital expenditure to March 31st of £339,203, the expenditure during the year being £6,730. The capital expenditure during the previous year was £19,125. Considerable attention has been given to the question of stores, with a view to reducing the amount in hand. For the first time repayments to sinking fund have exceeded the amount spent on new works, the respective amounts being £11,081 and £6,730. The total expenditure during the year was £31,133, an increase of £2,916 over that of the previous year, whilst the total receipts amounted to £66,937 10s. 7d., an increase of £1,927. Coal cost £13,454, an increase of £1,674. The coal bill would have been considerably increased but for the large stock of coal purchased under old contracts, which effected a saving of several hundred pounds. Certain purchases during the spring had, together with the stock brought in, the general effect of preventing the coal bill reaching a still higher figure. The net surplus on the year's working is £12,242, as compared with £8,927 12s. 3d. for 1907. Against this sum, however, is the cost of coal bunkers and conveyor, £2,100 already incurred. The price per unit obtained for private supply, viz., 3·6, has decreased 0·2d.; the number of consumers is 2,902, an increase of 256; the units generated increased from 6,027,338 to 7,005,141, and the units sold from 4,936,857 to 5,875,003; whilst efficiency of distribution has increased from 82·8 per cent. to 84·03 per cent. The maximum load on the station for both general supply and traction was 3,255 kw., against 3,381 kw. for the previous year, and the load factor has increased from 16·66 per cent. to 20·60 per cent. The capacity of the works remained stationary at 5,750 kw. The reduction in the maximum load on the works is attributed to the adoption of metal-filament lamps in shops. With the amount allocated last year the reserve fund now stands at £22,410. With regard to future requirements, the report points out that the only outstanding loan is that granted in April, 1907, amounting to £21,812, which has been almost expended. Application has been made for a further loan amounting to £13,500, the whole of which is required for the distributing system. Mr. Cramb concludes his report with a reference to the general position of the undertaking. He says that a fair increase in the business of the undertaking has been made, and the more general use of metal-filament lamps has given great satisfaction and effected a large economy in the case of many consumers' accounts. This, of course, had the effect of minimising the rate of increase of units sold for lighting during the past year. It is probable that

Digitized by Google

there will be a far greater reduction in the amount of electricity sold for private lighting to existing consumers during the present year. The following figures of the totals of 12 lighting consumers' accounts for the last two years show the saving now being made by the adoption of metal-filament lamps, and in all cases with greatly increased light:—1907, £612 15s. 10d.; 1908, £447 13s. 5d.; decrease, £165 2s. 5d. The saving effected in individual cases has reached as much as 48 per cent. There has been a satisfactory increase in the amount of electricity sold for power purposes, and there is no doubt that the electric motor is rapidly increasing in popularity. The time switch system of charging for motive power has proved satisfactory, both to the consumer and the undertaking.

DARLINGTON: *Tramway Accounts.*—The Borough Accountant's statement of the financial position of the tramway undertaking to March 31st, 1908, shows a net profit of £2,314. It has been recommended that £465, capital charges which the Local Government Board has declined to sanction as part of loan expenditure, shall be written off the surplus.

DOVER: *Electricity Estimates.*—The estimates of revenue and expenditure in connection with the electricity undertaking during the coming year show a total expenditure of £9,059 and estimated receipts of £20,477. The deficit for the year just ended, namely, £2,147, is deducted, together with interest on loans, sinking fund, and bank interest, making a total of £13,711. There is consequently a deficit of £2,293 anticipated.

DUDLEY: *Electricity Accounts.*—There has been a gross profit of £5,977 upon the working of the electricity undertaking during the year just ended. Deducting interest and sinking fund, &c., there is a net profit of £335. The total capital expenditure to date is £86,808, compared with £81,410 for the previous year. There has been a steady growth in the number of new connections, and especially in connection with power supply, whilst the supply to the tramway company has also considerably increased.

DUNDEE: *Electricity Estimates.*—The estimates for the current year of the electricity undertaking show receipts amounting to £35,865, whilst the expenditure is set down at £35,850. The cost of current to the tramways department for traction purposes has been reduced from 1¼d. to 1½d. per unit, which will represent a reduction of £1,300 per annum.

EAST MOLESEY: *Telephone Extensions.*—The Secretary of the General Post Office has written, with reference to a decision of the District Council that telephone wires must be laid underground, pointing out that the cost of underground work is roughly four or five times that of an overhead line. The Postmaster-General had found by experience that it was the best policy both for the Post Office and for the general public to defer telephone extension in a new district until the road authority had agreed to his proposals as to the mode of construction. The Clerk has been instructed to inform the Postmaster-General that the Council cannot see its way to alter its previous decision.

EDINBURGH: *Telephone Charges.*—A deputation from the Edinburgh Merchants' Association recently waited upon the Corporation to urge the enforcement of the agreement between the Corporation and the National Telephone Co., special objection being taken to the introduction of the measured rate system. It was pointed out to the deputation, however, that under the present agreement with the Telephone Co. any subscriber has a right to demand an unlimited service at £10 per annum. A suggestion was made that a municipal service should be instituted in competition with the company, but in view of the fact that a licence would only be granted by the Government until 1931, the proposition is not to be entertained.

ERITH: *Tramways.*—A deputation from the Urban District Council is to wait upon Bexley Urban District Council with reference to the inter-running of the trams on the two systems.

FINCHLEY: *Electricity Accounts.*—At the last meeting of the Urban District Council, the annual statement and accounts of the electricity undertaking were presented. The total income, less bad debts, was £11,489, of which £8,002 was contributed from private lighting, £1,685 from public lighting, and £642 from power. The working expenditure amounted to £5,939, and after payment of interest and sinking fund the net result on the twelve months' working was a deficiency of £292. The capital expenditure on the year was £12,638. The number of units generated was 897,502, as against 890,000 in the previous year. The total units sold to consumers had increased from 464,212 to 485,060. Public lighting had consumed 244,700 units, as against 238,500 in the previous twelve months. The number of consumers had increased from 1,089 to 1,476. The income from power, &c., was about only half as much as in the previous year, owing to the fact that the Council had lost the bulk supply to the Metropolitan Electric Tramways Co. This loss, however, had been more than made up by the increase in private consumption, and the receipts per unit had increased from 3·6d. to 4·275d. Public lamps had been supplied at a cost of 1·52d., as compared with 1·635d. Although better light at less cost was given by metallic filament lamps, the cost of attendance, &c., had increased from £502 to £587. The gross income from all sources was £11,559, as compared with £10,031 in the previous year. On the other side of the account the cost of generation was £2,490, or 0·82d. per unit sold, as against £2,175, or 0·74d. per unit. This increase was due to the fact that coal had gone up 5s. per ton. The total cost of distribution was 0·084d. per unit, as against 0·033d., while the total expenses of management amounted to 0·397d. per unit, as against 0·598d. The gross profit was 48·3 per cent., as against 46·8 per cent. in the previous year and 39·3d. the year before. The absence of any provision for depreciation was commented on. The chairman of the Electricity Committee, replying, said the grievance they had in Finchley was that the period for repayment of loans was too short as compared with similar municipal undertakings in the metropolis and elsewhere.

GLASGOW: *Tramway Returns.*—The receipts from the tramway undertaking for the year just ended were £907,494, an increase of £20,113 over those of the previous year. The car miles run were 20,766,722, an increase of 416,355, and the revenue per car mile increased by 0·023d., making an average of 10·488d. The traffic receipts per passenger worked out at 0·960d., an increase of 0·01d. The passengers carried were 226,948,290.

Tramway Extension.—The Tramways Committee on Thursday received a deputation from the Clydebank Town Council in connection with the proposed extension of the tramways and the erection of two new bridges over the Forth and Clyde Canal.

GRIMSBY: *Electricity Accounts.*—At the last meeting of the Town Council a profit of £2,085 was reported upon the municipal electricity undertaking for the year ended March 31st, 1908. The Electrical Engineer, Mr. W. A. Vignoles, recommends that this amount be carried forward for the reason that the committee were carrying out an improvement for which the Local Government Board would not sanction a loan. After some discussion the Council decided to allocate £500 of the surplus to the relief of rates.

LINCOLN: *Electricity Accounts.*—At the last meeting of the City Council, the Chairman of the Electricity Committee stated that the undertaking was growing quickly and paying its way. The output for the past year amounts to nearly one and a half million units, and £1,000 has been provided towards the relief of rates. With regard to the tramway system, he said that although this had been much abused, it had provided over £2,500 for depreciation and sinking fund, and the small loss of £70 had been met by the Electricity Committee. This £70, however, could not be regarded entirely as loss, as the Electricity Committee had made a profit upon the current sold to the tramways department.

LLANDUDNO: *Tramway Extension.*—The extension of the Colwyn Bay tramways from Rhos to Station Road, Colwyn Bay, was inspected by Col. Yorke on behalf of the Board of Trade last Friday, and the line was opened to the public on the following day.

LONDON: *Islington: Infirmary Generating Costs.*—At the last meeting of Board of Guardians, Mr. Parker asked what was the cost per unit of the electric lighting as generated at the Highgate Hill Infirmary. Mr. Lambert said that although the cost of the electric lighting at the infirmary had been said to be about 8d. per unit, as a matter of fact it did not exceed 2d. per unit, and this figure included all administrative expenses.

Paddington: Reinstatement of Trenches.—At the meeting of the Borough Council, the Works Committee reported that for several years past the Council and the late vestry had reinstated trenches opened by the electric lighting, gas, and similar companies, and charged for the work on the basis of schedules which had been adopted from time to time. The Legal Committee had informed the Works Committee that the charges should in future be on the basis of the actual cost of the work. The Works Committee endorsed this view, and the recommendation was adopted.

Southwark: Underground Telephone Lines.—The Works Committee of the Borough Council have considered a joint report drawn up by the Town Clerk and Borough Engineer upon the subject of the conditions attached to the consent of the London County Council, to the laying by the National Telephone Co. of short underground connecting lines. The report states that so far as the conditions relate to interference with the County Council's tramways, there appeared to be little objection to the Spring Garden authority exercising a proper control, but any attempt to interfere with the exercise by the local authority of their right to say in what positions and at what times the boxes and lines are to be laid, and how the property of the local authority is to be dealt with, regardless of the wishes of the local authority, could produce nothing but constant friction and inconvenience. The Works Committee support this view, and will object to the County Council imposing upon the National Telephone Co. any conditions with reference to matters which are within the jurisdiction of the Borough Council as road authority, except in so far as may be necessary for the protection of the County Council's property in the tramways or otherwise.

Westminster: Breaking up of Roads.—The Works Committee reported at the meeting on June 4th having considered a letter from the Gas Light and Coke Co., asking the Council to nominate one or two of its representatives to receive a small deputation from some of the public companies (gas, electricity, and water), whose duties involve interference with the surface of thoroughfares, in order to discuss, and, if possible, arrive at a settlement of the questions relating to paving charges, which have so long been in dispute. The Committee have agreed with the

Digitized by Google

suggestion, and have appointed the Mayor, their chairman, and vice-chairman (Alderman Spencer-Smith and Councillor Abady), together with the Town Clerk and the City Engineer, as the Council's representatives at the proposed conference.

Woolwich: Electricity Undertaking.—There are some interesting facts relative to the position of the Borough Council's electricity undertaking in the report of the district auditor (Mr. A. Carson Roberts) on the accounts for the year ended March 31st, 1907, which was presented at a meeting of the Council on June 4th. In connection with the revenue position, it is explained that a loss of £15,744 for the year is shown by the accounts, but the loss shown would have amounted to nearly £17,000 if loans had been raised sufficient to cover the capital expenditure as it was incurred, and the proper share of their redemption charged in the year. The rates will have to provide rather more than the gross earnings of the undertaking, which, apart from the charges for wiring and motors, amounted to £16,824. The rates raised in aid of the undertaking yielded £9,794, but the deficiency brought forward at March 31st, 1906, exceeded this amount by over £1,000, and the accounts show a deficiency at March 31st, 1907, of £16,835. This, however, falls short of the true deficiency at that date, as no account had been taken of the proportion of standing charges which had accrued but not fallen due for payment, bringing the revenue deficiency up to £21,200. In the year just closed he was informed that the rates raised in aid of the undertaking have averaged over 9d. in the £, and have yielded £29,771, a sum sufficient to cover the arrears of deficiency, including accrued proportions, and to provide £8,571 towards the loss on the year's working. Loans have been raised sufficient to cover the capital outlay for the time being.

Woolwich Tramways.—For some months, consideration has been given to the question of the electrification of the L.C.C. tramways from Beresford Square to Greenwich in order to supersede the existing horse tramways between the electrified portions at Greenwich and Woolwich. The Borough Council is to urge the L.C.C. to take the necessary steps for the construction and electrification of the tramways along a route which the former body has approved; it is 1 mile, 2 furlongs, and 160 yards long, and which will involve a net estimated cost for the acquisition of property and for executing necessary street works of £10,000.

NEWPORT: *Gas v. Electricity.*—The Newport Gas Co. has invited the Corporation Electricity Committee to take part in a trial of the relative values for public lighting of incandescent gas and incandescent electric lamps, but the Corporation has decided that they do not think it necessary to take part in such a test.

NOTTINGHAM: *Electricity Accounts.*—The report of the Electricity Committee for the past year states that no additional machinery has been required, owing to the increasing number of consumers who have taken advantage of the metallic filament lamps. The capacity of the plant in the three generating stations is as follows: Talbot Street, 8,925 h.p.; St. Ann's, 6,040 h.p.; Eastcroft Destructor Works, 720 h.p.; making a total of 15,685 h.p. The output during the year amounted to 11,116,835 units, an increase of 1,586,759 units over the output for the previous year. The total costs work out at 1·62d. per unit, a decrease of 0·07d. over the previous year, in spite of a 25 per cent. increase in the cost of coal. The connections are now equivalent to 349,699 eight c.p. lamps, compared with 321,240, and there are now also connected to the mains 3,418 h.p. of motors, an increase of 484 h.p.

PLYMOUTH: *Tramway Receipts.*—The receipts from the municipal tramway undertaking for the year ended March 31st, 1908, amount to £32,932, against £32,454 for the previous year. The expenditure amounted to £24,550, against £23,049 for the previous year, leaving a gross profit of £8,381, against £9,404 in 1906-7. To this has to be added the sum of £1,182 received from the Plymouth, Stonehouse, & Devonport Tramways Co., and £75 from the district funds towards capital charges. The total gross profit, therefore, amounted to £9,639, from which has to be deducted interest and sinking fund charges amounting to £8,866, leaving £772 as net profit, compared with £1,352 in the previous year.

PUDSEY: *New Tramway Service.*—The extension of the Leeds tramways from Stanningley to Pudsey was opened on Thursday by the Mayor of Pudsey. The extension, which is a little over a mile in length, has cost £15,000.

RATHMINES & RATHGAR: *Electric Lighting Undertaking.*—The accounts for the year ended March 31st, 1908, show that after meeting extra capital charges there is a loss of about £50 on the undertaking, which is accounted for by bad debts. The income from private lighting, there having been a large number of new consumers, has increased by about £1,000 over the income of last year.

SHEFFIELD: *Electricity Accounts.*—A statement has been prepared by Mr. S. E. Fedden, comparing the position of the Corporation electrical undertaking at present with the position in 1899, when the Sheffield Electric Light & Power Company's undertaking was acquired. In 1899 the total revenue was £24,342, against £78,355 in 1908; the average price obtained at these two periods was 3·88d. and 2·17d. per unit respectively; the number of consumers were 967 and 3,383; the cost per unit 1·6d. and 0·72d.; the output 1,295,900 units and 8,300,948; and the maximum load in kilowatts 1,073 and 6,243. In 1899 there was not a motor connected to the mains, but at the present time the number of motors is 1,037, having a horse-power of 9,674, and the average price obtained for this supply is 0·943d. per unit. The sum of £117,252 has been paid into sinking fund for redemption of debt, whilst the interest on loans for the nine years ended March 25th, 1908, was £188,430. Motors to the value of £2,200 have been purchased out of revenue, and a sum of £10,000 has been placed to renewals fund. The present available surplus from the undertaking is £16,329.

SOUTHGATE: *Electric Lighting.*—Mr. E. T. Ruthven-Murray, the engineer of the North Metropolitan Electric Power Supply Co., has discussed at considerable length with a committee of the Urban District Council the financial and other details of a suggested scheme for the supply and distribution of electricity within the district. The result of the conference was that Mr. Ruthven-Murray is to submit an alternative scheme for the committee's consideration in the course of the next few days.

STAFFORD: *Electricity Accounts.*—The report of the Electricity Committee states that the total capital expenditure to date amounts to £33,063, of which £9,961 have been repaid. The total number of units sold during the year to March 31st, 1908, was 361,622, compared with 307,321 units in the previous year. The total revenue was £4,371 against £3,971, whilst the expenditure was £1,784 against £1,526. Against the gross profit of £2,587 have to be set to capital and other charges, viz., £2,090.

SWANSEA: *Electricity Accounts.*—A financial statement which has been presented to the Corporation dealing with the electricity undertaking shows a profit during the past year of £1,230, and after meeting sinking fund and interest charges, there is a balance of £789.

TONBRIDGE: *Electricity Accounts.*—It is stated that the deficit upon the municipal electrical undertaking for the past year is £311.

WALSALL: *Dispute with Tramway Company.*—A resolution will shortly be put before the Town Council recommending that notice be given to the Wolverhampton & District Tramway Co. terminating the agreement by which the Corporation has running powers over the company's lines into Willenhall, unless more satisfactory terms can be arranged.

WEST BROMWICH: *Electricity Accounts.*—The Electrical Engineer's report upon the electrical undertaking for the twelve months ending March 31st, 1908, shows that the total number of units sold were 1,824,887, an increase of 25,534 over those of the previous year. The output for power supply shows a 26 per cent. increase. There has been a decreased demand for lighting, chiefly caused by the effect of metallic filament lamps. There is also a further decrease in the supply for traction purposes, owing to the loss of two sections of the South Staffordshire Tramways outside the borough, which had previously been supplied. The total units generated during the year amount to 2,187,396, an increase of 42,005 compared with the previous year. There has been an increase of 26 consumers connected during the year, with an equivalent of 8,285 8-c.p. lamps, the corresponding figure for the previous year being 20 consumers and 5,956 8-c.p. lamps. The total connections, including public lighting, at March 31st, amounted to 44,673 8-c.p. lamps, or about 1,300 kilowatts, the total possible demand, including the maximum traction demand, being 2,050 kilowatts. The maximum load during the year was 1,000 kilowatts, on December 23rd, the lighting and power being 560 kilowatts and the traction demand 440 kilowatts. The combined load factor for lighting and traction is 20·8 per cent., which is an increase of 1·5 per cent. over last year's figure. The lighting and power load factor is 14·4 per cent. and the traction 14·5, which is an increase of 1·1 per cent. for lighting and power and a decrease of 1·0 per cent. for traction. In his report upon the works, the Electrical Engineer states that the storage battery has been of considerable service during the past year, and the watt hour efficiency over the whole time is 74 per cent., the maker's guarantee being 75 per cent. An analysis of the accounts shows that the cost per unit has increased by 0·03d. The amount paid for repairs and maintenance, 0·164d. per unit sold, shows an extraordinary increase of 0·054d. per unit, due to the fact that one of the 250 kilowatt armatures has had a new commutator fitted at a cost of about £105. Repairs have also been carried out to the shunt windings of a 200 kilowatt machine, at a cost of £85. The items of additional expenditure over and above those of the previous year are as follows:—Fitting new commutator to 250 kw. armature, £105; re-winding field coils of 200 kw., £85; purchasing CO_2 recorder and fixing, £35; repairs to balancer, £30; amount withdrawn at Local Government Board inquiry, now charged against revenue, £150; battery maintenance, increased amount compared with last year, £106; louvres for ventilating works, £48 10s. In the reduced costs attention is drawn to the amount, £108, now paid for oil, waste, water, and engine-room stores, which is only a few pounds more than the similar charges on the first year's working of the undertaking, and is £330 less than for the year ending March, 1905, whereas the output has increased by 400,000 units. There is a decrease of £132 from the sale of current for public lighting, reducing the average price from

Digitized by Google

0·35d. to 0·55d. per unit. The total revenue was £12,793, and the working costs £6,737. Interest and sinking fund absorbed £4,027, leaving a net profit of £2,030.

WEST HARTLEPOOL: *Electricity Accounts.*—After providing for interest and sinking fund charges, the electricity accounts for the past year show a profit. The repayment of capital during the year amounted to £3,098, *i.e.*, 3¼ per cent. on the capital expenditure, and interest, at 3 per cent., amounted to £2,902. The average price paid for coal during the year was 13s. 5d., compared with 12s. 1½d. during the previous year, and had the price remained steady, the credit balance would have been £350.

WIMBLEDON: *Electric Lighting.*—An agreement has been come to with landowners respecting the construction and maintenance by the Council of a weir across the River Wandle for the purpose of improving the supply of water for condensing purposes to the electricity works. A sub-committee has been appointed to consider and report upon the present methods of street lighting and what improvement, if any, it is desirable to make therein. The Foster Arc Lamp & Engineering Co., Ltd., wrote asking at what price the Council would supply energy for power purposes to their works on the basis of a minimum consumption of 20,000 units per annum. A reply is to be sent to the effect that energy will be supplied for power purposes at the rate of 1½d. per unit.

WOLVERHAMPTON: *Tramway Accounts.*—The tramway accounts for the year ended March 31st, 1908, show a total income of £44,431, and expenses £26,460. Interest and repayment of loans absorbed £11,064, income tax on profits £150, leaving a net balance of £6,762. Of the balance, £4,416 have been transferred to renewals fund and £34 has been allocated towards the loss on the motor omnibuses, whilst £1,292 have been utilised for wiping off the deficit on the previous year's accounts. The balance of £392 has been carried to a general reserve fund. Although the receipts show an increase of some £500, compared with that of 1907, the working expenses have increased by £1,500.

YORK: *Electricity Loans.*—A Local Government Board inquiry into the application by the Corporation to borrow £31,604 in connection with the electricity undertaking was held last week, and again adjourned. £24,404 represents excess of expenditure over borrowing powers, and £7,200 represents the suspense account. The previous inquiry had been adjourned in order that the Inspector, Mr. H. R. Hooper, might be supplied with details of capital expenditure to March 31st, 1908. The inquiry was again adjourned for the provision of further particulars with regard to capital expenditure in past years, the Inspector expressing the opinion that he would continue the inquiry until he was quite satisfied upon this point. It was stated that the capital expenditure to date upon the works amounted to £125,254. Being unable to obtain answers to various questions with regard to past capital and its repayment the Inspector suggested that the Corporation should be content with a loan for a much shorter period. This course, he said, had been followed in the past where it had been found impossible to explain what had gone on in previous years, and the period then had varied between 5 and 12 years. No answer was given to this suggestion, and the inquiry was adjourned as mentioned above. It came out that the capital charges at York are at present more than 0·5d. per unit in excess of the generating expenses.

TENDERS INVITED AND PROSPECTIVE BUSINESS

BELGIUM.—Tenders will be received by the Société Nationale des Chemins de Fer Vicinaux, Rue de la Science 14, Brussels, by June 17th, for the installation of overhead electrical equipment and electric rail connections for the Brussels-Grimberghen section of the line from Brussels to Humbeek. Price of specifications, 2 francs; of plans, 24 francs.

The Antwerp Municipal Authorities invite tenders by June 18th for the supply of 1,600 metres of electric cable. A deposit of 2,000 francs (about £80) will be required. Specifications may be obtained from the Hôtel de Ville at a cost of 0·50 franc, or copies may be consulted at the Commercial Intelligence Branch of the Board of Trade.

BULGARIA.—H.M. Vice-Consul at Sofia (Mr. G. O'B. Toulmin) reports that the Bulgarian Direction Générale des Chemins de fer et des Ports invite tenders by June 20th for the supply and installation of electric apparatus required by the Bulgarian State Railways. Tenders must be addressed to "Monsieur le Préfet de Sofia." The estimated cost of the work is 170,000 francs (£6,800), and a deposit of 5 per cent. will be required to qualify any tender. It is very desirable that tenders should be written in French and submitted through a competent agent on the spot. A list of agents established at Sofia may be obtained by British contractors on application at the Commercial Intelligence Branch of the Board of Trade. A copy of the specification (*cahier des charges*), form of tender, drawings, &c., may also be seen at the Commercial Intelligence Branch, or may be obtained at a cost of 3 francs from the Direction Générale des Chemins de fer de l'Etat Bulgare, Sofia.

DOVER.—The Electricity Committee recommend the purchase of a booster at an estimated cost of £700.

BURNLEY.—Coal handling plant is to be erected at an estimated cost of £1,818.

CARLISLE.—The Local Government Board has sanctioned the borrowing of £5,000 for mains, service, and meters in connection with the electricity undertaking.

FINCHLEY.—The Local Government Board has sanctioned a loan of £24,890 in connection with the electricity undertaking.

GILLINGHAM.—Tenders are invited for the supply and delivery of coal at the generating station for the period ending June 30th, 1909. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by June 22nd.

HOLYWOOD (COUNTY DOWN).—The question of electric lighting is still under consideration by the Council, and a further report has been called for from the Consulting Engineer.

ILFORD.—The Urban District Council is inviting tenders for wiring the Seven Kings library and hall. Specifications can be obtained and plans seen at the office of Mr. Arthur H. Shaw, Ley Street, Ilford. Tenders close on the 23rd inst.

LONDON COUNTY COUNCIL.—The Council invite tenders for the manufacture, supply, and delivery of tramway feeder pillars. Full particulars from the Clerk (fee, £2, returnable), and tenders by June 23rd.

City Guardians.—The question of lighting the new infirmary buildings at Homerton by electricity in preference to gas was discussed at considerable length at a meeting of the City of London Guardians on Tuesday. The estimated cost of the electrical scheme was stated to be about £1,000, whilst the Gas Light & Coke Co. offer to equip the institution with incandescent gas for £289, but the cost of illumination and maintenance was £210 in the case of electricity against £366 in the case of gas, the candle-power under the electrical scheme being twice that of the gas scheme. Ultimately the recommendation to adopt electric lighting was carried.

Islington.—At a special meeting of the Borough Council on Thursday, held in committee, it was decided that an expenditure of £3,560 was necessary for the purpose of extending the electric lighting undertaking. The Lighting Committee was authorised to incur such expenditure, and the L.C.C. are to be asked to sanction a loan for the amount.

Stepney.—Tenders are invited for ampere-hour meters, demand indicators, and time switches; also arc lamp carbons. (For particulars see an advertisement this week.)

Woolwich.—The Council is to extend distributing mains, at an estimated cost of £45. The Electricity Committee has had under consideration (in pursuance of a policy of reducing the cost of generation on the lines suggested by Sir Alexander Kennedy in his report on the undertaking) the desirability of equipping Globe Lane Station with coal-handling plant, which, it is estimated, will reduce the cost of handling the coal by the present method by about two-thirds. Tenders are to be invited for plant, in order that the Committee may consider more closely the advantages to be derived.

MALVERN.—Tenders are invited for the supply, delivery, and erection of a 50-kw. steam alternator exciter, &c. Particulars from Mr. W. J. Baker, Engineer and Manager, and tenders to the Clerk by June 29th. (See an advertisement last week.)

MANCHESTER.—The Electricity Committee invite tenders for the supply of the following during the twelve months ending June 30th, 1909:—(*a*) direct current motors, (*b*) direct current motor-starters, (*c*) ampere-hour and watt-hour meters, (*d*) fuse-boxes. Particulars from the Secretary to the Electricity Department, Town Hall, and tenders to the Chairman of the Electricity Committee by June 19th. (See an advertisement this week.)

ROTHERHAM.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £5,300 for the purposes of the electrical undertaking. It is the intention to instal an additional 500 kw. direct-current turbo-generator.

SHEFFIELD.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £20,000 for the purposes of the electrical undertaking. £10,000 is needed for mains and sub-stations, and the remainder is for extensions at the Neepsend power station.

SPAIN.—The *Gaceta de Madrid* announces that the Dirección-General de Obras Publicas are prepared to receive offers for the construction and working of an electric tramway from La Coruna to Burgo. Tenders, which should be accompanied by a deposit of 3,658 pesetas (about £128) will be received up to July 31st. An application for this concession has already been filed by the Compania de Tranvias de la Coruña, which will have preference on equal terms. Forms of tender, &c., may be seen at the Commercial Intelligence Branch of the Board of Trade.

TONBRIDGE.—Extensions to the electricity works are to be carried out at a cost of several thousand pounds.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

CROYDON.—The Corporation has accepted the tender of Chas. Pullan (Bradford), at £428, for the electric lighting installation of new buildings in connection with the Mental Hospital.

DUNDEE.—The Electricity Committee recommend the purchase of 10,500 tons of Polmaise coal from the Russell Collieries.

The following tenders have also been accepted in connection with the erection of the new power station buildings at Stannergate: Mason and brick work, Messrs. A. & T. Craig, £3,519 14s. 11d.; structural iron-work, Clyde Structural Iron Co., Ltd., £4,315; chimney stack, J. J. & P. M'Lachlan, £1,107 5s. 3d.; carpentery and joinery works, James Pollack, £559; slater's work, James Laburn & Son, £153 14s. 8d.; plumbing work, P. Anderson & Sons, £673 19s.; plaster work, James Laburn, £174 16s.; painting work, David Morrison, £77 10s.; steel casements, Henry Hope & Sons, Ltd., £272 4s. 4d.; patent glazing, British Luxfer Co., £288.

LONDON: *Woolwich.*—The Borough Council has received the following tenders for a motor-alternator:—

Manufacturing firm.	Amount of tender. £	s.	Speed r.p.m.	Time for completion. Months.	Guaranteed efficiency. full load.	¾ load.	½ load.	¼ load.	Remarks. Power factor.
Vickers, Son & Maxim	754		375	3	81·0	78·8	73·5	61·4	—
Bruce Peebles & Co.	775		375	4	83·5	80·5	75·0	—	0·8
Siemens Bros. Dynamo Works	775	5	375	3½	81·0	75·6	68·6	51·6	0·8
British Thomson-Houston Co. (accepted)	784	10	375	3	82·8	81·5	77·8	67·6	0·8
British Westinghouse Co.	789	15	375	5	83·0	80·0	76·0	62·0	—
General Electric Co.	790	15	375	3	83·5 83·0	— 80·0	— 75·5	— 62·5	0·8 1·0
J. H. Holmes & Co.	804		400 (max.)	4	82·5	79·0	73·0	56·0	—
Brush Electrical Engineering Co. (alternative)	833	10	500	4	83·75	82·0	78·25	68·0	—
Lancashire Dynamo and Motor Co.	878	10	not stated	3½	83·5	82·0	78·5	68·0	—
Dick, Kerr & Co.	922		428	(4 f.o.r.)	(incomplete tender).				
Brush Electrical Engineering Co.	995		375	4	83·75	82·0	78·25	68·0	—

Each of these tenders includes a provisional sum of £40 to cover any special expenses which may become necessary during the execution of the contract. The tenders sent in by Messrs. Holmes & Co., the Lancashire Dynamo Co., and Dick, Kerr & Co. do not refer to the wages conditions, but the remainder comply in every respect. The Electricity Committee, reporting on the tenders at the last meeting of the Borough Council, said that the most potent factors in the selection of the machine were those of efficiency and time of delivery, and as it was required for long hour running generally at the lower loads, the higher the efficiency under these conditions the greater would be the saving to the Council. A further saving would be effected by quick delivery.

Holborn.—The Council has received the following tenders for electrical fittings for the new Council offices:—J. W. Singer & Sons, Ltd. (accepted), £368 17s.; D. Hulett & Co., Ltd. (old brass finish), £390 6s., (bronze finish), £451 15s.; Hart, Son, Peard & Co., Ltd., £472 7s.; Galsworthy, Ltd., £477 8s.; Thos. Elsley, Ltd., £542 15s.

PARLIAMENTARY INTELLIGENCE

LONDON ELECTRIC POWER BILLS.—Our report of the proceedings before Lord Cromer's Committee will be found on pages 881 to 884.

NOTTINGHAMSHIRE AND DERBYSHIRE TRAMWAYS BILL (No. 2).—The Midland Railway Company have deposited a petition in the House of Commons against this Bill.

PROGRESS OF ELECTRICAL BILLS.—Tramways Order Confirmation Bill (No. 2) and King's College, London (Transfer) Bill were passed by the Unopposed Committee of the House of Commons last week.

COMPANIES' MEETINGS AND REPORTS

ANGLO-PORTUGUESE TELEPHONE.—At the annual general meeting on Thursday the report and accounts given in our last issue were adopted. Mr. H. Allen, who presided, referring to the question of working expenses, said that the telephone business differed from most other commercial enterprises as, after a certain point was reached in the number of subscribers to an exchange, an increase in business brought with it a more than proportionate increase of working costs. Having regard to all the circumstances under which their business was conducted, he did not think they could anticipate over any appreciable period a lower ratio of expenses to receipts than about 50 per cent. An extension of underground work in Lisbon had been put in hand, and although it was a costly operation at the outset it would be distinctly remunerative in the long run. During the year about £9,000 had been spent on capital account without in any way encroaching upon their reserve capital of £10,000, which still remained intact. For the third year in succession they had set aside £5,000 from profits to the reserve fund. The principal work completed during the year was the extension of the switchboards at Lisbon and Oporto, giving an increased capacity for 900 subscribers in the former and 240 subscribers in the latter. The total number of calls during the year was 7,750,000, which gave an average receipt of 1¼d. per message, demonstrating the important fact that the Portuguese public got value for their money.

ARON ELECTRICITY METER.—The report for the six months to March 31st, 1908, states that after providing for general charges and depreciation, there is a net profit of £11,485, making, with the balance carried forward from the last accounts of £6,228, a total available profit of £17,714. The directors recommend the payment of a further dividend of 7 per cent. on the cumulative preference shares towards paying off the arrears, and a transfer to the reserve towards goodwill and patents of £5,000, leaving to be carried forward £3,971. On December 12th, 1907, a 6 per cent. preference dividend was paid, representing 3 per cent. for the six months to September 30th, 1904, and 3 per cent. for the six months to March 31st, 1905. The directors are pleased to record a further progress of trade in all branches, which is ascribed to an increased demand for the company's meters and clocks. The factories have again had to be enlarged in order to cope with the increased business. A taximeter has recently been placed on the market which has been approved by the Commissioner of Police and passed by the National Physical Laboratory. The meeting is on Tuesday.

BIRMINGHAM & MIDLAND TRAMWAYS.—The report for the year 1907 states that the total revenue for the year from all sources amounted to £85,837, compared with £92,582 for the preceding year, but the latter figure included the receipts for the first six months of the year of the Dudley Road Tramway in Birmingham, which has since passed into the hands of the Corporation. The expenses for the year amounted to £38,652, compared with £44,951 for 1906. After providing for all expenses chargeable to revenue, including rents, repairs, and maintenance, placing £1,500 to depreciation and renewals accounts, and adding the £552 brought forward from the last account, there remains £44,236. The directors propose to place to the debenture redemption fund £3,550, to pay a dividend on the preferred ordinary shares at the rate of 4 per cent. for the year ended December 31st, 1907 (less tax), and to carry to next account £85. The total expenditure on capital account during the year amounted to £24,820, and included the completion of the car sheds and workshops at Tividale, the Bearwood Road sub-station, and additional plant and cables in connection with the development of the electric light undertaking. The meeting is to-day.

BRUSH ELECTRICAL ENGINEERING.—The report for the year ended December 31st, 1907, states that effect has been given in the balance-sheet to the reduction of capital approved by the shareholders in August, 1907. The amounts standing to the credit of the general reserve and depreciation reserve funds, as well as the balance of profit brought forward from the year 1906, have also been absorbed. The patents and good-will account is now represented by the round figure of £100,000, while the company's investments, which were entered in the 1906 balance-sheet at £164,522, now stand at £101,335. The general profit and loss account shows a gross profit of £63,294. After debiting general charges and maintenance, the amount carried to net profit and loss account is £32,294, and after paying debenture and other interest, the net balance is £10,229. Consistently with the character of the present balance-sheet, which is essentially one of reduction and adjustment, the directors recommend that this balance be applied to initiate a new general reserve fund. The output from the works during 1907 has been the largest in the history of the company, but the directors regret that the profits realised have not been commensurate. This is chiefly due to the fact that competition in the electrical engineering industry continues to be very keen, while the after effects of the strike at the company's Loughborough works have been severely felt. The company has also suffered in its operations by the lack of adequate working capital. The contracts upon which it has been engaged have involved a large

Digitized by Google

lock-up of money while in progress, and this situation has had to be met by temporary loans from bankers and others, which, owing to the financial stringency that prevailed for so long a period during 1907, carried a high rate of interest. A portion of these loans was obtained from the British Electric Traction Co., Ltd., without security, and, as part of the arrangement then made, the directors have waived their option to call upon the British Electric Traction Co. to accept £2 ordinary shares at par in satisfaction of the advance of £30,740 made by that company in 1901, and have agreed to repay the said advance by twelve half-yearly cash instalments commencing in January, 1909, and carrying interest at the rate of 3½ per cent. per annum. With a view to placing the company in a position to carry on its business under more favourable and economic conditions, the directors put forward in January last a scheme to consolidate the existing £250,000 first and second debenture stocks, and to make a further issue of £100,000 four and a half per cent. debenture stock. This proposal, however, was not supported by the first debenture stockholders, and the directors have now arranged to make an issue of £125,000 five per cent. prior lien debenture stock, which will be specifically secured upon the freehold and leasehold lands, buildings, and fixed plants of the company at Loughborough. The reduction of capital embodied in the present balance-sheet makes the company's preference and ordinary shares of the face value of £1 6s. 8d. In order to arrive at a more marketable denomination it is proposed to subdivide these shares into shares of 6s. 8d. each, and to consolidate every three of the latter into one £1 share, thus giving the shareholders four £1 shares for every three shares at present held. Similarly, the unissued 74,268 ordinary shares of £2 each will be converted into 148,536 ordinary shares of £1 each. An extraordinary general meeting to consider resolutions to give effect to such subdivision is to be held after the general meeting. The directors have decided to give the preference shareholders the right to convert 25 per cent. of their holding into ordinary shares. The meeting is on the 16th inst.

CITY OF BUENOS AIRES TRAMWAYS.—A meeting of the debenture-holders was held on Friday to consider a resolution assenting to a proposition by which the company's rights to a specific charge on certain lands and stations of the company, granted in a contract with the Anglo-Argentine Tramways Co. in 1904, are to be waived in view of the fusion of all the tramway undertakings of Buenos Aires. The resolution was carried unanimously.

METROPOLITAN AMALGAMATED RAILWAY CARRIAGE & WAGON.—At the annual meeting on Friday, the report and accounts were adopted. Mr. F. Dudley, the chairman, who presided, said he was happy to be able to congratulate the shareholders once more upon a successful year. The paid-up capital had increased from £1,084,096 to £1,432,940, and the reserve fund now stood at £350,000.

WEST INDIA AND PANAMA TELEGRAPH.—At the ordinary general meeting last week the report and accounts given in our last issue were adopted. Mr. W. B. Kingsford, the Chairman, who presided, said that comparing the results for the year with those of the previous year, there was a decrease in the receipts of about £1,900, but it was fair to mention that in the previous year the receipts had been swollen owing to the earthquake in Jamaica.

NEW COMPANIES

ELECTRO-HYDRO.—This company was registered on May 29th, with a capital of £1,000 in 900 10 per cent. participating preference shares of £1 each, and 2,000 ordinary shares of 1s. each, to carry on in Manchester and elsewhere the business of an electro-medical and electro-hydropathic establishment, to acquire the electrical apparatus, appliances, and utensils, &c., installed at 344 Bury New Road, Manchester, and to adopt an agreement with J. Brown. The subscribers are :—Margarita de Abaitua, D. H. Bailey, J. Brown, S. Boot, T. Cotton, W. B. Brown, Maude Cotton. No initial public issue. The number of directors is not to be less than two nor more than seven; the first are T. Cotton and J. Brown. Qualification, 50 shares. Remuneration, one guinea each per meeting attended. Registered office, 344 Bury New Road, Manchester.

W. FORREST & CO. (SHEFFIELD).—This company was registered on May 30th, with a capital of £2,000 in £1 shares, to take over the business of electrical, mechanical, and general engineers, machinists, millwrights, metal workers, and the like, carried on by W. E. Forrest at Industry Works, Sylvester Gardens, Sheffield, as "W. Forrest & Co." The subscribers are :—F. Naylor, Mrs. F. B. Naylor, Mrs. E. Fox, W. E. Forrest, Mrs. M. A. Forrest, W. H. Storm, F. Crawshaw. No initial public issue. The number of directors is not to be less than two nor more than five; the first are W. E. Forrest and F. Naylor. Qualification, 100 shares. Remuneration as fixed by the company. Registered by Alfred H. Atkins, Ltd., 27-28 Fetter Lane, E.C.

RAILWAY AUDIBLE SIGNAL CO.—This company was registered on May 30th, with a capital of £50,000 in £1 shares, to acquire any patents, inventions, licences, concessions, and the like relating to the production, treatment, storage, application, distribution, and use of electricity, in particular to certain existing inventions relating to signalling on railways, to adopt an agreement with the said syndicate, and to carry on the business of manufacturers of and dealers in signalling apparatus, railway rolling stock, &c. The subscribers are :—S. T. Hargreaves, T. W. Hargreaves, R. Harradine, G. R. Campbell, W. C. Crofts, Florence Ridge, T. H. Archer. Minimum cash subscription, 5 per cent. of the shares offered to the public. The number of directors is not to be less than three nor more than seven; the first are W. Dawson, Cote, Audley Road, Hendon; H. G. Drury, St. Oswalds, Downes Road, Clapton, N.E.; A. Haes, 17 Bishopsgate Street, E.C.; W. A. Hart, 23 Westbourne Villas, W.; and T. Eaton, 21 Corfton Road, Ealing, W. Qualification, 100 shares. Remuneration, £600 per annum, and such further sums, not exceeding £400 in any year, as the company shall determine.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted Tuesday night was £59 5s. to £59 15s. per ton (no alteration from last week's price).

ARC LAMPS, LTD.—As we have already announced, Messrs. Arc Lamps, Ltd., are removing to their new works, and we are asked to announce that all goods and empties sent to the firm should in future be addressed to St. Albans.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—Creditors of the Brockie Pell Arc Lamp Co., Ltd., are requested to send particulars of their claims to Mr. H. McLellan, one of the joint-liquidators, at 6A Devonshire Square, London, E.C., by July 6th.

A meeting of the Gardner Electric Drill & Hammer Co. will be held at 138 Salisbury House, London Wall, E.C., on Wednesday, July 8th, at 12 noon, for the purpose of hearing the liquidator's account of the winding up.

A meeting of Merz-Oatway Fire Appliances, Ltd. (1901), will be held at 92 and 94 Paul Street, Finsbury, London, on July 6th, at 12 noon, for the purpose of hearing the liquidator's account of the winding up.

The first meeting of creditors in the bankruptcy of Walter Wardle, electrician, of 14 Osborn Road, Levenshulme, Manchester, will be held at the Official Receiver's offices, Byrom Street, Manchester, on June 17th, at 3 p.m., and the public examination at the Court House, Quay Street, Manchester, on July 3rd, at 10 a.m.

Albert Lord, trading as Lord Brothers, electrical engineers, Ogden's Chambers, 134 Deansgate, Manchester, has been adjudicated bankrupt.

The first meeting in the bankruptcy of E. Goacher, Electrical Engineer, of Worksop, will be held at the Official Receiver's offices, Figtree Lane, Sheffield, on June 19th, at 3 p.m., and the public examination will be held at the County Court Hall, Bank Street, Sheffield, at 2 p.m., on June 25th.

MISCELLANEOUS CITY NOTES

CANADIAN GENERAL ELECTRIC CO.—The directors have declared a dividend of 1¾ per cent. upon the common stock of the company for the three months ending June 30th, 1908, being 7 per cent. for the year.

MEXICAN LIGHT, HEAT & POWER CO.—A dividend of 1 per cent. upon the outstanding ordinary shares has been declared.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. B. Hamilton, the General Manager of the Leeds Corporation Tramways Department, has been presented with a silver rose-bowl and set of candlesticks by the officials and staff of the tramways department on the occasion of his silver wedding.

The three candidates for final selection for the post of tramway manager to the South Shields Corporation were Mr. L. E. Harvey, assistant tramway manager at Sunderland; Mr. R. Chadwick, chief assistant tramway manager at Birkenhead; and Mr. F. Taylor, assistant tramway engineer at Bolton. There were 64 applications. The voting resulted as follows :—Mr. Harvey, 29 votes; Mr. Chadwick, 10; and Mr. Taylor, 6.

The principal prize of two hundred guineas, offered by the American Co-operative Electrical Development Association for a canvassers's handbook, dealing with data useful to canvassers and central station managers, has been awarded to Mr. R. Borlase Matthews, London.

Mr. C. W. Mallins, hitherto Traffic Manager of the Liverpool Corporation Tramways, has been appointed General Manager. Further particulars will be found on p. 910.

QUALIFICATIONS OF FACTORY INSPECTORS

IN the House of Commons on Wednesday last week, on the motion for the adjournment for the Whitsun holidays, a discussion took place upon the increasing number of fatal and non-fatal accidents in factories under the Factories and Workshops Act.

Mr. GLOVER (St. Helens) moved a resolution to the effect that the increase was of such a character as to demand immediate attention, more particularly in so far as it referred to the organisation of the Factory Department of the Home Office. During the past eight years fatal accidents had increased by no less than 308, and non-fatal accidents from 1897 to 1907 had increased by 66,767. These were figures, he thought, which proved that the Government should consider this question seriously. It was impossible for the present staff of inspectors to keep proper observation on the large number of factories coming under the Act, namely, 255,189. He criticised strongly the methods of appointment of inspectors, and urged the appointment of men who had had practical experience of the works and machinery which they had to inspect.

Mr. SEDDON (Newton, Lancs.) ridiculed the method of appointing inspectors under an examination system which included familiarity with the poets and an appreciation of distinction between miracle plays and mysteries, but which did not make essential any practical knowledge of machinery.

Mr. TENNANT (Berwickshire), whilst not going so far as the previous speaker, not being one who believed in the doctrine that a factory inspector was better without academic education, suggested that mechanics and chemistry should be added to the compulsory subjects set in the examination for inspectors.

Mr. HARWOOD (Bolton) expressed the opinion that the problem of safeguarding life in factories needed a knowledge of machinery, and for this reason only specialists should be appointed. He urged the separation of the duties of factory inspectors into those dealing with the ordinary routine work, and others to inspect systematically factory by factory in order to see that every danger was safeguarded.

Mr. HERBERT GLADSTONE, the Home Secretary, in reply to the discussion, said that if he could be convinced that the present system of appointing factory inspectors did not produce the right men, he was perfectly ready to change it. The present system provided for an initial examination of candidates by nomination in certain compulsory and optional subjects. Those who passed were appointed as probationer-inspectors for two years, during which time they worked under an inspector and gained practical experience in all questions relating to factory law, sanitary science, mechanics, &c. At the end of the probationary period the candidates had to undergo a final examination before they were made full inspectors. He deprecated the system of open examination, for under it candidates would come up in tribes for examination. Everybody seemed to think he would make a factory inspector. With regard to the staff, the Department had devised a scheme by which a second deputy chief inspector and second medical inspector had been appointed, whilst with the sanction of the Treasury they had also appointed 16 new inspectors, 5 lady inspectors, and 11 inspectors' assistants. He believed this would have the effect of giving the head of the departments more time to consider the general question of organisation and disposition of work. At the same time, there was no doubt that the Workmen's Compensation Act had had the effect of increasing the number of accidents, for it was possible that both employers and workmen became rather more careless through the knowledge of insurance on one hand and compensation on the other. He quite agreed that the large increase in non-fatal and fatal accidents was disturbing, although he preferred to regard fatal accidents as a more reliable guide to the efficiency of the Home Office supervision. During the ten years from 1899 to 1908 they had increased by 62 per cent., and the increase from 1905 to 1907 was 10·9 per cent. With regard to the appointment of practical men, he reminded the House of the complexity of the duties imposed upon factory inspectors and of the large number of trades with which they had to deal. There were about 10,000 different trades in the country, and he looked upon a practical man as a man with a head upon his shoulders which enabled him to take a reasonable and practical view of all trades. The present system had been ridiculed, but no case of failure or shortcoming had been brought to his notice during the time he had held his present office. Nevertheless, he would welcome an impartial inquiry, whether by Departmental Committee or Select Committee.

Mr. RAMSEY MACDONALD (Leicester) said he preferred a Select Committee, but Lord BALCARRES (Chorley) favoured an inquiry by Departmental Committee, as did also Sir F. BANBURY (City of London). The motion was then withdrawn.

A Science Museum.—In the House of Commons last week, in reply to Sir William Anson, Mr. McKinnon Wood said he thought it would be eminently desirable that there should be a science museum in immediate proximity to the Imperial College of Science and Technology, and if the Commissioners of the 1851 Exhibition felt themselves in a position to co-operate, he should be happy to bring the matter under the notice of the Chancellor of the Exchequer.

THE ACCOUNTS OF THE NATIONAL PHYSICAL LABORATORY

THE accounts of receipts and expenditure of the National Physical Laboratory with balance-sheet for the year 1907 have now been issued as a Parliamentary "white paper." According to the revenue account, the administration expenditure amounted to £1,078, including a rent of £31. Salaries, wages, &c. (including the director's salary of £1,300) amounted to £12,198, and £1,290 is set down under the head of general expenses. The expenditure of the observatory, physics, metallurgical, and engineering departments are given separately as £244, £570, £294, and £185 respectively. The figure for the physics department includes £137 for the electrical measurements division and £165 for the electrotechnical division. Other miscellaneous expenses bring the total expenditure up to £16,257, and in addition to this £500 was transferred to equipment fund for maintenance and additions. The income was made up as follows:—Treasury grant, £6,000; donations and subscriptions, £1,250; interest on Gassiot Trust Fund, £450; charges for work done (including £7,804 from fees for tests), £9,324; other receipts, £35. Total, £17,058. There was thus a final balance, being excess of income over expenditure of £302. The capital expenditure on alterations, &c., of Bushy House has been £48,028, including £15,464 during the year, and on equipment (excluding gifts of apparatus) £8,716, including £230 during the year, but of a Treasury grant of £500 for Eskdalemuir Magnetic Observatory only £38 has been spent up to the end of the year.

THE "METALIK" INCANDESCENT LAMP

ON page 814 of our issue of May 28th, in referring to some experiences with the metal filament lamp known as the "Metalik," we alluded to a case where the lamps were still unblackened after burning 1,356 hours. Mr. Boddy has kindly pointed out that this figure should have been 1,856 hours, and at the same time gives us some further particulars of the case in question. It appears that these lamps are of the 220-volt 50-c.p. size, placed in a sloping position on an alternating-current circuit with a not very constant voltage, and a later communication which we have seen from the engineer to the same undertaking speaks of a lamp which is still in good condition after 2,775 hours. This appears to be something like a record for high-voltage lamps. Some records of candle-power tests on continuous-current are also given. The candle-power in one case of the lamp when new was 35 British c.p., and increased to 43 c.p. after 250 hours' burning, while the consumption was constant at 58 watts. We have also seen a letter from Mr. T. Roles, City Electrical Engineer, Bradford, stating that two sample 50 c.p. Metalik lamps showed an average life of 1,407 hours, and would have run longer had not the filaments become shorted by twisting. Other Corporation engineers who have reported favourably on these lamps are Mr. Long, of Norwich, and Mr. A. C. Cramb, of Croydon. Excellent accounts of their burning are also received from consumers in Liverpool. Messrs. G. M. Boddy & Co. have also sent us their schedule of discounts to the trade and to Corporations on quantities of lamps taken in 12 months, and inform us that they have brought out descriptive cards, with particulars, which can be printed with the agents' names and addresses.

CATALOGUES AND PAMPHLETS RECEIVED

PORTABLE ACCUMULATOR LAMPS.—A list from Accumulator Industries, Ltd., of Woking and London, describes a new pattern of accumulator hand-lamp, the principal features of which are a gimbal reflector capable of reflecting light in any direction without movement of the incandescent lamp. The cells are fitted with a floating head discharge indicator, and 4-volt metal filament lamps are used.

INCANDESCENT LAMPS.—A card from the British Thomson-Houston Co. illustrates the B.T.-H. "Meridian" No. 4 large bulb carbon filament lamp, with special shade, forming a globe of soft white light, with an excellent distribution of illumination.

DRY BATTERIES.—Messrs. Siemens Brothers, Ltd., of 12 Queen Anne's Gate, S.W., have issued a comprehensive new catalogue of their well-known "Obach" dry cells. In addition to the ordinary type, a special cell is made for motor-car ignition. For this purpose three- and four-cell batteries are made up in one case, and it is recommended that two such batteries be used alternately by means of a change-over switch, and that an adjustable resistance be included in the circuit and gradually cut out as the battery voltage falls. The company's Hellesenall is also listed, as well as the "transport" cell, into which the electrolyte is liquid and can be emptied out when not in use.

ELECTRIC DRILLS.—An attractive mail card from the Armorduct Manufacturing Co. calls attention to the firm's well-known "little hustler drills," which are described as the key to economy in drilling.

Digitized by Google

THE ELECTRICAL INDUSTRY IN GERMANY

THE annual report of the British Consul-General for the district of Berlin contains some interesting figures relating to the electrical industry in Germany. The year 1907, says the report, witnessed a considerable growth in the business of the electrical industry; the financial results of the large electrical companies also proved very satisfactory. The influence of the continued rise in the scale of wages and the price of raw and auxiliary materials was indeed noticeable, but cautious purchasing prevented the increase in prices from being too keenly felt, and also weakened the effect of the sudden fall in the price of copper. The concerns sought to check the growing demands of the workmen by replacing manual labour as far as possible by automatic machinery. This accounts for the remarkable circumstance that the Allgemeine Elektricitäts Gesellschaft, in spite of an increased business, reduced the number of their employees in the year 1907 from 33,900 to 30,670, a reduction of nearly 10 per cent. The scarcity in the money market did not affect the electrical companies to any appreciable extent. Much progress has been made in the application of electric driving. Twelve reversible rolling mills are now electrically driven. The machinery for these has been supplied by German firms, but only six are in Germany. Of the remaining six, one is in England (Middlesbrough), one is in Switzerland, another is in Belgium, and the other three are in Austria. The electrification and extension of the elevated and underground railways in Berlin and Hamburg has afforded the railway departments of the large firms continuous occupation. The introduction of electric traction on the Berchtesgarden-Salzburg line in Bavaria will also bring in business. The next undertaking will probably be the electrification of the Berlin Stadt und Ringbahn. The utilisation of Germany's water-power for the production of electrical energy is also a pressing question. The consumption of electric energy in Berlin for the last two years is shown in Table I.

Table I.

Consumption of Electric Energy in Berlin (in Kilowatt Hours) for the Years 1906 *and* 1907.

	1907	1906
	£	£
Private lighting	28,524,790	24,817,983
Public lighting	3,376,513	2,808,339
Power	48,902,247	43,049,036
Accumulators	5,088,784	4,522,829
Tramways	53,196,218	50,952,760
Used in Works	3,833,264	1,952,901
Total	142,921,816	128,103,848

The extended application of electric driving in Berlin is seen from Table II., which gives the number and the total horse-power of the motors used in various branches of industry in Berlin for the last two years.

Table II.

Number and Capacity of Electric Motors in Berlin.

	1907		1906	
	Number of Motors.	Horse-power.	Number of Motors.	Horse-power.
Lifts	2,342	14,137	1,985	11,611
Ventilators	2,312	737	2,097	659
Metal-working machines ...	2,295	9,768	2,156	9,216
Printing machines	2,228	6,512	2,033	5,904
Wood-working Machines ...	1,998	7,044	1,520	5,762
Butchers' machinery	997	3,585	850	3,064
Grinding and polishing machines	434	1,535	418	1,499
Paper-making machines ...	425	1,272	413	1,246
Laundry machines	365	1,019	296	849
Sewing machines	362	286	303	277
Pumps	330	1,323	302	1,197
Cutting machines	271	174	241	163
Winding machines	165	388	142	344
Leather-working machines ...	151	561	129	465
Dynamos	129	1,338	81	1,271
Miscellaneous	2,164	5,784	1,954	4,892

The improvements in wireless telegraphy during the year were evidenced by the greater distances over which communication was established; for instance, the German cruiser *München* successfully communicated with the station in the Duchy of Oldenburg from Bergen (Norway), a distance of 750 miles, while the North German Lloyd steamer *Bremen* effected a connection with the Nauen station (22½ miles from Berlin) from a distance of 1,500 miles.

The extent of Germany's foreign trade in electrical machinery and other electrical apparatus is shown in Table III. The principal customers were Belgium, the United Kingdom, the Netherlands, Russia, and Austria-Hungary. The imports were divided principally from France, the United Kingdom, and Switzerland. The electrical exports amounted to 2·15 per cent. of the total value of the exports, and the electrical imports to 0·09 per cent. of the total imports.

Table III.

Germany's Foreign Trade in Electrical Machinery and Apparatus during the Year 1907.

Articles.	Imports.	Exports
	£	£
Dynamos, motors and transformers	94,450	1,716,400
Electric cables	76,050	2,260,250
Arc lamps	4,200	145,100
Reflectors, search lights	2,450	134,450
Incandescent lamps	53,150	419,100
Telegraph and telephone apparatus	58,450	765,250
Switchgear	45,200	922,950
Apparatus for surgical and dental purposes	3,700	67,250
Measuring, counting and registering apparatus	27,700	392,100
Dry cells, accumulators, and thermo-electric couples	1,050	38,650
Insulators of earthenware, porcelain, and glass	8,700	20,200

In connection with the analysis of the foreign trade in electrical machinery and apparatus as shown in the above table, it is interesting to note that of the first two items in the table, over 10 per cent. by weight of the exports were for the United Kingdom. Nothing under the heading of the first item was imported from the United Kingdom, but 926 tons out of 1,460 tons of cables imported into Germany came from the United Kingdom. A proportion of each item of the exports was sent into the United Kingdom, but besides the cables mentioned above the imports from the United Kingdom were limited to insulators (17 per cent.), switchgear (15 per cent.), and arc lamps (27 per cent.).

NEW GENERAL MANAGER OF THE LIVERPOOL CORPORATION TRAMWAYS

WE are pleased to announce that the Liverpool City Council at their meeting on the 3rd inst. confirmed the recommendation of the Tramways and Electric Power and Lighting Committee, appointing Mr. C. W. Mallins General Manager of the Liverpool Corporation Tramways. Mr. Mallins has been connected with the Liverpool Tramways for upwards of 34 years, and became Traffic Manager when the Corporation took over the undertaking from the Liverpool United Tramways and Omnibus Co. in September, 1897, since which date an enormous development has taken place in connection with the Tramways, as will be seen from the following figures, viz. :—

	1897. (Last year of Company control.)		1907.
Passengers	38,409,084	...	124,043,239
Receipts	£290,743	...	£572,822
Mileage	6,013,182	...	12,231,799
Vehicles in service ...	267	...	505
Average length of 1d. stage	About 1,200 yards.		2 miles, 737 yards

It may also be mentioned that the sum of £182,662 has been handed over to the relief of the rates, and £975,173 set aside towards the redemption of capital and to a reserve, renewal, and depreciation account. Since the death of the late Mr. C. R. Bellamy, Mr. Mallins has practically carried out the duties of General Manager, and his appointment is the natural outcome of his services in that capacity. Mr. Mallins has placed several of his inventions at the disposal of the Corporation, notably his patent sanding device, which has been the means of preventing numerous accidents and inspiring the drivers with greatly increased confidence in handling their cars on steep gradients; also his patent ticket punch, with which the Liverpool tramways service has been equipped and which is giving every satisfaction, resulting in considerable financial gain to the department.

55-Volt Lighting Mains.—In an article in the *Elektrotechnischer Anzeiger*, the advantages of the 2×110 volt three-wire distribution system for town lighting, as opposed to the 2×220 volt system, are emphasised. The lower voltage is more suitable both for arc-lamps and for metal filament lamps. As an example of low voltage distribution the town of Agram is mentioned. This town, which is near Trieste (Austria), and has a population of 70,000 inhabitants, is supplied at 2×55 volts. Metal filament lamps are used exclusively, the smallest lamps used being 20 (Hefner) candle, 24 watt units.

SUMMARY

A tender for the provision of another 6,000 kw. turbo-generator for the Stuart Street station of the Manchester Corporation has been recommended for acceptance. The turbine will be of the Zoelly pattern, constructed by J. Howden & Co., and will be larger than any turbine of that type yet constructed. The alternator will be made by Siemens Bros.' Dynamo Works, and will be similar to that forming part of the first set. We are able to give some extracts from the specification, showing the conditions with which these machines have to comply. (Page 915.)

The annual report of the Birmingham Electric Supply Department shows that the number of units sold during the year 1907–8 was 20,800,000, as compared with 10,900,000 during the previous year. The working costs have been reduced from 1·06 to 0·766 pence per unit. The whole of the surplus, amounting to over £20,000, was written off towards the value of obsolete plant at the Dale End generating station. (Page 916.)

A new automatic starting device, which operates without any tilting of the lamp, has been devised for use with mercury vapour lamps. The resistance to the discharge, which is practically all concentrated at the cathode, is broken down by applying, at the instant of switching on, a high potential across the lamp; at the same instant, small sparks are produced in the neighbourhood of the cathode, which have the effect of reducing the resistance so that the discharge is started. (Page 916.)

The electric lighting installation at the new Public Offices in Whitehall includes several novel features. The cables in the sub-basement are supported in iron troughs suspended from the ceiling. A special form of sealing box, which admits of the cables being quickly and easily disconnected if required, is employed. Over 6,000 carbon filament lamps are used in the building, there being no metal filament lamps and no arc lamps. The paper lifts are electrically driven, and have push button control. (Page 917.)

Under "Electrical Science," in the British and American Section, there appears a note on a further development of Bellini and Tosi's directive system of radiotelegraphy, described in a Paper before the Physical Society, and an abstract of a Paper on the effects of self-induction in large iron cylinders. In the Papers abstracted in the Continental Section, Ménard criticises the effectiveness of the Roentgen ray test for death. Dumoulin describes the best method of working self-excited alternators in parallel, and Buisson and Fabry investigate the two forms of the iron arc.

In an article in a German contemporary on single-phase motors, Dr. W. Reichel discusses the question

Digitized by Google

of the most suitable frequency for single-phase railways, and gives the results of some interesting tests made on the Niederschöneweide-Spindlersfeld experimental line, with a view to determining the influence of variations in the line pressure on the operation of single-phase motors. (Page 919.)

THE electrically equipped rolling stock in use on the Heysham-Morecambe-Lancaster lines of the Midland Railway consists of three motor-cars, two with Siemens and one with Westinghouse equipment, and some special trailers fitted with driving equipment. Although the Westinghouse car is provided with electro-pneumatic control and the Siemens cars with all-electric control, arrangements have been made to enable any car to be driven by the master controller of any other. Each motor coach carries two motors of the maker's nearest standard size to 150 h.p. (Page 921.)

THE first electric train for the London Bridge—Victoria line of the London, Brighton & South Coast Railway Co. was completed last week. It is expected that the remaining trains will be delivered in August, that the experimental running will be commenced in the autumn, and that the actual opening of the line to the public will be before the end of the year. (Page 929.)

THE electrical engineering exhibits at the Franco-British Exhibition can hardly be regarded as fully representative of either the French or British electrical industries. In the railway section, the Metropolitan Railway exhibit a car which has been converted from steam to electrical traction. Comparatively few French firms exhibit heavy electrical engineering plant, but the plant of Sautter Harlé and the Société Gramme may be noticed, the former containing an example of high-speed Diesel engines, and the largest searchlight projector in the world. The British engineering section contains several examples of large gas engines, including those exhibited by Mather & Platt, Crossley Bros., the British Westinghouse Co., and others. C. A. Parsons & Co. exhibit an 1,800 kw. continuous-current turbo-generator, supplied with steam from a battery of Babcock & Wilcox boilers. The combined exhibit promoted by the electric supply companies is not as yet quite complete, but attention should be drawn to the complete miniature furnished flat fitted to demonstrate the domestic applications of electricity. There is also a fine collection of machine tools. A number of objects of electrical interest are also contained in the science section. (Page 930.)

THE Board of Trade inquiry into the circumstances attending the accident on the Bournemouth Corporation tramways on May 1st was concluded on June 10th. At the inquest, concluded on June 11th, the jury returned a verdict of accidental death, the accident having been caused by the car getting out of control, owing to a defective controller. The driver was exonerated from all blame. (Page 934.)

A PATENT specification by V. A. FYNN, published on Thursday last, relates to single-phase motors having a series characteristic, and describes a method of introducing a negative torque after the motor has reached a predetermined maximum speed. The starting torque is not affected, but the motor cannot race on light loads. S. O. COWPER-COLES has patented a method of obtaining a smooth homogeneous deposition of copper or other metals. A specification by L. H. WALTER describes a self-restoring tantalum-mercury coherer for wireless telegraphy, and another by SIEMENS BROS'. DYNAMO WORKS relates to the insulation of high-tension transformers. A method of avoiding the distortion of metal filaments, when being reduced, due to the reaction between the earth's field and the current carrying filament, is the subject of a patent by the GLÜHLAMPEN-WERK ANKER GES. of Berlin. Two other specifications relate to the manufacture of resistance bodies and a wattmeter for measuring power on unsymmetrical three-phase circuits respectively. A patent by E. G. ACHESON for an electric furnace especially adapted for the production of carborundum expires during the current week. (Page 935.)

A NOVEL idea for measuring resistance of a very high order was described before the American Electrochemical Society at their recent meeting. It consists in ionising air by means of radium bromide, and is based on the law that the ionisation current through a gas subjected to a constant source of ionisation is approximately proportional to the potential difference between the plates when this potential is small. In Luxemberg a large electric steel works is in course of construction. Electrochemistry and Electrometallurgy, (Page 937.)

ON the resumption of the proceedings in connection with the London Electric Power Bills before Lord Cromer's committee, on Tuesday, the case for the Bill of the London Electric Lighting Companies was opened. This provides for the utilisation of the six most modern generating stations of the companies, in which additional generating plant will be erected, and from which current will be supplied to the smaller stations. At present eight companies are joined in the promotion of the Bill. It is proposed that a joint committee be formed to manage the whole undertaking, and provision is made for other companies and local authorities to join if they so desire. The undertaking of any company of local authority joining in the scheme becomes the property of the Joint Committee. Capital to the extent of £1,000,000 is proposed, and under the purchase clause the whole of this sum is to be repaid at the end of 42 years by a purchasing authority, which may be the London County Council. Purchase may also take place in 1932, but in that case compensation is to be made as between 1932 and 1952. The promoters have proceeded upon the assumption that it is unwise to look ahead for more than five or six years, and they have calculated figures showing that in this period the additional demand likely to arise will not exceed 25,000 kw., although, as a matter of fact, there is sufficient land and buildings at the disposal of the Joint Committee for the installation of 34,000 kw. They have, therefore, prepared estimates on the basis of 25,000 kw., and they have produced figures to prove that utilising the existing resources of the companies' generation can be carried on at a cheaper rate than a new power company could do it. In the estimates of Mr. J. S. Highfield and Mr. C. P. Sparkes, who are joint engineers to the scheme, provision is made for 12,000 kw. of gas engine generating plant, Mr. Highfield expressing a great belief in the future of this type, as well as oil engines; in fact, he mentioned that the Charing Cross Co. have installed oil engines in one of their sub-stations for generating purposes, with the result that the total generating cost, including capital charges, might be only 0·39d. per unit.—It is stated that the securities of the London supply companies have depreciated in value by £186,000 since the present Committee commenced their sittings, and by nearly £4,000,000 since the introduction of Mr. Merz's first Bill in 1905. (Page 937.)

IN connection with the sale of the Bath Electric undertaking to the Somerset & District Electric Power Co., a scheme has been proposed for embracing the working of the Bath electric tramways under the same management.—It has been decided to convert the whole of the street lighting in Beckenham from gas to metal filament lamps.—A new proposal has been placed before the Brighton Corporation for the running of a through service of East to West trams by a syndicate. The loss on the year's working of the tramways has been £969, against a profit of £2,410 last year.—A profit of £5,647 has been made by the Coventry electricity department for the past year, out of which it is proposed to hand over £1,000 in relief of rates.—The working of the Eastbourne Electricity Department for the past year shows a net profit of £2,214, compared with £1,567 last year.

Digitized by Google

The total cost per unit for the year have, however, increased from 1·98d. to 2·11d.—A service of electric tramways in Delhi has just been opened.—The experiment is to be made in Liverpool of running a service of first-class tramcars at increased fares.—The profit on the Newcastle Corporation tramways for the past year has been £96,884, which is slightly less than for the preceding year. The receipts average 11·5d. per car mile. (Pages 929 to 942.)

TENDERS are invited by the London County Council for main and auxiliary switchgear for the Greenwich tramway generating station.—A scheme is proposed for the provision of two additional water-tube boilers and coal conveying plant at the Wolverhampton Electricity Works.—A large order for magnetic tramway track brakes for Australia has been placed with the British Westinghouse Co. (Pages 942 and 943.)

IN his speech at the meeting of the Brush Electrical Engineering Co. on Tuesday, Lord VAUX, of Harrowden, said that although the output of the works for the year had been a record, business had to be accepted at prices leaving a disproportionate profit. Some further debentures are to be issued.—At the meeting of the Aron Electricity Meter Company, Mr. H. HIRST referred to the increase of business anticipated owing to the introduction of the metal filament lamp, especially as regards their new prepayment alternating current meter. (Page 944.)

IN his report on the slight fire which destroyed a locomotive on the City and South London Railway, on May 24th, Mr. A. P. Trotter, Electrical Advisor to the Board of Trade, says that it is impossible to connect the fire with any electrical cause. By being allowed almost to burn itself out, without damaging the carriage coupled to it, or the wooden platform of the station, it afforded an interesting and satisfactory test. (Page 946.)

THE annual report of the Patent Office for the year 1907 has just been issued. As compared with the year 1906 there was a decrease of 3·3 per cent. in the number of applications received. This, says the report, is partly due to the falling off of the activity in connection with the motor-car industry. Judging from the titles only, the inventions relating to motor road vehicles during the year 1907 decreased nearly 35 per cent. A large increase is observable in the subject of wireless telegraphy. (Page 948.)

A NEW form of electrolytic rectifier has been introduced, specially suitable for charging small ignition accumulators. (Page 947.)

IN a report on fire alarm systems by the State Inspector of Buildings in Berlin, attention is called to an automatic system in use on the Continent which has the feature that the detector or thermostat is not only sensitive to an increase of temperature above a defined limit, but is also sensitive to an increase in the rate at which a room is heated over that which could normally occur with the usual heating arrangements. (Page 948.)

A LETTER from the Hart Accumulator Co. deals with a misconception which might arise owing to a liquidation of a company of similar name. (Page 948.)

WE publish this week a detailed and well-illustrated description of the rolling stock on the "electrified" portion of the Midland Railway. Read in conjunction with the article on the overhead equipment published in our last issue, it affords a detailed study of the problem of adapting the newest method of electric driving to standard English railway requirements and established methods of operation. This is particularly demonstrated in the design of the overhead work, which has been made to conform to exacting conditions of clearances to accommodate steam trains composed of all classes of vehicles of full standard size. It is well known that vehicle dimensions have been increased during recent years nearly up to the full capacity of existing structures, so that there are many places where the clearances available for carrying the conductors are measured in inches only. When the conductors are supplied at extra high tension, and the insulators are exposed to locomotive exhausts, it is obvious that the conditions are trying, and permanently successful operation in these circumstances will prove the practicability of the system for general railway work. There are no tunnels on the lines electrified, it is true, and anyone who knows what the inside of a railway tunnel is like will admit that it is well to get some experience from working in the open before designing tunnel work. The rolling stock shows just as much adaptation of design to standard conditions, but there is less novelty here. The ingenious replacement of the standard large and small vacuum brake ejectors by a double speeded motor is worthy of note, as is also the interlocking of the brake and control gear, ensuring that the locomotive shall not be started until braking power is available. This is one among many points in which electric traction lends itself to security of working.

Among the constructive details in which the equipment shows novelty, the system of catenary suspension is perhaps the most important. It may be called the "compound" catenary, and we believe it was first introduced by the Siemens-Schuckert Co. in Germany. As now developed, it gives to each member of the catenary the fullest permissible individual freedom, and therefore the greatest possible equalisation of stresses, whilst keeping the contact wire in a very nearly horizontal line. It also simplifies the arrangement of pull-offs at curves, and special work, and consequently reduces the number of points at which surface leakage may occur, as well as the area exposed to wind, two points of very great importance, which the weather of the Morecambe district will put to severe test. These advantages are mainly in comparison with the "duplex" catenary, in which the two carrier and one contact wire are arranged at the angles of a vertical triangle, a system which has been used on several of the American single-phase lines. The greater lateral space occupied is also against it for English railway work. The return circuit arrangements are mainly distinguished by the deliberate provision of earth returns. As two of the earth-plates used at the three termini are immersed in the sea, and the third in a tidal river, they are tried under the most favourable conditions. As regards the operation of the railway, it is of the first necessity that the rails shall never be at such a potential difference from earth as to administer serious shocks to platelayers and others. With the train service at present contemplated, and the short distances between the earth-plates, such a condition is not likely to obtain on the lines in question, but, having regard to the high impedance of steel rails, the point will require careful attention in less favourable circumstances. Meantime the records of current carried *via* the earthplates will afford useful information, and the earthplates themselves will demonstrate how far alternating current electrolysis has to be reckoned with. Experience will also be gained on the effect on neighbouring telephone and telegraph wires. That earthed tele-

Digitized by Google

graph circuits will be considerably affected is tolerably certain, also that the insulation of metallic telephone circuits will have to be very well maintained.

WHILST the Midland Railway deserves all congratulations upon being the first in this country to operate a single-phase line, and has thus justified its long-standing reputation for enterprise and initiative, it must be remembered that the London, Brighton and South Coast Railway was the first to publish its decision to adopt the system, and that it chose for the scene, not a country line with a moderate traffic, but a suburban line with a "tramway" service, entering two London termini, and complicated by joint ownership and running powers with other companies. The differences fully account for the slower progress made on the Brighton Co.'s line, the work on which is in every way more difficult, and in some respects more important. It is well known that this pioneer initiative of the Brighton Company is largely due to the energy of Mr. PHILIP DAWSON, who appreciated the possibilities of single-phase traction at a very early date, and has done an enormous amount of work on the subject, which is not yet within the public view. We believe, in fact, that Mr. Dawson actually placed some of his work at the disposal of the Midland Company's officers. As stated elsewhere in this issue, it is anticipated that experimental running will be commenced on the line between Victoria and London Bridge in the autumn, and that this important suburban line will be opened for public traffic by the end of the year.

LORD CROMER'S Committee resumed its consideration of the London Electric Power Bills, after the Whitsun recess, on Tuesday, when the scheme for "linking up" the existing stations of the electric lighting companies was described by Mr. BALFOUR BROWNE, K.C., and subsequently by Mr. J. S. HIGHFIELD, of the Metropolitan Electric Supply Co., who is to be followed by Mr. C. P. SPARKS, of the County of London Electric Supply Co. Briefly, the proposal is to utilise the most modern of the generating stations owned by the eight companies promoting the Bill, viz., Bow (Charing Cross, West End & City Co.), Bankside (City of London Co.), Deptford (London Electric Supply Corporation), Blackwall Point (South Metropolitan Power Co.), Willesden (Metropolitan Co.), and Wandsworth (County of London Co.), for the erection of additional generating plant, and to supply from these to the less economical power stations. At present only eight companies have joined forces, but if, as the promoters hope, all the other companies fall into line, as well as some, if not all, of the local authorities, then the principle of supplying from one or more large generating stations in bulk at rates cheaper than the energy can be generated in less favourable spots, applies equally to this Bill as to the scheme promoted by Mr. PARSHALL and Mr. HAMMOND. The main difference from the engineering point of view is that, whereas only one large station—eventually to supply the whole of London—is contemplated in the Parshall-Hammond scheme, six power-houses are to be employed in carrying out the companies' proposal, and as several different systems of generation are employed, the work of modifying these to work in unison, if there is really to be interconnection, will be a task calling for all the ability of the engineers at the heads of the various undertakings. From the business point of view, the main difference is that, while the Parshall-Hammond Bill contains provisions for securing the largest power users in the areas of the various companies and local authorities already established as suppliers of electrical energy, no poaching is contemplated in the companies' Bill. The letter asks for authorisation to supply railways, docks, and canals, whether in the companies' own area or outside, but otherwise the consumers and prospective consumers of the companies and local authorities outside the "combine" are to be left alone. The companies say, moreover, that they expect no demand from tramways, and that railways require special plant, which would be put down when the need arose, just as the London Electric Supply Corporation has put down special plant in connection with the electrification of the London Bridge-Victoria line of the London Brighton and South Coast Railway. Thus it is estimated that 25,000 kw. of extra plant will be ample to meet the requirements of the next five or six years, which is less than half of the 60,000 kw. put forward as the first stage of the Parshall-Hammond station. This, the companies' engineers say, is looking far enough forward, in view of the rapid progress that is being made in engineering invention. In fact, it is interesting to note that Messrs. HIGHFIELD & SPARKS already look upon the gas engine as a formidable competitor of the steam turbine, and in their estimates of the 25,000 kw. of new plant, 12,000 kw. of gas-driven plant is included, for the reason that it is more economical to run these during the day load, reserving the steam turbine for the peak load. This idea has found an energetic advocate in Mr. LEONARD ANDREWS, whose estimates were recently published in our columns, and elicited an interesting controversy. Mr. Highfield also spoke of the possibilities of oil engines, and mentioned that the Charing Cross Co. has installed some in a sub-station, where the total generating costs, including capital charges, were 0·39d. per unit. With regard to the terms upon which the local authority may ultimately purchase the undertaking—which have been stumbling blocks in every London Power Bill hitherto—an interesting feature so far is that the London County Council decline the honour which is offered by the Bill of being the purchasing authority. The views of the County Council have yet to be heard, and up to the present the purchase clause has hardly been discussed.

In comparing the two Bills, it must be borne in mind that they approach the subject from an entirely different standpoint as to the demand which has to be met, and consequently the respective estimates are not strictly comparable, and lend themselves to no useful deductions. Either side disputes the premises of the other's calculations, and so far as the companies are concerned, they appear to be taking up the most uncompromising attitude towards the new power company, probably for the reason that they are now working together much more in harmony than was the case three years ago, when Mr. Merz's Bill was on the *tapis*. So far as the fight in the Committee Room is concerned, one looks in vain for an indication of the spirit of "sweet reasonableness" which suddenly manifested itself during the House of Lords proceedings on Mr. Merz's Bill, and brought the promotors into line with the most powerful of its opponents.

ANOTHER 6000 KW. TURBO-GENERATOR FOR MANCHESTER

A GOOD deal of attention centred round the inauguration of the Willans-Siemens 6,000 kw. turbo-alternator last month at the Stuart Street generating station of the Manchester Corporation (see ELECTRICAL ENGINEERING, May 14th, page 735), and it is interesting to know that the acceptance of a tender for a second set of this size has been practically decided upon. The new set will be somewhat different from that already put down, as it will be driven by a turbine of the Zoelly type, constructed by Messrs. James Howden & Co., of Glasgow, and will be larger than any Zoelly turbine yet made. Messrs. Howden have already built several large turbines of this type, including a 2,000 kw. set for the Powell-Duffryn collieries. The alternator will be made by Messrs. Siemens Brothers' Dynamo Works, Ltd., and will be similar to that forming part of first set. Seven tenders were considered, but until the official confirmation of the acceptance of the tender we must withhold a complete list. It may be of interest, however, to give a few technical particulars of the requirements of the set from the specification.

The turbine is specified to be of the horizontal pattern, either of the impulse or reaction type, and must be adapted for the full range of expansion of the steam. The steam pressure at the turbine stop valve will be 190 lbs. per square inch, and the speed is not to exceed 1,000 r.p.m. The turbine must be capable of developing sufficient power to enable the alternator to deliver an output of 6,000 kw. of electrical energy at its terminals at normal speed, with a steam pressure of 190 lbs., and a vacuum of 27 ins.—either on a non-inductive circuit or on an inductive circuit—with a power factor of 0·85. It must further be capable of developing as an emergency load, with the same conditions as to steam pressure and speed, sufficient power to enable the alternator to give on non-inductive circuits an output of 7,500 kw. for six hours. It must also be capable, when working non-condensing, of developing sufficient power to enable the alternator to deliver an output at the terminals of 6,000 kw. under normal steam pressure and speed. From 100° to 150° Fah. will be added to the temperature of the steam; the turbine must therefore be capable of working under normal conditions at a total temperature of 600° Fah.

The turbine is to be provided with a main governor, which shall be so adjusted that if the whole load be suddenly thrown on or off the variation of steady speed shall not exceed 2 per cent., and of momentary speed 5 per cent. The total variation in the load at the present time on the station may be taken at 15 per cent. The variation in speed of the turbine must not exceed, therefore, half of one per cent. either way on a load varying 7½ per cent. up or down from the mean load. Provision to be made for a 5 per cent. up and down, or a total of 10 per cent. variation by hand adjustment. It is essential that this adjustment should be controllable from the switchboard gallery as well as from the engine-room floor level. The variation in angular velocity during each revolution must not vary by more than one-twentieth of one per cent. with constant load.

A safety centrifugal mechanical governor must be fitted, capable of being operated by hand or working automatically, to act as an emergency governor should the speed exceed 15 per cent. above the normal, and that under no condition whatever shall the turbine race injuriously.

The alternator is to be of the three-phase type, delivering alternating currents with an angle of 120° between each phase. It is to be of the revolving field type with stationary armature, the windings of which are to be star connected, and a connection from the centre point is to be brought out to a terminal on the bedplate for earthing purposes, if required. The alternator is to be of the completely enclosed-in type. For providing the necessary ventilation a separate and electrically-driven fan is to be supplied and fixed, capable of blowing 21,000 cubic feet per minute, or otherwise to enable the alternator to comply with the clause regarding temperature rise. The fan house is existing. It is to be excited by continuous current at a pressure from 200 to 225 volts, supplied normally by its own exciter direct coupled on the end of the shaft, or from the existing Corporation exciting bus-bars. The alternator must be capable of delivering at its terminals at any voltage between 6,400 to 6,600 an output of 6,000 kw. at a periodicity of 50 per second, either on an inductive load with a power factor of 0·85 or on a non-inductive load. It must further be capable of giving an output of 7,500 kw. for six hours as an overload, and the speed is not to exceed 1,000 r.p.m. The periodicity of the alternator is to be 50 complete cycles per second.

The current density in the armature circuits on full non-inductive loads must not exceed 1,300 amperes. The field magnets or rotating part of the alternator may be of the salient pole or cylindrically wound type, but must run perfectly true and be accurately balanced, and the methods of construction throughout must be of a thoroughly sound mechanical nature. Special care must be taken to insulate the field circuit from earth throughout. The current density for the field circuits on full non-inductive load must not exceed 1,700 amperes per square inch. The insulation resistances taken during manufacture and after a six hours' full test shall not be less than the following:—Between armature windings, 3 megohms; between armature windings and earth, 3 megohms; betwen field magnet circuits and earth, 2 megohms. A 13,000 volt alternating pressure will be applied between the armature circuits and earth, and a 1,000 volt pressure between the field circuit and earth, and each test will be applied for one hour continuously, and must be successfully withstood. The inherent regulation of the alternator is to be such that without any adjustment or regulation, but with constant excitation and speed giving 6,500 volts on open circuit, the full load volts on a full non-inductive load shall not rise by more than 3·5 per cent.

On an inductive full load, with a power factor of 0·85, the rise shall be within 14 per cent. The winding and arrangement of the armature is to be such that if the terminals of the alternator be short-circuited the current shall not rise to more than 3½ times the normal full load current or cause any damage or injurious heating to the armature if it is so run short-circuited for one minute. The alternator must carry its full load without undue heating, either from mechanical or electrical causes. The temperature of no part of the armature, field coils, core, must exceed 60° Fah. above that of the immediate surrounding air at the conclusion of the full load non-inductive test of six hours' run. On an inductive circuit, with a power factor of 0·85, after a six hours' continuous run on full load, a figure of 70° Fah. must not be exceeded.

The total electrical energy absorbed in exciting the field magnets' full non-inductive load shall not exceed 21 kw., and when working on an inductive full load with a power factor of 0·85 shall not exceed 35 kw. The exciting current is to be provided by a direct-driven, continuous-current, shunt-wound dynamo to be supplied under this contract, and preferably coupled to the end of the alternator shaft. The exciting voltage to be 200 to 225.

The condensing plant is specified to be of the "Contraflo" type.

The following clauses are extracted from the section of the specifications headed General and Testing:—

It is of the greatest importance that the whole of

Digitized by Google

the plant specified shall work without undue noise or vibration. The turbo-alternator must be capable of being easily put into parallel and remaining in step with either of the existing units now installed at Stuart Street, and with any of the existing synchronous plant installed in the various sub-stations. There must be no appreciable "surging" between the alternator of this set and the existing alternators when operating in parallel. The steam consumption of the plant, with a pressure of 190 lbs. per square inch, and a degree of superheat of 120° Fah. at the stop valve, and a 27 in. vacuum on the condenser, on full load, with a power factor of 1·0, shall not exceed 15·75 lbs. per kilowatt hour. A deduction of £300 per lb., and *pro rata* for a part of a lb., shall be made from the contract price for any excess of consumption per kilowatt hour beyond the figure specified above. A bonus of £300 per lb., and *pro rata* for every part of a lb., shall be paid by the Corporation to the contractor for every lb., and *pro rata* part of a lb., by which the actual consumption is less than the consumption specified for above.

BIRMINGHAM ELECTRICITY SUPPLY ACCOUNTS

THE report of the Electric Supply Department of the City of Birmingham for the year ended March 31st, 1908, gives some figures showing how the undertaking has grown in the last three years, and also some comparative figures for the works costs for the year in question and the previous year. The total number of units generated was 24,763,655. The units used on works amounted to 1,024,327. The number of units sold was 20,793,670, as compared with 10,887,684 units during the previous year (1906–7), and 5,383,904 units during the year 1905–6. The maximum load on the plant was 11,020 kw., and the capacity of the plant installed 14,740 kw. The load factor was 21·5 per cent. The following figures, calculated from the revenue account, give an analysis of the costs per unit sold for the year ended March 31st, 1908, and also for the previous year:—

COSTS PER UNIT SOLD.

	Year ended Mar. 31, 1907.	Year ended Mar. 31, 1908.
Generating costs—		
Coal	0·340d.	0·252d.
Oil, waste, water, and stores	0·037	0·021
Wages at generating stations	0·181	0·122
Repairs—buildings	0·004	0·005
Repairs—engines, boilers, &c.	0·070	0·046
Distributing costs—		
Repairs and maintenance—mains, meters, &c., including wages	0·052	0·052
Repairs, maintenance, and renewal of apparatus at substations, including wages	0·038	0·051
Total works cost	**0·722**	**0·549**
Management charges, &c.—		
Rents, rates and taxes	0·115	0·080
Salaries—Engineers' department	0·105	0·070
Salaries—Accountant & clerical staff	0·036	0·022
Stationery and printing	0·009	0·005
General establishment charges	0·041	0·033
Insurance, law costs, &c.	0·032	0·007
Total cost per unit sold (excluding capital charges)	**1·060**	**0·766**
Capital charges—		
Bank interest	0·009	0·024
Interest on mortgage debt	0·623	0·392
Sinking fund	0·397	0·287
Total cost per unit sold (including capital charges)	**2·089**	**1·469**

The total working expenses, as analysed above, were £66,424; but a further sum of £9,159 brought the total expenditure up to £75,583. This sum of £9,159 represents the cost of a battery and of building alterations at the Parker Street substation, and a switchboard for the Water Street generating station. This special expenditure, corresponding to 0·106 pence per unit sold brings up the total cost per unit sold (excluding capital charges) to 0·872d., and including capital charges to 1·575d. The receipts from all sources amounted to £156,789, and of the balance of £81,206, a sum of £20,279 was written off, as the value of obsolete plant at the Dale End generating station, the remaining £60,927 being absorbed by interest and repayment of loans. The average price obtained per unit was 1·809d., and taking the total cost per unit as 1·575d. (including capital charges and special expenditure) a net profit of 0·234 pence per unit is shown, the whole of which, amounting to £20,279, was written off as the value of obsolete plant as stated above.

The following table shows the capital expenditure up to March 31st, 1908:—

	£
Expenditure up to 31st March, 1907	1,102,830
Expenditure since that date—	
Buildings	8,923
Machinery	73,132
Mains and services (including laying)	38,246
Meters	2,157
	1,225,288
Less Plant abandoned	20,279
Total	**£1,205,009**

This last figure, divided by 14,740, the present capacity of the station in kilowatts, gives £81·7 as the cost per kilowatt installed.

A NEW STARTING DEVICE FOR MERCURY VAPOUR LAMPS

IN order to start the discharge in a mercury vapour lamp, it has been usual to tilt the tube in such a way that the mercury is caused to flow along its entire length, and form an uninterrupted bridge between the electrodes. When the stream breaks an arc is established, which fills the whole tube, as this is allowed to drop back into its original position by gravity. This operation of tilting the tube may be performed by hand or by means of an electromagnet. The latter method is for mechanical reasons confined to lamp-tubes not exceeding 21 in. in length. In an article by F. H. von Keller, in a recent issue of the *Western Electrician* (Chicago), a new form of starter is described, with the aid of which a lamp may be started without tilting the tube.

In this method of starting advantage is taken of the fact that in a mercury vapour lamp, as in all other cases of a discharge through a gas, the resistance to the discharge is practically all concentrated at the surface of the negative electrode. This phenomenon was explained by Prof. J. J. Thomson, in his recent series of lectures on "Electric Discharges Through Gases," at the Royal Institution. (See ELECTRICAL ENGINEERING, March 12th, page 410, and subsequent reports.) In the lamp in question a metallic coating is provided on the outside of the condensing chamber at the negative electrode. This coating extends above and below the mercury edge formed inside of the chamber. The metallic coating and the mercury thus form the two plates of a condenser, and the glass is the dielectric. If this condenser is suddenly raised to a high potential, minute sparks are produced between the surface of the mercury and the inside surface of the glass. These are sufficient to render the gas in the neighbourhood of the negative electrode conductive, and the discharge is started. At the instant of applying the high potential across the condenser, the whole length of the tube is also subjected to this high potential. This is done in the following manner. In parallel with the tube is an auxiliary starting circuit, comprising a starting resistance and a quick-break mercury switch. In series with these two parallel circuits is an inductance coil and the usual series resistance. The mercury switch consists of a glass bulb about two inches long, provided with a V-shaped indentation, forming a partial partition, and serving to separate the contained mercury into two globules. Each of these globules makes connection with an outside terminal by means of a small platinum wire. The bulb is exhausted to a high degree of vacuum.

Digitized by Google

When the circuit is closed the bulb is in such a position that the mercury forms a bridge connecting the two terminals together. A current of about one ampere then flows through the bulb, the starting resistance and the inductance. The inductance coil actuates an armature which turns the bulb and causes the partition to separate the globule and thus break the circuit. A lasting discharge cannot take place in the bulb as the current is limited to one ampere, and the current is interrupted so suddenly that a high potential rise takes place across the bulb, the lamp tube and the condenser, the metallic coating of which is connected to the iron positive electrode of the lamp. This potential rise created by the inductance on breaking the auxiliary circuit is insufficient by itself to start the discharge across the ¼ in. of space between the globules in the bulb, and also, of course, across the 50 in. of space between the electrodes of the lamp tube, but in the latter the high resistance at the surface of the negative electrode is broken down by the ionising influence of the minute sparks, and the discharge is started. The resistance to the discharge at the surface of the negative electrode asserts itself not only when the lamp is being started, but also at intervals when the lamp is running, thereby tending to put the lamp out. The frequency with which this will occur increases with decreasing current. The inductance in series with the lamp tube reacts upon these impulses of the negative electrode with a high-voltage kick, which keeps the lamp running continuously at its current consumption of 3·5 amperes.

The successful application of this method presents a distinct improvement in the art of mercury-vapour lighting, as it is entirely automatic, and is the only method by which the tube as a whole remains perfectly stationary during the starting. An 800-c.p. lamp, employing this method, consists of a straight one-inch tube of 50 in. (light-giving) length, suspended in a holder from a compact round housing in which all the auxiliary apparatus is contained. The lamp consumes 3·5 amps at 110 volts direct current, or approximately 0·5 watts per candle. The light emitted is highly diffused on account of the great length of tube, and the light source itself is made least offensive to the eyes by a relatively low intrinsic brilliancy.

THE ELECTRICAL INSTALLATION AT THE NEW PUBLIC OFFICES, WHITEHALL

THE large new block of public offices at the southern end of Whitehall, which will be the home of the Local Government Board and the Board of Education, and later of the Board of Trade, is now practically complete, and a description of the lighting installation, which includes over 6,000 lamps, may be of interest. The building is supplied jointly by the Westminster and London Electric Supply Corporations; the former supplies current for power and lighting, and the latter for lighting only. At present about three-fifths of the whole building is built, and this portion is supplied chiefly from the London Electric Supply Company's mains, but when the remaining two-fifths of the building are finished, the lighting load will be about equally divided between the two companies. The scheme provides for two pairs of service cables from each company's mains, at different parts of the building, and there will be four separate main switchboards at these intake points. The Westminster supply is three-wire direct-current, 400 volts across the outers; and each main switchboard is divided into two halves, the 200-volt lighting circuits being balanced on either side of the three-wire system. The London Company's supply is alternating. Two feeders supply two sets, each of three 40 kw. single-phase transformers in parallel, the two sets, as mentioned above, being in different parts of the building. These transformers transform down from the mains pressure of 2,500 volts to the lighting pressure of 200 volts. The transformers are in a fire-proof chamber adjoining the room containing the main switchboard, but the handle of the high-tension oil-break switch projects through a slot in the wall, and so the transformers can be isolated from the high-tension mains or changed over from one pair of cables to the other without entering the transformer chamber. The transformer chambers and main switchboards are situated in the basement proper, and from the four main boards 1,000-ampere flexible rubber cables lead down through openings in the floor to the sub-basement. From the point where the cables leave the main switchboard room, they are carried in 6 in. by 2½ in. iron troughing, built up of sections a few feet in length and covered with a loose iron cover. This troughing is hung from the ceiling of the sub-basement by half-inch iron rods hinged to hooks which are attached to the girders. The troughing is continuous throughout, and the curved portions were cast specially for the work. The cables are lead-covered, paper-insulated, and the joints between these and the short lengths of rubber cable leading down to the sub-basement are enclosed in specially designed sealing boxes, one for each of the two cables, which can easily be disconnected if required. Each sealing box consists of a brass cylinder (iron was not permissible for the alternating-current cables), at each end of which a brass cap is screwed on. One cap is sweated on to the lead-covering of the paper cable, and the other cap contains a gland which makes an oil-tight joint round the rubber cable. The ends of the cores are sweated into lugs, and these are screwed together with a sheet of copper gauze covered with tinfoil between the machined surfaces, and the cylinder is filled with oil. From the 1,000-ampere cables smaller (250-ampere) cables run up to the sub-main boards in the basement. The iron troughing widens out where the cables enter a junction box, to the sides of which the troughing is bolted, the whole forming a continuous conduit. There are about a dozen of these sub-main boards, each containing a double-pole switch, and eight double-pole porcelain enclosed fuses. These boards are let right into the 18 in. wall, and the backs of the boards are accessible from the other side of the wall. From this point onwards the wiring is entirely in ¾ in. galvanised steel seamless conduit. In the basement and sub-basement the wiring is on the surface, but everywhere else it is in special ducts and under the plaster. Where the leads from the sub-main boards enter the conduit, the insulation is protected from the edge of the conduit by "Crystalate" bushes. The main and sub-main boards were supplied by Messrs. Drake & Gorham. The distribution boards, 132 in all, were supplied by the Electric Ordnance Accessories Co., and are 5-ampere way, but only 3 amperes per way is used.

The fittings in the corridors and rooms are all hung on gimbals from the ceiling. The ornamental electroliers in the Council Chamber and in other important rooms were made by the Bromsgrove Guild, but all the other fittings were supplied by Messrs. Verity. Ceiling rose blocks are arranged in the centre of the rooms so that either a single electrolier can be suspended or five separate flexible leads can be brought through ceiling eyes to separate counter-weight lamps. All rooms are well provided with wall-plug sockets, which are flush with the skirting and are not screwed on to the wood blocks sunk in the wall, but are sprung into brass rings attached to the blocks. This gives a much neater appearance. Four handsome standards by the Bromsgrove Guild, supported on marble pillars, serve to illuminate the Grand Staircase leading to the Council Chamber. The lamps are all 200-volt carbon filament lamps, mostly 16 candle-power, a few 8 candle-power lamps being used in the corridors. There are in all over 6,500 lamps; 4,000 of these are counter-weight lights, and there are over 1,000 wall plugs for table lights, &c.

The telephone arrangements, which are being carried

Digitized by Google

out entirely by the Post Office, are not yet complete. There will be two exchange rooms in the building, and at night the telephones in several rooms on each floor will admit of direct communication to the hall-porter, so that in case of fire, anyone in any part of the building can inform the hall-porter, who in turn communicates with the fire station and no time is wasted. Of twelve lifts installed, all supplied by Messrs. Waygood, six passenger and goods lifts are hydraulic, as well as an ash lift provided by the Eastern Lift Co. The paper lifts are, however, electrically driven. These lifts, which have push button control, can hoist 1 cwt. at the rate of 120 ft. per minute. Five of the lifts have a rise of 82 ft., and the remaining lift 69 ft. The one horse-power motors are operated off the 200-volt direct-current supply.

All the wiring was designed and carried out by the electrical department of the Office of Works. The lead-covered cables were supplied by Messrs. Siemens Brothers & Co., the smaller cable by the Liverpool Cable Company. The whole of the engineering work of the building has been under the direction of Mr. E. G. Rivers, chief engineer to the Office of Works.

ELECTRICAL SCIENCE

British and American

Directive Wireless Telegraphy.—At the Physical Society meeting on Friday last, E. Bellini and A. Tosi described their system of directive wireless telegraphy and gave some details of a

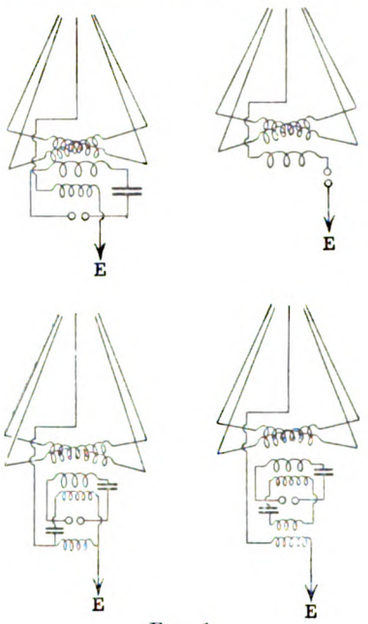

FIG. 1.

further development of their system. The principal methods and apparatus have already been fully detailed in ELECTRICAL ENGINEERING, p. 748, Vol. 2, and p. 348, Vol. 3. They employ two closed radiators, fixed in vertical planes at right angles to one another, and, by means of an apparatus called a radiogonometer, they adjust the phases of the waves emitted by the two closed radiators so that the energy is transmitted principally in one plane. The closed radiators are usually of the convenient form of wire triangles supported from the same mast. In the Physical Society Paper an important improvement on the above-sketched apparatus is recorded. The improvement consists of means for transmitting principally in one direction, and not merely in one plane—that is, the radiated energy is despatched practically wholly towards one side of the sending station, as well as principally in one plane. This improvement is effected by adding a plain vertical aerial wire to the sending aerial system, and by exciting this added aerial just so strongly, and with the right phase relation, as to annul the radiation sent to the one hand by the closed-circuit aerials, and to add to the radiation sent to the other hand by the closed-circuit aerials. The authors have accomplished this by exciting the aerial inductively from the moving coil of the radio-goniometer described in our articles quoted above. This secures the simultaneous excitation of the closed oscillatory circuits and of the vertical antenna, and ensures perfectly uniform excitation of the latter, however the moving coil of the radio-goniometer be rotated. Various arrangements which have been employed are diagrammatically depicted in Fig. 1. In the first of these arrangements the excitations of the two systems are in phase; in the other three cases they are in quadrature. Fig. 2 shows one of many diagrams picturing the distribution of the radiated energy. This diagram was obtained by using the thermo-galvanometer to measure the radiation from the second arrangement shown in the above diagrams. The very small backward radiation here shown may be taken as experimental proof that there is a phase-difference of 90° or thereabouts between the emissions from the closed-circuit and the open-circuit systems. Not only unilateral transmission, but unilateral reception also has been accomplished by the authors in the principles laid down above. In fact, the process of reception is exactly the inverse of the above-described process of transmission. The incoming waves excite oscillations in the closed-circuit aerials and in the vertical aerial simultaneously. By a modified receiving radio-goniometer, these oscillations act on the detector. If the waves come from one side, the effects are added; if from the other, the effects of the two systems are subtracted. It is found necessary to obtain quadrature between the action of the vertical system and that of the closed-circuit system on the detector. This is effected very well by means of the arrangement shown in the diagram of Fig. 3, where *R*, the detector, is in a tuned circuit linked through one inductive coupling with the vertical antenna, and through two inductive couplings with the closed-circuit aerial system.

Self-Induction in an Iron Cylinder Traversed by Alternating Currents.—In the May *Proceedings* of the Royal Society, E. Wilson gives an account of his further experiments on the effects of self-induction in an iron cylinder. The previous experiments (*Roy. Soc. Proc.*, 1906) related to the effects of reversing a continuous current flowing through the cylinder. In the present experiments slowly alternating currents are passed through the cylinder in the direction of its length. The currents were made to alternate in the following manner. A continuous-current dynamo, capable of giving up to 2,000 amperes or more, was weakly excited and its brushes were short-circuited by the cylinder to be experimented on. The brushes were moved by hand round the commutator by aid of a worm and a worm-wheel from the position of maximum to that of zero current, when the field was reversed and the brushes moved back to their initial position. By continuing these operations an alternating current was caused to flow through the cylinder, and its periodic time was controlled by the operator listening to a seconds clock. The current was led into and from the cylinder by massive gun-metal castings. The cylinder was of mild steel 10 in. in diameter and 10 in. long. It was provided with pairs of holes drilled in a plane containing its axis of

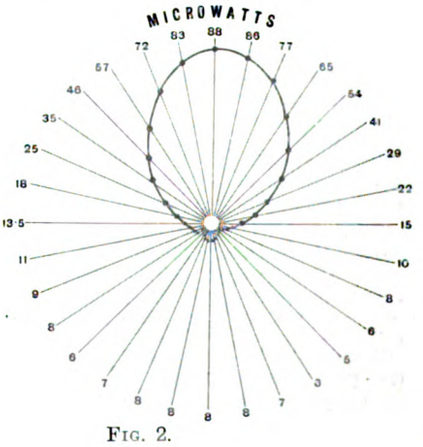

FIG. 2.

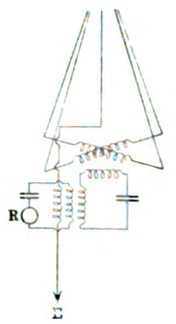

FIG. 3.

figure in such a manner that exploring coils could be threaded to enclose certain portions of that plane. The depths of the holes reckoned radially were 1, 2, and 4 in. The three coils were connected to dead-beat galvanometers. The galvanometer deflections allow the magnitude, the wave form, and the phase-displacement, and the energy dissipated in the cylinder, to be studied. The period of alternation of the current varied from

Digitized by Google

six minutes to three-quarters of a minute. One result well brought out is that for a maximum total current of 1,000 amperes the percentage diminution of maximum flux of induction, as the periodic time is varied from 6 to 0·75 minutes, is much greater than in the case of maximum total currents of 500 and 2,000 amperes. For the periodic time 0·75 minute, the shielding effect for maximum total currents of 1,000 amperes is much greater than for currents of 2,000 amperes, an effect which is ultimately connected with the higher average permeability of the iron at the 1,000 amperes maximum. Further, for a given total current, the maximum of the induced E.M.F. occurs later as the frequency is increased. The wave-forms of the E.M.F.'s are very much more peaked for the higher currents and for the longer periodic times. The peaks of the E.M.F. curves cease to be prominent at the high frequencies, but they are retained more with the large total currents than with the small ones. The watts lost in resistance and in hysteresis were separately estimated by the author by methods fully explained in the Paper. It is interesting to note that for a given total current the ratio of the resistance loss to the hysteresis loss diminishes as the frequency increases; the increase in the hysteresis watts due to increased frequency much more than counterbalances the decrease owing to the greater skin effect.

Continental

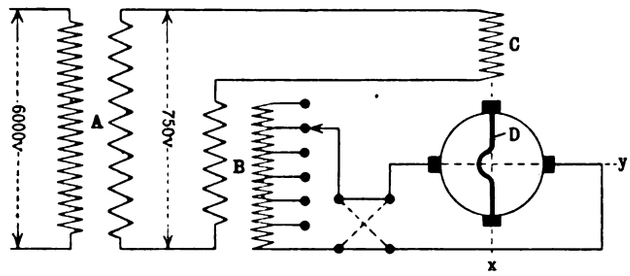
X-ray Test for Death.—The effectiveness of the Roentgen ray test for death is seriously questioned by M. Ménard in the *Comptes Rendus* for May 25th. Vaillant has maintained that the radiographic aspect of the intestines is decisive for or against death, but some radiographs taken by the author show that the aspect is the same 80 minutes after death as it is 5 minutes after the cessation of respiration, except that some of the convolutions are discernible. The convolutions are all traceable 20 hours after death, but by that time other physical signs usually relied upon have set in. The visibility of the walls of the intestine is not a matter of structure, but simply of thickness. An intestine distended by gas becomes invisible on radiographs because the walls become thinner. This was proved by direct experiments with the intestine after removal from the body. The invisibility of the intestine cannot be attributed to phosphorescence, as that would have no power of penetrating the other tissues.

Parallel Working of Alternators.—M. Dumoulin gives some results of experiments in the parallel working of self-excited alternators in the *Comptes Rendus* for June 1st. Most such alternators are excited by rectified currents, and the exciting E.M.F. depends upon the mean value of the p.d. between the brushes, within limits depending upon the commutation. This mean value varies with the phase, and a displacement of phase produces the effect of a shifting of the brushes, and *vice-versa*. If a self-exciting alternator whose brushes have been shifted, in the sense of the rotation, in advance of the position for maximum E.M.F., is subjected to some kind of perturbation, oscillations will be set up. The alternating p.d. at the brushes will present an increasing retardation of phase with respect to the commutation. This retardation will act practically as a diminution of the forward displacement of the brushes, and will increase the mean rectified E.M.F. The final effect will be diminution of the resisting couple. In the opposite oscillation there will be an increase in the resisting couple, and the oscillations will increase and finally prevent the alternator from working in parallel at all. If, on the other hand, the brushes are shifted in the direction contrary to that of motion, a similar reasoning shows that this condition is particularly favourable to parallel working, since an advance will increase the resisting couple, and a retardation will diminish it. The author gives the equation governing the oscillatory movement described. The energy corresponding to the damping in the second case above considered is absorbed by the network, so that no energy is actually lost. The process described has been successfully tested at the Anzun Mines.

The Iron Arc.—H. Buisson and C. Fabry have found that two distinct types of arc are possible between iron electrodes, and that these two types differ by the aspect of the arc and its electric conditions. Particulars are given in the *Comptes Rendus* for June 1st. In the more usual form, there is a brilliant point on the drop of molten iron on each of the electrodes, and these points emit the "spark" lines. The flame which joins the two points is brightest over the negative pole, and it is this part of the flame which alone shows the lines due to the rarer elements contained in the iron as impurities. The flame as a whole shows the "arc" lines, and none of the "spark" lines. On increasing the resistance in the circuit, but leaving the length of arc and the E.M.F. unchanged, another form appears abruptly. The point over the positive pole disappears, while that over the negative pole remains constant. For the same current strength, the E.M.F. has to be higher in the second form. Thus, for a current strength of one ampere, the E.M.F. is 92 volts for the first form and 117 volts for the second. It is one more evidence of the superior importance of the cathode in arc phenomena. An arc can be obtained between a solid terminal and an electrolyte, but only if the latter is the anode.

SINGLE-PHASE TRACTION MOTORS

Commutation and the Effect of Variations in Voltage



IN an article in a recent issue of *Elektrische Kraftbetriebe und Bahnen*, Dr. W. Reichel discusses the properties of single-phase traction motors particularly with regard to the commutation and to the effect of variations in the line pressure. In enumerating the requirements of a traction motor, the author emphasises the importance of a series characteristic, moderate temperature rise, substantial mechanical construction, freedom of the commutator from damage due to sparking, and low sensitiveness to variations in pressure, especially at starting. Although as regards most of these properties the single-phase commutator motor can be considered as equivalent to the continuous-current motor, there are two respects, however, in which the continuous-current motor is superior to the single-phase commutator motor, that is, with regard to commutation and sensitiveness to variations of pressure. The commutators of good continuous-current traction motors require practically no attention when good carbon brushes are employed, and do not require to be turned or ground until the car on which they are fixed has run some 20,000 to 25,000 miles; indeed, many motors will do even better than this. On the contrary, the commutators of single-phase motors need constant attention, and not only are the costs of supervision thus increased, but the commutators themselves have to be changed much more frequently than is the case with continuous-current motors. It is, therefore, very necessary to improve the commutation of the former type of motor, especially during the starting period. Compensating windings, interpoles, and resistance leads between armature winding and commutator have been successfully used for this purpose. Yet another means of improving the commutation lies in the employment of a lower frequency than is at present usual, say, for example, a frequency of 15 cycles per second. An increase in the capacity of the motor for a given weight and a better power-factor are also obtained, and the latter improvement renders the use of a larger air-gap possible between rotor and stator. Above all, the inductive drop in the transmission line and the extra resistance (due to the skin-effect) of the rails are very considerably reduced. In the face of these advantages, the influence of a reduction of the frequency on the generators and transformers does not seem to be so important. As the main lines operated on the single-phase system will require large amounts of power, the generating units will have a capacity of at least 2,500 h.p. each, and if these are driven by water turbines, the design of 15-cycle alternators will present no difficulty. The turbines would probably run at a speed of between 150 and 300 r.p.m., and a 15-cycle alternator at this speed would require from 12 to 6 poles. Alternators driven at a slower speed by large gas engines would be even easier to design for 15 cycles. If the prime movers are steam turbines, two-pole, 900 r.p.m. generators of from 1,500 to 3,000 kw., or four-pole, 450 r.p.m. generators of from 3,000 to 5,000 kw. would be employed. In cases where the capacity per unit would be less than 2,500 h.p., piston engines running at from 75 to 100 r.p.m., and coupled to 24- to 18-pole generators, could well be used. Where small units are desirable, as, for example, for the power supply to branch or local lines not operated in conjunction with the main lines, the continuous-current system may be preferable. Instances of such cases are the Cologne-Bonn (2,000 volt), and the Düsseldorf-Crefeld continuous-current railways.

The transformers both in the generating and sub-stations and on the trains would be heavier and more costly than those for a 25-cycle system, but not in the ratio of 25 to 15, as the iron could be worked at a much higher density than that allowed at 25 cycles. On the whole, the advantages obtained by the use of a lower frequency for that most vital part of the system, the motors, and also for the transmission, seem of greater importance than the disadvantage of the increase in weight and cost of the generators and transformers. Maintenance of commutators and reduced brush wear are factors of the highest importance in main-line traction, and the question of the employment of a lower frequency deserves more attention on the Continent than is at present devoted to it.

The other property in which the continuous-current motor is superior to the single-phase motor is the less sensitiveness to

Digitized by Google

variations in pressure. Thus, if, due to the concentration of the traffic on a portion of the system far removed from the power station, the contact-line pressure were to be reduced to half the normal value, a single-phase motor under certain conditions, for instance, on an incline or on a curve, would not even start. The vector sum of the ohmic and inductive drops in the leads,

A. Main Transformer. *C.* Stator Winding.
B. Series Transformer. *D.* Short-circuited Brushes.

FIG. 1.—DIAGRAM OF CONNECTIONS FOR WINTER-EICHBERG MOTOR.

contacts, transformer, and motor windings would be equal to the applied voltage, and the current would not be sufficient to start the train. A continuous-current motor, on the other hand, with only one-fifth of the normal terminal voltage, would develop a large torque and start the train easily. All single-phase commutator motors have this failing to a greater or less degree. The effect of a drop in line pressure is even more pronounced with three-phase motors. This failing is, however, not so very

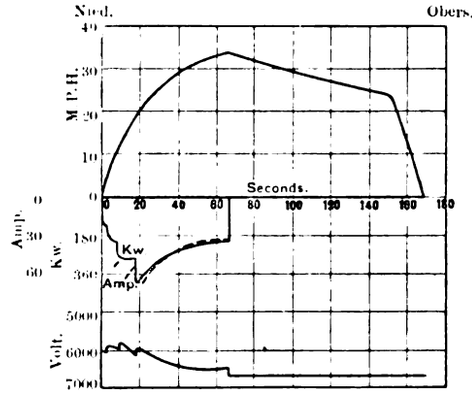


FIG. 2.—SPEED-TIME, KILOWATT-INPUT, CURRENT AND VOLTAGE CURVES ON A TEST RUN BETWEEN NIEDERSCHÖNEWEIDE AND OBERSPREE. LINE PRESSURE, 6,700 VOLTS.

important, as such a large drop as 50 per cent. could hardly occur, especially on a 15-cycle system with over-compounded generators. If such a drop were to occur it would mean that the section of conductor and the number of feeding points had been reduced below the economical limit.

When, as in the case of the A.E.G. Winter-Eichberg motor, a series transformer is also included in the motor circuit, as shown

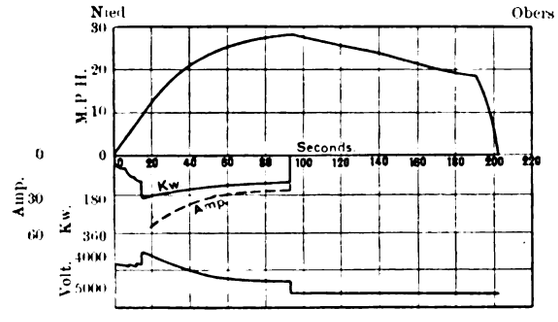

FIG. 3.—SPEED-TIME, KILOWATT-INPUT, CURRENT AND VOLTAGE CURVES ON A TEST RUN BETWEEN NIEDERSCHÖNEWEIDE AND OBERSPREE. LINE PRESSURE, 5,100 VOLTS.

in Fig. 1, one would imagine that the impedance of the transformer winding would further increase the sensitiveness to pressure variation. Actual measurements show, however, that the series transformer has practically no influence, and that the Winter-Eichberg motor suffers no more in this respect than a compensated series or any other type of commutator motor. Fig. 2 shows the result of a test run on a double car equipped with three W.E. 115-h.p. motors, the total weight of the loaded car being 80 tons. This test was made on the Niederschoneweide-Spindlersfeld experimental line, and the double car was similar to those now in use on the Blankenese-Ohlsdorf-Hamburg Railway. The speed-time diagram shown is for the run from Niederschöneweide to Oberspree, where a 20 second stop was made before going on to Spindlersfeld. The car attained a schedule speed of 21 miles per hour over the two and a half mile track, with the one 20-second stop in the middle. Curves showing the power input to the car (as measured at the feeding point at one end of the track), and the amperes input, are

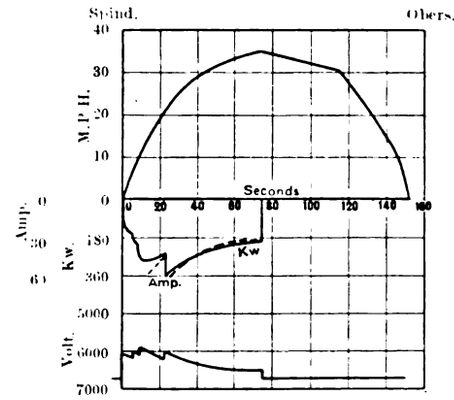

FIG. 4.—SPEED-TIME, KILOWATT-INPUT, CURRENT AND VOLTAGE CURVES ON A TEST RUN BETWEEN SPINDLERSFELD AND OBERSPREE. LINE PRESSURE, 6,700 VOLTS.

given. The lower full line curve shows the line pressure as measured at the feeding point. It will be noticed that at starting the line pressure fell from 6,700 volts to 5,800 volts, or 13·5 per cent. Fig. 3 shows the result of a test made on the same portion of the track, in the same direction and with the same car. The line pressure was only 5,100 volts, and fell at starting to 4,000 volts, or 21·5 per cent. The total fall in pressure, *i.e.*, from 6,700 to 4,000 volts, was over 40 per cent., and yet the run was accomplished at this reduced pressure. The times taken to complete the run being 169 and 202 seconds respectively. Fig. 4 shows similar test results for a run on that portion of the track between Spindlersfeld and Oberspree, at the line pressure of 6,700 volts. The same run at the lower pressure of 5,100 volts is shown in Fig. 5. The times taken to complete the run were 151 and 180 seconds respectively. With regard to the effect of the pressure drop on the starting torque, the following figures are of interest:—With

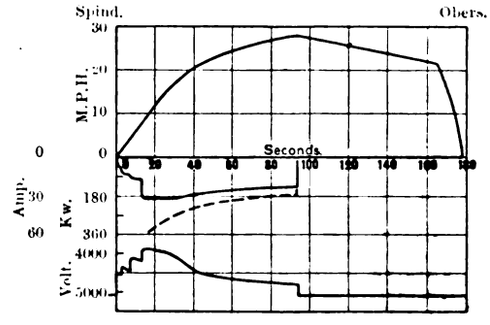

FIG. 5.—SPEED-TIME, KILOWATT-INPUT, CURRENT AND VOLTAGE CURVES ON A TEST RUN BETWEEN SPINDERSFELD AND OBERSPREE. LINE PRESSURE, 5,100 VOLTS.

the full pressure of 6,000 volts, a total draw-bar pull of 5,750 kg. for the test car was obtained on the second stop of the controller at starting. With the same car and a line pressure of 4,000 volts, or 34 per cent. below the normal, a starting draw-bar pull of 5,600 kg. was obtained on the fourth stop of the controller, or a pull of 70 kg. per ton for an 80-ton car. The upper limit of the pressure during the tests was about 6,700 volts, so a drop in voltage of nearly 40 per cent. can apparently be permitted without seriously affecting the operation of the motors. Thus, concludes Dr. Reichel, in respect of sensitiveness to variations of pressure, the single-phase motor may be considered to be practically as satisfactory as the continuous-current motor.

ELECTRIC TRACTION ON THE MIDLAND RAILWAY

Single-phase Equipment of the Heysham, Morecambe, and Lancaster Lines

Rolling Stock

As mentioned in our last issue, the electrically equipped rolling stock at present consists of three trains, two with equipments of Messrs. Siemens Brothers Dynamo Works, Ltd., and one equipped by the British Westinghouse Co. There are three motor coaches and four special trailers provided with driving gear at both ends, but the train can, of course, be made up to any length by means of the company's ordinary passenger stock.

The motor cars are of the open central corridor type, and have a total length over end panels of 60 ft., and an extreme width of 9 ft.; there are three compartments with a total seating capacity of 72 passengers, the vestibule compartment at each end being reserved for the accommodation of driver and guard. Of the passenger compartments, the middle one with a length of 25 ft. has the seats arranged transversely, while the other two compartments, each 13 ft. 5 in. long, have longitudinal seats to allow of trap doors in the floor for easy access to the motors, &c.; hand straps have been provided throughout all the vehicles for safety and support of passengers whilst standing, and when entering or leaving. Efficient ventilation is provided by means of drop lights in the upper part of the side windows, and "torpedo" air extractors in the roof. The rolling stock has been built by the Midland Railway Company in their carriage and wagon shops at Derby, to the designs of Mr. D. Bain. The lighting of the cars is from the power current throughout; the motor cars are also electrically heated from the same source, but the trailers have not yet been fitted with heaters, as their extensive use during the winter months is not anticipated. The interior finishing and decorating has been carried out with regard to facility in keeping the cars clean; the roof is covered with millboard and painted white; the cabinet work is of polished oak, and the seats are covered with perforated sycamore. The underframe is constructed of Z and channel section steel, with angle knees and gusset plates, and well supported with truss rods to sustain the electrical equipment. The trailing bogie is of the Midland Railway Company's standard type, composed of pressed steel members. The wheel base is 8 ft., and the wheels are 3 ft. 7½ in. diameter on tread. All the cars are fitted with both hand and power brakes, under easy control of the driver, who can work at either end of the vehicle, of both motor cars and trailers; the power brake is of the vacuum type obtained by pumps driven from independent motors, and each trailing bogie wheel is braked on both sides.

The trailer cars have a length over end panels of 43 ft., and extreme width of 9 ft.; they consist of one long compartment with a driver's vestibule at each end. The seats are placed transversely throughout, and will accommodate 56 passengers. The interior finish, ventilation, and lighting is similar to that of the motor cars. The underframing is of light construction, as it has no electrical equipment to sustain; but the two bogies are interchangeable with the trailing bogie of the motor car, with the exception of the springs, which are of lighter construction.

The motor bogies were constructed by the Company's Locomotive Department, and owing to the small number required have been specially built up of rolled sections and plates. The axles are of forged steel 6¼ in. diameter parallel between the wheels and reduced to 4¾ in. in the axle bearing, the length of the journal being 9 in. The wheel base is 8 ft. 6 in., and the driving wheels are 3 ft. 7½ in. diameter on the tread when new. As only a few cast steel wheels were required an existing tender wheel pattern was made use of for the wheel centre, and consequently the wheels are considerably heavier than is really necessary. The centres are of cast steel, and the tyres of mild steel ordinary rolled tyre section; in fact, the wheels are practically standard tender wheels. The tyres are 5¼ in. wide, and are shrunk on the centre and held by screws through its rim. The steel side frames are of rolled joist section 14 in. by 6 in., the end frame being 10 in. by 4 in. channels, and the transom, or centre cross frame, being built up of plates and angles. It is of box section, the bolster lying inside between the webs. The top plate and gussets on both sides of the centre pin are in this case in one complete piece slotted out of the solid. The bottom plates are as usual in two pieces, one each side of the centre, the gusset plate being combined with the cross flange in this case also.

Owing to the necessary length of bolster being too great to get in between the flanges of the side frames, a certain amount had to be cut from the inside of the top flanges of these, and as this necessitated doubling plates on the top of these flanges and their combination with the top flanges of the centre cross-frame, the making of the top plate in one piece as above described followed naturally; incidentally this construction gives a very stiff and rigid backbone to the bogie. The swinging bolster is of pressed steel, and is similar to that of the trailing bogie, except for the heavier springs.

The axle-boxes are of a special pattern built for these bogies, though they are very similar to the standard carriage axle-boxes suitably altered to act as driving boxes. The brasses, which are white-metalled, subtend a slightly larger angle than the usual carriage brass, being about the same angle as locomotive brasses. Lubrication is effected entirely from a pad at the bottom supplied from the usual oil well, the brasses being well chamfered away at each side so as to ensure an ample feed of oil into the journal and its formation into a proper lubricating film. The top of the box casting forms a seating for the ordinary laminated steel bearing springs. The horn blocks are cast steel, bolted with the usual fitted bolts to the framing. The brakes, as is usual in electric motor trucks, act only on one side of the wheels, lack of space making it impossible to adopt the standard railway practice of two brake blocks per wheel. The blocks are hung from brackets on the bogie end frames, and are actuated by levers connected to bars running lengthwise under the inside top flange of the side frames. An arc-shaped cross bar connects these bars together, and is coupled to the brake pull rod through a shackle and roller arrangement, which allows for the swivelling of the bogie on curves without affecting the brake gear adjustment. The weight of the whole bogie is 6½ tons, the extra weight of the wheels, however, accounting for about 1 ton of this.

Before going on to deal with the actual driving equipment of the cars the other accessory apparatus, which may be of interest, may be shortly described. Each motor car has two brake cylinders, that for the motor bogie having special levers giving the cylinder greater purchase than usual. The trailer cars have only a single brake cylinder, operating brakes on both bogies. The vacuum is obtained from a Gresham & Craven vacuum pump supplied through the electrical equipment contractors, by the Vacuum Brake Com-

Digitized by Google

pany. The pump is motor driven with a worm speed reduction running in an oil bath. A single brake pump is used on each motor car.

The control gear for the pumps is arranged so as to give a high speed and a low speed, the latter being a quarter of the higher. The pump runs at the low speed throughout the operation of the train, and whether the brakes are being applied or not, excepting when put on to the high speed in order to take off the brakes rapidly. The action thus corresponds exactly with the operation of the large and small ejectors on a locomotive.

The pump control gear has been specially arranged with a view to making it practically impossible for a train to be moved without proper vacuum having first

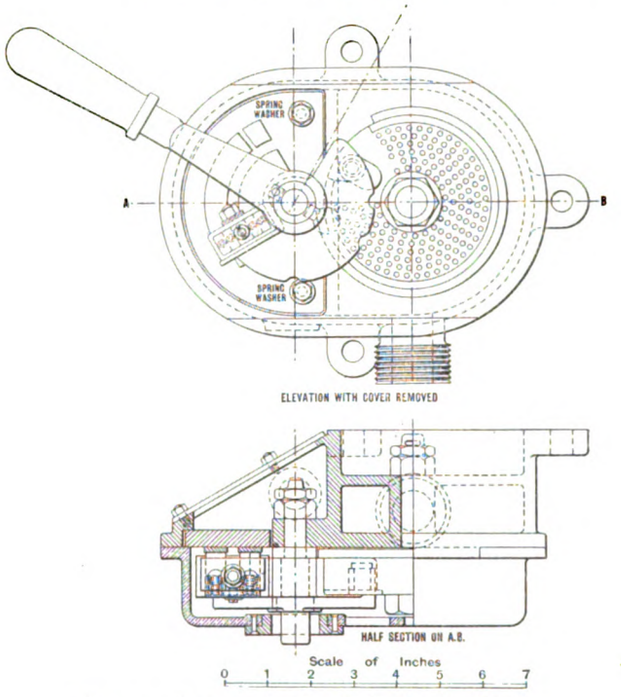

FIG. 1.—DETAILS OF DRIVER'S BRAKE VALVE.

been obtained, as follows:—The driver's brake valve is of special construction, as shown in Fig. 1, and is combined with a switch which operates the contactors controlling the pump. Current is fed up to this switch through one contact of a three-way plug, of which one of the remaining contacts is the feed wire from the auxiliary transformer, and the third goes to the master controller; it is, therefore, impossible to move the car by means of any of the controllers unless this plug is inserted, and its insertion automatically operates one of the pump contactors and starts it working at either the high or the low speed; most probably the former, as the driver's brake valve handle is removable but can only be removed in full pump speed position. The use of this plug also ensures that only one controller throughout the train can be used at a time. There is, of course, a driver's brake valve in every driving compartment, but it will be clear that only the valve and switch in that compartment which is being used for driving and in which the driving feed plug is inserted is operative for starting and varying the speed of the pump, but the brake can be *applied* by the guard or other authorised person who is in possession of a handle at either end of every coach. There is also fitted to each motor car an additional switch controlled by the vacuum which will trip the main circuit breaker in the event of the vacuum falling below about 15 in., this being decided upon principally in connection with emergency applications of the brake by a guard, who will thus be given full control over the train, an advantage, seeing that there is only one motor man. This switch also ensures that motor men cannot start the train before taking off their brakes.

A horn, which takes the place of a locomotive steam whistle, is carried on each end of each motor car, and is electrically operated, the sound being produced by the vibration of a diaphragm by means of apparatus similar, but of greater power and more substantial construction, to the ordinary trembling bell, a surprisingly loud and clear note being obtained in this way. The sound is multiplied considerably by use of properly designed trumpets obtained from Messrs. Boosey & Co., and a very satisfactory sound is produced at an expenditure of far less power and much less complication than would be the case with a vacuum operated horn; in fact, the electric horn compares well with a horn operated by compressed air, which was not available on these cars. The vibrators were supplied by Messrs. Marples, Leach & Co., and are operated by a small 12-volt set of secondary batteries, the train wire for operating them being carried through the train in the ordinary train cable and through the jumpers.

The lighting is carried out by groups of six 24-volt lamps in series from the 150-volt auxiliary transformer control main. The two side tail lights, however, which are electric, are each direct on the 150-volt mains, the lamps being carried inside ordinary tail lamp lanterns, which are detachable and carry an ordinary watertight plug, the socket being fixed on the end of the coach, just above the lamp-iron. Lamp-irons, plugs, and plug sockets are provided at each end of each coach. The lamp in the driver's compartment is specially shaded so as to throw only a narrow beam of light on the vacuum gauge and ammeter, thus allowing the driver to get a good view of the road outside, his compartment being practically dark. The shade is arranged so as to be opened when occupied as a guard's and luggage compartment, or as an entrance vestibule.

The window on the left or near side of the train is that through which the driver views the road and, in order to clear the outside of this window from snow and rain, a special scraper has been arranged with a handle inside the compartment so that by throwing this handle up and down the window is cleared. The scraper consists of a squeegee made of flat rubber on edge.

The specification of the driving equipments called for two motors per car, both to be carried on one bogie, as it was considered both the more economical and the more mechanical arrangement to concentrate the motor power and reduce the number of parts as much as possible, while with single-phase traction and voltage step control there is, of course, no necessity to consider series paralleling. The normal train was specified to consist of a motor car and two trailers, the weight of these being, without any of the electric apparatus or the mountings for the same, 25 tons for the motor car, and 17½ tons for each of the trailers. The motor car seats 72 passengers and the trailers 54, the respective standing capacity being 58 and 36, giving a total maximum capacity without encroaching on the vestibules of 310, with a total of 180 seats.

It was specified to the contractors that they would be permitted to run at 25 miles per hour round the speed-restricted curves, and on this basis the trains were to be capable of working a 20-minute service from either end as between Heysham and Morecambe with a single train, and a 15-minute service as between Morecambe and Lancaster under similar conditions. The capacity of the motor car was to be such as to enable it to take on occasions two additional main line coaches weighing 26 tons each, and it was also to be capable of climbing with its train the gradient from Lancaster Green Ayre to Lancaster Castle occasionally.

The specification also called upon the contractors, should the order for the coaches be divided, to make

Digitized by Google

their equipments capable of being worked from the same master controllers, and though considerable difficulty had to be got over in order to meet this condition it was found possible to work the Siemens all-electric equipments in conjunction with the Westinghouse

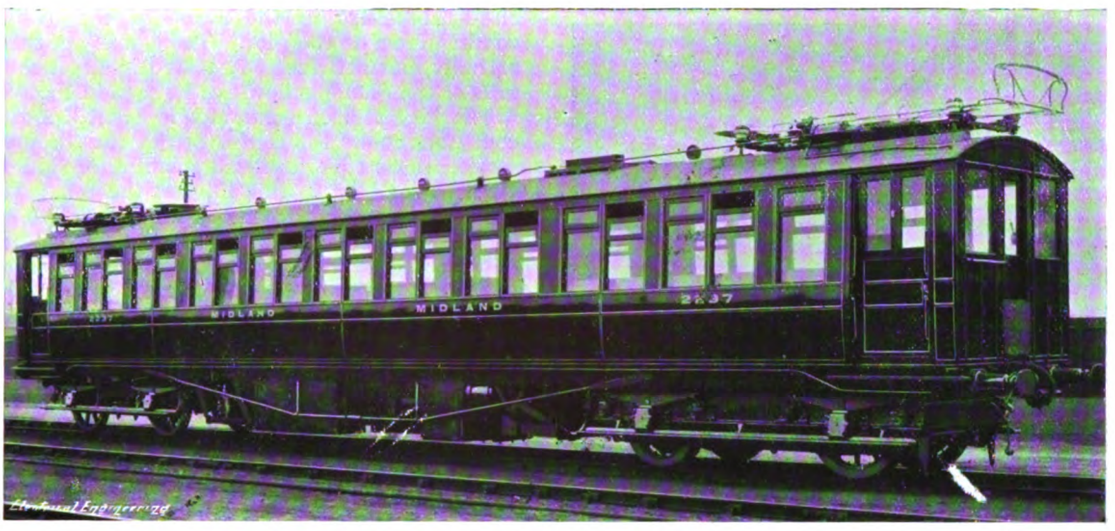

FIG. 2.—SIEMENS CAR COMPLETE.

electro-pneumatic equipment in this way. It was considered by the railway company that two 150 h.p. motors per motor coach would satisfactorily carry out the work, and the respective contractors supplied motors of their nearest standard sizes to this, the Siemens motors being nominally of 180 h.p., and the Westinghouse motors of 150 h.p. The specification called for the motors being capable of delivering, when tested on the stand with single-phase alternating current

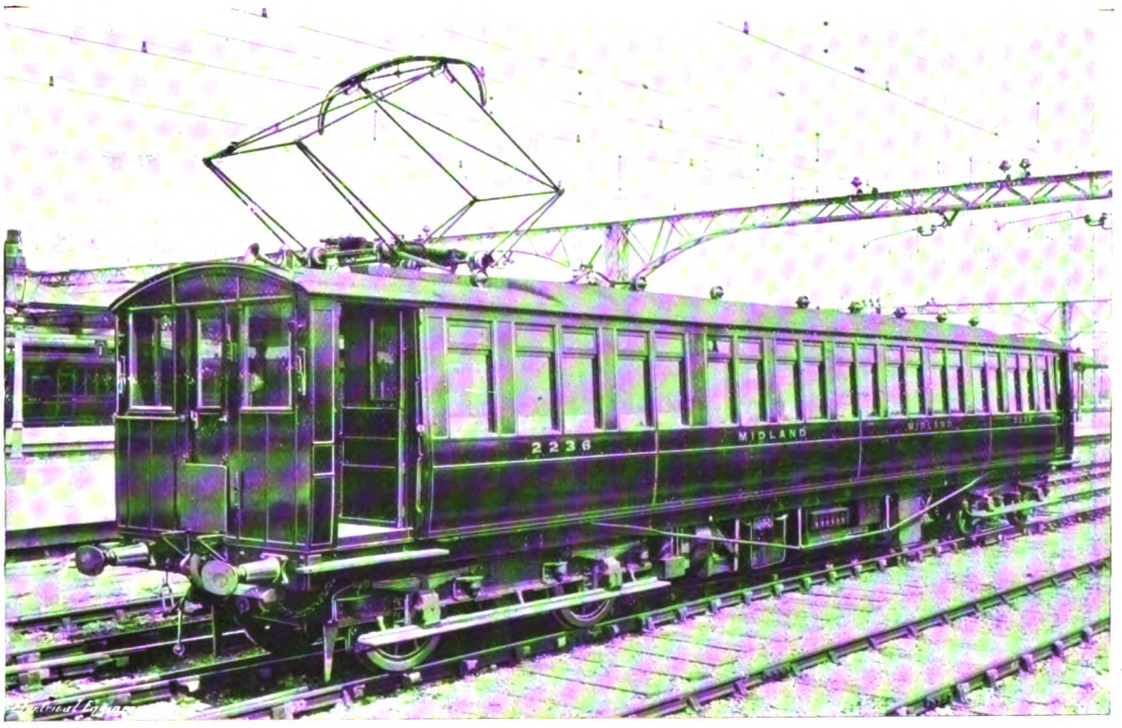

FIG. 3.—WESTINGHOUSE CAR COMPLETE.

of the proper periodicity, their declared output for one hour with a temperature rise not exceeding 135° F., and they were also required to have a temperature rise not exceeding 90° F. on any portion after having run the three-coach train for six double trips as per the schedule above mentioned from Heysham to Morecambe, Morecambe to Lancaster, and return. Overload and other similar tests were also specified.

The control gear was specified to be preferably all-electric multiple unit type. The Westinghouse car has, however, been accepted, with their standard electro-pneumatic control modified as necessary to enable it to work with the Siemens car which is all-electric. Stringent guarantees of efficiency, energy consumption in watt hours per ton mile, and general performance were required to be given. The main transformer was required to conform to the same test conditions for heating as the motors, an auxiliary transformer being specified to provide for the supply of current for lighting, heating, and working the control apparatus and brake pump, this transformer having a three-hour test specified, it being subject to continuous working. A view of one of the Siemens cars is given in Fig. 2, and of the Westinghouse car in Fig. 3.

E

The Siemens cars are provided with two collector bows, it being considered by the firm best to ensure continuous contact as far as possible. It was found impossible to get the firm's standard inverted pantagraph bow into the restricted space at disposal between

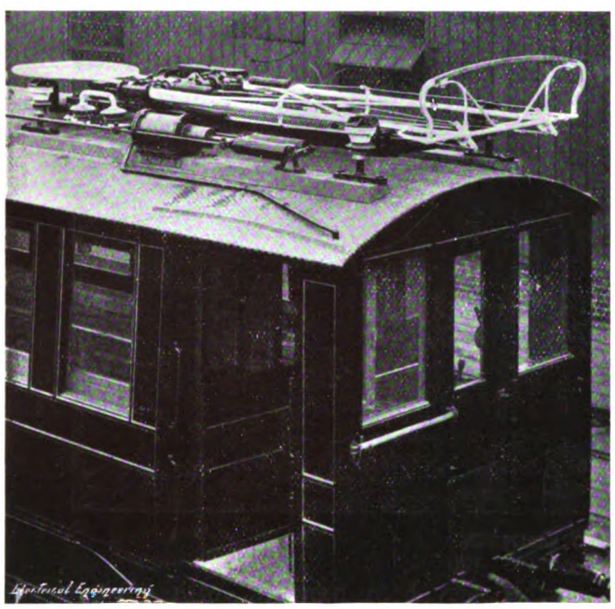

FIG. 4.—END OF SIEMENS CAR, SHOWING COLLECTOR AND WIRE NETTING ON ROOF.

the coach roof and over-bridges, and a type of bow has been adopted somewhat similar to the Continental tramway type of bow, but having a small auxiliary bow at the end controlled by parallel motion. This bow, while appearing somewhat simpler than the standard bow, and requiring less room, has the disadvantage that it requires balancing by a wind screen. Both makers' bows are purely spring controlled so far as their working is concerned; the Siemens bow, however, is lowered by a master spring which can be thrown out of action by a vacuum cylinder. The two Siemens bows can be raised or lowered separately, and the vacuum for holding them up is obtained from the train pipe through a ball valve, so that when the brakes are operated the vacuum remains on the bows. All the "live" portions of the collector gear in each case are carried on porcelain insulators. It may be mentioned in connection with the collector gear that the roofs of all the coaches have been covered with an "earthed" wire netting, so as to throw out the station circuit breakers in the event of the overhead wire coming down on the roof. The efficacy of this has been actually and satisfactorily tested in practice. The details of the Siemens bow can be seen in Fig. 4.

The high-tension conductor is carried down from the collectors about the centre of the car through a heavy section brass tube, the lead covering of the cable being sweated solid on to this tube at the top. The further high-tension wiring to the two transformers on this car is also in lead-covered cable, which again in its turn is protected in metal tubing. These cables are rubber insulated. Except for the short length down through the coach the high-tension wiring on the Siemens car is, from the bow down through the high-tension chamber to the main transformer, all bare wire, being carried on porcelain insulators on the coach roof and underneath the coach. The vertical tube through the coach itself is of brass, and in this case made removable, being practically part of the wiring. The cable is paper insulated, lead-covered, terminating above and below in bitumen sealing chambers with porcelain insulator terminations. There is about 3-16ths of an inch air space between the lead covering and the inside of the tube. Both lead covering and tube are heavily "earthed."

On the Siemens cars the high-tension wire proceeds into the high-tension chamber, shown in Fig. 5 the door of which is mechanically interlocked with the bows so that it cannot be opened unless the bows are down.

The low-tension wiring does not call for much description. Longitudinally it is carried between the two girders forming the centre members of the under-

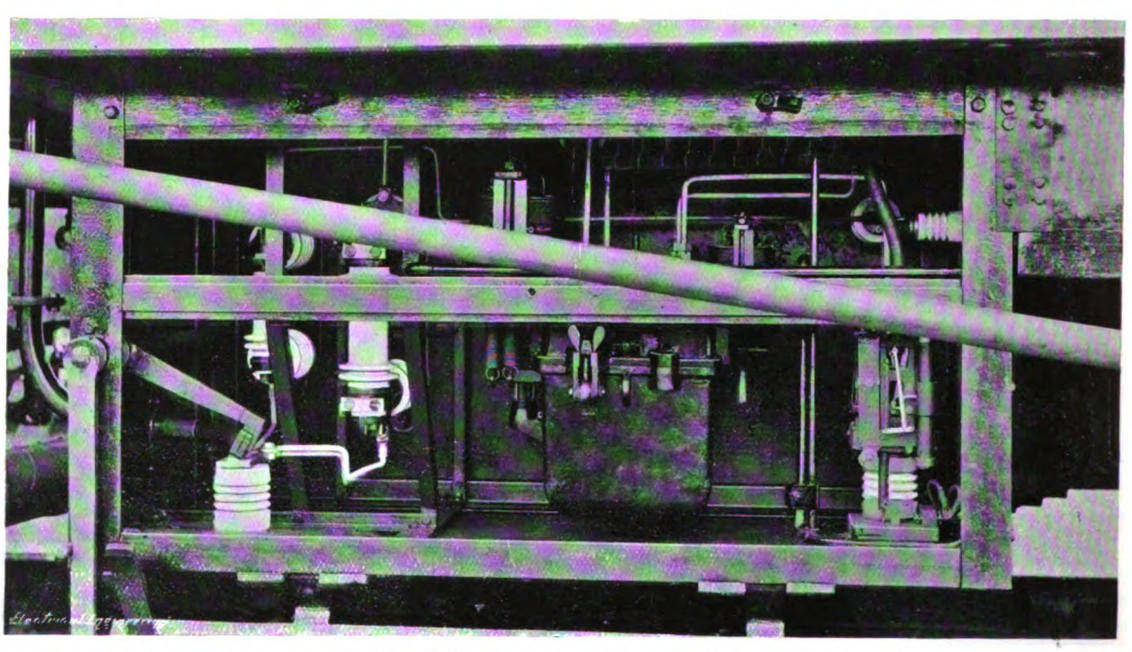

FIG. 5.—H.-T. CHAMBER ON SIEMENS CAR, OPEN.

frame, and it is supported between these two members in wooden frames spaced about 18 inches apart. The low-tension cables themselves are not carried in metal tubing, as probably eddy current troubles would arise if they were, but they are substantially surrounded with metal, and the coach body and its frames are all covered with sheet iron and asbestos wherever cables are run underneath. Where these cables require to go crosswise they are carried between the tops of the girders

Digitized by Google

and the floor and spread out fanwise. The train cable is carried along the outside of the coach alongside the sole-bar in a metal tube, being carried round the bends in flexible metallic tubing. The train cable, couplers, and master controllers, for the whole of the motor cars, and trailers, as well as all the pump motors and their control gear have been supplied by Messrs. Siemens. The high-tension apparatus and contactors are contained in sheet-iron cases, which have been made by the railway company. The supporting of these and of the transformers, auxiliary transformer, preventive coil, and other apparatus has involved the provision of a good deal of special girder work on the underframe, which has added considerably to the weight of the latter, and which, as the coach had to be proceeded with before the final details of the electric equipments could be decided upon, could be considerably lightened in a future case.

The Siemens equipment consists of the two motors, the main transformer, the auxiliary transformer, preventive coil, and commutating transformer, high-tension circuit breaker and fuse in the main transformer circuit, high-tension fuse in the auxiliary transformer circuit, contactors, motor fuses which also act as motor cut-outs, and low-tension fuses in the circuit feeding the control, and also a low-tension fuse in the circuit feeding the fan.

There is intentionally no fuse placed in the brake pump main circuits, the cables for which are carried in special heavy section tubing, so that if anything goes wrong on the pumps the main high-tension fuse will be blown, and it will be impossible to work the car.

A full description of the working of the Siemens single-phase traction motor was given in ELECTRICAL ENGINEERING, Vol. II., page 367, and details of the construction of the motors actually employed on the Midland Railway are given in Fig. 6.

The apparatus was very stringently tested at the makers' works. At 180 h.p., and with forced draught, the motors were very much under their guaranteed temperature rise, and did not exceed this temperature rise when tested at this h.p., with natural ventilation on the stand. With forced draught, and with only 300 volts on their terminals (the full voltage being 340), they tested under the specified temperature rise at 200 h.p., corresponding at full voltage to fully 225 h.p. They were also tested for continuous operation giving at 250 volts, which was chosen as being a mean operating voltage, 105 h.p., for five hours with a temperature rise of only 115° F., so that at full voltage, allowing nothing for the improved ventilation at the higher speed, the machine can give continuously nearly 150 h.p. The sparking tests were equally satisfactory, there being no objectionable sparking at a current of 1,100 amps., at 300 volts, which corresponds at full voltage to 350 h.p., and a torque of fully 2½ times that at the rated h.p. of 180. The commutating transformer, while apparently an additional complication, probably pays its way in effectiveness, as we understand that the sparking of these Siemens' motors, both on test and during actual running on the line, has proved to be quite as good as that of any, and better than that of many D.C. traction motors; in fact, during the testing on the line, currents of over 1,000 amps. per motor have been of frequent application without any demonstration at the commutators, even just at starting, the brushes on the latter portion of the acceleration, and during free running, being absolutely dark.

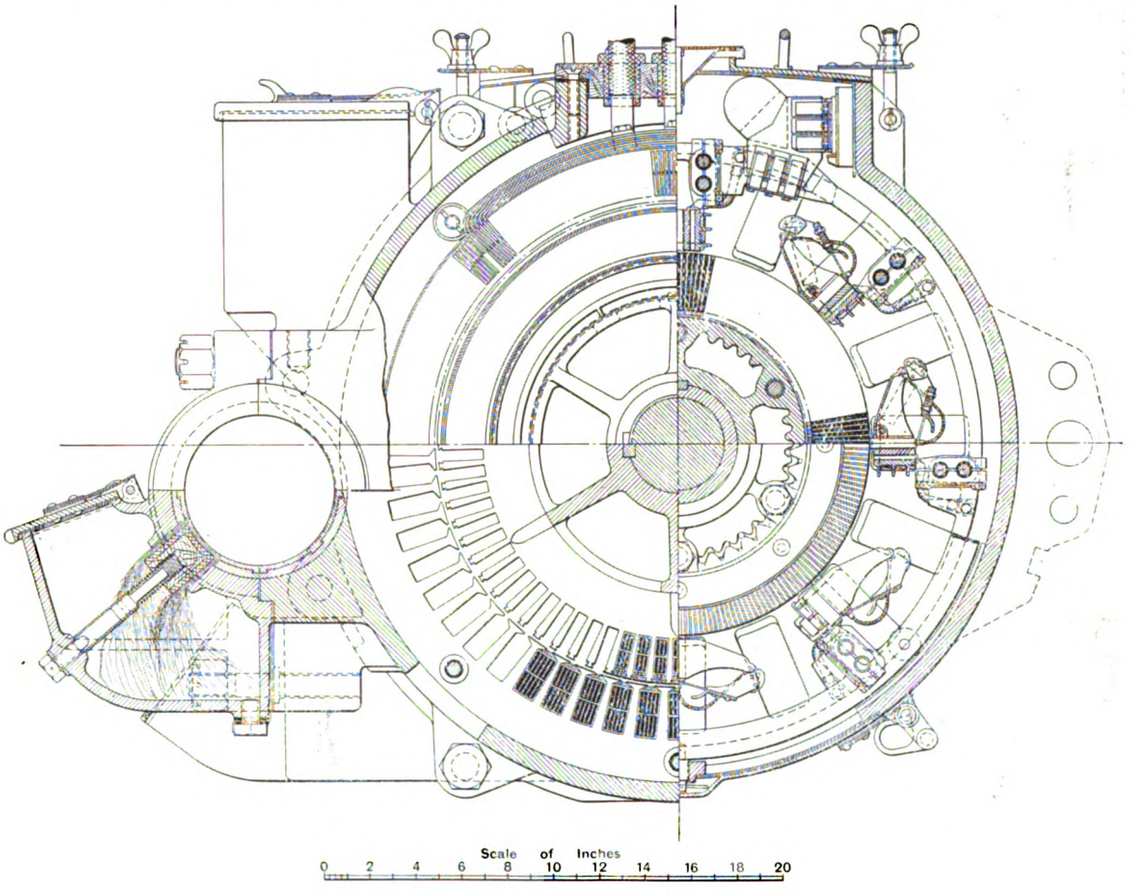

FIG. 6.—SECTION OF SIEMENS MOTOR.

The position of the various items of the control equipment under the car is shown in Fig. 7. On the left is the high-tension chamber, and the transformers are seen in corrugated cases between this and the case containing the contactors. The high-tension transformer windings are of copper wire, and the low

Digitized by Google

voltage windings of copper strip wound on edge. All the windings are divided into a number of parts, mounted alternately, in order to reduce the stray field. The various taps on the secondary coil are connected to the contactors. Space is left between the core and the windings for the free circulation of the cooling oil

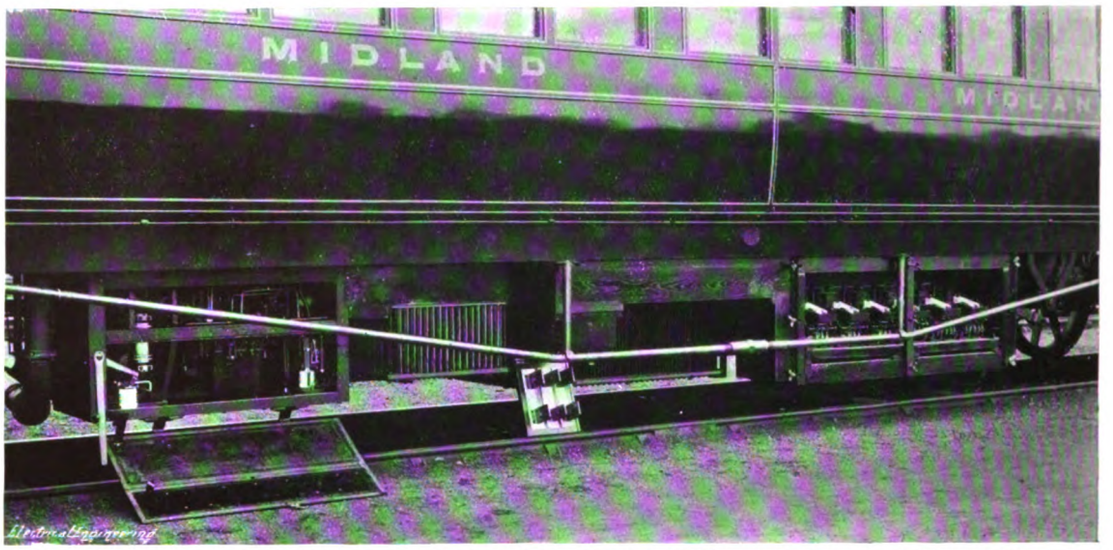

FIG. 7.—APPARATUS ON UNDERFRAME OF SIEMENS CAR, SHOWING H.-T. AND CONTACTOR CHAMBERS OPEN.

contained in the high-tension chamber. The main switch consists of an electrically worked oil-switch. It has four contact fingers mounted on a spindle, two of the fingers being longer than the other two; the circuit is made and broken therefore in two steps. The first step closes the circuit through a damping resistance which prevents a sudden rush of current into the transformer. The second step short-circuits this resistance. It is not necessary to pause on the first step; the arrangement works satisfactorily however quickly the switch is closed. The switch is held in its closed position against the action of a spring by means of an electro-magnet which loses its current when the master controller is moved to the "off" position.

The master controller consists of two barrels, one for controlling the speed, the other for reversing. The contact fingers pressing on the barrels are connected to the contactors and to the secondary windings of the auxiliary transformer. The main controller barrel is moved against a spiral spring and held in any working position by means of a catch on the driver's handle, which is depressed into a notch by the weight of the driver's hand. The main barrel is divided into two parts, the lower part being rigidly connected to the driver's handle and the upper part being carried with it by means of a projecting catch. The relative motion of the two parts opens a switch in the control circuit. The high voltage main switch can only be closed in the first position. The main barrel and the reversing barrel are interlocked in the usual manner.

The contactors are operated by electro-magnets. The magnet core consists of laminated plates. Part of one of the magnet poles is surrounded by a short-circuit winding producing an auxiliary field which prevents vibration. The switch has several contacts arranged side by side, only one of which is used for actually breaking the circuit; this contact has a magnetic blow out. In order to maintain a good electrical contact, the switch is so designed that the contact pieces, after meeting, have a rubbing motion.

The contactors are mechanically interlocked so as to prevent the possibility of wrong connections. The

FIG. 8.—APPARATUS ON UNDERFRAME OF WESTINGHOUSE CAR SHOWING TRANSFORMERS, CONTACTORS, &C.

Digitized by Google

interlocking levers have the further advantage that if any contactor should accidentally remain closed, the closing of the next contactor will open it. These con-

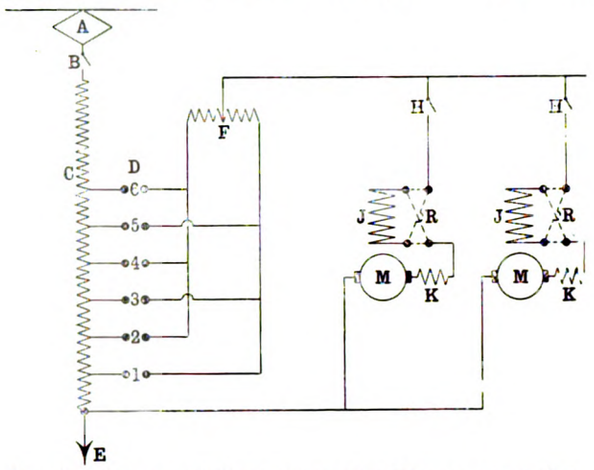

FIG. 9.—DIAGRAM OF CONNECTIONS FOR WESTINGHOUSE CAR.

tactors differ from others in having no auxiliary contacts.

We are informed that the working of the contactors has proved quite satisfactory, and gives none of the trouble that has been prophesied in various quarters for single-phase contactors in the direction of humming and chattering, excessive size, &c., though they are more liberally designed than will probably be adhered to as standard practice.

It will be noticed that the feature of the master controllers is the fly-back or dead-man handle type, being somewhat different from the usual design, inasmuch as the release of forward pressure on the handle by the driver trips the whole of the contactors at once, no matter on what stop the driver may be working at the moment, and without his allowing the handle to come back to the "off" position. This practically ensures the obtaining of the maximum amount of safety that can be obtained from a handle of this type, though the occasional sudden throwing off of heavy loads in this way is a somewhat severe tax on the regulating properties of the power station.

The electrical equipment of the Westinghouse car consists of two 150 h.p. motors, a main transformer, an auxiliary transformer for the lighting and control circuit, collector, circuit-breaker, compressor, contactors, and control gear. The pantagraph bow collector is of the standard Westinghouse pattern. The collecting surface is held up against the overhead wire by spring pressure acting on the supporting frame, and is lowered by an air cylinder at the base of the apparatus. A small hand pump is supplied for raising the bow when first starting out in the morning, or at similar times when no compressed air or vacuum is available. From the collector, the current is carried to the main circuit-breaker through a lead-covered rubber insulated cable, which is further protected by being led through a heavy brass conduit. The circuit-breaker, which can be seen on the extreme right of Fig. 8, is electro-pneumatically operated, and breaks contact under oil. It opens automatically on overload, and is closed again from the driver's cabin by moving the master controller to the first notch. The current then passes to the high-tension end of the oil-insulated self-cooling auto-transformer, the other end of the winding of the transformer being earthed. This transformer, the corrugated case of which is shown in Fig. 8, has a continuous capacity of about 150 k.v.a. The oil tank can be readily lowered away from the transformer, when it is necessary to inspect the latter.

The contactor group, shown in the middle of Fig. 8, measures only 43¼ in. by 24½ in. by 23 in., and weighs 845 lb. The switches are provided with electric interlocks, which ensure their closing in the proper sequence. From the electro-pneumatic switch group the current passes to the two terminals of the preventive coil, from the centre point of which the lead to the reverser is taken. The reverser is of the drum type, and is electro-pneumatically operated. The magnet valves on the reverser are interlocked with those on the main switch group, so that it is impossible to close any of the switches in the latter until the reverser is set in the right position. Cut-out switches are fitted in the reverser case, so that either of the two motors may be disconnected if desired. A diagram of connections for the two-motor equipment is shown in Fig. 9. In this diagram *A* is the pantagraph collector, *B* the circuit-breaker, and *C* the main auto-transformer. The six tappings on the transformer are connected to the corresponding six contactor switches *D*, which are also connected to the preventive coil *F*. This coil, which bridges across the sections of the transformer winding, is highly inductive, and consequently only small wattless currents flow in the local circuits. The load current is taken off from the centre of the coil, and thus, as this current flows in opposite directions in the two halves, the resultant inductive effect is zero. With the aid of this coil, the voltage across the motors is gradually increased without either breaking the circuit or shorting any section of the transformer. In the motor circuits, *H* represents the isolating switch, *J* the main field winding, *R* the reversing drum, *K* the compensating winding, and *M* the motor armature. The usual practice of the Westinghouse Company is to have only one transformer, from which tappings are taken off for the lighting and control circuits as well as for

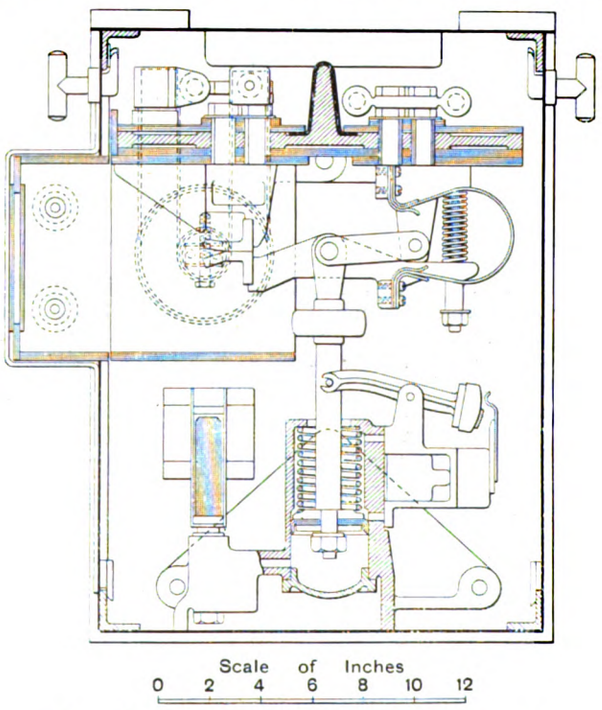

FIG. 10.—SECTION OF WESTINGHOUSE CONTACTOR.

the motor circuit. In the equipment under consideration, however, a separate auxiliary transformer is used for the former purposes. This transformer, which can be seen to the right of the contactors in Fig. 8, supplies the lighting circuit and the control circuit at 150 volts. The Westinghouse system of electro-pneumatic control was fully described in ELECTRICAL ENGINEERING, Vol. I., page 593, and both the continuous-current and single-phase systems were dealt with. The diagram of connections for the single-phase systems given on page 596 of that description repre-

Digitized by Google

sents the connections employed for the present equipment with the exception that the latter is a two and not a four motor equipment, and the lighting and control circuits are shown in that diagram as being supplied from the main transformer, whereas they are supplied from the auxiliary transformer in the present case. Fig. 10 shows a cross-section of one of the unit

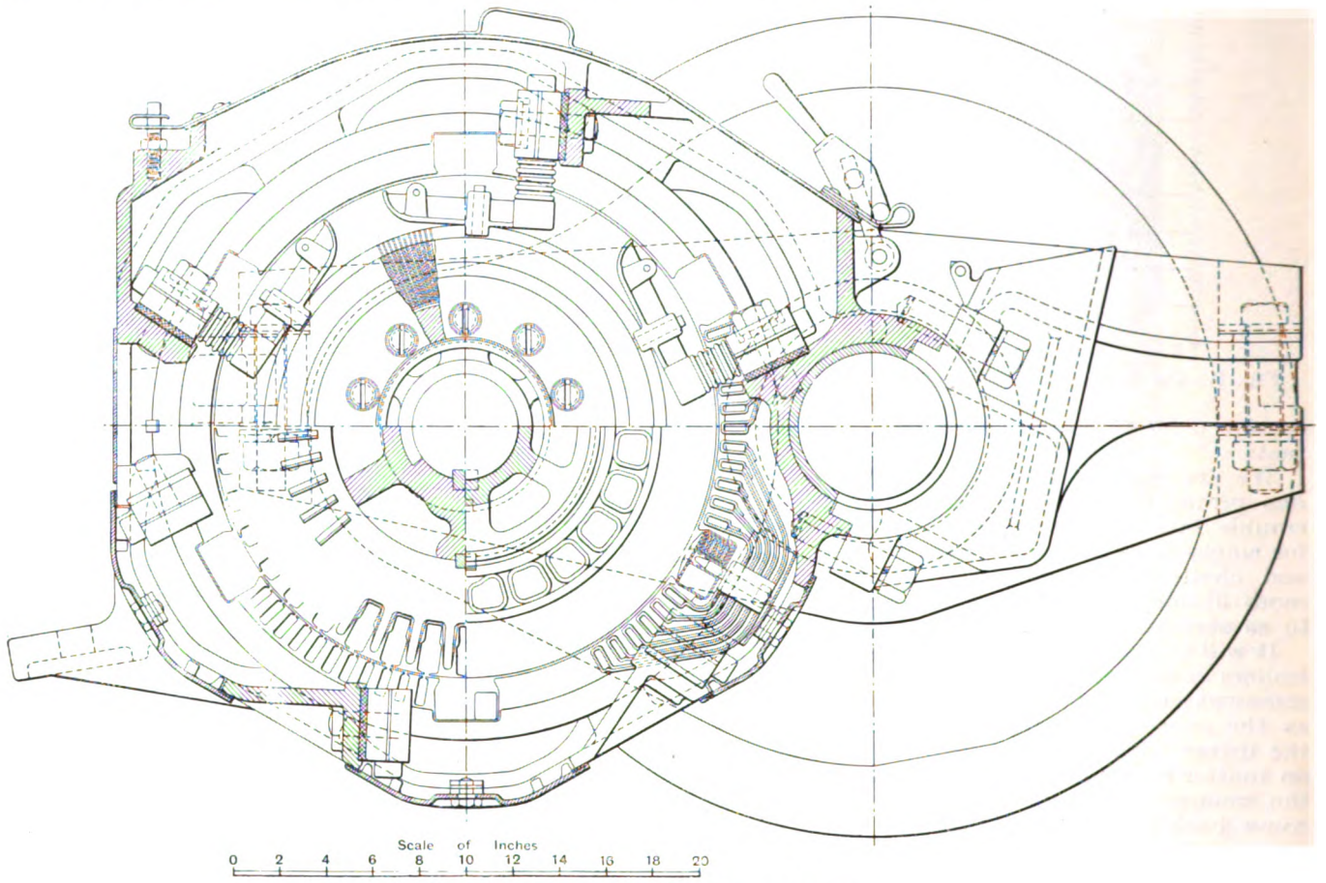

FIG. 11.—SECTION OF WESTINGHOUSE MOTOR.

switches or contactors forming the group illustrated in Fig. 8. It will be seen from the former figure that each switch-arm makes and breaks contact in a powerful magnetic field. Air is admitted to and released from the air cylinder by a small pin valve actuated by an electro-magnet. In order that the Westinghouse car should be capable of being worked in combination with the Siemens cars, it was necessary to operate the Westinghouse electro-pneumatic control circuit at the same pressure as the Siemens solenoid control circuit, viz., 150 volts instead of 50 volts; and furthermore, as the Siemens solenoids take a large current in comparison to the solenoid valves used in the Westinghouse system, the master controllers installed on the Westinghouse car had to be somewhat larger than usual.

The motors are of the Westinghouse Company's standard series compensated type arranged for forced ventilation. A cross section is given in Fig. 11, from which it will be seen that the motor has six poles and six sets of brushes. The field core is made up of laminations having six inwardly projecting poles, and is enclosed in a cast steel shell. Each pole is surrounded by a former wound field coil, which can be readily removed if required. Semi-closed slots in the pole faces are provided for carrying the compensating winding which is connected in series with the armature. Air is admitted to the motor for forced ventilation at openings over the pinion end and passes through the motor and out through the perforated commutator cover. This method of cooling the motors, which was first introduced by the Westinghouse Company on the Metropolitan Railway, has proved very effective in service, and materially increases the capacity of the machine. With the construction adopted by the Westinghouse Company it is not necessary to have any complicated system of forced lubrication; both the armatures and axle bearings on this motor are equipped with simple oil and pad lubrication.

The above equipment was designed for operating in regular service a train weighing 82 tons, including passengers, but has shown itself capable of dealing with much heavier trains than this. A train made up of seven ordinary vehicles and this motor car, giving a total weight of 161 tons, has been run between Lan-

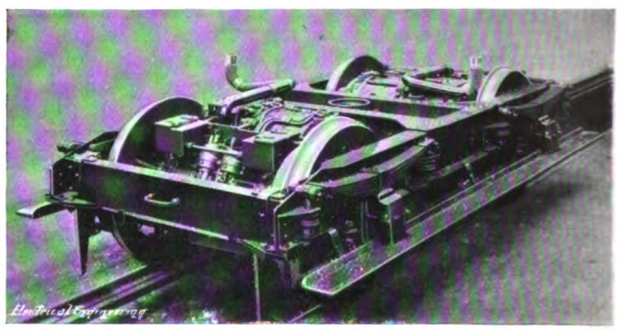

FIG. 12.—COMPLETE MOTOR BOGIE.

caster and Morecambe. On starting with this load each motor takes about 1,050 amps., and this current is commutated quite satisfactorily without the motor showing any signs of distress. The train accelerated rapidly and smoothly, reaching a maximum speed of about 50 miles an hour. A view of one of the motor bogies, which are similar in appearance in both makes of car, is given in Fig. 12.

Digitized by Google

The respective weights of the two motor coaches are as follows:—

	Siemens.			Westinghouse.		
	Tons.	Cwts.	Qrs.	Tons.	Cwts.	Qrs.
Carriage body work	13	5	0	13	5	0
Carriage bogie	4	10	0	4	10	0
Special supports	1	6	0		17	0
Motors with gear and gear case	6	5	0	5	11	0
Main transformer	2	14	2	2	11	0
Aux. com. transformer and preventive coil		19	2		9	2
Pumps and compressors ...		9	2		16	0
Contactors and chambers	1	2	2		9	3
Other sundries, including bows, blowers, controllers, &c. ...	3	7	0	2	9	3
Motor bogie...	6	11	0	6	11	0
	40	10	0	37	10	0

The forced ventilation for the motors of both sets of cars has been fairly simple to arrange. For the Siemens car the suction duct has been carried inside the car under one of the seats, the whole of the air coming in this case from the inside of the car. The Westinghouse car has a similar duct inside, but as more air is required for their motors they have also a suction duct with a filter taking air from the outside of the car. In both cases this duct comes direct into the suction eye of the fan, and the delivery duct after leaving the fan splits into two pipes, one of which crosses to the other side of the coach and comes up under the longitudinal seat on that side, thus getting across the cross-member of the under-frame, and coming down again above the motor, to which the air then proceeds through a rubber concertina pipe. The other half of the duct proceeds direct up under the longitudinal seat on its own side, coming down in a similar way to the other motor.

The auxiliary transformer was adopted chiefly at the instance of Messrs. Siemens with a view partly to suiting their control gear better, and partly to obviating any possibility of the lights in the coaches being put out by the coming cut of the overload circuit-breaker in the high-tension circuit, or by any other accident which would cut off supply from the main transformer. Also, during a great portion of the year the cars will be lying in the stations for long intervals between running, and an appreciable saving of energy will be effected by doing away during such stoppages with the magnetisation losses of the large transformer. On the Westinghouse car, however, at the instance of that company, the main transformer is kept continuously energised except when the main circuit breaker comes out on overload. The auxiliary transformer might be dispensed with in cases where the cars are in continuous service, and this would also save some amount of high-tension apparatus.

On the Westinghouse car there is no interlocking of the high-tension chamber with the bow, the high-tension circuit-breaker and fuse being put in lockfast cases, the keys of which are kept at headquarters, so that the train staff are not permitted access to these chambers at all.

The Engineers to the Midland Railway state that the performance of the motors of these three cars both on the test bed and on the line suffices to disprove the assertion made against single-phase motors of excessive and injurious sparking. They also mention that in a test with a two-car train weighing approximately 58 tons, made incidentally in the course of ordinary running, one of the Siemens cars attained speeds of 30 miles per hour in 41 seconds, and 48 miles per hour in 80 seconds, and the free running speed of 60 miles per hour in 160 seconds, starting, and running for 440 yards after starting, on an up grade of 1 in 200, there being, however, thereafter about 100 yards of level, and then a down grade of 1 in 500 for 1¼ miles; this portion of the line is also very considerably curved, with curves of 30 and 40 chains radius. These tests are not the most favourable that could be obtained, as the motors were not being worked to their utmost capacity. If analysed, bearing in mind that the machines are geared for "free running" at 60 miles per hour, and remembering the high train resistance at this speed, this test shows the accelerating power of the equipments to be very satisfactory.

The general scheme for the electrification, the equipment of the power station, and the driving equipments of the rolling stock, were originated and planned by Mr. R. M. Deeley, Locomotive Superintendent of the Midland Railway Company, and his assistant, Mr. J. Dalziel. The carriages are, as has already been mentioned, to the designs of Mr. D. Bain, Carriage and Wagon Superintendent of the Midland Railway Company, who has been assisted by Mr. P. Ellis, Carriage and Wagon Department chief draughtsman. We wish to express our thanks to these gentlemen and to Mr. W. B. Worthington, Chief Engineer to the line, under whose direction the designs of Mr. J. Sayers relating to the overhead equipment were prepared, as well as to Messrs. Siemens Brothers Dynamo Works, Ltd., and the British Westinghouse Company, for descriptive particulars, drawings, and photographs, from which these two articles have been prepared.

Electrical Equipment of the London, Brighton & South Coast Railway Co.'s Suburban Line.—The first train for this service, consisting of two motor coaches and one trailer, was completed at the Metropolitan Amalgamated Railway Carriage & Wagon Co.'s works last week, and it is expected that the whole of the trains will be delivered to the Brighton Co. by August. The first train was inspected last week by the Chairman of the company, Lord Berborough, who expressed himself highly delighted with what he saw. The experimental running of the trains will probably begin in the autumn of this year, and, as soon as the repair shops at Peckham Rye have been completed, running for public traffic should be commenced. This will probably be by about the end of this year, when it is hoped that the whole 25 miles of single track which is being electrically equipped, will be in regular operation.

The Journal.—The June number of the Journal of the Institution of Electrical Engineers (No. 189, Vol. 40) contains the proceedings of the meetings in London, where the following Papers were discussed, together with the corresponding provincial discussions:—"Standard Performances of Electrical Machinery," by Dr. R. Goldschmidt; "Protective Devices for High-Tension Transmission Circuits," by Mr. J. S. Peck; and the following Papers, discussed only by Local Sections:—"The Reluctance of the Air-gap in Dynamo Machines," by Mr. T. F. Wall; "Experimental Determination of the Losses in Pole-shoes due to Armature Teeth," by Messrs. T. F. Wall and E. P. Smith; "The Heat Conductivity of Iron Stampings," by Mr. T. M. Barlow; and "Direct-current Generators," by Mr. W. Hoult.

The Kearney High-Speed Railway.—A Press demonstration of a working model of this railway system was given by Mr. E. W. C. Kearney at Aldwych, Strand, on Saturday afternoon. The system is a "mono-rail" with guide-rail, the former being the bearing-rail beneath the car and the latter being above the car, two pairs of wheels fixed on the roof of the car, underrun the guide-rail. On straight portions of the track the guide-rail is exactly vertical above the bearing-rail, but on curves it has a shorter radius of curvature than the bearing-rail, so that the car leans inwards to the proper degree. It is stated that derailment is physically impossible, so long as the rails do not break, and that much higher speeds can be permitted on sharp curves and steep gradients than were possible with the ordinary twin-rail system. Thus it is proposed to construct tube railways with the stations at the surface, but the intermediate level stretches 90 ft. below the surface. The train would descend out of the station on a gradient of 1 in 7, attain within 20 seconds from starting a maximum speed of 50 miles per hour, and then, after completing the level stretch at this speed, would run up a gradient of 1 in 7 into the next station. It is proposed that long-distance railways on this principle should follow the contour of the country, and that speeds of 120 miles per hour should be attained on long runs. A company is to be floated for exploiting the invention.

Recent Developments in Electric Lighting.—A course of three lectures on "Recent Developments in Electric Lighting" was commenced on Monday at the East London Technical College by Prof. J. T. Morris. The second and third lectures will be given on June 22nd and 29th respectively.

ELECTRICAL ENGINEERING AT THE FRANCO-BRITISH EXHIBITION

IN our issue of May 7th (page 687), we described in some detail the arrangements for the supply and distribution of electricity for lighting and power purposes in the Franco-British Exhibition, in itself an electrical engineering undertaking of some magnitude. Since that time a great deal has been done to remedy the state of unpreparedness which obtained at the time of the opening, and a very fair proportion of the exhibitors' stands in the various buildings are more or less complete. The chief portions of the exhibition to present objects of technical interest to the electrical engineer, apart from the applications of electric power for driving machinery of every description throughout the grounds, and the lighting arrangements already alluded to, are found among the exhibits in the British and French sections of the Machinery Hall and the Science section. The general impression obtained in glancing round is that, although a few electrical firms have striking displays, the heavier branches of electrical engineering are not well represented. Lighting, heating, and other domestic uses of electricity will be effectively demonstrated on the completion of the collection of stands which has been the outcome of the combined energies of the electric lighting companies, but at present a good deal remains to be added to this interesting display.

Electric Traction, &c.

The large hall which runs across and joins the western ends of the French and English Machinery Halls proper is devoted chiefly to iron and steel manufacture and transportation, including both shipping and railways, and here are to be found some fine exhibits by the leading steel makers of the country, and a magnificent collection of ship models.

One of the two exhibits of actual railway rolling stock is that of the METROPOLITAN RAILWAY CO., who show a complete compartment coach which they have converted at their Neasden Works into an electric motor coach with multiple unit control. This forms a part of a series of trains which at the time of the conversion of the line to electric traction had only recently been built. Two or three of these trains were put into service in

COACH CONVERTED FROM STEAM TO ELECTRIC TRACTION. SHOWN BY THE METROPOLITAN RAILWAY CO.

their converted form in July, 1906, and the equipment of the remainder has proceeded since. The conversion consisted in the case of the motor coaches of a certain strengthening of the underframes, the provision of new motor bogies, and the addition of the control equipment. The particular coach exhibited is shown in the accompanying figure. It differs somewhat from some of the first to be converted, and is fitted with a Westinghouse two-moter equipment with the usual electro-pneumatic multiple unit control (see ELECTRICAL ENGINEERING, Vol. I., page 593). The main differences from the standard equipment, as fitted to the ordinary Metropolitan rolling stock specially constructed for electric traction, lie in the arrangement of the whole of the control apparatus, including contactors resistances, &c., above the frame in the driver's compartment, and the provision of more complete arrangements on switch panels near the driver for isolating parts of the circuit and cutting out single motors if required. Another difference from the earlier Westinghouse equipment is the provision of a motor generator instead of a battery for the supply of current to the control circuit. The only part of the equipment below the frame is the motor-driven air compressor, but the automatic switch by which this is controlled is placed inside the car. In these later connected coaches a corridor is provided by which the guard can obtain access to the driver's compartment. In addition to this complete coach, a sample bogie without motor is shown, and also a G.E. 69 motor by the British Thomson-Houston Co., such as is used on some of the other Metropolitan trains.

In this part of the building is a show-case forming the exhibit of MESSRS. HANS RENOLD, LTD., of Manchester, and demonstrating their well-known system of chain driving. This includes patent silent chains; bush roller chains; block, stud, balance, textile, pipe wrench, and other special chains. In several cases the parts of the chains are displayed separately, so as to show the construction. The complete chain drives shown include sizes for powers ranging from 3 to 40 h.p., and speeds from 400 to 1,300 ft. per minute. In the silent chain drive is included a spring wheel, part of the cover of which is cut away to expose one of the springs. This special form of wheel is used for drives where the load is impulsive, as in pumps, compressors, forging machines, &c.

French Electrical Engineering.

Before the exhibition was opened, it was rumoured that the French electrical section was to be particularly complete, but on visiting the wing of the Machinery Hall occupied by our Continental friends, we confess to some disappointment. The variety of industries represented is very considerable, but many of the exhibits finding prominent places in the building are only most remotely connected with machinery and engineering, and, indeed, what may be described as heavy French electrical engineering is only represented on one or two stands.

Of the French electrical engineering stands, one of the most striking is that near the entrance of the MAISON SAUTTER HARLÉ & CIE., of Paris. One of the most interesting exhibits is a direct-coupled generating set driven by a four-cylinder 225 h.p. Diesel high-speed enclosed engine of what may practically be described as the marine type. This engine is very much more compact than the form of long-stroke slow-running Diesel engine which has usually been seen in this country, and a fine example of which is to be found in the *Daily Mail* Pavilion, particularly as regards over-all height. There are differences in the mechanical arrangement of the valves and fuel-injection pumps, but the main principle of working with a sufficiently high compression to produce self-ignition and the maintenance of a supply of compressed air for starting and injection of the fuel into the cylinders is, of course, the same. A description of the working of the earlier form of Diesel engine was given in ELECTRICAL ENGINEERING, Vol. I., page 559. The engine is direct-coupled to a four-pole generator provided with commutating poles, and designed for an output of 1,180 amperes at 120 volts, and to run at 450 r.p.m. It is to be regretted, however, that it has not been found convenient to show this interesting set running. A most imposing exhibit on the stand is a huge searchlight projector, which claims to be the largest projector in the world, having a mirror two metres (nearly 6 ft. 7 in.) across. This is provided with an automatic lamp taking 250 amperes, with a positive carbon 50 mm. in diameter and a 35 mm. negative carbon. The carbons are horizontal, and the starting and feeding are entirely automatic; a hand adjustment is, however, provided, by which each carbon can be centred independently. A special feature is the mirror, which is entirely of metal manufactured by a patent process, and is gilt to produce a beam of greater penetrative power than the ordinary silver surface. A complete set of apparatus, lenses, &c., for a lighthouse lamp is also shown. Another object of interest on the stand is a vertical shaft sinking pump for mining work, direct-driven by an enclosed water-cooled continuous-current motor of special design, taking seven amperes at 1,000 volts and running at 2,900 r.p.m. The pump is of the Mégy centrifugal type. A horizontal electrically-driven high-lift multistage centrifugal pump is also shown.

Digitized by Google

The adjoining stand is occupied by the SOCIÉTÉ GRAMME, of Paris (whose London agents are Messrs. T. L. Scott and Co., of 28 Martin's Lane, Cannon Street, E.C.) One of the most interesting exhibits shown by this well-known firm is a small complete generating set for isolated plants, consisting of a standard four-pole Gramme continuous-current dynamo for an output of 70 amperes at 110 volts, direct-coupled to and driven by a 10 h.p. two-cylinder vertical Tabord gas engine, supplied with gas from a specially constructed suction gas generator made by E. Bardot, of Paris, capable of using wood, charcoal, or even refuse as a fuel. The actual set is not shown running, but we understand that a similar set can be seen running in London on application to Messrs. Scott. Sets of this nature should prove of considerable use where coke or anthracite such as is required by the ordinary suction plant is not available. A representative group of continuous-current motors of various sizes is shown, and some examples of switchgear, including some motor starters and a series of automatic cut-outs of the laminated edgewise switchboard type, with auxiliary copper and carbon breaks. Smaller apparatus on the stand includes electric fans, and ignition apparatus and accumulators for motor-cars.

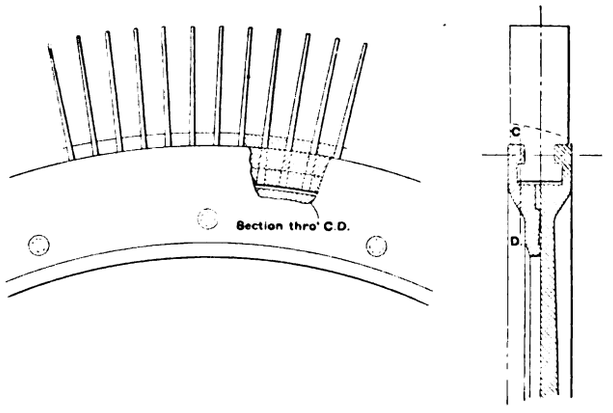
The firm of J. A. GENTEUR, of Paris, have a small stand near by, on which is a fine example of a marble switchboard. Among the smaller electrical apparatus in this part of the building is a display of small accumulators and motor-car ignition apparatus by A. DININ, of Puteaux.

Large accumulators are represented by a stand of the SOCIÉTÉ ANONYME DES TRAVAILS ÉLECTRIQUE DES MÉTAUX, who show plates and complete cells of their "T.E.M." accumulator, including a large 6,000 ampere-hour central-station cell.

A fine, well-arranged exhibit has been provided by the FRENCH POSTAL TELEGRAPH DEPARTMENT, comprising typical sets of apparatus for the various systems employed, including several forms of Hughes printing telegraph Morse and other instruments.

One of the finest of the machine-tool stands in the French section is that of the SOCIÉTÉ DES ANCIENS ETABLISSEMENTS PANHARD ET LEVASSOR, better known now perhaps for their motor-car work than for the branch of engineering which they originally practised. The most prominent feature is the wood-working machinery. On the same stand MESSRS. JACQUOT & TAVERDON, of Paris, are showing a very convenient form of hand-worked shaping machine, which should be useful for small work of a non-standard nature. Wood-working machinery is also shown by Messrs. GUILLOT FILS & CIE.

Among the larger exhibits, attention should be drawn to a full-sized water-tube boiler of the land type exhibited by Messrs. J. & A. NICLAUSSE, of Paris. This is of the firm's well-known model, with fire-box cut away to show the arrangement of the grate and the tubes. In the boiler exhibited there is a single steam and water drum, and a collection of straight inclined tubes, with their upper ends towards the boiler front, and arranged so that not only can they be readily cleaned, but any one tube can be quickly removed and renewed without disturbing the others in a few minutes.



Carbon brushes, dry batteries, carbons for microphones, &c., are exhibited on an effectively arranged stand by LE CARBONE, of Levallois Perret (London office, 17 Water Lane, Great Tower Street, E.C.), who claim to be the pioneers of carbon brushes in Europe, having exhibited them as long ago as the Crystal Palace Exhibition of 1892. The collection shown comprises carbon brushes, carbon switch contacts, microphone discs, shot and powder, welding carbons, primary cells of different descriptions, and the firm's patented connection for brushes fitted with pigtails. In addition to the well-known "X," "Z." and "S" grade carbon brushes, the company have during the last few years introduced several high-conductivity types, such as the "K.K.," "C.C.1.V.2," "L.F.C." (low-friction coefficient). It is claimed for the "K.K." brushes that they take a load of 100 to 120 amperes per square inch of contact area; they are recommended for slip-rings of alternating-current machines and induction motors, and for switch contacts which have to deal with a high-current density. The "C.C.1.V.2" brushes can be loaded up to 125 to 150 amperes per square inch, and are recommended for slip-rings of alternating-current machines and induction motors, and also for low-voltage direct-current machines designed for plating and electrolysis, while the L.F.C. grades, which can be worked up to about 65 amperes per square inch are specially intended for turbo-generators. Special types of brushes are also shown for dealing with commutation difficulties, and others which possess the property of attrition.

Several firms have closed glass cases containing examples of apparatus in which they specialise, but in the absence in many cases of attendants and the presence of armies of workmen engaged in the fitting up of adjoining stands, it is a little difficult sometimes to obtain information as to the special points of the apparatus exhibited. Among these show cases may be mentioned that of CHARBONNEAUX & CIE., of Reims, containing examples of their special "Isorex" insulator for overhead lines constructed of a dark coloured glass; a case containing induction coil, wireless telegraph, and Roentgen-ray apparatus shown by E. DUCRETET, of Paris; a display of bells, indicators, and telephones, by CH. MILDÉ FILS & CIE., of Paris; and a show case containing a collection of "NILMELIOR" ignition apparatus. An effective show of telephone apparatus has been sent over by the SOCIÉTÉ INDUSTRIELLE DES TÉLÉPHONES, of Paris. Dry batteries are also shown by P. DELAPON, of Paris.

British Electrical Engineering.

The stands in the English wing of the Machinery Hall present a rather different appearance to those in the French wing, as they are not partitioned off from one another to the same extent as the French stands. Although perhaps the same degree of artistic taste is not exhibited in the arrangement of the stands, it is possible to obtain a much more imposing general view of the exhibits, and the large machinery is certainly displayed much more effectively.

Entering the hall from the eastern end, the first examples of British engineering which meet the eye are those on the large stand of MESSRS. MATHER & PLATT, of Manchester. In the centre of this well-arranged display is a large twin cylinder two-cycle gas engine of the Körting type, capable of developing 800 B.H.P. continuously at 107 r.p.m. with a gas supply of about 140 B.Th.U. per cu. ft. This engine has mounted on its shaft between the cranks a massive fly-wheel, forming the

SECTIONS SHOWING ATTACHMENT OF BLADING OF ZOELLY TURBINE. (MESSRS. MATHER & PLATT.)

rotor of a three-phase alternator designed for an output of 170 amperes at 2,200 volts 25 cycles, which, at a power factor of 0·8, is equivalent to 520 kw. This set is absolutely complete, although it has not been found convenient to connect it up with a gas supply for running, and is one of two which will run in parallel together built to the order of Messrs. Cory Bros. Another object of interest is a small Zoelly turbine; this, however, does not form part of a generating set, but is coupled to a patent high-lift turbine pump. This set is designed to run at 3,000 revolutions per minute, and the turbine will develop 210 b.h.p. when supplied with steam at a pressure of 160 lb. per square inch, and condensing. The pump will lift 1,200 gallons per minute against a total head of 400 ft. The construction of this type of turbine is better seen from a single wheel complete with vanes forming part of a much larger turbine, which is shown separately. These wheels are forged in one piece with the boss from Siemens-Martin steel, and are polished all over. The blades, of nickel steel, are much fewer in number per wheel than in the reaction type, are secured by a patent special device to the periphery of the wheel, and are separated by accurately-cut distance pieces, the whole being backed by a grooved ring of forged steel riveted to the wheel, as shown in the accompanying figure. The cross-section of the blades decreases from the point of attachment towards the tip, with the result that they are well adapted to resist the strains set up by the high peripheral speed at which they run. The blades,

Digitized by Google

like the wheels themselves, are highly polished in order to minimise friction losses, while the nickel steel of which they are constructed enables them to retain their polished surfaces and clean-cut edges over lengthened periods of continuous operation. Another exhibit is a pair of patent high-lift turbine pumps direct-coupled to a direct-driven steel-clad motor, placed between the two pumps. The motor runs at 1,060 revolutions per minute, and is capable of giving out 150 b.h.p. The two pumps, which have each six successive chambers, through which the water passes, are connected in series, and are capable of pumping 400 gallons per minute against a total head of 720 ft., that is, each of the twelve chambers in series furnishes pressure sufficient to overcome 60 ft. This is at 1,060 revolutions per minute; at 1,450 revolutions the output would be 500 gallons per minute against 1,300 ft., and at 1,850 revolutions 600 gallons per minute against 2,000 ft. head. In addition to this plant the firm also show a large tank constructed of standard-sized cast-iron plates, with accurately-machined external or internal flanges, and several steam-driven pumps. An example of Messrs. Mather & Platt's "armoured" fire-resisting door for factories, &c., is also shown. In connection with the exhibition the firm have issued a series of five most attractive pamphlets, with artistic embossed covers, containing descriptions of the products of various departments of the firm, including engines and dynamos, textile machinery, hydraulic machinery, water-purification plant, and fire appliances.

MESSRS. CROSSLEY BROTHERS, LTD., have a large stand also at the end of the Hall on which is shown a fine example of an entirely new type of engine for direct coupling to electrical generators. This is of the vertical single-acting four-cycle pattern, and runs at a rather higher speed than has hitherto been characteristic of Messrs. Crossley's practice. The engine exhibited has four cylinders, each 14 in. bore and 16 in. stroke, and is rated at 215 b.h.p. on town gas and 180 b.h.p. on producer gas at 250 r.p.m. It is coupled to a 125 kw. 220-volt multipolar dynamo, built by the General Electric Co. at their Witton works, and is shown running off a standard No. 8 Crossley suction gas producer, burning anthracite. The principal features of the engine are the arrangement of the admission and exhaust valves side by side right in the cylinder heads, worked by vertical tappet rods from a camshaft inside the crank chamber, and the improved design of the throttle, which acts both on the gas and air inlets, and secures very even running on low charges. The ignition is on the high-tension system, with four separate trembler coils supplied by accumulators, and a specially designed contact maker is used in which the timing of each cylinder can be adjusted separately. A small dynamo is belted to the engine for charging one set of ignition accumulators while the other is in use. A compressed air starter is provided. As a contrast to this set, a small single-cylinder vertical engine is shown, running off town gas, and driving a dynamo for an output of 32 amperes at 100 volts at a speed of 700 r.p.m. This design of engine, which has also the valves arranged at the top, is such that it can be arranged for petrol or paraffin as well as gas. Some examples of the familiar horizontal single-cylinder engine are also shown, as well as a 40 h.p. automobile petrol engine of the firm's manufacture.

A large horizontal gas engine is being erected on an adjoining stand by the NATIONAL GAS ENGINE CO., but is not as yet quite complete, and a description must be deferred to a later date.

Reference has already been made to the large gas engine at the other end of the British wing of the Machinery Hall, which has been provided by the BRITISH WESTINGHOUSE ELECTRIC & MANUFACTURING CO. to assist in the lighting of the Exhibition. This is an example of the latest type of vertical tandem six-cylinder three-crank Westinghouse gas engine, generally similar to the engine described in another column of this issue in connection with the Midland Railway. The engine is rated at 750 h.p. on producer gas, and is direct coupled to a 500 kw. 500-volt Westinghouse multipolar generator. When complete the set will run in parallel with the Parsons steam turbo-generator referred to below. The engine works with gas supplied from a Mond gas producer, provided by the POWER GAS CORPORATION. The cooling tower for the water in connection with this plant was supplied by Messrs. Jarvis Bros., Middlesbrough.

In addition to this generating plant, to which we hope to make further reference when it is more complete, the British Westinghouse Co. have supplied certain plant in other parts of the Exhibition, as well as a large number of motors in use on various stands. For generating electricity for use in their pavilion, the Canadian Government have erected two gas-engine generating sets, each of 150 kw. capacity. These engines are of the same type as those supplied for the Machinery Hall, and each is direct connected to a 130-kw D.C. generator. The engines are run on ordinary illuminating gas. The Canadian Government have also installed in their pavilion some 48 D.C. and A.C. Westinghouse standard pattern flame arc lamps. The Australian Pavilion will be lighted, and the machinery therein operated, from two gas-engine generating sets, one of 100 kw. and the other of 130 kw. capacity. The former engine is a single-crank two-cylinder, and the latter a three-crank six-cylinder engine, both being of the new vertical tandem type, and both being adjusted for operating on ordinary illuminating gas.

In the same part of the Machinery Hall is the 1,800 kw. continuous-current tandem turbo-generator of MESSRS. C. A. PARSONS & CO., of Newcastle-on-Tyne, which forms the most powerful generating set in the Exhibition, and which, when complete, will take part together with the Westinghouse set in the supply of current to the exhibition for power and lighting purposes. The set consists of a standard Parsons steam turbine running at 1,800 r.p.m., coupled to two continuous-current compound-wound generators, each capable of an output of 900 kw. at 460 to 550 volts, and overloads of 25 per cent. for two hours, or 50 per cent. momentarily. These generators are of Messrs. Parsons' standard two-pole type, with compensating windings, but without commutating poles. The overall length of the set is about 46 ft. Alongside the set is a glass case containing a model of a 10,000-kw. turbo alternator and a turbine-driven blower.

The set exhausts into an ejector condenser by MESSRS. KÖRTING BROTHERS, LTD., placed outside the main hall.

Steam is supplied to the Parsons generating set from a set of three boilers erected just outside the Machinery Hall, supplied by MESSRS. BABCOCK & WILCOX, LTD., and of their standard land-water-tube type. In order to exhibit the different ways of mounting these, they are arranged two in a battery and one independently. They are fitted with the usual mountings and the latest form of superheater and automatic chain grate stoker. Each has 3,140 square feet of heating surface, and can evaporate 10,000 lb. of water per hour. A short iron chimney is provided, working with induced draught supplied by two fans, one electrically driven and the other steam driven. Messrs. Babcock & Wilcox have also a stand in the body of the hall, upon which a coal conveyor of the gravity bucket type is shown, together with a small marine boiler, a model Lassen and Hjorth water softener, and other exhibits.

On the stand of MESSRS. W. H. ALLEN, SON & CO., of Bedford, near the west end of the British Machinery Hall, are examples of this firm's well-known high-speed compound vertical enclosed engines, one of 450 h.p. and one of 220 h.p. These engines are, however, not under steam. A good exhibit of condensing plant is also shown, and several electrically driven pumps. An interesting novelty is a small generating set driven by a vertical two-cylinder 6 b.h.p. paraffin engine of the firm's own manufacture, which runs at 800 r.p.m. The vapouriser requires to be heated by a lamp at starting, but afterwards the necessary heat is maintained by the working of the engine. Low-tension magneto ignition is fitted.

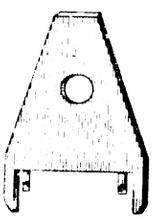
The Combined Exhibit Promoted by the Electric Supply Companies.

Electrical interest naturally centres largely round the combined exhibit of the applications of electricity which has been organised by a joint committee of the electric lighting companies of London. Owing, however, to an unfortunate chain of circumstances upon which it is unnecessary to dwell here, the scheme for the display only took final shape a very short time before the opening of the exhibition, and although the work has been pushed forward with great rapidity, it is not yet in a sufficiently advanced state to be done justice to at present by a complete description. We will, therefore, reserve the full particulars of the exhibits to a later date, and content ourselves at present with a brief indication of the range covered by some of the principal exhibits.

A good deal of attention will be attracted by the complete miniature flat furnished by Messrs. Warings, which is fitted up to demonstrate the various domestic applications of electricity. This is the most complete part of the display, and, when the descriptive literature which will doubtless be prepared is ready, will prove an interesting object-lesson to consumers, but we are inclined to think that its usefulness in this direction would be enhanced by a greater number of attendants to call attention to and explain the utility of the many accessories which might easily pass unnoticed. The visitor enters a tasteful hall, and

Digitized by Google

wanders successively through a series of miniature rooms forming dining-room, drawing-room, bedroom, nursery, and kitchen. All are lighted electrically in suitable style, provided with radiators for heating and fans for cooling, and a thousand and one small electrical accessories for adding to one's domestic comfort, particularly so in the luxurious bedroom, containing electric footwarmers, warming pans, curling-iron heaters, water boilers, &c. Attention should also be drawn to the very effective and reposeful lighting of the drawing-room by concealed lamps below the frieze. The feature of the house, however, is the kitchen, completely fitted with every variety of cooking appliance by Messrs. RASHLEIGH PHIPPS & Co., and demonstrated by a lady attendant.



More or less surrounding the "Home" is a group of some twenty stands tenanted by well-known electrical firms, but with one or two notable exceptions, these are far from complete. We give below, however, the names of some of the firms whose exhibits are complete or approaching completion, together with an indication of the nature of their principal exhibits :—

Barlow's Patent Lift Co.—Model of patent electric lift similar to that shown at Machines Exhibition at Olympia (see ELECTRICAL ENGINEERING, Vol. II., page 524). *British Thomson-Houston Co.*—Domestic heating appliances. *Berry, Skinner & Co.*—Non-clad switches, &c., similar to those used throughout the Exhibition. *H. Cox & Co.*—Induction coils, and high-frequency electro-medial apparatus. *Dowsing Radiant Heat Co.*—Electro-medical appliances, including radiant heat baths, &c. *Edison & Swan United Electric Lighting Co.*—Artistic fittings, lamps, distribution boards, &c. *Electromotors, Ltd.*—Motor-driven pumps, fans, drills, &c. *O. C. Hawkes, Ltd.*—Convection type electric heaters. *Imperial Lighting Co.*—"Fairyland" strip, such as used for the exterior decorative lighting of the Exhibition. *Linolite Co.*—Component parts of their "Tubolite" lighting system. *F. W. Reynolds & Co.*—Wood-working machinery. *A. Reyrolle & Co.*—Distribution boards, plugs, switches, controllers, &c. *R. Waygood & Co.*—Complete working model electric lift. *Westminster Engineering Co.*—Flame and other arc lamps.

There are also several stands of interest to electrical engineers in the Machinery Hall other than those included in the combined exhibit and those containing heavy plant already mentioned. Among these are the following :—

W. GIEPEL & Co. have an effective exhibit of the new non-hygroscopic insulating material known as "Liconite," the properties of which were recently described in ELECTRICAL ENGINEERING (May 28th, page 803) in connection with a demonstration of leadless cables insulated with this compound at the works of Messrs. Johnson & Philips. Arrangements are made on the stand for showing lengths of cable under continuous test at a pressure of 50,000 volts alternating. Examples of the Giepel well-known "Rapidity" steam trap are shown on the same stand.

Several interesting articles are to be seen on the stand of J. DUGDILL & Co., of Failsworth, Manchester, whose convenient flexible fittings we have more than once had occasion to refer to. The principal feature of most of these fittings is the special self-sustaining elbow joint, fully described in ELECTRICAL ENGINEERING (Vol. II., page 525), but this is now applied to a greater variety of fittings and in larger sizes than formerly. Among the new designs shown we noticed a fitting in the form of a tree, with a number of branches suitable for shop window lighting, and a convenient double-arm table fitting. Attention should also be drawn to the large size jointed brackets of very strong construction for workshop use, the largest of which has a swing of six feet, and can be raised or lowered for bench or floor work of any description more conveniently than a pendant on a cord. Messrs. DUGDILL have also brought out one or two useful small tools for wiremen, which are worthy of notice. One of these is a simple punch, illustrated herewith, for making holes in the correct position for screws in wooden casing cover, which not only secures improved accuracy in the position of the holes, but results in a great saving of time. Another novelty is a tool for removing shade rings from lamp holders when the shades are too narrow to admit the hand. This is double ended, and can be used either for ordinary or miniature holders.

TOOL FOR MAKING SCREW HOLES IN WOODEN CASING COVER. EXHIBITED BY J. DUGDILL & CO.

Among the exhibits on the stand of Messrs. THOMAS BROADBENT & SONS, of Huddersfield, are several electrically-driven hydro-extractors, in which the direct driving vertical spindle meter forms an integral part of the apparatus, and is connected to the body of the extractor by an automatic centrifugal friction clutch. As an example of electric crane work, a 10-ton crab is shown, as used in the firm's standard 3-motor workshop travelling cranes. An electric capstan with several interesting features is also shown.

Messrs. JOHN BARKER & Co., of Kensington, show examples of Kennedy's patent pipe-bending machine for all sizes of tube from light conduit to heavy piping. This apparatus was described in ELECTRICAL ENGINEERING in connection with the Machinery Exhibition at Olympia (Vol. II., page 485).

One of the earliest of the small stands to be completed was that of Messrs. SMITH & PARKES, LTD., of Manchester. Examples are shown of this firm's "Roko" belting of camels' hair yarn, with a specially woven patent "pile" surface, which takes all the wear and is impregnated with a special waterproof compound, samples of "Karmal" fibrous packing, and also a special form of flexible non-metallic protected hose with a damp resisting textile cover suitable for water or steam.

Perhaps one of the most striking features of the British section of the Machinery Hall is the collection of machine tools displayed on several large stands. We will not, however, attempt to describe them in detail at present.

One of the largest of these stands is that of Messrs. SELIG, SONNENTHAL & Co., and some fine examples of automatic machinery are to be found on the stand of Messrs. ALFRED HERBERT, LTD., of Coventry. A number of recent improved designs, particularly as regards lathes, boring, and milling machines specially made for individual electric drive, are shown by Messrs. JOHN HETHERINGTON & SONS, of Manchester. Messrs. JOHN STIRK & Co., of Halifax, show a number of lathes and other machine tools for electric driving, and a special design of electrically-driven planing machine is shown in action on the stand of Messrs. JOSHUA BUCKTON & Co., of Leeds.

The Science Section.

The Science Section of the Exhibition is very complete, and contains a large number of most interesting exhibits amongst the fine series of scientific apparatus and products which have been brought together. A brief description of this section, owing to the great variety of subjects dealt with, forming, as they do, a summary of the whole realms of science, is difficult to prepare without describing practically everything which is present. We will, however, endeavour to confine ourselves in the main to the electrical exhibits, but even these we will not attempt to take in chronological order.

An historical exhibit of great interest, and which appeals not only to scientific workers, but perhaps even more to commercial men, is that of Sir Joseph Swan, in which the earliest incandescent lamp ever shown in public is included, together with objects exemplifying the gradual development which has led up to the metal filament lamp of the present day. The older filaments, such as those of parchment, with enlarged ends, are shown, and also the cellulose squirted filaments, both before and after carbonisation. In the next case are exhibited the original Leyden jars, which were the property of, and were also used by, Cavendish in his electrical experiments in the eighteenth century. There is also a very comprehensive exhibit by the Cambridge Scientific Instrument Company, such as Ayrton-Mather-D'Arsonval and other galvanometers, standard cadmium cells and various apparatus designed by Duddell, amongst which must be noticed the latest forms of oscillograph designed for use on high-tension circuits, and by the use of which circuits of high potential up to 30,000 volts may be safely studied. In this instrument the magnetic field

Digitized by Google

is produced by means of a strong permanent magnet, so that the only connections to the oscillograph are those from the vibrating systems to the circuit to be investigated. The insulation, which is thus easy to effect, is provided by placing the oscillograph on a tall corrugated porcelain insulator; it has also a porcelain cover, while brush discharge is provided against by a large porcelain plate between the instrument and the case. Behind the oscillograph there is a large high-tension insulator for supporting the leads to the oscillograph. All the working parts are in a strong metal case, with iron pole pieces let into the side to concentrate the magnetic field. This case is filled with the damping oil, and is provided with an oil-tight lid. The two vibrating systems are each distinct from one another, and can be removed independently for repair. As each vibrating system is made as simple as possible, no special skill is required to repair it, any reasonably skilled experimenter being able to re-suspend it in about a couple of hours. A special non-inductive resistance to put in series with one pair of strips to obtain the P.D. wave can be supplied with the instrument. A somewhat similar form of the same instrument, fitted with a powerful electro-magnet, has been most successfully employed in the investigation of telephone currents. A frame of various oscillograms is exhibited.

Among the exhibits relating to magnetism and electricity from the Wheatstone Laboratory, King's College, London, we notice the original Daniells batteries and original Wheatstone Bridge, also Clerk-Maxwell's dynamical model, to illustrate the primary and secondary circuit; Wheatstone's 4-needle Instrument (1837), and his original resistance box. There is also a large Russian lodestone in ancient mounting, used by Faraday to show the induction of currents by a natural magnet, and Faraday's coil employed with it. There are some extremely interesting photographs of electrical discharges of extra high tension and frequency by K. J. Tarrant.

Marconi's Wireless Telegraph Co., Ltd., have an interesting exhibit representative of modern wireless telegraphy, in which they show types of coherers from 1895 to the present time. Early and modern coherer and magnetic receivers, old multiple and enclosed spark gaps, also the revolving discharger formerly used at Poldhu, and a variety of other early and present day apparatus employed in wireless telegraphy.

The National Physical Laboratory has an exceptionally fine exhibit, and one obtains an idea from this how varied is the work which is carried out in their laboratories. There is a model showing the construction of an apparatus used at the laboratory for testing radiation pyrometers over the lower ranges up to 1,400° C. The electric furnace on which the pyrometers are tested gives nearly perfect "black body" radiation up to 1,400° C. The temperature of the radiator is determined by means of the thermo-couple and potentiometer. The pyrometers shown under test have been devised by Prof. Féry, and are supplied by the Cambridge Scientific Instrument Company. In one of these, the Féry radiation pyrometer, the radiation from the object whose temperature is to be determined is concentrated upon a minute thermo-couple at the focus of a concave gilt mirror. There is also on exhibit an apparatus for comparison of mercury thermometers with standards. This apparatus consists of an electrically-heated bath suitable for water or oil. In the latter medium comparisons can be made up to a little over 200° C. The exhibit shows a set of mercury thermometers, which are being standardised by comparison with a platinum resistance thermometer, whose readings are taken by a Callander Griffiths bridge. The Campbell type of mutual inductance standard is also shown. This is a secondary fixed standard, in which exact adjustment is easily made by altering the number of turns on a small coil concentric with the large primary and secondary coils. By stranding the wires several ranges are obtained with one adjustment (*e.g.*, 0·1, 0·2, 1·0, and 2·0 millihenries).

The National Physical form of resistance bridge is also shown. The bridge is arranged for the evaluation of a tenth-ohm in terms of a unit coil, balance being obtained by shunting one of the ratio coils; at the same time, the ratio of the two coils which shunt the small resistance connecting the tenth-ohm to the unit coil is made equal to the ratio of the proportional arms. The arrangement is that of the Kelvin double bridge, but special observations are made for determining the resistance of the current leads and contacts, since for comparisons of high precision no assumption as to constancy of contact resistances is admissible. Resistances from 0·0001 ohm to 1,000,000 ohms can be compared in the same bath. Standard cadmium cells are also exhibited, the form shown being the H style.

Under Metallography there are two interesting electric resistance furnaces, one arranged for carbon combustion and the other one for quenching metals. The metal is heated up in a quartz tube under vacuum to the required temperature, and when this is reached it is immediately quenched by opening a tap, the end of which dips under water; water rushes into the tube, cools the metal, and at the same time drives it out of the tube.

Messrs. Reynolds & Branson show various Leyden jars of different capacity in the Astronomical Section. There are also in this section Apps' Patent Induction Coils, one giving a 20-inch and the other a 14-inch spark.

In the Chemical Section there is shown Lord Rayleigh's apparatus, in which, by means of a special form of discharge, he ultimately separated argon from the air. Dr. Sand shows electrodes which can be rapidly rotated and used for the quick deposition of metals electrolytically. There are also a very fine display of pieces of electrolytic apparatus shown by Dr. F. M. Perkin, and also a number of specimens of various chemical products which have been prepared by electro-chemical means, and are shown to illustrate what it is possible to do by means of electro-chemistry.

An Australian Submarine Cable Guarantee.—We read in the *Australian Mining Standard* that a writ has been issued by the Eastern Extension Telegraph Co. against the Commonwealth Post and Telegraph Department, in connection with the Government guarantee on the submarine cable between Tasmania and the mainland. In pre-federation days the Eastern Extension Co. made an agreement with the Tasmanian Government, under which the company was not only subsidised, but received a "receipts guarantee," and the company was indemnified against loss through business dropping below a certain specified point. This agreement was continued by the Commonwealth when the postal department was transferred. In 1906 the Federal Parliament passed an Act abolishing the rate of ½d. per word, which, it is contended, was really the point guaranteed, and the Government has since declined to pay anything beyond the subsidy. The original contract, however, is still in force, and the company claims that if the Government elects to reduce the charge of telegrams to the public it must be at Government expense, and not at the company's. The company, therefore, claims damages to the extent of £605, namely, the difference between the bare guarantee and the guarantee plus the charge of ½d. per word, which had been discontinued.

Bournemouth Tramway Disaster.—The Board of Trade inquiry into the circumstances attending the accident on the Corporation tramways on May 1st was concluded on June 10th, before Major Pringle. Wilton, the driver of the car, said that he did not observe anything wrong with the car when he took it over. He had no difficulty in removing the handle from the rear controller when he changed over at the Poole terminus. At Poole Hill he applied the hand brakes before the car started, and then later tried to put on the magnetic brake, but found there was no effect. Realising that the magnetic brakes were not working he pulled the reversing lever over and worked the power notches, but this, instead of retarding the car, accelerated it. The speed was then between 20 and 25 miles per hour. The car then rushed the curve and went over into the glen. No instructions as to the trying of the magnetic brakes before going down hill were issued until after the accident. After some further evidence from previous witnesses, the inquiry was concluded. The report of Major Pringle, the Board of Trade Inspector, will be issued in due course.

As announced on page 869 of our issue of June 4th, the inquest was resumed on June 11th. Wilton said that he could have taken the car down the hill on the hand brake, and would have applied it earlier had he known that the magnetic brake circuit was out of order. Other drivers gave evidence as to the condition of the brakes and controller of the wrecked car previous to the accident. The jury returned a verdict of accidental death, the accident having been caused by the car getting out of control, owing to a defective controller. The driver was exonerated from all blame, but the jury recommended that more supervision should be exercised over repairs.

Electric Traction on the Prussian State Railways.—The following further details relating to the electrification of the main lines in the district of Magdeburg are taken from an American consular report (see also ELECTRICAL ENGINEERING, April 30th, p. 668, and June 11th, p. 893). At first short sections Güsten-Stassfurt and Güsten-Bernburg-Köthen will be electrically equipped, and then later on the lines Magdeburg-Leipzig and Halle-Leipzig. There are some large deposits of bituminous coal between Halle and Leipzig. This coal (Braunkohle), though not suitable for locomotives, will be used at the central power station, which will be built in the coal district, and which will provide power for both lines. The ordinary passenger traffic will consist of light trains at frequent intervals, but the express and freight trains will be hauled by electric locomotives. The single-phase system will be employed with a contact wire pressure of 10,000 volts. It is estimated that the change over of the two main lines mentioned above (amounting to 102½ miles of line) from steam to electric traction will take two years.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 11th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.

Names in brackets indicate communicators of inventions from abroad.

1907 Patents

11,288, V. A. FYNN. This invention relates to single-phase commutator motors of the type in which the field winding is partly on the rotor, and in which two rotor circuits, the axes of which do not coincide, are connected in series either directly or through a transformer. Such motors have a true series characteristic, similar to that of a continuous-current series motor, and their no-load or light-load speed greatly exceeds their full-load speed. According to this invention, a negative torque is produced after a determined speed has been reached, and so the light-load speed is reduced. Thus the machine has only a true series characteristic at starting. The negative torque is produced by reaction between the rotor exciting current and the transformer field. Although such a machine will start with a powerful torque, it will not race at no load. Eight claims, eleven figures.

11,471, S. O. COWPER-COLES. A method for the electro-deposition of metals in a smooth homogeneous form at a rapid rate. The electrolyte is caused to travel over the surface of the metal at a speed of about 500 ft. per minute, the circulation being obtained by means of air jets placed around the metal surface. One claim.

15,412, L. H. WALTER. A self-restoring receiver for wireless telegraphy, consisting of a fine tantalum wire in contact with mercury. Good results have been obtained with a tantalum wire 0·05 mm. in diameter, taken from an ordinary tantalum lamp, and supported in a glass sheath from which the point projected about 1/16 in. The potential difference applied may be anything from 0·1 volt upwards, but a pressure of 0·2 to 0·3 volt has been found very suitable. The property of not giving a good electrical contact with mercury seems peculiar to tantalum, as platinum, tungsten, vanadium, and even iron in contact with mercury give a good electrical connection. The above coherer is not so sensitive to atmospheric changes as the carbon-mercury coherer, and has a longer life. Four claims, two figures.

21,860, SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke Ges.*). A method of reducing the necessary thickness of insulation between the windings and the iron core of high-tension transformers. If the potential gradient through the dielectric is made uniform, a smaller amount of insulation is required than when some layers of the dielectric are subject to higher stresses than others. To obtain this uniform fall of potential through the dielectric, layers of good conducting material are inserted in the dielectric at suitable intervals, and connected to suitable points of either the high-pressure winding itself, or a resistance fed from that winding. Two claims, two figures.

23,585, W. FAIRWEATHER (*Glühlampenwerk Anker Ges.*). It has been noticed that when raw filaments are reduced by heating by the electric current in an atmosphere of some inert gas, the reaction between the current-carrying filament and the earth's magnetic field, or any other magnetic field that may be present, causes the filament to become distorted. This is particularly noticeable when continuous current is used. According to the present invention, the filament is supplied with a continuous current which, with the aid of a commutator, is repeatedly reversed. At the same time the applied voltage is gradually reduced. The filament oscillates with the current reversals, but as the current dies down the amplitude of swing is reduced, and the final metal filament sets perfectly straight. One claim.

23,778, C. A. DAY (*Fabrik Elektrischer Zünder Ges.*). Resistance bodies are manufactured by mixing together metallic particles with particles of semi- or non-conducting material and a suitable binding agent. While the mixture is setting or solidifying, it is put under the influence of Hertzian waves, and a coherer action takes place. The resistance can be adjusted to any desired degree by this means, and the solidification of the mixture renders the condition permanent. One claim.

24,074, V. ARCIONI. A direct-reading, recording, or integrating wattmeter for measuring power on unsymmetrically loaded three-phase circuits without a neutral conductor. The instrument is an electrodynamometer, consisting of two stationary coils and one movable coil. The movable coil is fed by a current proportional to the line pressure (across phases), and one of the stationary coils is fed with the current of one phase. The second stationary coil is fed with a current equal to the current of the second phase, but leading in phase by 60°. The fields due to the stationary coils are superimposed, and react on the field produced by the pressure coil, giving a deflection proportional to the load on the system. To obtain the leading current mentioned above, a current transformer, with a magnetic circuit of high reluctance, and a secondary circuit of high resistance, is used. Three claims, seven figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Summaries of the more important of these patents will appear in our next issue.

1907 Patents

4,713, FESSENDEN. Transmission of energy by electromagnetic waves.
9,397, DE PONT. Compositions for insulation.
12,239, BÉKÉSY. Portable signalling apparatus.
12,369, BRZESKI & STRAUSS-COLLIN. Arc lamps.
12,436, SCIPLE. Cross arms for telegraph, telephone, or other posts.
12,443, RAWORTH & RAWORTH. Control of electric motors.
12,902, QUINT. Enclosed arc lamps.
13,285, ELLISON. Circuit breakers for the protection of induction motors.
13,596, JAHR. Wireless telegraphy.
15,012, ROSS. Magnet or solenoid coils.
15,050, YATES. Electric fire and burglar alarm.
15,878, SIEMENS BROS. & Co. & GRIMSTON. Electrically controlled selective switch and a transmitter of current impulses.
16,092, ALLGEMEINE ELEKTRICITÄTS GES. Alternating current commutator machines.
17,796, FRICKER. Electric sign apparatus.
18,245, RANSFORD (*Compagnie Parisienne des Voitures Electriques procédés Krieger*). Electrically-driven vehicles.
19,891, BOURDIL. Safety device for overhead lines.
19,907, HAY, COUPER, & LINDSAY. Portable electric vulcanising apparatus.
20,006, SCHWARZLOSE. Automatic fire-arms.
20,510, SIMPSON. Brakes for railway vehicles.
21,535, MAICHE. Transformers.
23,529, FELTEN & GUILLEAUME-LAHMEYERWERKE AKT.-GES. Electric valve.
23,386, KITSEE. Relays.
25,123, ARCIONI. Electric meters.
25,444, BARRETO. Electrical ignition devices for internal-combustion engines.
25,830, LOEBL & THE BRITISH EVER READY ELECTRICAL CO. Electric switches.
27,073, SIEMENS-SCHUCKERTWERKE-GES. Systems for driving machinery subject to variable loads.

1908 Patents

66, LITTLE. Arc lamp electrodes.
665, STROHMENGER. Material for separating plates of secondary batteries.
878, SIEMENS BROS. DYNAMO WORKS (*Elektrizitäts-Akt.-Ges. vorm. Schuckert & Co.*). Arrangement on electricity meters for determining the maximum consumption.
1,615, BELIN. Electrical apparatus for reproducing pictures at a distance.
4,112, SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke Ges*). Section insulating arrangements for the overhead construction of electric railways.
4,432, MASCHINENFABRIK OERLIKON. Single-phase commutator motors.
4,464, SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*). Manufacture of coils of large section for electromagnetic apparatus.
7,219, ADAMIAN. Electrically-controlled apparatus for seeing at a distance.

Complete Specifications open to Public Inspection before Acceptance.

1908 Patents

10,317, MERSHON. Insulating supports for high-tension conductors.
11,068, ROUTIN. Regulators for electric generators and furnaces.
11,128, HANKIN. Electric heating apparatus.

Expiring Patent

The following patent expires during the current week after a life of fourteen years :—

No. 12,221 of 23rd June, 1894. P. M. JUSTICE (*Edward G. Acheson*). An electric furnace especially adapted for the production of carborundum. A core of some refractory material, of higher conductivity than the mass to be treated, is provided, and this forms a direct path for the current. The mass to be treated is packed round this core. Also a mixture for the production of carborundum, consisting of 29 parts sand, 20 parts coal, coke, or other form of carbon, 5 parts common salt, and about 2 parts sawdust or cork.

ELECTROCHEMISTRY AND ELECTROMETALLURGY

AT the recent meeting of the American Electrochemical Society, Dr. H. L. Bronson described a method for measuring the resistances of the order of 100,000 megohms. There are many difficulties in measurements of such high resistances. Resistances of the magnitude of 10^{11} ohms can be measured by means of fine carbon lines on ebonite or ground glass, but as the resistance is probably merely due to bad contact it is very uncertain. So, also, are liquid resistances, such as xylolylol or amyl alcohol, contained in capillary tubes. Dr. Bronson makes use of the resistance of an ionic gas, the process being based on the law that the ionisation current through a gas subjected to a constant source of ionisation is practically proportional to the potential difference between the plates when this potential is small. The resistor vessels are of ebonite, the inside measurements being $2{\cdot}5 \times 1{\cdot}5$ c.m., with aluminium electrodes, the active material consisting of radium bromide, about 1_{10} milligram. Usually it is possible to adjust the distance between the plates so that a linear relation exists for a considerable range of potential. It is, however, necessary to obtain a calibration curve for each vessel. From the results given in the paper it would appear possible to make standard vessels of this type, and keep them as standard high resistor standards. They should remain constant over a long period of time, and would have a much higher resistance than the usual standards.

The firm of Le Gallais Metz and Co., in Luxemburg, are building a large electrolytic steel works, in which they will install an improved form of Kjellin induction furnace. Not only will the furnaces be employed for the manufacture of high-class steels, but it is intended also to manufacture ordinary cast steel. It is hoped that the works will be in operation by the early autumn.

In the American Patent, 886,857 (1908), E. F. Price and W. S. Horry describe a method for obtaining metallic calcium electrolytically. The bath employed is of calcium chloride or calcium fluoride, and it is said to be advantageous to also have present corresponding salts of strontium and ammonium in order to lower the melting point. A composite anode of calcium carbide and a binder is employed, iron forming a suitable cathode. As electrolysis proceeds the anode gradually dissolves, the calcium of the calcium carbide combining with the liberated halogen, the bath thus being kept replenished. The carbon of the calcium carbide may float on the surface and be consumed by coming into contact with atmospheric oxygen, or calcium oxide may be added to the bath. In this case the oxygen ion is liberated at the anode, and unites with carbon, consuming it there, the calcium ion of the oxide being deposited at the cathode.

From *Electrochemical and Metallurgical Industry* of June we notice that Dr. E. F. Kern contributed a Paper upon the "Electrolytic Refining of Iron" to the recent meeting of the American Electro-Chemical Society. He describes the experiment carried out with different electrolytes. The solutions employed were various:—Ferrous sulphate, sodium sulphate, ferrous chloride with sodium chloride, and ferrous fluosilicate. With the last-named solution it was found that the metal deposited was of a grey colour, and was very brittle, due to contamination with silica. The E.M.F. when from 10-20 amperes per square foot of current was employed was 0·9 to 1·2 volt, the temperature being 20°. At 60° the E.M.F. dropped to 0·55 to 0·7 volt. Satisfactory deposits were obtained by electrolysing ferrous sulphate solutions containing 6 per cent. iron and 3 per cent. sodium in the form of sulphates, or 8 per cent. iron and 4 per cent. sodium as chlorides. The E.M.F. with a current density of 10 to 20 amperes per square foot was 1·15 to 1·4 volts at 20° and 0·8 to 0·98 at 50°. When the electrolysis was started in solutions of sulphates and chlorides, the iron deposited at the cathode commenced to peel off; this was due to the presence of ferric salts in the solution. After the electrolysis had been conducted for from 3 to 4 hours, however, regular and smooth deposits were obtained. If the solutions were boiled previous to electrolysis, less pitted deposits were produced, and it was always found that smoother iron was obtained when the electrolysis was conducted at from 40 to 60°. The deposits produced in neutral chloride electrolytes containing sodium chloride were of finer grain and more flexible than those formed in neutral sulphate solutions. Deposits of iron obtained from neutral sulphate or chloride electrolytes readily became malleable when they were heated to redness, *i.e.*, provided no ammonium salts were present. In presence of ammonium salts they were harder and more brittle and less rapidly oxidised. It was suggested that perhaps this was caused by iron deposits obtained from ammonium solutions containing nitrogen. In the discussion which followed the Paper, Dr. Richards suggested that the time had now come for attempts to be made as to commercial possibilities of iron depositions from aqueous solutions. Readers of this column will remember that the Thames Iron Works have already produced iron on a commercial scale by electrolysis of aqueous solutions. ELECTRICAL ENGINEERING, Vol. I., p. 444. In the same number of the *Electrochemical and Metallurgical Industry*, Dr. H. Goldschmidt contributes a note upon "The Use of Calcium Silicide for the Purification of Metals, particularly of Steel." Many metals and alloys have been used for a number of years in the purification of liquid steel, the best known being manganese and ferro-silicon. Aluminium also possesses in a high degree the property of ridding liquid steel of the last traces of oxygen. In the case of aluminium, the oxide, owing to its infusibility, remains in small quantities in the steel. Titanium likewise has similar properties, but in this case it is mainly owing to the fact that the metal combines with nitrogen forming a cyano-nitride. Aluminium is unable to unite with sulphur, and in this respect calcium silicide has a great advantage in that the calcium can remove sulphur, and probably the nitrogen, whereas the silicon removes the oxygen; it therefore represents a new and very effective purification agent. The product employed contains about 30 per cent. calcium, the remainder being silicon. Calcium silicide is also useful for the refining of nickel copper or bronze castings.

LONDON ELECTRIC POWER BILLS

LORD CROMER'S Committee of the House of Lords resumed consideration of the London Electric Power Bills, after the Whitsun recess, on Tuesday. At the time of the adjournment, the whole of the opposition to the London and District Electric Power Bill had been heard, and it had been arranged that Mr. Fitzgerald's reply should be deferred until he opposed the second Bill. Consequently, on the resumption, Mr. Balfour Browne, K.C., opened the Bill for the eight electric lighting companies of London. We gave the full details of the Bill in ELECTRICAL ENGINEERING, Vol. II., p. 1007, the objects of which, briefly, are as follows:—The creation of a Joint Committee, the undertakings of the companies or local authorities forming which would come under the control of that body, and be worked as one undertaking. So far, only eight companies have agreed to be represented on the Joint Committee, but an area has been scheduled somewhat smaller than that in the previous Bill, all the authorised distributors in which will have the option of joining the Joint Committee.

Authorised distributors will be supplied in bulk at prices not exceeding £5 per annum per kw. of maximum demand *plus* 0·35d. per unit, on a contract for not less than seven years. Incidentally, it may be pointed out that the Bill proposes to revise the schedule of prices attached to the Provisional Orders of the London companies, so that from January 1st, 1909, the maximum charge for electrical energy for power purposes shall be £4 10s. per annum per kw. of maximum demand and 0·5d. per unit, a price which may be revised by the Board of Trade after seven years on the application of 20 consumers, or the London County Council, the Joint Committee, or the individual companies themselves. The Joint Committee takes powers to supply electrical energy throughout the area for canal haulage, or traction, &c., but the "bulk supply" areas of the following companies are exempted from the provisions of the Bill:—North Metropolitan Electric Power Supply Co., Kent Electric Power Co., Metropolitan Electric Supply Co., Charing Cross, West End & City Electricity Supply Co., South Metropolitan Electric Light & Power Co.

The financial clauses of the Bill provide that stock may be created called "The London Electric Supply Joint Committee Guaranteed Stock" to the extent of £1,000,000 at interest not exceeding 5 per cent. per annum, and it may be redeemed at not less than 110 on the purchase of the undertaking of the Joint Committee in 1932, or at par if not purchased until 1952. The following companies will guarantee the interest upon this stock:—Charing Cross, West End & City

Electricity Supply Co., City of London Electric Lighting Co., County of London Electric Supply Co., London Electric Supply Co., Metropolitan Electric Supply Co., South Metropolitan Electric Light & Power Co.

THE "EIGHT COMPANY" BILL.

Mr. BALFOUR BROWNE, K.C., who appears for the Bill, with Mr. C. A. Cripps, K.C., Mr. C. C. Hutchinson, and Mr. Tyldesley Jones, said that the scheme involved: (1) the concentration of the generation of electricity at six of the largest stations, belonging to the companies, four of which were upon the river, and two below bridges; (2) the ultimate purchase by the London County Council or some other Parliamentary authority of the whole unified system; (3) the building up of the new business upon the existing business, and utilising the existing plant; (4) the sharing of the benefits with the public, which was the modern principle of legislation given effect to in relation to gas, although there was not a sliding scale in the Bill. At present eight companies were joined in the scheme as follows:—Brompton & Kensington Co., Charing Cross Co., Chelsea Co., City of London Co., County of London Co., London Electric Supply Corporation, Metropolitan Co., South Metropolitan Power Co., but provision was made for other companies or local authorities to join the Joint Committee. Every member of the Joint Committee would have one vote, and an additional vote for every £10,000 guaranteed under the Bill. There was also a provision in the Bill by which the London County Council could become members of the Joint Committee, but he gathered that they did not desire to be so represented. By this Joint Committee, continued Mr. Balfour Browne, they would ensure a sort of public body regulating the supply of electricity, which seemed to be a far more likely thing than offering the public electrical energy as distributors. The Joint Committee constituted by the Bill would be under an obligation to supply electricity at a certain price to the various companies, but, of course, the price would depend upon various considerations. Provision had been made, however, for a temporary supply to the Joint Committee by the existing companies, because for a time the Joint Committee would not have any works themselves. The Bill also took powers to erect plant within five years which would be sufficient to supply 27,000 kw., which plant would be worked by the companies on behalf of the Joint Committee, and the companies would be paid for working it. Failing agreement as to terms, the matter would be determined by a standing arbitrator between the Joint Committee and the companies. At the present time two of the companies had already at the disposal of the Joint Committee land which would be sufficient to take plant up to 11,000 kw. The capital which it was proposed to raise for preliminary works and trunk mains was £1,000,000; this was guaranteed by six of the companies, and he believed there would be no difficulty in raising this money at 4 per cent., as all the guaranteeing companies were dividend paying concerns. The revenue of the Joint Committee was to be first of all applied in paying the interest on the guaranteed stock; secondly, towards a sinking fund and reserve, upon a basis of 42 years, and, before any profit went to the companies, 2 per cent. was to go to the guaranteeing companies. After that, any profit up to 6 per cent. was to be shared between the guaranteeing companies and the authorised distributors in the proportion that the guaranteeing companies took one-third and the authorised distributors, who took electricity from the Joint Committee, two-thirds. The object of the Bill was that the Joint Committee should merely supply the authorised distributors, and not in any way compete with them, and the bulk of their income would come from this source. It was believed that co-operation in this way would be a great advantage to the existing authorities. With regard to the prospects of the new concern, the existing companies supplied 46 per cent. of the total power installed in the area, and the whole of the remainder they calculated would be met by additional plant of 23,000 kw. With regard to railways, these required special plant, and if any railway wished to enter into a contract, then special plant would be provided. They had not much hope of getting contracts from tramways, because the three great systems in existence in the area, namely, the London County Council Tramways, the London United Tramways, and the Middlesex County Council Tramways, were already supplying themselves. Therefore the Joint Committee did not look for any business apart from the existing distributors. It was worthy of notice that the increase of load throughout the area during the past few years had been 9,799 kw., but this was decreasing at the present time. The problem was how best to provide for future demands at less capital cost than under existing restrictions, and at the same time to reduce the cost to the consumers by the most economical means of generation. The chief restrictions, which had been mentioned more than once, were the disadvantages of small self-contained districts, and the inability to associate amongst the various districts. As a matter of fact, this latter was now looked upon as a wrong principle, for the Board of Trade sought to remove it in the Electricity Supply Bill of 1905. By this means the Joint Committee would be enabled to use the smaller stations as peak load stations, just as the promoters under the other Bill proposed to do. Further, by allowing association between the companies, a very large amount of spare plant would be placed at the disposal of the Joint Committee, as at present each distributor had to have a larger amount of spare plant than would be necessary if they could fall back upon each other in emergency. It was calculated that the amount of spare plant thus made available would be 17,000 kw.

The six power houses which it was proposed to use as main generating stations were the Bow station of the Charing Cross Co., the Bankside station of the City of London Co., the Wandsworth station of the County of London Co., the Deptford station of the London Electric Supply Corporation, the Willesden station of the Metropolitan Electric Supply Co., and the Blackwall Point station of the South Metropolitan Power Co. The present capacity of these stations was 89,150 kilowatts; there was room for 34,500 kilowatts in the existing buildings, whilst of the total area of 34·15 acres there were 14½ acres unoccupied, on which buildings having a capacity of an additional 14,800 kilowatts could be erected. Similarly, the local authorities who would be able to come on to the Joint Committee had a large amount of surplus plant, totalling some 52,000 kilowatts, and if the Joint Committee could relieve them of the necessity of having large spares, or having duplicate plant, it must tend to great economy. It was also the contention of the promoters that very great savings would be made in the transmission losses by having the generating stations situated nearer the centre of supply. The promoters of the previous Bill had shown great savings by scrapping the existing stations, but his engineers argued that the saving would only be part of the local coal bill, some wages and oil, because the capital charges on the station scrapped remained exactly the same. Figures had also been got out showing that the works costs of 17 authorised distributors in London were 27·6 per cent. of the cost of supplying the consumer, and if the station were shut down, they would only effect some saving of this 27·6 per cent. The new plant which would be installed in the existing buildings by the proposed Joint Committee would be upon the three-phase system at 50 cycles and 10,000 volts pressure, and the amount of plant so provided would be sufficient for the next five or six years. In view of the slow growth, the companies did not think they ought to look any further ahead than this. Mr. Balfour Browne then handed in tables showing the comparative capital cost of plant and transmission mains for supplying a load of 25,000 kilowatts from steam-turbine plant worked on a station, say, at Barking, by a new company, and for the same output by the existing companies utilising their buildings and land. In the first case they took three sets of 12,000 kilowatts each, and taking land, buildings, and river work at £186,500, plant at £254,590, and transmission system at £521,350, making a total of £943,440, the existing companies could install the same amount of plant for £756,958. Adding the engineering and preliminary expenses, which in the case of a new company would necessarily be higher, they arrived at the figures of £1,137,630 in the case of a new company, as compared with £843,658 by the existing companies. The capital cost per kilowatt came out at £23·1 per kw. for 25,000 kilowatts, or £22·2 per kw. if the load were increased to 34,000 kilowatts, which was the capacity for additional plant of the present buildings and land. The figures for the new company, he said, were based upon the promoters' estimates for their 60,000 kilowatt station. Another table showed how the two schemes would work out so far as the consumer was concerned, and it estimated that the cost per unit delivered, for untransformed energy, was 0·486d. in the case of the new company against 0·441d. for the existing companies. Thus, for the 25,000 kilowatt load, which the existing companies thought was the extent to which they could look ahead, by utilising the existing resources they could generate cheaper. That it was exceedingly rash to look too far ahead in engineering matters, even the promoters themselves admitted in the evidence of Sir Hugh Bell, who looked forward to gas turbines, and at the present time suction-gas plant and oil engines were very serious competitors with steam turbines. The Charing Cross Co. were installing oil engines in one of their sub-stations, to the value of £30,000, and the total costs per unit were 0·39d., against 0·48d., which was the estimate of the promoters of the previous Bill.

An important feature of the Bill was the purchase clause, which proposed a modification of the existing legislation as it affects the companies. The clause in question provided for the London County Council or any public authority authorised by Parliament to purchase the undertaking of all the electric supply companies in London, either in 1932, the present date of purchase, or in 1952, i.e., 42 years from January 1st, 1910. The terms of purchase were to be the redemption of the Joint Committee guaranteed stock, minus the sinking fund, and if the 42 years were allowed they believed the sinking fund would probably be equal to, at any rate, the £1,000,000 sought under the Bill, so that should this be the case, the purchasing authority would get the £1,000,000 undertaking for nothing. The sinking fund was made absolutely compulsory upon the Joint Committee. If the purchase took place in 1932, the purchasing authority had to give compensation to the Joint Committee for the loss as between 1932 and 1952. The amount of compensation in the event of purchase in 1932 would be determined by arbitration. These terms, however, applied only to the Joint

Digitized by Google

Committee's undertaking, leaving the undertakings of the Electric Lighting Companies purchasable under the terms of the Electric Lighting Acts. Another point in the purchase clause was that whereas certain parts of the undertakings of some of the existing companies were not purchasable, such as the Willesden Station of the Metropolitan Co., it was now proposed to make the whole of the undertakings of all the London companies purchasable. It should also be pointed out that any generating station transferred to the Joint Committee would cease to be the property of the electric lighting company. Powers were also taken in the Bill to supply electrical energy for use outside the area, and another clause revised the maximum price in all the electric lighting orders in London to persons requiring power. Probably some of the local authorities would object to this, but there was no Kitson clause in the Bill, as it was not applicable to the scheme, and it was thought that this would be a protection to the consumer. As he had already pointed out, the scheme aimed at utilising to the full capital already expended, and he asked that some consideration should be given to the company who had carried out pioneer work, if they were willing and in a position to do their duty to the public.

Mr. J. S. HIGHFIELD, Chief Engineer to the Metropolitan Electric Supply Co., and Joint Engineer with Mr. C. P. Sparks for the Bill, was called in support of the views expressed by Mr. Balfour Browne, and of the tables handed in. With regard to the decreasing rate of growth during recent years, he said that in 1907 the growth was 84·64 per cent. of the average of the previous three years. The falling off was mainly in light, but power users were steadily growing, and prices were steadily falling. Owing to the effects of metal filament lamps, a certain proportion of mains was thrown idle, and this would be taken up by the increasing power load. He did not think metal filament lamps had been used long enough to judge of their ultimate effects upon the supply business. A good deal, he said, had been made of the fact that London was behind in the matter of electric supply, but figures had been got out showing that the average size of the stations in London was larger than those in the provinces. The process which would be followed out by the Joint Committee would be first to utilise the existing spare plant; secondly, to erect additional plant in the existing buildings; and, thirdly, to erect new buildings and plant on the existing sites. This latter would give a capacity as stated by counsel, and beyond that he did not think it wise to go for the moment. The estimates, already given, so far as the existing companies were concerned, had been worked out after consultation with the engineers of the various companies. There was considerable doubt as to the type of plant that would be used in the future. Gas engines were now being largely used, and for the solid portion of the load these would show more economical working. On peak loads the cost of coal was not such an important item as at other times, and it was for the day load that gas engines would undoubtedly find a field. He illustrated the economy of gas engines by saying that whereas the lowest quantity of coal used was 2·5 lb. per unit generated, the equivalent in a gas engine was 1·7 lb., whilst there was a further saving in the value of the by-products, which he placed at 7s. 5d. per ton, so that, taking coal at 11s. per ton, the cost of the fuel would be reduced to 3s. 7d. per ton by the use of gas engines. As a matter of fact, in the estimates he had provided for 12,000 kilowatts of gas-driven plant, and the figures had been arrived at after consultation with the chief engineer of the Kastner Kellner Alkali Co., which company had replaced the whole of their extremely economical steam plant by gas engines.

Cross-examination was commenced by Mr. BLENNERHASSETT, K.C., on behalf of the Westminster City Council, in reply to whom Mr. Highfield agreed that the priniciple of giving a bulk supply was the same under this Bill as in the last Bill, although the companies had opposed it.

Mr. RIGG, K.C., for the City Corporation, asked what the object of the Bill really was, as the advisers to the City had not been able to make it out. He said that the case for the companies against the other Bill was that the public were quite satisfied now, and that the companies were doing the best that could possibly be done, yet the present proposal was to supply cheaper than at present. Was not the object of the Bill merely to keep out competition? Mr. Highfield replied that the object of the Bill was to give a cheaper supply, and, in reply to further questions, as to laying mains in the City, he stated that the plans which had been prepared of the routes for the mains showed that the City had been carefully avoided. Another question by Mr. Rigg was that there was no provision in the Bill for a reduction in the price to lighting consumers, but cross-examination on these points of policy was deferred for a later witness.

Mr. WILLIAMS, for the Stepney Borough Council, put it to Mr. Highfield that the companies had consistently opposed power Bills for the reason that competition should not be allowed, yet this Bill proposed to compete with existing authorities in the supply to docks, railways, &c. Was Mr. Highfield willing to make it quite clear that, so far as railways were concerned, the supply should only be for haulage and not for lighting stations. The Chairman, however, ruled that this question again came within the category of policy, and it was left over.

Mr. TALBOT, K.C., cross-examining on behalf of the promoters of the London and District Electric Power Bill, had some difficulty in getting Mr. Highfield to admit that both sides were agreed as to the necessity of giving a bulk supply to the authorised distributors, although the companies had argued to the contrary in their case against his Bill. After one or two members of the Committee, however, had expressed their opinion that this must be so, Mr. Highfield agreed that his Bill provided for a bulk supply to the authorised distributors, and to that extent the principle was the same, but the methods of carrying it out were entirely different. Mr. Talbot then asked Mr. Highfield if he had considered the machinery by which the scheme was to be put into operation, and suggested that as every member of the Joint Committee could refer every single matter to arbitration, it was not a very efficient scheme. Mr. Highfield did not agree, and stated that no difficulty would exist if a standing arbitrator were appointed. Another point brought out by Mr. Talbot was that although a considerable area outside the County of London had been scheduled in the Bill, the greater portion of it was in the areas of other bulk supply companies, and under the Bill the consent of these companies had to be obtained before any supply could be given. Consequently the scheme of the Bill practically dealt only with the County of London. Mr. Highfield replied that the promoters of this Bill did not believe in competition between bulk supply companies, and consequently the clause giving the other bulk companies the veto had been inserted. Mr. Talbot next dealt with the estimated costs referred to by Mr. Balfour Browne of giving a supply of 25,000 kw., and pointed out that if Mr. Highfield was correct, the London and District Company could never hope to compete with the existing companies. Mr. Highfield agreed that he believed a new power company would have no chance against the existing companies, whereupon Mr. Talbot asked why so much money and time had been spent opposing their Bill on the ground of competition? Mr. Talbot next dealt with the maximum prices in the Bill, and pointed out that there was a very large margin between the estimated costs under the Bill and the maximum prices.

The Committee adjourned.

In our account of the proceedings last week, Mr. Seale, Secretary of the Charing Cross, West End & City Electricity Supply Co., is reported to have said that since Mr. Merz introduced his first Bill in 1905, depreciation in the value of the companies' securities amounted to no less than £186,000. This is not quite accurate. What Mr. Seale actually stated was that the depreciation of £186,000 in the securities of the various London electric supply companies had occurred since the present Committee commenced their sittings this year. Previous to that there had actually been a depreciation of nearly £4,000,000 since the introduction of Mr. Merz's first Bill.

LOCAL NOTES

ABERDEEN: *New Telephone Exchange.*—Considerable progress is being made with the National Telephone Exchange in Aberdeen, which has been designed by Mr. Leonard Stokes, of Westminster. The main features of the façade are three large semi-circular arches forming the windows of the ground floor. The switch-room is on the second floor, the ground floor being partly occupied by the battery room. The switchroom is 47 ft. 6 in. by 36 ft., the lighting being by a large cupola above the flat roof, measuring 37ft. in length, and 18ft. in breadth. Adjoining the switch-room there will be an operator's instruction school. The basement will be used for the purpose of accommodating stores and the cable subway.

Electricity Works' Outing.—The staff of the electricity works had their annual outing last week to Ballater.

ARBROATH: *Electric Lighting.*—A commencement has been made with the laying of cables by the Arbroath Electric Light & Power Co., and it is anticipated that a supply will be given by the middle of next month.

AUSTRALIA: *Sydney—Electric Lighting.*—Final arrangements have now been made by the City Council for the taking over the business of the Stroud Electric Light & Power Co., and instructions have been given for the preparation of the agreement. The estimated annual business of the Strand Co., says the *Australian Mining Standard*, is 1,250,000 units, and the purchase money is fixed at £45,000. When this purchase is completed, the Council will have assumed control of virtually the whole of the electric light and power supply of the city, the Empire Co. having been already taken over. The business of the Arcadia Co. is also being acquired.

The Electric Lighting Committee are considering the installation of a storage battery at the Town Hall sub-station to help on the peak loads during the winter

Digitized by Google

of 1909. The engineer's report for the year 1907 states that during that year, the third year of working, the Council sold over six million units, and that the average price per unit received during 1907 was 2·14 pence. A reduction in the present charges for current for lighting purposes is being considered. The Lighting Committee have recommended the Council to take over the business of the Oxford Street Electric Light Co., at a price of £13,500, exclusive of machinery, &c. (the annual output of this plant is about 350,000 units). The company, which originally offered the business to the Council for £17,570, have accepted the lower figure.

BATH: *Sale of Electrical Undertaking.*—In connection with the proposal to lease the Corporation's electrical undertaking to the Somerset and District Electric Power Co., an offer has also been received from the Bath Electric Tramways Co., by which the two undertakings would be worked in conjunction with each other.

BARROW-IN-FURNESS: *Electricity Accounts.*—In the annual report of the Electricity Committee, it is stated that the capital expenditure during the year was £2,027, making a total of £110,872. The revenue account increased by £745, but the costs have increased by £1,080, with the result that the gross profit has gone down from £6,437 to £5,988. The capital charges for the year were somewhat heavier than usual, and there is a loss of £791 compared with the profit last year of £33. The greater portion of the deficit is attributed to the increased cost of coal, whilst there has also been a smaller relative increase in the consumption, owing to the use of metal filament lamps. There has been a large increase during the year in the consumption for power and heating, the number of units having increased from 128,000 to 221,000.

BECKENHAM: *Street Lighting.*—It is announced that the Beckenham Council have decided, as the outcome of experiments with metal filament lamps for street lighting, to change over the whole of the street lighting from gas to electricity, and have given notice to the two gas companies supplying the district to that effect.

BEXLEY: *Tramways.*—The Urban District Council has sealed a conveyance and transfer of the tramway in High Street, Plumstead, to the London County Council. At the last meeting of the District Council, the Clerk explained that if there was no delay it should be possible to run the trams through the Beresford Square in the course of three weeks. Negotiations are progressing between the Council and the Erith authority upon the subject of the proposed inter-running of the tramway systems of the two bodies.

BRIGHTON: *Tramways.*—Messrs. Stephen Sellon & Partners, consulting engineers, of London, have placed a proposal before the Brighton Corporation for running a service of trams from Kemp Town through St. James's Street, North Street, and Western Road to Worthing. The Tramways Committee have considered the proposal, and recommend the Council to authorise them to negotiate with the promoters and to report further. The promoters are prepared to consider an arrangement by which the undertaking within Brighton should fall into the hands of the Corporation at the end of 35 or 42 years without consideration. A rental of £2,500 per annum is offered.

Tramway Accounts.—The report of the Manager of the Municipal Tramways, Mr. William Marsh, states that the total revenue for the year to March 31st, 1908, amounted to £47,200, as against £50,652 last year, showing a decrease of £3,452. The working expenses for the year amounted to £34,559, as against £34,499. The net result of the year's operation shows a loss of £969, against a profit of £2,410 last year. Although he regrets that the gross profit was not sufficient to meet all the statutory capital charges, the Manager points out that the average return on the whole capital invested amounted to £4 15s. 10d. per cent., a result only attained by a very few tramway companies as distinct from municipalities. The number of passengers carried during the year amounted to 9,945,574, a decrease of 813,736 on the previous year's total, but the average fare received has remained the same—namely, 1·09d. The report states that the permanent way continues to be a heavy drain on the financial resources of the undertaking, and there is no prospect of the load being lightened, but rather the reverse, the wood paving being the chief item. In the early part of the year the rail joints in Gloucester Place and Marlborough Place were welded by the "Thermit" process as an experiment. The result has been that the cars make considerably less noise than they did formerly, but, owing to the rails being in unbroken lengths, the earth tremors of a passing car are transmitted over a longer length of track than was the case before, causing the wood paving blocks to rise more than they did. This disadvantage will be provided against in all future work by anchoring the rails down every seven or eight feet. The cost of welding the joints with all the necessary work which it involves is so high that it cannot be carried out on an extensive scale on the old track, but it should receive serious consideration in connection with extensions. The overhead line and underground cables give less trouble than any other part of the system, the cost of maintaining the cables only amounting to a few shillings a year. With regard to the price paid for current, Mr. Marsh points out that the Tramways Committee are at present paying £1,638 per annum more than ought, in his opinion, to be paid. It is almost hopeless, he says, to try and make the tramways pay their way so long as this overcharge continues.

BRYNMAWR: *Provisional Order Revoked.*—The Board of Trade has revoked the Electric Lighting Provisional Order granted in 1904.

BUENOS AIRES: *Tramway Amalgamation.*—The municipality has consented to the incorporation by the Anglo-Argentine Tramways Co. of the other tramway undertakings in the town. The arrangement has already received the sanction of the shareholders.

Electric Lighting Statistics.—The German Electric Light Co., says the *Review of the River Plate*, have presented the Municipality with plans and descriptions of the various lands, machinery, cables, &c., the property of the company. There are four power stations, having a capacity of 29,490 kw.; 17 substations, 10 of which are installed at tramway company's buildings, the converters being capable of dealing with 13,600 kilowatts, whilst the existing six batteries have a capacity of 11,976 ampere hours. The length of the cables is 1,671.868 metres; distributing boxes number 1,696, and there are 19.964 meters. There are also 100 transformer stations, capable of dealing with 10,323 kw.

CARDIFF: *Electricity Supply.*—The Corporation have been granted permission to supply electrical energy on the Bute property, and one of the first customers is the Hills Dry Dock Co., whose demand, the Chairman of the Electricity Committee stated last week, will be anything from 800 to 2,000 h.p.

CARLISLE: *Station Superintendent.*—A station superintendent is to be appointed at a salary of £130 per annum.

COLCHESTER: *Vibration from Electricity Works.*—The Town Clerk has been served with a writ by Messrs. Hollington Bros., alleging vibration from the electricity works, and the Council is to defend the action. The Town Council has considered a special report by Messrs. Lacey, Sillar & Leigh with reference to the provision of a new generating station upon a site near the sewage outfall works. The Electricity Committee recommended that Messrs. Lacey, Sillar & Leigh be retained as consulting engineers for the proposed generating station, but when the matter came up for discussion in the Council, the opinion was expressed that other firms of consulting engineers should be considered in conjunction with Messrs. Lacey, Sillar and Leigh, and an amendment was moved referring the Committee's recommendation back.

COVENTRY: *Electricity Account.*—The Corporation electricity undertaking has yielded a net profit on the past year's trading, after paying capital charges, of £5,647 4s. 6d. It is proposed to hand over a thousand pounds in relief of the rates, and to carry the remainder to the reserve fund. Last year the profits were £5,114 14s. 1d., and in 1906 £2,339 11s. 6d., whilst in 1905 there was a loss of £228 13s. 2½d., but a profit in 1904 of £775 11s. 6½d. Up to the last-mentioned year there had been losses annually on the undertaking since its commencement in 1896.

CROMPTON: *Provisional Order Revoked.*—The Board of Trade has revoked the Electric Lighting Provisional Order granted in 1901.

CROYDON: *Telegraph Wires.*—An application has been received from the Postmaster-General for permission to attach telegraph wires to certain tramway poles, and the Tramways Committee recommend that an agreement be entered into upon the payment of a nominal rent, the agreement to obtain such clauses and conditions as the Town Clerk may consider necessary for safeguarding the interests of the Corporation.

DARWEN: *Tramwaymen's Holidays.*—The Amalgamated Association of Tramway and Vehicle Workers has communicated with the General Purposes Committee asking for a week's holiday a year, with pay, for drivers, conductors, and shed men, but the application is not to be entertained.

DUMBARTON: *New Tramways.*—The tramway system from Dalmuir to Balloch is complete, with the exception of a gap of about 100 yards at Old Kirkpatrick. The Board of Trade inspection was held yesterday. The whole new route is about eleven miles, and when complete it will be possible to travel all the way from Glasgow to Loch Lomond by tramcar.

DUNDEE: *University College.*—Plans for a new electrical engineering laboratory at the University College have been approved by the Corporation.

EALING: *Lighting and Tramways.*—At the meeting of the Town Council on June 11th, the Town Clerk was directed to take proceedings under the Gas Works Clauses Act, 1847 (with which the Electric Light Acts are incorporated), to recover penalties against a Mr. Gibbons in respect of the distribution by him to Messrs. Lipton, Ltd., of electricity supplied by the Corporation. The Commissioner of Police wrote with reference to the noise of the trams, that inspections were proceeding, and an account of them would be sent as soon as possible. So far the noise had been found to be due to the condition of the track rather than of the cars. The Town Clerk said he had forwarded to the Commissioner the numbers of certain cars which were particularly noisy. The Mayor, Town Clerk, and Borough Surveyor were requested to see Mr. Nield, M.P., with a view to his calling the attention of the House of Commons to the matter. Mr. W. Ottway gave notice that at the next meeting he would move that the centre tramway standards be removed. He said he knew it was rather a tall order.

Digitized by Google

EASTBOURNE: *Electric Lighting Accounts.*—The report of the Borough Electrical Engineer, Mr. J. K. Brydges, for the year ended March 31st, 1908, states that the number of lamps, including 96 public arc lamps and six double-lamp metal filament lamps, and 99 motors connected to the mains, were the equivalent of 99,248 of 8 candle-power, and the number of consumers 1,285, the corresponding figures for last year being 90,506 and 1,175. The results are as follows:—Units sold for private lighting, 983,365, as against 904,029, an increase of 9 per cent.; and for power, 84,505, as against 72,172, an increase of 17 per cent., the increases for the previous year being 12 per cent. and 51 per cent. respectively. The increase in the number of units sold for lighting is slightly less than for last year, probably owing to the largely extended use of metal filament lamps. A total of 280 h.p. of motors is now connected to the mains, which may be considered a satisfactory motor load in a non-industrial seaside town. There are now 52 miles of feeder, distributor, and arc lamp cables laid. The report makes a reference to the proposed Home Office regulations, dealing with the supply of electricity. These regulations, however, it is not anticipated, will seriously affect the Eastbourne undertaking, though small alterations will probably have to be made to some of the sub-stations. The total income was £24,696, and the expenditure £12,109. Deducting capital charges, there is a net profit of £2,214, compared with £1,567 last year. It is recommended that the sum of £2,000 be allocated to depreciation, bringing this fund up to £9,150. The total costs for the year were 2·11d. per unit, compared with 1·98d. for the previous year, and the average revenue was 4·49d. per unit, against 4·55 in 1907. The maximum load was 1,056 kw., and the load factor 13·55 per cent., the corresponding figures for the previous year being 972 and 13·43 respectively. The Borough Accountant reports that he is now engaged on a report dealing with the depreciation of mains, plant, &c., which will show whether the depreciation and reserve fund of the undertaking is adequate or otherwise.

ECCLES: *Manchester Exhibition.*—At the meeting of the Town Council last week, some objection was taken to the subscription of £10 which has been made to the Manchester Electrical Exhibition, but as the resolution to subscribe was passed some time ago, it was ruled that the matter could not again be discussed.

EPSOM: *Electricity Statistics.*—A statement was presented at the last meeting of the Urban Council showing that the receipts for the half-year ended March 31st totalled £2,238, being £39 below the estimates. There was about £100 to be collected for private lighting. The expenditure for the period was £1,447, being £168 above the estimates. The explanation given for this excess was that there were 85 tons of coal in hand on March 31st, and £44 for new batteries and £26 for flues were items expended during the half-year which were not provided for in the estimates.

HANDSWORTH: *Tramways.*—The Tramways Committee have issued a report giving the results of the recent negotiations with the Birmingham and Midland Tramways Co., respecting the through running of cars. It had been agreed that the fare from Birmingham to Perry Bar should be 2½d., of which the City of Birmingham Tramways Committee should take 1d. and the Tramways Co. and the Handsworth Council should equally divide the remainder. A condition of the agreement was that the Handsworth Council should purchase the Villa Road lines at once, reconstruct them, and give the company running powers. When the draft agreement was submitted to the Tramways Co., however, certain alterations were made, to which the Committee felt it impossible to agree, and they therefore recommend the Council to decline to accede to the terms demanded by the company, which give the latter running powers over other lines not originally contemplated. The general result is that the suggested running powers will not now be granted.

HEMSWORTH: *Electric Lighting Order.*—The Board of Trade has notified the Urban District Council that they propose to revoke the Hemsworth Electric Lighting Order, as the company concerned cannot give the Board a satisfactory deposit.

HULL: *Telephone System.*—At a meeting of the Council of the Hull and District Chamber of Trades last week, it was resolved to forward to the Corporation a resolution of congratulation upon the results of the municipal telephone system, the accounts for which have just been published (ELECTRICAL ENGINEERING, June 11th, 1908, p. 878).

INDIA: *Delhi Tramways.*—The Delhi Electric Tramways and Lighting Co. has just opened its tramway service.

LANCASHIRE: *Coal Supplies.*—We understand that certain municipal Electricity Committees in central and south-east Lancashire are arranging for supplies of coal from Staffordshire and other Midland coalfields. It is said that the prices asked for Midland coal are lower than those asked by Lancashire colliery proprietors and merchants.

LIVERPOOL: *Tramways.*—The Tramways Committee has decided to experiment with running a service on the principal tramway routes for first-class passengers only. This change is the outcome of complaints that coal-heavers and other workmen travel in the ordinary cars.

LONDON: *London County Council—Forest Hill Tramways.*—A meeting was held last week by the four local associations who have been identified with the agitation for urging the County Council to construct tramways in the Honor Oak Park and Brockley district. It was pointed out that these trams were authorised four years ago, and an open-air demonstration is to be held next month with the object of inducing the County Council to include the lines in their programme of tramway construction next year.

Islington.—The Highways Committee of the London County Council has written to the Borough Council calling attention to the fact that the electric lighting mains beneath Seven Sisters Road and Caledonian Road have been laid at such a depth as to make it necessary to lower them when reconstructing the tramways. The Highways Committee remarked that the Borough Council, as electric lighting authority, did not appear to have given notice to the L.C.C., as required, of their intention to lay certain of these mains. A considerable expense had to be incurred in lowering the mains, and the Committee asked, in view of the correspondence on the subject in 1905, that in future the Borough Council would acquaint the central authority of electric lighting works proposed to be undertaken. The latter is under consideration by the Borough Electric Lighting Committee.

Lambeth: South London Supply Co.'s Accounts.—Messrs. Price, Waterhouse & Co., Board of Trade auditors, in their report upon the accounts of the South London Electric Supply Corporation, Ltd., for the year ended December 31st, 1907, point out that the directors' fees, amounting to £2,275, charged to capital in 1900, still remain to the debit of that account. The expenses of flotation, previously described by the official auditor as an unrealisable asset, continue in the balance sheet, as at December, 1906, at £29,289. This sum, together with the book value of discarded plant and the costs of the action against Lambeth Borough Council, will be extinguished in connection with the reduction of the company's capital by £65,000. After allowing for renewals charged to depreciation fund account during the year, that fund has been increased by £1,871 to £25,475, and the auditors do not feel justified in referring to the fund as inadequate. The capital expenditure during 1907 was £13,559, including siding to railway, £3,094, and mains, £6,580. The auditors do not object to a proportion of the salaries of the company's permanent officials, amounting to £941, being charged to capital account, in respect of time allotted to capital purposes.

Marylebone.—In compliance with a request from the authorities of the Middlesex Hospital the supply to that institution will be at the current rates as from the end of the present quarter, but the allowance of £60 per annum for transformer losses will be discontinued. A gratuity of £19 is to be distributed amongst certain members of the clerical staff who have been working overtime. The Works Department complain that a pipe was laid by the Electricity Department under the kerb in High Street, St. John's Wood, against the protest of the Acting Surveyor that it should be laid in the carriageway. The Electricity Supply Committee have been requested to instruct their officers to adhere to the regulations in this respect.

Wandsworth: Tramway Extensions.—Some pressure is being brought to bear upon the Borough Council by local influence in connection with the construction of tramways down the Wandsworth Road. It appears that some difference has arisen between the London County Council and the Borough Council with regard to street widenings, to the cost of which the latter have fixed the limit of their contribution at £3,500. The views of the inhabitants have been placed before the Mayor and the Borough Council, who will report to the Highways Committee of the Council.

St. Pancras.—During the quarter ended March, 383,939 units were sold for power purposes, as compared with 292,921 in the corresponding period of 1907. For lighting 1,768,137 units were sold for £19,573, against 1,597,750 and £18,225 respectively in the March quarter, 1907. The units supplied for public purposes were 663,454, producing £4,491. The total number of units supplied for all purposes was 2,431,591, against 2,220,247 in 1907, and the total value was £24,072, against £22,460 last year. The number of consumers at the end of the quarter was 2,934, an increase of 13 on the figures for the previous March. The maximum demand during the quarter was 6,478 i.h.p., against 6,136 i.h.p. last year. The bad and doubtful debts for year ended March 31st last amount to £165 6s. 1d., equivalent to 0·21 per cent. of the accounts rendered. The Electricity Committee has decided in favour of the Council's undertaking wiring and fitting of consumers' premises. With the new machinery in course of erection at King's Road generating station, the Committee point out that there will be a large margin of power available for utilisation, and by making arrangements whereby consumers' premises can be wired under the supervision of the Council, the full benefit of the plant and machinery may be obtained. The Committee wish to make it clear that they do not suggest that the Council should carry out the wiring by the staff of the electricity department, but that the work should be let out to contract, under competition, for stated periods, at an accepted schedule of prices. The following clause, which has never been enforced, is to be deleted from the conditions of contract with power consumers:—"Provided always that in consequence of the special price charged, viz., 1d. per unit, the Council are at liberty to discontinue the supply of current each day at any time upon notice being given to the consumer that the current is required by the Council's ordinary consumers for

Digitized by Google

lighting purposes; for the carrying out of any necessary repairs to the mains, plant, and machinery; further, in the event of any unforeseen accident or interruption of the supply, the Council will not be liable for loss or damage occasioned thereby." The Electricity Committee state that in each of the Bills for a bulk supply in London during the last few years a point has been made to the disadvantage of the Council by the promoters, that no large power user would take a supply with such a condition imposed. A water-measuring apparatus, capable of recording on a chart the quantity of water passing from the turbines, is to be purchased at a cost of £49. The instrument will indicate the steam consumption at all loads, and enable undue consumption of steam to be checked.

Stealing Telephone Wire.—A labourer named George Harris was sentenced to four months' hard labour at the West London Police Court on Thursday for stealing telephone wire belonging to the National Telephone Co., to the value of £5.

LOWESTOFT: *Free Wiring.*—With reference to the application of the Corporation for sanction to borrow £1,000 for free wiring, the Local Government Board has asked for details of the expenditure of the previous loan of £940 sanctioned for similar purposes. It has been decided to insure the free-wiring installations of the Council in the Sun Fire Office at a premium of 5s. per cent. up to £2,000.

LUTON: *Tramway Extensions.*—The Leagrave Parish Council, in the neighbourhood of Luton, has decided to ask the Corporation to extend its tramway system to that district.

MANCHESTER: *Tramway Extensions.*—A new tramway route was opened last week to Ardwick Green.

MARGAM: *Provisional Order.*—A letter has been received from the Board of Trade stating that, after careful investigation, they have decided to revoke the Provisional Order.

MUSSELBURGH: *Street Lighting.*—The Town Council has agreed to pay the overdue quarter's bill for public electric lighting, in view of the offer by the Musselburgh Electric Lighting & Traction Co., to install twenty new lamps.

Condition of Tramway Track.—It has been decided to write a letter to the Tramway Co. "in the strongest terms possible," calling attention to the dangerous state of the tramway track, and threatening to report the matter to the Board of Trade if no improvement is made within a week. The Town Clerk has been instructed to ascertain whether, under the agreement with the company, the Council can make repairs at the company's cost.

NEWCASTLE: *Tramway Accounts.*—The accounts of the Corporation tramways for the year ended March 31st, 1908, show that the working expenditure increased by £9,533. The total traffic receipts were £205,322, or 11·17d. per car mile, against £205,261 in the previous year, an average of 11·56d. per car mile. The total receipts for the year, including revenue from public lighting, &c., was £211,318, an average of 11·50d. per car mile, against £209,891, an average of 11·81d. per car mile for the previous year. There is a gross profit of £96,884, against £105,643 last year, from which has to be deducted sinking fund, interest, reserve, and renewals fund, &c. No contribution is made to the relief of rates this year, but last year the sum of £12,000 was so allocated.

RATHDOWN (IRELAND): *Supply from Greystones.*—At the meeting of the Rathdown Rural District Council last week, a letter was received from the Wicklow County Council stating that, in consequence of certain conditions under which they had granted to the Greystones Lighting Co., Ltd., provisional leave to carry on operations not having been complied with, the permit would be now absolutely withdrawn. In the absence of Dr. Archer, who is taking a great deal of interest in the lighting scheme, no action was taken by the Rathdown Council until he can be communicated with. This unexpected hitch has caused considerable comment.

SHEFFIELD: *Corporation Loan.*—The Corporation has issued £1,500,000 3½ per cent. stock at 97, of which loan £1,000,000 will be applied in repayment of existing temporary loans, and the balance is to be expended upon extensions of the tramways, electric lighting, and other municipal undertakings of the city.

SOUTHAMPTON: *Tramways.*—Application is to be made to Parliament next session for considerable extensions of the tramways.

STALYBRIDGE, &c.: *Tramway and Electricity Board.*—At the last monthly meeting of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board it was stated that the loss on the electrical portion of the scheme for last year was £463, but on the tramway section the loss was £10,322 against £8,199. The net result was a loss on the whole undertaking of £10,700 against £13,600 for the previous year, and the amount required from each of the four Corporations would be £2,711, or £705 less than last year.

Tramway Insurance.—It has been decided that the Chairman and Deputy-Chairman of the Tramways Committee be appointed to attend the conference *re* mutual insurance.

STEYNING: *Charges for Electricity.*—The Brighton Corporation, which supplies in Steyning, has notified the Council that, in consequence of the revised tariff recently put into force, the charge for lighting will be 4½d. per unit, and 2d. per unit for power, heating, and cooking, this price being a halfpenny per unit above the rates in Brighton. Objection is taken by the Council to this increase, and the suggestion has been made that a Provisional Order should be applied for. A resolution has been passed calling upon the Brighton Corporation to supply at the same price as in the Borough of Brighton as provided for in Clause 3 of the agreement.

STOCKPORT: *Electric Clocks.*—The inauguration of the system of electric clocks on the Palmer system at the Town Hall took place on Tuesday. In addition to the clock in the tower with four dials 6 ft. in diameter, there are 70 clock dials in the interior of the building.

TAUNTON: *Electricity Accounts.*—The accounts for the year to March 31st, 1908, show a net profit of £281 after meeting interest and sinking fund. The sum of £265 has been transferred to the motor-purchase fund, and the Electricity Committee report that the whole of the motors purchased for hire purposes have now been paid for out of revenue.

TWICKENHAM: *Tramway Speeds.*—At the last meeting of the District Council a resolution was passed that on three evenings, between six o'clock and midnight, steps be taken to ascertain the speed of tramcars travelling along Hampton Road and the Green. Councillor Ayland, who moved the recommendation, said he supposed that if it was found that the cars travelled at a greater speed than ten miles an hour the Council would take proceedings against the tramway company. Councillor Anderson complained that the track was getting worn, as also was the machinery of the cars, which were exceptionally heavy.

WADEBRIDGE: *Electric Lighting.*—An offer has been made by a syndicate with reference to an electrical installation in the town on the condition that no rival scheme be sanctioned by the Council. The proposal is to carry out a non-statutory scheme. The matter has been postponed for a month.

WOLVERHAMPTON: *Tramways.*—It was stated at a meeting of the Town Council on Monday that the net profit for the tramway department during the past year had been £2,112, all of which had been set aside to cover the cost of improvements and to pay off the deficit.

TENDERS INVITED AND PROSPECTIVE BUSINESS

ACCRINGTON.—A Local Government Board inquiry will be Dukinfield Joint Tramways and Electricity Board, for sanction to borrow £7,500 for the electricity undertaking.

AUSTRALIA: *Sydney.*—The Electric Lighting Committee are considering the installation of a storage battery with the necessary boosters and switchgear at the Town Hall sub-station.

Melbourne.—The Council invite tenders for the supply of 5,060 yards insulated copper cables. Specifications, &c., from Messrs. McIlwraith, McEachern & Co. Proprietary, Ltd., agents for the Council, Billiter Square Building, London, E.C., to whom tenders by July 3rd.

DARWEN.—Application is to be made to the Local Government Board for sanction to borrow £4,300 for mains, &c.

EPSOM.—The Council have decided to apply to the Local Government Board for sanction for a loan of £1,500 for extensions of mains.

GOVAN.—An application is to be made to the Secretary of Scotland for increased borrowing powers of £23,000 for probable expenditure upon the electrical undertaking during the next four years.

GRAVESEND.—The Electricity Committee invite tenders for the supply and erection of yellow-flame arc lamps, columns, &c. Particulars from the Electrical Engineer (fee two guineas, returnable), and tenders to the Town Clerk by June 27th.

HANDSWORTH.—An inquiry was held by Mr. Shelford Bidwell into the application to the Local Government Board for sanction of a loan amounting to £22,300 for the Electricity Department to cover £18,200 already spent on the generating station, and £3,100 for additional plant to meet the increasing load for the ensuing winter. £1,000 is also required for a scheme of free wiring in private residences. Mr. E. Ward, Clerk to the Council, in giving particulars, stated that the application for £18,200 practically amounted to cancelling certain old powers and acquiring new ones.

HANLEY.—The sanction of the Local Government Board has been given to a loan of £20,643 out of the amount of £21,969 applied for the Electricity Department.

HULL.—Loans are to be taken up from the Hull Savings Bank for electric lighting purposes to the extent of about £3,500 in connection with the electrical undertaking.

LONDON: *London County Council.*—The Council invite tenders for the manufacture and delivery of high-tension main switchgear and low-tension auxiliary switchgear for the Greenwich generating station. Particulars from the Clerk, fee £2, returnable, and tenders by July 7th.

Fulham.—The Guardians invite tenders for a vertical high-speed engine and a 20-kw. dynamo, both British made. Full

Digitized by Google

particulars from the Clerk, Guardians' Offices, 129 Fulham Palace Road, to whom tenders by July 2nd.

Islington.—Distributing mains are to be laid in three streets at an estimated cost of £320.

Stoke Newington.—The Electric Lighting Committee of the Borough Council has had under its notice a report by Messrs. Talbot & Stevenson, consulting engineers, advising the provision of a series booster in connection with the Palatine Road feeder, to remedy the present fluctuations of load on that feeder, and the consequent unsteadiness of the light in that neighbourhood during performances at the Stoke Newington Theatre. The estimated cost of the scheme is £410, and the committee has decided that tenders be obtained. An inquiry was held on Monday by Mr. H. R. Hooper, the Local Government Board Inspector, with reference to the proposed loan of £3,380 for erecting a generating station in connection with a dust destructor for the supply of electricity to the borough. Numerous objections were made on the ground of expense.

LOWESTOFT.—An inquiry was held last Friday by Mr. W. A. Ducat, of the Local Government Board, into a proposed loan of £1,661 for the electricity department, of which £1,000 is to be for free wiring, and the remainder for the provision of mechanical stokers to three of the boilers. There was no opposition to the application.

ROTHERHAM.—A Local Government Board inquiry has been held into the application for a loan of £300 for the purchase of a site upon which to erect a dust destructor station, and for £3,500 for extensions to the electricity undertaking.

STALYBRIDGE, &c., TRAMWAYS AND ELECTRICITY BOARD.—A Local Government Board inquiry has been held into an application by the Stalybridge, Hyde, Mossley, and Dukinfield Joint Tramways and Electricity Board, for sanction to borrow £25,223 for electric lighting purposes.

ST. ANNE'S-ON-SEA.—A feeder cable is required by the Council. Particulars from the Electrical Engineer (fee one guinea, returnable), and tenders to Town Clerk by June 27th.

SWEDEN.—H.M. Consul at Gothenburg (Mr. J. Duff) reports that tenders are invited for the supply of a 42-ton electric travelling crane, with the necessary bridge, required for the power-station of the "Kungliga Trollhatte Kanal och Vattenverk." Tenders, addressed to the "Kungliga Trollhatte Kanal och Vattenverk" by June 27th. A copy of the specification and drawings may be seen by British makers on application at the Commercial Intelligence Branch of the Board of Trade.

SWINDON.—At the last meeting of the Corporation, the Electrical Engineer drew attention to the fact that throughout last winter, and the same would occur again next winter, there was no reserve at the power station at times of heavy load. The Chairman of the Electricity Committee, in putting the matter before the Council, said that were he not Chairman, he would oppose the proposition to apply for sanction to borrow £8,000, and would recommend the Council to take the risk, whatever it was. Eventually the recommendation was referred back.

WALSALL.—A condenser and purifying plant is to be erected at the electricity works at a cost of £2,775.

WILLESDEN.—The Local Government Board has sanctioned the following loans for electricity purposes:—Additional plant, £2,931; meters, £1,166; services, £3,675; mains, £5,955.

WOLVERHAMPTON.—The Electricity Committee has submitted a scheme for the provision of two additional water-tube boilers, including draught and coal-conveying plant, at the electricity works, at an estimated cost of £6,000, and that applications be made to the Local Government Board for loan.

A 15,000 kw. Steam Generating Station in Japan.—A generating station is being built for supplying the town of Osaka, on the south coast of Nippon, with electric light and power. The town, which has over one million inhabitants, has up to the present been lighted exclusively with gas. The generating plant is to consist of five 3,000 kw. turbo-alternators running at 1,200 r.p.m., and generating three-phase current at 11,000 volts, 60 cycles. Five exciters, each of 38 kw. capacity, will be direct-coupled to the turbine sets.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—At the weekly meeting of the Tramways and Electrical Committee Sir Robert Anderson, Lord Mayor, presiding, the manager was authorised to have automatic point controllers fixed wherever necessary. The offer of Messrs. Munro, Brecknell & Rodgers to supply the same was accepted.

DUNEDIN (NEW ZEALAND).—As a result of the successful performance of Westinghouse magnetic brakes on the Dunedin, Wellington (N.Z.), Sydney, Bendigo, Ballarat, Fremantle, and East Fremantle tramways, Australia, the municipal authorities of Adelaide have just placed an order with the British Westinghouse Electric & Manufacturing Co., Ltd., for 120 magnetic brake equipments of their latest improved type, similar to those in use on all the London County Council tramcars.

FOLESHILL.—The tender for the electrical installation at the Isolation Hospital has been placed with the Electrical Trades Supply, Ltd.

LONDON: *Bermondsey.*—The Borough Council has accepted the tender of Messrs. Crompton & Co. for the supply of an arc lamp column, with double carbon arc lamp and lowering gear, at £26 13s. 3d., less 2½ per cent. discount. The British Insulated & Helsby Cables, Ltd., has agreed to guarantee cables to be supplied by them for two years, instead of one year, at an increase of 1 per cent. above the contract price.

Lambeth.—The General Purposes Committee, having considered quotations from the Town Hall Superintendent and from various firms for the installation of telephonic communication between the various departments in the new offices, has decided to purchase from the General Electric Co. the necessary materials and instruments, and by its own Town Hall staff to execute the work of installation. The Council on June 11th sanctioned an expenditure of £45 on the installation, exclusive of the cost of materials.

Marylebone.—The Electric Supply Committee of Marylebone Borough Council received 25 tenders for the annual supply of coal to the generating station. The engineers having carried out tests (taking into account both price and efficiency), the tender of W. Cory & Son, Ltd., has been provisionally accepted at the following prices:—

	Price per ton.	Quantity available in tons.	Size of coal in. in.
Tibshelf small nuts	13/9	10 000	1¼ by ⅝
Shipley nuts	14/2	12,500	1¼ ,, ⅝
Mapperley nuts	14/3	10,000	1¼ ,, ⅝
Digby High Hazel small nuts	14/2	5,000	2 ,, 1¼
Pinxton small nuts	14/2	10,000	1¼ ,, ⅝
Kingsbury D/S nuts	14/0	10,000	1¼ ,, ⅝
Kingsbury beans...	13/0	10,000	⅝ ,, 5/16
Griff peas	12/2	12,000 (if desired)	⅝ ,, 5/16
Nuneaton D/S nuts	13/5	10,000	1¼ ,, ⅝
Cowdenbeath nuts	14/6	20,000	1 ,, ½
Cowdenbeath peas	12/3	20,000	½ ,, ¼
Hillhouserigg singles... ...	14/6	20,000	1 ,, ½
Edinburgh peas	12/6	20,000	½ ,, ¼
Methley nuts	16/3	10,000	¼ ,, 5/16
Ackton Hall nuts	16/3	10,000	1½ ,, ⅝

The Baths Committee of the same Council has placed an order with Maple & Co. for supplying and fixing 11 new battery wall telephones for £10 18s.

MANCHESTER.—The tender of Messrs. James Howden & Co., of Glasgow, for a 6,000 kw. alternator driven by a Zoelly steam turbine has been recommended for acceptance by the Electricity Committee. (We give some technical particulars on page 915 of this issue.)

RANDFONTEIN ESTATES.—The *Financial Times* states that the central power station at the Randfontein Estates is being equipped with Parson's turbines and B. & W. boilers. The first section of the plant is reported to be nearing completion. The estimated capacity of the plant to deal with this group of mines is intended to be 10,000 kw., and transmission will be by underground cables.

WESTON-SUPER-MARE.—A tender has been entered into with the Weston-Super-Mare Electric Supply Co. for lighting Walliscote Road for a period of five years, with option to continue for a further five years on similar terms.

£10,000 Counterclaim.—In the Brighton County Court on Friday the National Telephone Co. brought an action against Colonel G. E. Gouraud, of 109 Marine Parade, Brighton, for £5 5s. 5d., in respect of telephone charges due. The Colonel entered a counterclaim for the sum of £10,000 on the following grounds:—(*a*) neglect of duty, (*b*) breach of contract, (*c*) pecuniary loss, (*d*) injury to health, (*e*) prolonging an already long and critical illness, (*f*) increasing expense of doctors, (*g*) unwarrantable and illegal disconnection of exchange service, and (*h*) making statements prejudicial to the credit and honour of the defendant. The hearing has been adjourned until July 3rd owing to the illness of the defendant.

Digitized by Google

COMPANIES' MEETINGS AND REPORTS

AFRICAN TRANSCONTINENTAL TELEGRAPH.—The annual general meeting was held in London on Monday, Mr. R. Maguire presiding. The Chairman stated that the prospects of direct telegraph communication between Cairo and the Cape appeared brighter at the present time than they had been. In view of the recent improvements in wireless telegraphy he thought it quite possible that the gap between the two sections of the line might be bridged by wireless telegraphy, in which event Cape Town and all the intervening stations would be directly connected with each other.

ALTRINCHAM ELECTRIC SUPPLY.—The report of the directors for the year ending December 31st, 1907, states that the business shows satisfactory progress. During the year 73 installations, representing 3,595 8-candle-power lamps have been connected to the mains; the total at the end of 1907 being 1,016 actual consumers with 57,673 equivalent 8-candle-power lamps. In progress there are 28 installations with 1,504 equivalent 8-candle-power lamps. After providing £1,821 2s. 8d. for interest on loans and debentures and adding £2,000 to reserve for depreciation, the net profit for the year is £2,132 5s. 5d., to which must be added the amount of £100 17s. 4d., brought forward from the previous year. The directors recommend that a dividend of 7 per cent. be declared on the shares, which will absorb the sum of £1,750, leaving a balance of £483 2s. 9d. to be carried forward, subject to provision for directors' fees.

ARON ELECTRICITY METER.—At the eleventh ordinary general meeting last Tuesday the report and accounts, referred to on page 907 of our last issue, were adopted. Mr. H. Hirst, who presided, said he had very little to add to the report, which showed a record six months in their history. He referred to the approval by the Board of Trade of their prepayment meter for alternating currents, and looked forward to a great increase in the method of metering now that, owing to the introduction of high efficiency metal filament lamps, electric lighting bid fair to become the poor man's illuminant as well as that of the rich. The success of the company's new taximeter for cabs was also mentioned.

BIRMINGHAM & MIDLAND TRAMWAYS.—At the annual general meeting held in London on Thursday, the report and accounts given in our last issue were adopted. Mr. C. S. B. Hilton, Chairman of the company, who presided, said that although the name of the company was the Birmingham & Midland Tramways Co., as a matter of fact they derived their income from three distinct sources, namely, from the tramways, from the electric supply, and from investments from subsidiary companies, which are controlled and worked by a joint committee. Having dealt with the general figures in the report, he pointed out that there was a tendency in very direction to endeavour to reduce the price of electrical energy, but the policy of the Board had been, and would be, to take no business that did not show a fair margin of profit. With regard to the motor-omnibus service, the results of this had been so unsatisfactory that in December last the directors decided to entirely discontinue it altogether, and only maintain those horse routes which were entirely free from competition from the municipal tramways, or which actually showed a profit on the work. The motor-omnibuses were now being used for pleasure traffic in various towns, for which purpose some of them had been sold. He regretted to say that so far no agreement had been arrived at respecting the lease of the lines from the Corporation of Dudley, the terms sought by the Corporation being so onerous that to accept them would probably mean in some instances that no dividend could be paid, and that in others the dividend would be reduced. The dividends paid by any of the companies interested was only 5 per cent., and the Board regarded it as inequitable that, in addition to paying interest and sinking fund on the purchase price, the local authorities should endeavour to extract a profit rental which would cripple the companies, and leave no fair return. In addition, the company was being continually asked to make the stages longer, to give halfpenny fares to children, and lower fares to workmen. So far they had been able to resist this pressure, and in some instances the fares had even been slightly raised, but the general result has only been to prevent a further drop in the average fare. The directors considered that the controlling interest which the company had acquired in the Shropshire and Worcestershire Power Co. would justify additional capital expenditure whenever it was required.

BRUSH ELECTRICAL ENGINEERING.—The nineteenth ordinary general meeting was held on Tuesday, and the report and accounts, abstracted on page 907 of our last issue, were adopted. Lord Vaux of Harrowden, who presided, characterised the output of the works for the year as a record, but said that the profits were disproportionate to the amount of work done owing to the excessively low prices at which business had to be undertaken owing chiefly to competition, labour troubles, and insufficiency of working capital. On account of the failure of a scheme put forward in January for providing further capital meeting the approval of the debenture-holders, a fresh scheme, involving the issue of £120,000 5 per cent. debentures, had been decided upon. A revival in the business of building tramcars was looked forward to. Criticism was offered by shareholders of the policy of the directors and the advisability of issuing new debentures, and in reply to a question it was pointed out that the consent of the existing debenture-holders to the new issue was not necessary. Mr. E. Jarke was elected to a seat on the board, and will act, for a time, as chairman, owing to the resignation of Lord Vaux. An extraordinary meeting was subsequently held, at which it was agreed to subdivide the 150,000 fully-paid non-cumulative 7 per cent. preference shares of £1 6s. 8d. each, and the 105,732 ordinary shares of a like amount into four fully-paid shares of 6s. 8d. each respectively.

BUENOS AYRES & BELGRANO ELECTRIC TRAMWAYS.—An extraordinary general meeting was held on Friday for the purpose of passing a winding-up resolution on the completion of the sale of the undertaking to La Compagnie Generale de Tramways de Buenos Ayres. The winding-up resolution provided that the sum of £7,500 be paid to the directors as additional remuneration for their special services in carrying out the sale, and £5,000 additional remuneration to the officers and servants of the company. Mr. J. Barber Glen proposed the resolution, which was carried unanimously. Mr. J. B. Concanon, Chairman of the company, who presided, thanked the shareholders for the support which the directors had been given, and mentioned that the only dissent to the sale and winding-up had come from a shareholder who held 50 shares.

MADRAS ELECTRIC SUPPLY.—At the annual general meeting on Wednesday last week, the report and accounts given in our issue for June 4th were adopted. Mr. A. Walrond, who presided, said that Messrs. Crompton & Co., the contractors for the generating plant, had practically finished all the machinery, but its delivery had been delayed by the backwardness of the building. This latter had been largely occasioned by the scarcity of bricks, it having been anticipated that the work would have been completed by the end of 1907. The company, having invested £20,000 in preferred ordinary shares of the Madras Electric Tramways Co., had obtained the contract to supply that concern with a guaranteed minimum of 1,000,000 units per annum.

MARKET DRAYTON ELECTRIC LIGHT & POWER.—The report for the year ending December 31st, 1907, shows that the company has again made progress, the total connections being increased from 8,772 to 9,470 equivalent eight c.p. lamps, and the revenue from sale of current being increased from £1,106 to £1,187. The profit on the year's working amounts to £425, which, with the balance brought forward from last year, gives a total of £836 to be dealt with. The directors have decided to carry forward £400 to the reserve for renewal fund account, and recommend that the balance of £436 be carried forward to the next account. At the meeting last week the report and accounts were adopted.

SHEERNESS & DISTRICT ELECTRIC POWER & TRACTION.—The report for the year ended December 31st, 1907, shows that the receipts from the light railways amounted to £3,160, and from the electricity supply to £3,228, making with sundry receipts, a total of £6,413. The expenses (including debenture and other interest) amounted to £6,713, leaving a loss on the year's working of £300. Adding this loss to the debit balance of £676 from last account, there is a debit of £976 to be carried forward. The capital expenditure at the end of the year amounted to £75,167. The balance to the credit of working account on the traction section has risen from £88 in 1906 to £656 in 1907, the improvement being largely due to a closer adaptation of the service on the light railways to the requirements of the district. Negotiations have taken place between the company and the promoters of a light railway of about a mile and a half in length, proposed to be constructed from a physical junction with the company's line at the Sheerness East terminus to the village of Minster, and the company has offered to supply the necessary electrical energy, and to work the proposed light railway on terms. The high price of coal during the twelvemonth under review materially increased the operating expenses. The additions to the power-house and extension of mains referred to in the last report are now in course of completion, but the benefit of these extensions will not be felt until the second half of the current year. The company has joined the British Electrical Federation, Ltd., formed by various electric traction and lighting companies, for the purpose of co-operation and joint action in matters of common interest. The number of units sold during the year was 260,C01, and the maximum demand upon the station was 326 kw. The mileage of light railways in operation has not been added to during the year, and represents 2·479 miles of routes, 2·254 miles being double track, and 0·225 miles single track. The number of passengers carried increased from 759,538 to 834,511, but the average receipts per passenger dropped from 0·98d. to 0·88d. At the meeting on Thursday, the report and accounts were adopted.

TRAMWAYS AND LIGHT RAILWAYS ESTATES.—The report for the year ended December 31st, 1907, shows a total revenue of £1,400 and expenses of £813. The directors recommend that £100 of the balance should be allocated to the reduction of goodwill account, and that a dividend of 3 per cent. per annum upon the ordinary shares be paid, leaving a balance of £186 to be carried forward.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted Tuesday night, was £59 10s. to £60 per ton (last week £59 5s. to £59 15s. per ton).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A meeting of the creditors of Henry Gorton, trading as H. Gorton & Co., Electrical Engineers, of 19 Grand Parade, Highgate, and 535 High Road, Tottenham, was held last week. Liabilities amount to £1,240, and the assets were expected to produce £1,060. A committee was appointed to investigate and report to the creditors.

Creditors of the St. Albans & District Electric Supply Co. are requested to send particulars of their claims to the liquidator, Mr. James McLeod, 101 Finsbury Pavement, London, E.C., by July 31st.

A meeting of the Electric Traction Construction and Equipment Co. will be held at 5 New Court, Lincoln's Inn, London, W.C., on July 21st, at 3 p.m., to hear the Liquidator's account of the winding-up.

MESSRS. J. H. HOLMES & CO.—The silver jubilee of J. H. Holmes & Co., Newcastle-on-Tyne (founded 1883), was celebrated on Saturday, the 6th inst., by the partners of the firm inviting their staff to an excursion on that day to "Glen Allen," the country house of Mr. J. H. Holmes (the founder of the firm), near Whittingham.

MESSRS. L. E. WILSON & CO.—In order to deal with increasing business in the Liverpool district, Messrs. L. E. Wilson & Co., of 20 Cross Street, Manchester, have decided to open a branch establishment at New York Buildings, 67 Stanley Street, Liverpool. Telephone: Central, 87; telegrams: "Telephony," Liverpool. They have also appointed Mr. F. L. Monkhouse, M.I.E.E. (late manager in Liverpool for the Walsall Electrical Co., Ltd.) as Managing Engineer.

THE LINOLITE CO.—A very successful outing of the staff of this company was held last Saturday. The party journeyed by rail to Clandon, and were accompanied by Mr. and Mrs. A. S. E. Ackermann and Mr. R. L. Matthews.

The Electric Railway Journal.—It was announced a few weeks ago that the McGraw Publishing Co., of New York, the proprietor of our well-known traction contemporary, the *Street Railway Journal*, and other periodicals, had purchased from the Wilson Co. the *Electric Railway Review*, formerly published at Chicago, with a view to the foundation of a consolidated periodical covering the entire field of electric traction. The first issue of the new form of the paper appeared under the title of the *Electric Railway Journal* on June 6th. Its external appearance resembles that of the *Street Railway Journal*, with the volume of which the numbering is consecutive, and the way in which the good points of both papers are combined in the contents augurs well for the success of the combined venture. The *Street Railway Journal* was started in November, 1884, at New York, as a monthly periodical, but was changed into a weekly paper in 1901. The younger member of the consolidation also appeared originally as monthly, under the title of the *Street Railway Review*, but since 1899 was issued during the conventions of the American Street Railway Association in a daily edition. In June, 1906, with a change in ownership, the title *Electric Railway Review* was adopted, and at the beginning of last year was changed from a monthly to a weekly paper.

Telegraph Traffic.—The cable between the Dardanelles and Constantinople is again in working order, repairs having been effected on the 10th inst. On the following day the cable between Djedda and Souakim, which ceased operating on June 9th, was also put in order. The *viâ* Fao and Hanekin routes have once more been in trouble, interruptions of the land lines having occurred between Alep and Bagdad, between Alep and Diarbekir, and between Sivas and Diarbekir, but they were both restored to working order on the 13th inst. On this day also the West India and Panama Telegraph Company successfully re-established telegraphic communication between Demerara and Trinidad, their cable-repairing steamer, the *Henry Holmes*, having repaired the cable between those two places. The question of a wireless system between these two British possessions, as a means of duplicating the submarine cable, does not appear to have advanced.

Extensions to the Cavendish Laboratory.—The new wing of the Cavendish Laboratory of Experimental Physics at Cambridge was opened by Lord Rayleigh, Chancellor of Cambridge University, on Tuesday in the presence of a large assembly. In his speech he referred to the five years he had himself spent as Cavendish Professor, and to the assistance rendered at the time of Drs. Garnett, Glazebrook, and Shaw, and others, especially in the work of evaluating the fundamental electrical units, and paid striking tribute to his distinguished successor, Prof. J. J. Thomson. The Cavendish Laboratory was opened on the same day of the year in 1874.

PARLIAMENTARY INTELLIGENCE

LONDON ELECTRIC POWER BILLS.—Our report of the proceedings before Lord Cromer's Committee of the London Electric Power Bill will be found on pages 937 to 939.

AUDIT OF ELECTRIC LIGHTING COMPANIES' ACCOUNTS.—In the House of Commons on Monday Mr. Chiozza Money asked the President of the Board of Trade if it had been decided in future to accept the audit of the electric lighting companies' own auditors as sufficient for a public audit of the Electric Lighting Acts. Mr. Churchill, in reply, stated that there had been some misapprehension as to the action taken by the Board of Trade in this matter. Official auditors were still appointed by the Board of Trade, and were especially instructed to direct their attention to the protection of the interests of the consumers and the possible purchasing authority. In all cases these official auditors were professional accountants, and in some cases were identical with the shareholders' auditors, an arrangement which avoided a certain amount of unnecessary duplication of work, though it might carry with it some possible disadvantages. But it had not been adopted in any case in which the local authority could purchase the undertaking upon the basis of capital expenditure. He would watch the present arrangements carefully in case any change should be necessary. (We discussed the whole question of the new policy of the Board of Trade with regard to audit in a long article in our issue for February 20th, page 281.)

RAILWAY ELECTRIFICATION.—Mr. Chiozza Money has given notice of the following question which he will address to the President of the Board of Trade on Tuesday next:—Whether his attention has been directed to the fact that the Prussian State Railways Administration is about to electrify some parts of its system; if, in the interests of British trade and locomotion, he can direct the attention of British railway companies to the fact; and if, in the event of British railway companies neglecting to avail themselves of electrical power, he will, in the public interest, introduce legislation to nationalise British railways in order to make them as efficient and as economical as those possessed by our greatest commercial rival.

PROGRESS OF ELECTRICAL BILLS.—The Central Ireland Electric Power Bill was read a third time in the House of Commons on Wednesday last week. The Bristol Tramways, Nottinghamshire & Derbyshire Tramways (No. 2), and the South Wales Electrical Power Distribution Bills, were read a second time on the same day.

MISCELLANEOUS CITY NOTES

ALUMINIUM CORPORATION.—According to the *Financial Times* the balance-sheet shows the following items:—Debit: issued capital, less calls in arrear, £285,830; creditors, £20,975; total, £306,805. Credit: property account, £86,140; construction and equipment of works at Dolgarrog and Wallsend to date, £100,455; contribution to cost of Wallsend electrical sub-station, &c., £6,200; expenditure on transmission line, £4,453; cash, £41,185; debtors, £1,333; stocks of material and aluminium, £3,808; expenses *re* Cowlyd Water Bill and Light Railway Order, £1,369; underwriting commission and preliminary expenses, £58,658; general expenditure during construction, less rents, &c., £2,606; other items, £598; total, £306,805.

ANGLO-ARGENTINE TRAMWAYS CO.—Applications have been invited for £565,000 four per cent. debenture stock at 92. The stock will be redeemable by purchase at not exceeding 102 and current interest, or by drawings at 102, by the operation of annual sinking fund, calculated to redeem the whole stock by June 30th, 1968. The company have a right to redeem the whole or any part of the stock at 102 at six months' notice after June 13th, 1918. The stock will be secured by a trust deed creating a floating charge on the undertaking of the company subject only to the existing 6 per cent. debenture stock.

BRITISH INSULATED & HELSBY CABLES.—The transfer books will be closed from the 17th to the 30th inst., both days inclusive, for the preparation of warrants for interest on the debenture stock. The warrants will be posted on the 30th inst.

BUENOS AYRES GRAND NATIONAL TRAMWAYS CO.—A final dividend of 2s. 6d. per share, less income tax, making 5 per cent. for the year to March 31st, 1908, has been recommended upon the 5 per cent. cumulative preference shares.

INTERNATIONAL ELECTRICITY CO. OF VIENNA.—The *Financial News* announces that a net profit of 2,555,000 kr. has been made and a dividend of 8 per cent. for the year declared.

LA COMPAGNIA DE GAS Y ELECTRICIDAD DE LA HABANA.—The numbers have been published of the 5 per cent. debentures which have been drawn for redemption at par on July 1st, at the office of Messrs. Greenwood & Co., 38 Austin Friars, E.C.

MELBOURNE TRAMWAY & OMNIBUS CO.—Cable advices have been received that a dividend at the rate of 15 per cent. per annum has been declared for the quarter ending 30th inst.

SAO PAULO TRAMWAY, LIGHT & POWER CO.—A quarterly dividend of 2¼ per cent. has been declared.

THE RECENT FIRE AT THE CLAPHAM COMMON STATION OF THE CITY AND SOUTH LONDON RAILWAY

MR. A. P. TROTTER, Electrical Adviser to the Board of Trade, has given the following report on the slight fire at the Clapham Common Station of the City and South London Railway, reported in our issue of May 28th last :—

I have the honour to report, for the information of the Board of Trade, the result of my inquiry into the accident that occurred on May 24th to an electric locomotive belonging to the City and South London Railway Company at the Clapham Common Station.

I visited the Stockwell Depôt of the City and South London Railway on May 25th, and inspected the locomotive which had been destroyed by fire. I was informed that the last train stopped at 11.40 p.m. on Saturday, 23rd, and that the electric current was shut down at 12.20 a.m. on Sunday morning. All the staff left the station, except the night watchman. He usually remains all night, but as the traffic does not begin until 11.30 a.m. on Sundays, he leaves at 3 a.m. on Sunday morning. He reports that he left everything in good order at that time. At about 7.30 a.m. smoke was seen coming out of the station and the fire brigade was called. The men had some difficulty with smoke on the stairs, and because they did not know the way. When they reached the platform there was less smoke, and they extinguished the burning locomotive.

There seems to be no evidence to show that the fire was due either directly or indirectly to the electric current, and it is impossible to connect it with any electrical cause.

It seems to have burned most fiercely at the corner where a cupboard stands, and at the opposite corner where there is a considerable collection of insulated cables. The contents, including controllers, and other machinery above the floor level were destroyed. A little woodwork remained not quite burned, and this was extinguished by the firemen. The amount of wood has been reduced in the newer locomotives. The carriage next to the locomotive was uninjured inside; the glass of the door was broken by heat, and the paint blistered.

If any servants of the company had been present when the fire first broke out, it could have been extinguished in a few minutes. But being allowed almost to burn itself out, it afforded an interesting and satisfactory test. The wooden platform showed no traces whatever, and the only signs that there had been a fire was a little smoke on the roof, split tiles, and the partial burning of a few feet of wood moulding round the advertisements. The complete escape of the carriage coupled to the locomotive is a point in favour of separate locomotives.

The cause may have been (1) a lighted match thrown down by a man just before leaving, or (2) the emergency oil lamp which may not have been extinguished, or (3) spontaneous firing of oily waste in the cupboard. No large amount of oily waste is kept on the locomotives, and spontaneous firing, I believe, does not occur with small quantities.

APPOINTMENTS AND PERSONAL NOTES

Messrs. Kennedy & Jenkin announce that they have taken into partnership Mr. John MacFarlane Kennedy and Mr. Sydney Bryan Donkin. The name of the firm remains unaltered.

After four and a half years' work as technical editor, Mr. W. Perren Maycock has severed his connection with the Westinghouse Companies' publishing department, and intends to take up a wider sphere of activities. Mr. Maycock, on leaving the Westinghouse works, was the recipient of a substantial cheque, subscribed for by no less than sixty of the chief members of the engineering and commercial staffs.

Mr. Lovick, late canvasser to the Stoke Newington Electricity Department, having been appointed to a similar position under the Fulham Borough Council, his arrangement with the Stoke Newington authority as a whole-time officer has been determined, and a new arrangement has been entered into whereby Mr. Lovick will devote a portion of his time only (during the evening), upon the same commission terms as heretofore, but without salary.

National Electric Light Association, Chicago Convention.—The total attendance at the thirty-first convention of the association, held in Chicago, on May 18th to 22nd, was 1,788, exceeding by 100 the attendance at Washington last year. An exhibition of electrical appliances was held in connection with the convention. The following are some of the Papers read before the convention :—"Distribution in Suburban Districts," by O. H. Lukes: "The Small Station and its Economical Operation," by J. T. Whittlesey and P. Spencer. Reports of various committees, including the "Progress Committee," the committee on the "Grounding of Secondaries," and another on the system of accounting for electric lighting companies. A Paper on "Some Observations on Photometric Precision," by Prof. A. E. Kennelly and S. E. Whiting, and others on "Low-pressure Steam Turbines," "Gas Engines," "Meters," and also three Papers relating to tungsten filament lamps. Abstracts of the more important of these Papers will appear shortly in our columns.

NEW COMPANIES

ETABLISSEMENTS SELBACH.—This company was registered on June 5th with a capital of £12,500 in £1 shares (5,000 preference) to carry on the business of contractors, designers, mechanical and electrical engineers, builders and proprietors of motor-cars, motor-boats, engines, carriages, and launches, &c., and to adopt an agreement with P. Piellat and O. C. Selbach. The subscribers are : O. C. Selbach, C. F. Davies, W. A. Dickinson, H. Carpmael, M. W. Thompson, M. Ludwig, C. C. Crowther. No initial public issue. The number of directors is not to be less than two, nor more than five; the first are O. C. Selbach (managing director), L. P. Piellat, C. F. Davis, and W. A. Dickinson. Qualification (except first directors), 250 shares. Remuneration as fixed by the company. Registered office : 77 Camomile Street Chambers, E.C.

C. LARKINS & CO.—This company was registered on June 4th with a capital of £1,500 in £1 shares (1,400 preference) to adopt an agreement with S. O. Hoad and F. P. Spicer for the acquisition of the business carried on by them at Bush Lane House, E.C., as "C. Larkins & Co.," and to carry on the business of electric and general engineers and contractors, builders, decorators, bank, office, and shop fitters, &c. The subscribers are : F. L. Spicer, R. T. Dalton, E. Adams, A. L. G. Distin, F. P. Spicer, S. O. Hoad, P. W. Ladcoat. No initial public issue. The number of directors is not to be less than two, nor more than 10; the first are S. O. Hoad and F. P. Spicer (both permanent; special qualification, 25 ordinary shares). Registered office : Bush Lane House, Bush Lane, Cannon Street, E.C.

LEEDS & BRADFORD DISTRICT ELECTRIC RAILWAYS.—This company was registered on June 5th with a capital of £60,000 in £1 shares (40,000 preference) to adopt an agreement with the Railway & Tramway Trust, Ltd., relating to the transfer to the company of the Morley & District Light Railway Order, 1901, &c., and to carry on the business of tramway, railway, omnibus, electric, steam, or other mechanical carriage and van proprietors, carriers of passengers and goods, electricians, electric, water, and gas engineers, suppliers of electricity, &c. The subscribers are : W. A. Hill, R. G. Cheshire, H. P. Dakin, E. Edwards, F. R. Mills, A. R. Warren, A. Northam. No initial public issue. The number of directors is not to be less than three, nor more than seven; the subscribers are to appoint the first. Qualification (except first directors), £200. Remuneration, £150 each per annum (chairman, £200).

McLAUGHLIN & BLAIR.—This company was registered in Dublin on June 12th with a capital of £5,000 in £1 shares, to acquire and carry on the business of plumbers' furnishers, electrical engineers, carried on by J. McLaughlin & W. Blair, as "MacLaughlin & Blair," at Belfast. The subscribers are : J. McLaughlin, W. Blair, W. R. Rawlinson, H. B. Brandon, W. J. Scott, H. A. McCann, W. J. McKerr. The number of directors is not to be less than two, nor more than five; the first are J. McLaughlin, W. Blair, and E. Lowden. Qualification, 100 shares. Registered offices : 20 Waring Street, Belfast.

MAGNETA TIME CO.—This company was registered on June 4th, with a capital of £30,000 in £1 shares, to take over the business and assets of manufacturers and installers of and dealers in synchronised time systems carried on by the Magneta Fabrick Electrische Uhren Actien Gesellschaft, of Zurich, at Millbank, London, and elsewhere (but only in the United Kingdom), as the "Magneta Co.," also to acquire for a certain period the services of A. R. Upward. The subscribers are A. R. Upward, F. Coveli, W. L. M. Benson, K. H. Young, W. H. Glendining, E. S. Saxton, and L. P. Turner. No initial public issue. The number of directors is not to be more than three; the first are A. R. Upward and one or two others to be nominated by the subscribers. Registered office : Millbank House, Millbank, London.

ORLING'S TELEGRAPH INSTRUMENTS SYNDICATE.—This company was registered on June 4th, with a capital of £1,500 in £1 shares, to acquire the benefit of certain provisional protections in respect of improvements in electro-capillary apparatus, for the transmission of a series of electric impulses along land lines or cables, and for improvements in cable telegraphy, to adopt an agreement with A. Orling, and to carry on the business of electrical and mechanical engineers, manufacturers of electrical and other apparatus, appliances, and machinery, &c. The subscribers are J. M. Horner, F. W. Burger, T. Inkersole, A. Orling, W. T. Moore, V. A. Wood, and E. Oldenburg. No initial public issue. Registered without articles of association by W. T. Moore, 24 Budge Row, E.C.

PREMIER ELECTRIC HEATERS.—This company was registered on June 4th, with a capital of £2,000 in £1 shares, to adopt an agreement with G. H. Collins and H. F. Collins for the acquisition of the business carried on as the "Premier Electric Heating Co.," and to carry on the business of manufacturers and sellers of electrically-heated appliances of all kinds, resistances for heaters, controllers, and regulators, &c. The subscribers are A. Barter, Mrs. E. Collins, A. J. Collins, W. T. Tonkin, G. H. Collins, E. Mackenzie, and H. F. Collins. No initial public issue. The number of directors is not to be less than two, nor more than seven; the first are G. H. Collins, H. F. Collins, and A. J. Collins. Qualification, £100. Registered office : Ashley Street, Birmingham.

ANNUAL PATENTS REPORT

THE twenty-fifth annual report of the Patent Office for the year 1907 has just been issued. The first few pages of the report are taken up by a digest of the Patents and Designs Act of 1907, the main contents of which were given on pages 434 to 436 of ELECTRICAL ENGINEERING, Vol. II. The alterations in Patent Office procedure consequent upon the Act, which came into force on January 1st, 1908, were outlined in our issue of January 2nd, 1908, page 5. The following is a summary of the report for the year 1907.

In dealing with the financial state of the Patent Office, the report says: The receipts from Patents Fees were £265,012, as compared with £255,646 in 1906, an increase of £9,366; from Designs Fees £5,473, as compared with £4,544, an increase of £1,129; and from Trade Marks Fees £18,447, as compared with £15,559, an increase of £2,888. The increase in Trade Marks Fees is due partly to the revised scale of fees which only came into operation in the course of the previous year, and partly to the large increase in the number of Trade Marks registered. The receipts from the sale of Patent Office publications (which are paid over to the Stationery Office) were £11,457, as compared with £10,593, an increase of £864. The total receipts were £300,389, as compared with £286,142, an increase of £14,247. The total expenditure on behalf of the Office amounted to £176,230, as compared with £175,272, an increase of £958. The payments for salaries and pensions exceeded those of the previous year by £10,000 and £1,000 respectively, while there was a saving of nearly £6,000 in the expenditure upon stationery, books, &c., a decrease of £1,000 in the amount paid for rent, &c., and of £3,000 in that for the Patent Office extension.

The number of letters and correspondence forms despatched from the Office in 1907 was 296,000, and the number of parcels of publications 95,000, as compared with 283,000 and 93,000 respectively in 1906. The staff of assistant examiners was increased during the year from 153 to 177, and the total number of persons employed in the Office was 619 in 1907, as compared with 572 in 1906. The number of readers who made use of the Library in 1907 was 148,198, as compared with 143,750 in 1906, an increase of 4,448 or 3·09 per cent., and the largest number recorded in any one year. The number of volumes added to the Library was 6,116, of which 1,227 were volumes of patent specifications or journals (English and foreign), and 351 were trade catalogues. The remaining 4,558 volumes were text books or periodical publications relating to scientific and technical subjects, and of these 3,527 were obtained by purchase, and 1,031 by donation. The number of works in the library at the end of the year was 35,449, and the approximate number of volumes (exclusive of duplicates) was 115,000.

Under the heading of "Patents," the following information is given: The sum received from renewal fees was £155,127, as compared with £149,142 in 1906, an increase of £5,935; and that from sealing fees was £16,071, as compared with £14,311, an increase of £1,760. The applications received in 1907 numbered 29,049, as compared with 30,030 in 1906, a decrease of 990 or 3·3 per cent. Of these applications 19,630 were accompanied by a provisional specification, and 9,410 by a complete specification. The applications accompanied by complete specifications continue to increase at a more rapid rate than those accompanied by provisional specifications. The proportion of the latter to the former was in 1885, 87 to 13; in 1895, 83 to 17; in 1905, 72 to 28; and in 1907, 68 to 32. The number of complete specifications filed after provisional specifications was 9,483. The total number of specifications received was 38,523, as compared with 39,268 in 1906, a decrease of 745, or 1·9 per cent. The largest number of applications received on any one day was 183—on June 29th, and the smallest 49—on January 5th. The applications received from women inventors numbered 560, as compared with 600 in 1906. There were 1,646 applications made by way of communication from abroad; of which 828 came from the United States of America, 453 from Germany, 70 from France, 38 from Switzerland, 30 from India, 29 from Canada, 27 from Austria-Hungary, 22 from Italy, and 22 from the Transvaal. The applications made in this country under the provisions of the International Convention of 1883 by inventors living in other States of the Union numbered 2,286, as against 2,044 in 1906. Of these, 819 were received from Germany, 587 from the United States, 548 from France, 91 from Sweden, 79 from Belgium, 56 from Italy, 47 from Switzerland, 26 from Norway, 17 from Denmark, 6 from New Zealand, 5 from Spain, 2 from Portugal, 2 from Australia, and 1 from Japan. None were received from Brazil, Ceylon, Cuba, Mexico, The Netherlands, San Domingo, Servia, or Tunis. The number of applications received from persons resident in England and Wales was 17,380 in 1907 as compared with 18,579 in 1906, a decrease of 6·5 per cent.; from Scotland 1,278, as compared with 1,307, a decrease of 2·2 per cent.; and from Ireland 349, as compared with 379, a decrease of nearly 8 per cent. As regards the Colonies, there was a decrease in the number of applications received from every State of the Australian Commonwealth except New South Wales, and also in those from Natal and Hong Kong. The number received from Canada was nearly the same as in 1906, while there was a small increase in those from New South Wales, New Zealand, Cape Colony, Orange River Colony, Rhodesia, the Transvaal, and India; and a more substantial increase in those from the West Indies. As regards foreign States, the numbers from Austria-Hungary, Holland, and Switzerland decreased; while those from Belgium, Denmark, France, Germany, Italy, Norway, Roumania, Sweden, China, Japan, and the United States increased. The foreign country which supplied the largest number of applications was again Germany, from which 3,541 applications were received in 1907 as compared with 3,253 in 1906. The numbers from the United States and France were respectively 3,104 and 1,042, as against 3,003 and 1,002 in the preceding year. The following gives the nationalities of the inventors to whom patents were granted during the last five years, the communicator of the invention being regarded as the patentee for this purpose:—Out of a total number of 16,272 patentees in 1907, 2,792 were resident in the United States of America, 2,608 in Germany, 753 in France, 299 in Austria-Hungary, 178 in Switzerland, 160 in Canada, 138 in Sweden, 128 in Belgium, and 112 in Italy.

Patents were sealed upon 16,300, or 54·2 per cent., of the applications made in the year 1906, and 525, or 4·3 per cent., of the patents sealed upon the applications made in the year 1894 were maintained for the full period of 14 years. The total number of patents which expired during the year was 14,470 and the total number of new patents sealed was 16,272. Thus the number of existing patents was increased during the year by 1,802. The names of 7 patent agents were added to the Register during the year, the total number on the Register on December 31st being 254.

A table in the appendix shows the progress of inventions from the year 1855 up to the end of 1906 in each of the 146 classes into which inventions are divided according to the official classification. The total number of complete specifications, which fell from 16,185 in 1904 to 15,459 in 1905, increased to 17,073 in 1906. The number of complete specifications relating to electric lamps, which was 329 in 1904, and 292 in 1905, rose to 370 in 1906. Specifications relating to telegraphy number 292, 293, and 294 in the same three years. The number of complete specifications under the heading of road vehicles increased from 257 in 1905 to 337 in 1906. Inventions relating to steam generators fell from 341 in 1904 to 259 in 1906.

The general trend of invention in matters of electrical interest during the year 1907 is summarised as follows:—The great inventive activity in connection with the motor-car industry, which has produced such a large number of applications for patents in recent years, now shows signs of falling off. Judging from the titles only, the number of inventions relating to motor road vehicles during the year 1907, although still large, has decreased nearly 35 per cent. from that of the previous year. The occurrence during the year of several serious railway accidents owing to the failure of signals has caused much attention to be given to automatic electrical systems of signalling, in which the services of signalmen are entirely dispensed with, and the signals are given on the engine itself instead of by means of the usual wayside devices. Several applications have also been made for stopping trains automatically when the signals are against them. The occurrence of accidents in lifts has directed the attention of inventors towards the improvement of devices for preventing a mine or lift cage from falling down the shaft in the event of its hoisting-cable breaking. A large increase is also observable in the subject of wireless telegraphy, and some attention was given to the transmission of portraits and designs by telegraphic means.

AN ELECTROLYTIC RECTIFIER

MANY users of motor-cars who have an electric supply available would be glad to use the same for charging their ignition cells if they felt they could do so with confidence and without danger of spoiling the accumulators. With direct current this can readily be accomplished by connecting the cells in series with an incandescent lamp, although it is not a very efficient method. With alternating current, some sort of converter is necessary in order to obtain a uni-directional current. The motor-generator, while fairly efficient at full load, has many drawbacks, not the least of which is its relatively great expense.

Electrolytic rectifiers have been in use to some extent for this purpose for some time. Such a cell in its simplest form consists of two electrodes immersed in an electrolyte, the combination being such that, through the chemical reactions, one electrode becomes covered with an insulating skin, which opposes the flow of the current in that direction. On placing such a cell on an alternating-current circuit, the currents in one direction will be stopped, but those in the opposite direction will be able to pass. This throttling effect is most marked when aluminium is used as one of the electrodes, the other element being usually carbon, lead, or iron. The electrolyte may be an acid, alkali, or a salt solution. The aluminium covers itself during formation with a thin skin, which weakens or throttles the positive current, and there is a certain maximum or critical voltage, partly depending upon the electrolyte, which

Digitized by Google

the aluminium will be able to stop. By connecting four cells in the manner suggested by L. Graetz, so as to provide two paths for the current, one only of which is open to the current at any moment, the two alternating waves are converted into uni-directional wave pulses. The pulsations may be smoothed out considerably, if desired, by the use of condensers or inductive resistances, but such additions are unnecessary when used for charging accumulators, as the insulating skin on the aluminium electrode prevents the cells discharging themselves through the rectifier while the voltage is below that of the cells. Herein is a great advantage over a motor-generator, which requires the addition of an automatic cut-out to disconnect the accumulators should the voltage drop from any cause. With a rectifier the cells may be left connected indefinitely without danger of discharging. Although the rectifier takes care of the current, it does not reduce the voltage of the supply. The most satisfactory and efficient way of doing this is to use some form of static transformer which can be wound to give any desired voltage to the rectified current. In order to reduce the initial cost of the apparatus, incandescent lamps are sometimes used as a resistance to absorb the excess voltage, but such a method is the most wasteful one that could be devised, and at best is only suitable for small currents.

The illustration shows an improved form of rectifier, the invention of S. W. Cuttriss, Leeds, and which is being manufactured by P. J. Pale, Dewsbury Road, Leeds. This arrangement has the advantage of only requiring one cell instead of four as hitherto used, and at the same time it utilises both semi-phases of the current. It is extremely simple in operation, and inexpensive to maintain. No acid is used, only an inexpensive salt (sodium phosphate), which does not give off any corrosive fumes, and has no action on the electrodes when not in use. By raising or lowering the aluminium electrodes, the current can be regulated within wide limits while the apparatus is in use. Ventilating chimneys are provided which prevent the electrolyte becoming unduly warm when in action. A special form of transformer has been designed for use with the cell, in which the circuits are so arranged that both currents always pass through the cell in the same direction. The transformer, which can be wound for any desired voltage on the direct-current side of from 2 to 50 volts, forms part of a complete switchboard, which also contains an ammeter, switch, fuse, and the necessary terminals. No additional apparatus is, therefore, required, and the current may be taken direct from a lamp-holder by means of an ordinary connector.

In addition to charging accumulators, such an apparatus may be used for working direct-current motors, medical appliances, arc lamps for optical lanterns, electrolysis, and any purpose where a direct current is required.

AUTOMATIC FIRE ALARMS

IN an article in the *Deutsche Bauzeitung*, Mr. Wendt, the State Inspector of Buildings in Berlin, describes two systems of automatic fire detection which are largely in use on the Continent. These are the automatic fire detector of Schöppe, Leipzig, and the "Dania" automatic fire detector of Tvermoes & Abrahamson, Copenhagen. An automatic fire-alarm system consists of the following parts:—The fire detector or thermostat, the system of wiring, and the alarm apparatus. The thermostats should be placed high up under the ceiling or roof near to doors, windows, lifts, and other ventilating channels, and there should be one detector for every room that is not larger than 30 ft. by 30 ft. and 12 ft. high. For larger rooms the number of detectors must be increased in proportion. In factories each division must be treated as a separate room and supplied with thermostats according to size. The thermostat in the Schöppe system consists of a bent spring or strip of metal fixed at each end to a cast-iron base. A screw, fitted with a platinum contact, and insulated by means of a porcelain collar from the base, faces another platinum contact on the spring. These platinum contacts are surrounded by a piece of rubber tubing as a protection against dust. An increase in temperature causes the spring to bend, and contact is either made or broken according to whether the open or closed circuit system is adopted. The temperature at which the thermostat operates can be fixed by means of the adjustable contact screw. The "Dania" thermostat consists of two independent elements: the "Differential" element, which works as soon as the heating rate of the room exceeds the normal rate at which the room can be heated by means of the usual heating apparatus, and the "Maximum" element, which works as soon as the temperature of the room has reached a certain value. The Differential element is a U-shaped sealed glass tube, about half filled with mercury. Over the mercury is placed in both branches a small quantity of a volatile liquid hydrocarbon. Before sealing all the air is extracted, so that the space in both branches is filled with vapour of the liquid only. A platinum wire conducts the current into one branch, and two wires in the other branch afford alternate circuits, one through a resistance and one direct to the main circuit. The branch in which one wire only is sealed has a thicker glass wall than the other branch. If the two branches have the same temperature there will be equal vapour pressure in both, and the mercury will stand at the same level. If both branches are acted upon by a current of air, whose temperature is rising at a certain rate, the heat will pass into the branch with thick walls at a slower rate than into the other. This means that the difference in pressure goes on increasing so that the mercury is pressed down in the thin-walled branch. As soon as the mercury comes below the top platinum wire, the current is diminished, as it can now only pass on through the resistance. When the current is thus diminished a danger call is given. After a short time the mercury will also come below the second contact, and the circuit will be totally broken, and a fire signal will be given. Thus the "Differential" element has nothing to do with a fixed temperature; the giving of the signals depends only on the heating rate and the actual temperature of the room is therefore immaterial. The "Maximum" element consists of a bent closed glass tube, in which are sealed three platinum wires conducting the electrical current through mercury contained in the tube. The mercury is supported by a solid non-conducting substance, that melts at a certain temperature. When the substance melts at this critical temperature the mercury sinks down. By this means the contact with the top platinum wire is broken, and the current must now go through the second platinum wire and a resistance. A danger signal is then given. When the mercury sinks still further the circuit is totally broken and a fire signal is given. The "Maximum" and the "Differential" elements are connected up in series.

As above stated, the Schöppe thermostat can be wired for the open or closed circuit system; the "Dania" thermostat, on the other hand, can be used on the closed circuit system only. The advantage of the open system is that an existing bell system may be utilised, and no extra wiring is needed. With the closed circuit system, however, a fault is at once disclosed automatically, and this system is therefore safer. In closed circuit-systems, a current of from 8 to 30 milliamperes is used, the alarm apparatus being operated by relays which come into operation if the detector circuit is broken. In the case of the "Dania" system, a break in the detector circuit not due to a fire will cause a sudden cessation of current, not preceded by a diminution of current. By an ingenious arrangement of the relay armatures, this is caused to give a warning signal only and not a fire signal. The alarm apparatus consists of an indicator board and alarm bell in each of the above systems.

CORRESPONDENCE

THE HART ACCUMULATOR CO.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Some misunderstanding having arisen through the notice published relative to the winding up of the Hart Secondary Battery Syndicate, Ltd., I should like to state that this liquidation in no way affects the Hart Accumulator Co., Ltd., beyond the fact that the Hart Accumulator Co., Ltd., have purchased the foreign patents of the syndicate with the intention of further developing their foreign and Colonial trade in accumulators.

The similarity of name has evidently caused some confusion, and I should be very glad if you will give me the opportunity of making this explanation.

Yours faithfully,
HART ACCUMULATOR CO., LTD
(*J. H. Poulton, Sec.*)

Stratford, June 10th, 1908.

CATALOGUES AND PAMPHLETS RECEIVED

ACCUMULATORS.—A list from Richard Pape, Ltd., of Albion House, New Oxford Street, W.C., gives particulars of several types of the "Fors" accumulators now manufactured by this firm for ignition and lighting purposes. The positive and negative plates are separated by porous partitions, and, on account of this, freedom from short-circuit, and retention of charge for a long period, are claimed. An output of 18 watt-hours per lb. of complete cell is guaranteed. A 4-volt 40-ampere-hour (ignition capacity) accumulator of this make weighs 5¼ lb. with a celluloid cell. An 8-volt 75-ampere-hour (one ampere continuous discharge) carriage lighting accumulator in a teak case weighs 36 lb. complete.

SUMMARY

The House of Lords Committee, presided over by Lord Cromer, has decided to pass the London and District Electric Power Bill (the Parshall-Hammond scheme) in an amended form. The company is to be authorised to supply "in bulk," and to supply railways, tramways, &c., but, so far as general power supply is concerned, consent of the "authorised distributor" is necessary in accordance with the so-called "Kitson" clause, by which the Board of Trade may intervene if consent is "unreasonably" withheld. The "linking-up" powers, and the powers to supply tramways and railways running outwards from their areas, are to be granted to the group of eight companies, but the elaborate scheme in the Bill for the formation of a Joint Committee has been thrown out. (Pages 952 and 953–959.)

The report of the Finance Committee of the London County Council upon the audit of the tramway accounts by Messrs. W. B. Peat and F. W. Pixley has been adopted by the Council after protracted discussion. The principal recommendation was that the repayment of the debt in respect of obsolete capital expenditure outstanding on the horse tramways, estimated at about £1,000,000, be spread over a period of 15 years, commencing March 31st, 1914. Reports have also been submitted by the Highways and Finance Committees on the question of provision for renewals in the tramway accounts, recommending the establishment of separate renewals and reserve funds, and considering the distinction between repairs and renewals for various parts of the equipment. (Page 959.)

A meeting of members of the Institution of Electrical Engineers is to be held next Tuesday to consider a scheme for the provision of a new home for the Institution by the purchase of the building on the Victoria Embankment, between the Savoy Hotel and Waterloo Bridge, now used as an examination hall, &c., by the Royal Colleges of Physicians and Surgeons. (Page 963.)

The thirteenth Annual Convention of the Incorporated Municipal Electrical Association will be held at Nottingham next week, from Tuesday to Friday inclusive, under the Presidency of Mr. H. Talbot, Chief Electrical Engineer to the Corporation of Nottingham. After the Presidential address on Tuesday, a discussion will take place on a Paper by Bailie Wightman, Convener of the Electricity Committee, Govan. On Tuesday afternoon the car-sheds and repairing shops of the Nottingham tramways and one of the power houses for the lighting and traction will be inspected. Thursday morning will be devoted to the Annual Business Meeting, when the Council's Report will be presented and the new President and Council will be elected. In the afternoon, Papers emanating from Dundee and

Digitized by Google

Worcester, on the design of generating stations will be discussed; and on Thursday Papers will be presented on "Alternating-current Accumulator Sub-Stations," and on the work of a testing and standardising department. We publish short biographies of the readers of the Papers, and portraits of these and other gentlemen who will fill prominent positions at the Convention. (Page 961.)

THE electricity supply of Nottingham is carried out by the Corporation from two coal-fired stations and one destructor station. At the three stations there are in all 34 sets, all consisting of Siemens continuous-current dynamos, driven by Willans central-valve engines running non-condensing; all the sets are under 500 kw. capacity. (Page 965.)

ON the Nottingham Tramways the British Thomson-Houston Co.'s new "electro-mechanical" track brake is being introduced. Other features are the use of trolley wheels with renewable centres, the replacement of the wooden shoes of the ordinary slipper-brakes with cast-iron shoes, and the gradual introduction of grooved trolley wire and mechanical ears. (Page 971.)

THE Annual Convention of the American Institute of Electrical Engineers is to be held at Atlantic City next week. The Convention of the Canadian Electrical Association was held last week at Toronto. (Page 970.)

COL. H. H. YORKE has now issued his Board of Trade Report on the accident on the Glasgow Tramway system last January, when a car ran away down a hill and collided with several vehicles. Owing to the death of the driver, it is impossible to ascertain the exact cause of the car getting out of control. The reversing handle of the rear controller had, however, jammed, and had been allowed to remain in the forward position, and with the particular type of controller used this may possibly have led to a cutting out of the magnetic brake circuit by an accidental shifting of the main spindle of the rear controller. (Page 973.)

THE causes which underlie the corrosion and rusting of iron are of perennial interest, and much work has been done upon the subject. Under "Electrochemistry and Electrometallurgy" we again refer to the subject, and show that solution of iron in water may take place without actual red rusting being apparent. Other subjects dealt with are the electric production of carbide and ferro-silicon, uses of aluminium, and a method for studying the effect of temperature during annealing upon the magnetic properties of iron. (Page 975.)

UNDER "Electrical Science," in the British and American Section, a novel rectification effect in vacuum tubes is described. In the Papers abstracted in the Continental Section, DOLEZALEK describes a new instrument called the Binant electrometer, and WITTE pleads for an electromagnetic theory of mechanics. (Page 976.)

THE accounts of the Brighton Corporation Electricity Department for the year ended March 31st last show a loss of £3,657 as compared with £10,233 for last year. The scheme for running a tramway service through the centre of Brighton from Worthing to Kemp Town has been rejected.—The accounts of the Dundee Corporation Electricity Department show a net profit of £1,078 after meeting interest and sinking fund.—After discussions extending over three years the Dunfermline Town Council has decided to lease their Provisional Order to the Fife Electric Power Co.—At the last meeting of the Edinburgh Town Council, it was decided that the period for the repayment of loans upon the electrical undertaking should be reduced from 30 to 25 years.—The St. Pancras Borough Council has had under discussion the question of wiring houses through the medium of private contractors at accepted schedules of prices. There was some opposition, and the matter has been referred back for further report. (Pages 977 to 980.)

THE Farnworth Council proposes to expend £7,000 upon its electric lighting undertaking. Six double-deck tramcars are required by the Pontypridd Corporation, and a feeder cable by the St. Anne's-on-Sea Council. The Metropolitan Asylums Board has decided to light the North-Eastern Hospital by electricity at the cost of £4,500. (Page 980.)

IT is proposed to register a new company with a capital of £250,000 to carry on the business of Messrs. Bruce, Peebles & Co. The report of Messrs. J. G. White & Co. for the year ended February, 1908, shows a net profit of £36,162. (Pages 981 and 982.)

THE report of the British Electric Traction Co., for the year ended March 31st, 1908, shows a gross profit of £250,539, whilst the expenses, including interest on 5 per cent. and 4½ per cent. debenture stock, amounted to £144,829. The balance to be dealt with, including the amount brought forward, is £118,824. The directors, after careful consideration, recommend that the full dividend on the preference shares at the rate of 6 per cent. per annum be paid for the six months ended September 30th, 1907, which is at the rate of 3 per cent. for the financial year. The sum of £35,000 is added to the reserve fund, and £35,393 is carried forward. (Page 985.)

A SHORT illustrated article is given on a 1,000 h.p. gas engine recently installed in this country, which, it is claimed, is the largest vertical gas engine in the world. (Page 987.)

JUDGMENT in the case between Messrs. Scott & Mountain, Ltd., and the Kent Collieries Co., Ltd., was given in the Official Referee's Court on Tuesday last. The generating plant delivered to the Kent Collieries Co. was found to be not according to the contract, and Messrs. Scott & Mountain were accordingly awarded only a portion of the balance due. The Kent Collieries Co. lost the case with regard to their counter-claim, with the exception of a small sum for damages, on account of breach of contract. (Page 987.)

AMONG the Patent specifications published last Thursday by the Patent Office is one by S. DE PONT, which gives a process for the manufacture of an insulating material which is non-inflammable and affected by neither water nor oil. Another, by G. ELLISON, describes a combined starting resistance, over-load cut-out and no-voltage release for use with three-phase induction motors. A specification by the COMPAGNIE PARISIENNE DES VOITURES ELECTRIQUES relates to the control of petrol-electric vehicles, and provides a method whereby the power supply to the motors can be stopped without breaking the main circuit. The composition of a magnetite arc-lamp electrode for use with alternating current is given in a specification by G. M. LITTLE, and A. P. STROHMENGER describes the manufacture of a separating material for use in secondary cells. THE WOLFRAM METAL FILAMENT LAMPS, LTD., have applied for amendments to several specifications relating to the manufacture of metal filaments for incandescent lamps. The amendments consist in striking out all references to molybdenum and limiting the inventions to tungsten. A patent for an improved Wheatstone automatic transmitter, and another relating to sealing and junction boxes for lead-covered cables, expire during the current week. (Page 988.)

NOTTINGHAM is to be doubly honoured this summer. Next week the Incorporated Municipal Electrical Association will hold its Convention there, under the presidency of Mr. H. Talbot, the Borough Electrical Engineer, and in September Mr. John Aldworth, general manager of the Nottingham tramways, will preside over the summer meeting of the Municipal Tramways Association in the same town. Although

Digitized by Google

from the point of view of the electrical engineering industry, Nottingham can hardly be described as one of the chief centres, yet it is a flourishing town with nearly a quarter of a million inhabitants, and is identified with a flourishing industry, lace and hosiery manufacture. In this, electric driving is being gradually adopted with considerable advantage, and this fact is a significant sign of the change in popular ideas and prejudices. Nottingham was one of the towns in which, just about a hundred years ago, the serious "Luddite" riots against the replacement of handwork by machinery centred, and hundreds of stocking frames were broken up. Now the new method of machine driving is welcomed, not only by the manufacturers, who see in it increased efficiency, better products, and greater output, but also by the operators themselves, who realise the improvement electricity is gradually effecting in the conditions under which they work.

WE are glad to be able to announce that steps are being taken to provide a permanent home for the Institution of Electrical Engineers, which shall render it possible for the meetings to be held without having to take advantage of the hospitality of other societies. Some particulars are given, in another column, of the building which it is proposed to acquire, and we can say at once from a personal inspection that it is one which can be excellently adapted to the purposes of the Institution. Alteration may be necessary, in the future, to the lecture theatre to meet the growing numbers attending the meetings, but even in its present form the seating accommodation is practically equal to that of the Institution of Civil Engineers, which we know so well. Some wonder may be felt among members as to ways and means for the provision of the £50,000 mentioned as the probable purchase price, and the couple of thousand required annually for ground rent, as no financial scheme is outlined in the circular convening the meeting. It may be thought that, at a time when the electrical industry generally is not overburdened with surplus revenue, an appeal to the generosity of members would be inadvisable, although we doubt not that there would be a ready response. Happily, however, the financial position of the Institution is such that the scheme could be got through without relying to more than a limited extent upon donations from the membership. It is estimated that the property which the Institution acquired some years ago in Tothill Street would realise about £25,000, and that the remaining half of the sum required might at a pinch be available from invested capital and other property, although this would deplete the funds of the Institution somewhat seriously. With regard to the ground rent, it is anticipated that this would be more than covered by rents from subletting the portions of the building not immediately required for the purposes of the Institution. In any case, however, the present annual surplus shown in the accounts is sufficient to provide the amount required. We trust that there will be a full meeting of members and associate members next Tuesday, so that the matter may be well discussed in all its bearings.

AN abstract of Colonel Yorke's report to the Board of Trade upon the remarkable tramway accident in Glasgow on January 3rd of this year, when a car ran away for 1,000 yards and collided with eight vehicles in succession, is published in this issue. The evidence available was imperfect, owing to the fact that the motorman was killed, but there is little doubt that the magnetic brake was out of action, and Colonel Yorke's conclusion is fully justified, viz., that the driver relied upon this brake to control the car down the long but not very steep slope between Cathedral Street and Glasgow Cross, and that by the time he found it useless the car was travelling too fast to be pulled up by the other means available. The way in which the magnetic brake was probably disabled is fully explained in the report, and is an example of unforeseen consequences, following upon the irregular use of apparatus which is well designed for its intended method of operation. The driving of a car with a stuck reversing handle at the rear end, and none at the driving end, is a contingency which the designer of the controller can hardly have contemplated; but it is surprising to learn that there are at this date controllers in use from which the driving handle can be removed when it is in any but the "off" position. Although the usual practice (in Westinghouse controllers, as well as other makes) prevents the removal of the handle, unless it is in the "off" position, it is quite possible to move the power barrel after the handle has cleared the retaining ring, but is not off the "square" of the spindle. The special lesson of the accident is that cars should not be kept in service with a glaring defect in the electrical equipment, since neither motormen nor inspectors, however intelligent and well taught, can be expected to foresee all the possible consequences of using the equipment in a totally different way to that intended by the designers and makers. Another lesson which this case reinforces is that where a power-brake is fitted, it should be used in regular service, and not reserved for special or "emergency" use. The progress of the British Thomson-Houston combined mechanical and magnetic track brake, described in this issue, will be watched with interest in this connection, for it is a brake whose efficacy as a magnetic brake is not impaired by its being employed as a hand brake, and, in fact, it should be one of the brakes which will assist in the dangerous hand wheel brake being consigned to the museum of antiquities.

JUST as we go to press, Lord Cromer has announced the decision of the House of Lords Committee on the London Electric Power Bills. The London and District Electric Power Bill, the scheme promoted by Mr. PARSHALL and Mr. HAMMOND, for the erection of a 60,000 kw. generating station at Barking, to supply all London "in bulk" and for power purposes, is passed with certain alterations making it acceptable to the London County Council. As amended the Bill gives powers to the new company to supply existing electricity undertakings "in bulk," and to give supply to railways, tramways, docks, canals, &c.; and also to supply for power purposes only with the sanction of the existing "authorised distributor," but if consent is "unreasonably" withheld, there is to be an appeal to the Board of Trade. Presumably the withholding of consent would be considered unreasonable if the new company offers to supply a consumer at a far cheaper rate than the present supply authority, but a small decrease in price would not be considered sufficient ground for the Board of Trade to intervene, as the Board will have

Digitized by Google

to take account of the less favourable position of the present suppliers with regard to the ultimate period of purchase. "Linking-up" powers are given to eight of the present London companies, but the complicated scheme for the establishment of a Joint Committee is not sanctioned. Permission to supply railways and tramways running outwards from these companies' areas is also given. The Bills have now to be gone through clause for clause by the Committee, and when brought into shape they will be reported for third reading in the Lords. After this, the present fight will be more or less repeated in the House of Commons, probably in the autumn session. Still, as the London County Council supports generally the decision of Lord Cromer's Committee, it may be expected that this decision will not be reversed.

ARRANGEMENTS FOR THE WEEK

TO-DAY, THURSDAY, JUNE 25TH.

Institution of Electrical Engineers.

8.30 to 11 p.m. Annual Conversazione at the Natural History Museum, Cromwell Road, London, S.W.

FRIDAY, JUNE 26TH.

Physical Society.

3.30 p.m. The meeting arranged to be held at the National Physical Laboratory, Bushy House, Teddington, has been cancelled on account of the death of Prof. W. Cassie, M.A., one of the honorary secretaries of the Society.

Royal Society.

4.30 p.m. Meeting at Burlington House, Piccadilly. Among the Papers to be read are the following:—(1) "The Emission and Transmission of Röntgen Rays," by C. W. C. Kaye; (2) "Further Notes on a Luminous Glow Generated by Electrostatic Induction in an Exhausted Vessel Made of Silica," by Rev. F. J. Jervis-Smith.

TUESDAY, JUNE 30TH.

Incorporated Municipal Electrical Association.

10.30 a.m. Annual Convention at Nottingham. Meeting at University College, when Mr. H. Talbot, Chief Electrical Engineer to the Nottingham Corporation, will deliver his Presidential Address. The following Paper will then be read and discussed:—"The Experiences of a Convener in the Establishment of an Electricity Undertaking," by Bailie Wightman (Govan).

2.30 p.m. Visits to Trent Bridge car shed and repair shops and the St. Ann's power station.

WEDNESDAY, JULY 1ST.

Incorporated Municipal Electrical Association.

Second Day of Convention at Nottingham. Day excursion to Dovedale. Special train leaves Nottingham (Midland) for Matlock Bath, at 8.40 a.m.

THURSDAY, JULY 2ND.

Incorporated Municipal Electrical Association.

10 a.m. Third Day of Convention at Nottingham. Annual General Meeting at the University College.

2.30 p.m. Meeting at the University College, when the following Papers will be read and discussed:—(1) "Some Considerations on the Design of a Generating Station," by H. Richardson (Dundee); (2) "The Reconstructions of an Electric Lighting Scheme with Observations on the Working of a Combined Steam and Water Power Plant," by C. M. Shaw (Worcester).

7.30 for 7.45 p.m. Association Dinner at the Exchange Hall.

Royal Society of Arts.

9 p.m. to 12 p.m. Conversazione at the Natural History Museum, South Kensington, S.W.

FRIDAY, JULY 3RD.

Incorporated Municipal Electrical Association.

10 a.m. Fourth Day of Convention at Nottingham. Meeting at the University College, when the following Papers will be read and discussed:—(1) "A.C. Accumulator Sub-station, and the Use of Accumulators for Peak Loads," by A. M. Taylor (Birmingham); (2) "The Work and Equipment of a Testing and Standardising Department," by H. A. Ratcliff (Manchester).

DECISION ON THE LONDON POWER BILLS

The Parshall-Hammond Bill passed by the Lords Committee

WHEN Lord Cromer's Committee on the London Electric Power Bills met yesterday (Wednesday) afternoon, the Chairman announced that the London and District Electricity Supply Bill would be allowed to proceed, on the assumption that the new "Cessor of Powers" clause, the full text of which the Committee has not yet seen, was satisfactory. The Committee were of opinion, he said, that it should be provided in the Bill that a larger proportion than one-fifth of the £600,000 which has to be guaranteed in the first instance should be actually paid up within twelve months. With regard to the "Kitson" clause (to the effect that the company may supply power in any area with the consent of the "authorised distributor," but may appeal to the Board of Trade if this consent is "unreasonably" withheld, and that the power user may be supplied with lighting up to 20 per cent. of his power consumption), the Committee will wish to consider, when the clause comes up for consideration, whether any modification of the 20 per cent. limit should be made

As regards the new clause relating to a maintenance and renewals fund (p. 958 of this issue), the Committee will wish to consider whether the contributions to this fund should not in certain circumstances be made obligatory.

Another point mentioned by the Chairman was that, in the schedule of maximum prices to be charged, three different kinds of electrical energy are specified with three maximum prices, and the Committee thought there seemed to be considerable difficulty in making a comparison with a single average price, as was done in the new clause relating to a sliding scale of dividends according to the price. The Committee would wish this point to be considered in the discussion of this clause.

Incidentally the Chairman mentioned that the Coal Smoke Abatement Society wished to be heard, and he thought the points raised by the Society in a letter to Lord Welby should receive consideration.

With regard to the London Electric Supply Bill, the Chairman announced the Committee had come to the conclusion that this should proceed, but only in respect of the following clauses:—

The clause giving power to the companies to supply electrical energy for haulage, traction, &c., for use in other areas than that of the Company supplying.

The clauses granting the companies powers to associate for the purpose of mutual assistance, with the omission of two small paragraphs providing for the construction of enlarged or extended stations by any one or more of the companies in combination and the laying of mains, &c., in connection therewith. An addition is to be made, however, empowering the existing companies to lay mains in districts intervening between their various power stations. The Chairman also stated that the Committee were of the opinion that a "Route" clause should be inserted, giving the local authority the right to prescribe the routes of mains in their districts.

A short discussion took place as to future procedure, when Mr. Seymour Bushe, K.C., on behalf of the third Bill before the Committee, promoted by the Westminster, St. James's, Notting Hill, and Kensington Companies, stated that there was no opposition to the preamble of this Bill, although there would be some discussion of clauses. It was therefore decided to hear the case for this Bill to-day (Thursday), and to take the clauses of the London and District Power Bill on Monday. The clauses of the other two Bills will then be discussed together.

G.B. Surface Contact Tramways in London.—It was stated by Mr. Whittaker Thompson, chairman of the Highways Committee of the London County Council, on Tuesday that the Board of Trade had inspected the equipment of the line in the Mile End Road on Monday, and that a certificate covering the ensuing period of six months had been received that morning. He believed that this was the usual form of certificate given in such cases. The matter was also referred to on Monday in the House of Commons, when in reply to Mr. B. S. Straus, Mr. Winston Churchill said he would do all in his power to urge forward the opening of the line.

LONDON ELECTRIC POWER BILLS

OUR report of the proceedings before Lord Cromer's Committee, in our last issue, took us to the adjournment on Tuesday, June 16th, when Mr. J. S. Highfield, Engineer-in-Chief to the Metropolitan Electric Supply Co., and joint Engineer for the "linking-up" proposal of the eight companies, was under cross-examination.

WEDNESDAY, JUNE 17TH. (TWENTY-SECOND DAY.)

Mr. BALFOUR BROWNE asked the Committee to consider whether they could visit some of the generating stations of the companies. It was a very important matter, unless the Committee were fully acquainted with generating stations, to realise what they were, and he suggested a visit either to the Bankside, Bow, or Willesden stations.

The CHAIRMAN promised to confer with his colleagues upon the matter.

Mr. TALBOT, K.C., then continued his cross-examination of Mr. HIGHFIELD on behalf of the London & District Electric Power Bill (the Parshall-Hammond scheme). He first asked as to what provision had been made for reciprocal supply from each of the six stations. Did he intend that any of the six stations should be able to supply any portion of the whole area. Mr. Highfield said, "No," but any authorised distributor would have a supply from two stations, *i.e.*, one station would be capable of giving all that a distributor required, and the other station only part. Mr. Talbot characterised this as splitting up the whole area into districts, and supplying each from one station; it was not linking up at all. Mr. Highfield agreed that "linking up" was a most misleading term, but they must regard the undertaking as one having all the various systems of supply linked up. Although the three-phase system was proposed under the Bill, he admitted that he had been an advocate of the high-tension direct-current series system, and, as a matter of fact, he regarded it as a question whether this system would not be the best for the western area of the Metropolitan Electric Supply Co. He had prepared estimates, and these were now under consideration by other engineers to see if their opinions agreed with his, as to the suitability of the Thury system for the particular area. With regard to the particular stations in which the new plant would be erected, Mr. Highfield said he could not say at the moment; it all depended upon where the load arose, and in reply to a question as to how he had been able to prepare estimates of the trunk mains if he did not know where the plant was to be, Mr. Highfield said that certain assumptions had had to be made, but the probability was, when the scheme came to be worked, the estimates for trunk mains would be reduced.

Mr. Talbot next dealt with the use of gas engines, and asked Mr. Highfield if he had had any personal experience of the use of gas engines in a scheme comparable with this, and had they worked successfully in parallel with steam plant? Mr. Highfield said he had no personal experience, but he was informed that they were working successfully at Essen in Germany and in the Westinghouse works; they were also in use at Ryde and Guernsey. It was true that these were working on a low-tension direct-current system. Mr. Talbot reminded Mr. Highfield that these were quite small stations, and asked if he was aware that gas engines had been used on a large scale in Johannesburg, and had been abandoned, and also that the Walthamstow Council was abandoning its gas-engine plant. Mr. Highfield said he happened to be particularly well acquainted with the circumstances at Johannesburg, but it was a fact that the gas engines were being replaced by steam-generating plant. He was not aware of what was being done at Walthamstow. As to the size of gas engines to be adopted, he thought these would be about 1,000 h.p. to begin with; these engines were not made in very large sizes at present, and they would necessarily have to go slowly. Some questions were then put to indicate that the sites of the majority of the existing stations were not comparable with that at Barking from the point of view of coal and water supply. Mr. Highfield said the difference between sea-borne and rail-borne coal was only about one shilling per ton, and he disagreed with the suggestion that the full advantage of steam turbines could not be obtained if cooling towers had to be employed.

Mr. HARPER, for the Middlesex County Council, wanted to know the position of the bulk portion of the undertaking of the Metropolitan Electric Supply Co., if the other portion of the undertaking was purchased in 1932 or 1952. Apparently, the Willesden station would be purchased, and, consequently, the Metropolitan Co. would be left with its West Middlesex bulk area—which could not be purchased—without a generating station. Mr. Highfield said that if such a state of affairs arose, they would have to build another station.

Mr. J. CONACHER, General Manager of the Metropolitan Electric Supply Co., spoke as to the agreements between the various companies for supplying the Joint Committee with energy during the period in which the Joint Committee will have no works of its own. For instance, the County of London Co. has agreed to supply the Joint Committee with electrical power from the Wandsworth and City Road station for three years from January 1st, 1909, to the extent of 3,000 kw. in 1909, 3,000 kw. in 1910, and 2,000 kw. in 1911, price to be settled by the standing arbitrator provided for under the Bill. The agreement further provides that the County Co. may be called upon within five years to erect buildings for 5,000 kw., with additional accommodation for a further 5,000 kw. All such plant will be the property of the Joint Committee, but will be worked by the company as part of their undertaking, the Joint Committee paying a rent for the accommodation.

The CHAIRMAN raised the question of possible difficulties in connection with a standing arbitrator, but Mr. Conacher said he had had great experience of Committees to which a standing arbitrator had been appointed, and he had never found any difficulties arise. Asked as to the difficulty of separating the plant belonging to the Joint Committee from that belonging to the company, Mr. Conacher said that in many cases there would be sufficient land to build a separate station.

Continuing his evidence, Mr. Conacher said he regarded the raising of £1,000,000 as a certainty, in view of the fact that last year, after paying debenture interest, the six companies who, under the Bill, guarantee the interest, had the sum of £331,000 divisible as profits, which was eight times the sum necessary if the stock was raised at 4 per cent., which he thought would be easily done. But he did not think they could raise the capital, if the ordinary terms of purchase were enforceable in 1932 (the time when the local authorities could purchase the existing companies). The Bill safeguarded the rights of the local authorities for purchase of the distributing mains in 1932 or 1952, if the Joint Committee's undertaking was then purchased by a central authority. The effect of this would be that the local authorities would be in possession of the distributing systems, whilst generation would be in the hands of the central authority. At the same time those portions of the companies' undertakings, which are not purchasable, are to be made purchasable upon arbitration terms. The charge of £4 10s. per kw. and 0·5d. per unit, which it was sought to have inserted in all provisional orders, was intended to apply to consumers of five kilowatts and over.

Mr. FITZGERALD, for the London and District Power Bill, cross-examined at first upon the constitution of the Joint Committee, and pointed out that if all the companies and local authorities came in, there would be 40 members, viz., 14 companies, 24 local authorities, and two London County Council representatives. Mr. Conacher said he failed to apprehend any difficulties from this. Mr. Fitzgerald asked what would be the position of the Joint Committee if the agreements came to an end. They were terminable at any time, and were not to be scheduled to the Bill. Mr. Conacher said the Joint Committee could put up their own stations. Mr. Fitzgerald retorted that no powers were taken in the Bill for land, but Mr. Conacher said they could come to Parliament for power. With regard to purchase he agreed that if no purchase took place by the London County Council or any other public body in 1932 or 1952, the whole of the rights of the local authorities would disappear. Even the special rights of the City of London Corporation to purchase in 1914 would disappear.

Mr. CLEASE, for the London County Council, indicated, by his cross-examination, that the view of the Council was that unless the Joint Committee erected a large generating station, there could not be a unified system, and there were no powers in the Bill compelling the Joint Committee to erect a station. He next drew attention to the fact that the maximum price in the Bill was higher than that proposed to be inserted in the Provisional Orders of the authorised distributors, so that, assuming the maximum price was charged, the distributors purchasing from the Joint Committee would have to supply at a loss. Mr. Conacher said this would be so, and although it was unlikely that the maximum price was charged, yet, if it were, the scheme provided for two-thirds of the profits over a certain amount to go to the authorised distributors. Mr. Clease next dealt with an agreement between the Joint Committee and the South Metropolitan Power Co., by which the latter agree to supply certain quantities of energy for three years from 1909, and afterwards to erect plant in their buildings, which would be the property of the Joint Committee. The agreement also provided, in the latter case, for the payment to the company of rent for accommodation of plant, rent for land, allowance for any other plant placed at the disposal of the Joint Committee, and the cost of working the Joint Committee's own plant. Mr. Conacher said he did not think this a complicated matter, and saw no difficulty in working under such agreements. In reply to a question as to why the Joint Committee was introduced, and if the companies had to work the plant, why they should not provide it, Mr. Conacher said the promoters regarded the formation of the Joint Committee as the only way of carrying out the recommendation of the Select Committee of 1906, that there should be one central authority controlling the supply of electrical energy; it was also the only means of safeguarding the interests of all the existing authorities.

Digitized by Google

THURSDAY, JUNE 18TH (TWENTY-THIRD DAY).

In reply to Mr. Morton, for the West Ham Corporation, witness said the promoters were quite willing to agree not to supply docks, &c., situated wholly within any individual borough.

In re-examination, Mr. Conacher said if the local authorities gave notice in time they could be represented at the first meeting of the Joint Committee, and have a hand in the election of the standing arbitrator. Furthermore, as at the first meeting, no stock would have been issued, the companies' representatives would only have one vote each, equally with the local authorities, so that it a sufficient number of local authorities applied, they might actually have a majority of votes at the first meeting.

The CHAIRMAN interposed with a question as to whether it was the intention of the promoters to proceed with this Bill before they knew another Bill was to be promoted.

Mr. CONACHER said yes. It was the intention to proceed with it from the moment it had had to be withdrawn last Session through lack of time.

The CHAIRMAN: Would you proceed with your Bill in the event of the other Bill being passed?—The other Bill is in two parts, viz., the bulk supply, and the competition. We dread the competition very much, but so far as this Bill is concerned we mean to go forward.

The CHAIRMAN: But do you consider the other proposal destructive of yours?—We dread it very much, and think it unnecessary.

In reply to some questions with regard to the working of the Joint Committee, Mr. Conacher pointed out that in the Port of London Bill it was proposed to have 25 members, whilst the Clyde Trust, a very important body, had also a large number of members, and he had never heard of any disputes.

Mr. J. B. BRAITHWAITE, chairman of the City and County of London Companies, said he had had considerable experience of raising capital for electrical enterprises, his firm of Foster & Braithwaite having raised over £1,000,000 for lighting and traction undertakings. The London companies had promoted this Bill, as they regarded it as the only possible and the best solution of the problem of the supply of electricity in London. Obviously, the Bill would solve the problem at a considerably smaller capital expenditure than in the case of a new company, which would have to put down an entirely new generating station, feeders, and distributing mains.

The CHAIRMAN: When you say it will solve the problem, you mean within the area in which you operate?

Mr. BRAITHWAITE said he meant it would solve the problem for London. They had taken in a considerable "fringe," and it would be many years before this was completely developed; he was certainly of the opinion that the scheme would solve the problem for the next 25 years.

In further answer to questions by the Chairman, Mr. Braithwaite said he did not suggest that the £1,000,000 under the Bill would be sufficient for the next 25 years. They would have to come to Parliament for further capital expenditure.

Mr. BRAITHWAITE, continuing his evidence, referred to the pioneer work of the companies, and to the fact that they had followed invention so closely in the machinery installed in their stations that considerable "scrapping" of plant out of revenue had taken place. If allowed to carry out the present project, they would unify the electric supply of London into one homogenous whole ready for the purchasing authority in 1932 or 1952. He also laid stress upon the greater security of supply for a number of stations compared with that from a single station, say, at Barking. Another point in his opinion which was in favour of the present Bill was that it involved no consideration as to what he termed "watered" capital, which under the previous Bill would exist to the extent of the £300,000 which was to be paid in interest out of capital during construction, and would have to be paid back by the purchasing authority, although it was not represented by assets. Summing up, he said there would be the minimum interference with the streets, owing to such a large network of mains being already laid, and this should appeal to the local authorities.

Lord LAMINGTON asked what would be the effect upon the scheme if the local authorities did not join in?

Mr. BRAITHWAITE said it would not then help London very much, but the companies would have the powers of linking up.

With regard to the finance of the Bill, he considered the guarantee of all the companies for the stock would be a very great factor in raising the necessary capital. For the year 1907, after paying interest on debentures, the companies had the sum of £377,294 available for the interest upon the stock, many times the amount which would be necessary.

In the course of further evidence, Mr. Braithwaite said the existing conditions had forced the companies to build a large number of generating stations and to spend much more capital than would have been necessary otherwise, and it was most unfair that the effect of these circumstances should be made use of as the foundation for arguing that a new company should be allowed to be formed. On the effect of the promotion of power Bills for London upon the securities of the existing companies, he endorsed the views of Mr. Seale, referred to in our last issue.

Lord WELBY suggested that the large number of generating stations erected in the area had been rather the result of jealousy between the local districts.

Mr. BRAITHWAITE said the position would never have arisen if Parliament had districted London only into, say, three large areas.

Mr. FREEMAN, cross-examining on behalf of the London County Council, pointed out that far from being a comprehensive scheme, this Bill only included eight companies; five others were promoting a scheme of their own, whilst the South London Electric Supply Corporation was not a party to either scheme. Mr. Braithwaite said this was so, but he claimed that the scheme of the Bill was a comprehensive one, and that as the other companies and local authorities came to see the advantages of it, they would join in. Mr. Freeman then dealt with a suggestion made in the report by the Board of Trade upon the Bill (given on p. 955), that the powers of the Bill should be limited to allowing mutual supply, and asked why, if the companies received this power, they wanted the Joint Committee. The answer was that the power to supply local authorities was an essential part of the scheme. On the question of the alteration in the prices to be charged by authorised distributors, Mr. Braithwaite agreed that it was a novel proposal, and he was aware that the Board of Trade had reported its doubt as to the companies being competent to legislate in this way, but novel things would have to be done if this problem was to be attacked. The whole circumstances in London were unprecedented.

Lord LAMINGTON asked if the primary object of the Bill was to make for more economical working of the companies' undertakings or the interests of London as a whole.

Mr. BRAITHWAITE said the supply of London was the first consideration of the Bill.

Lord LAMINGTON: Your evidence has rather been that the more economical working of the companies' undertakings was the first consideration.

Mr. FREEMAN, in further cross-examination, said that, under the terms of the Bill, if the Joint Committee was purchased in 1932, the purchase price of the stock was 110, in addition to goodwill. A good deal of discussion took place on this matter, Mr. Braithwaite maintaining that whether purchased in 1932 or 1952, the stock was purchasable at par. Eventually, however, Mr. Balfour Browne, for the promoters, agreed that Mr. Freeman was correct, but it certainly was not the intention of the Bill. The redemption at 110 in 1932 was as between the stock-holders and the Joint Committee, and did not concern the purchasing authority, &c. The Bill, therefore, should be made quite clear on this point, as he did not think this proposition would be fair.

Mr. BRAITHWAITE had previously mentioned that the interest out of capital during construction paid by the new company would be "watered" capital, which would have to be paid back by the purchasing authority, whereas under the present Bill there would be no "watered" capital; but Mr. Freeman suggested that if the stock under this Bill was issued at 80, there would be considerable "watered" capital to be repaid by the purchasing authority in this case also. Mr. Braithwaite said Mr. Freeman had no right to assume that the stock would be issued at 80, and therefore he could not agree that there would be watered stock.

Mr. TALBOT, K.C. for the Camberwell Borough Council, questioned Mr. Braithwaite as to the extinction of the present rights of the Council as to purchase by the Bill. He put it that the new conditions were absolutely against the obligations accepted by the company to secure the Council's consent to their order originally. Mr. Braithwaite did not dispute the facts, and said it was the effect of the general scheme.

Mr. TALBOT then cross-examined on behalf of the promoters of the London and District Electric Power Bill, and confined himself to endeavouring to ascertain the circumstances which led up to the promotion of the Bill. It appeared that in August last year all the London companies agreed to promote a power Bill upon the lines of the present one, but in October or November some of the companies came to the conclusion that the power business in their area was not of sufficient interest to warrant them continuing in the promotion. Consequently these particular companies promoted a separate Bill, asking for smaller powers.

Mr. TALBOT suggested that the present Bill was only introduced as a weapon for opposing the London and District Power Bill, although there were certain clauses in it which would be of value to the companies.

Mr. BRAITHWAITE said this was certainly not so, for the Bill was decided upon before the companies heard of the London and District Bill.

In re-examination, Mr. BRAITHWAITE, upon the question of transfer of undertakings to the Joint Committee, and the consequent extension of life, said that such transfers must be by the consent of the Board of Trade, and, further, an application would have to be made to Parliament for the necessary capital powers, as the £1,000,000 by the present Bill was not applicable to this matter at all.

Mr. W. F. FLADGATE, Chairman of the Charing Cross, City, & West End Electricity Supply Co., said he had been for two years Chairman of a committee of the London companies which had been formed for considering the question of electric supply, and the present Bill was practically the one which was withdrawn last Session. A good deal had been made of his state-

Digitized by Google

ment at the annual general meeting of his company, that there was no intention of raising £1,000,000 immediately, and that a few thousand pounds would probably suffice at first. This had reference to the position of the Charing Cross Co. as a guaranteeing company towards the £1,000,000 which it was proposed to raise under the Bill, and was in comparison with the enormous sums which the new company would have to raise. He meant by a few thousand pounds something in the nature of £200,000 or £300,000.

The cross-examination of Mr. Fladgate was very brief, and this closed the case for the Bill.

Board of Trade Report upon the "Eight-Company" Bill.

As mentioned in the cross-examination of the companies' witnesses, the Board of Trade has reported upon the proposals of the Bill, and we give below the main points in this report:—

The Board observes that the Bill contains provisions for the formation of a Joint Committee of the London Electric Supply Companies, for the supply of energy by them in bulk throughout London, and an area surrounding London, and for agreements between the companies, not only for the mutual supply of energy in bulk, but also for the joint management and working of generating stations and works, the appropriation and division of receipts, and the provision of capital. The report does not deal with the general questions of policy raised by these proposals, but only with the details of the clauses.

Clause 2. (Interpretation):—The definition of the expression "authorised distributor" limits the bodies who could be supplied with electrical energy in bulk under the Bill, to bodies engaged in the business of supplying energy at the date of the passing of the Act. This would exclude from all benefits under the Bill any undertakers in the area, who, though authorised to supply, have not yet commenced to supply. Such exclusion seems to the Board undesirable. The definition of the expression "power purposes" limits the consumers who would obtain any benefits from a reduction of price under Clause 42 of the Bill to consumers whose maximum demand is not less than 5 kilowatts. It appears to the Board that this might exclude a large number of small users.

Clause 30. (Agreements between Joint Committee and companies and distributing authorities):—The first proviso to paragraph C of the clause provides for Board of Trade approval of agreements for the acquisition of stations and works. The Board would prefer not to have the duty placed upon them of approving these agreements.

Clause 35. (Supply of energy for haulage, traction, &c.):—The Board observe that there is no provision in the clause as to the price to be charged for a supply, or the conditions under which the supply is to be given, or for penalty in case of failure to supply. The definition of "power-purposes" in Clause 2 of the Bill does not appear to include haulage, traction, &c.

Clause 38. (Guaranteed Stock):—The Board observe that the stock may be issued at such prices as the Joint Committee may think fit. It appears to the Board that this might affect the question of purchase under Clause 43 of the Bill. The Board observe also that the stock is redeemable in 1932 or 1952, but that there is no provision for redemption of the stock after the last-mentioned date.

Clause 41. (Application of revenue):—The clause provides, *inter alia*, for the formation of a reserve fund. There is apparently no limit to the reserve fund, and no provision as to what it is for or what becomes of it on the purchase of the undertaking.

Clause 42. (Supply of electrical energy by companies and distributing authorities for power purposes):—This clause limits the price which may be charged for power purposes by London electric supply companies and local authorities authorised to supply in the Administrative County of London. As pointed out above, consumers whose maximum demand is less than five kilowatts are excluded from the benefits of this clause. The Board doubt whether it is competent for this Bill, promoted by London electric supply companies, to limit the prices which may be charged by local authorities. The clause provides that the Board of Trade may fix temporarily prices in excess of those named in the clause. This provision is unusual. The Board think that the promoters should not be allowed in any case to charge prices higher than the maxima fixed by the Bill. It is a matter for consideration whether the prices named in the clause are sufficiently low, having regard to the benefits sought by the promoters under the Bill.

Clause 43. (Purchase of undertakings of Joint Committee and London electric supply companies at one and the same time):—The Board observe that the sub-clause 3 provides for the purchase of the undertakings mentioned in the clause in 1932 or 1952, but that there is no provision for purchase after the last-named date. Sub-clause 9 contains provisions under which the local authority for any district may purchase from the purchasing authority the distributing mains, plant, and works, within the area of such local authority. It appears to the Board that the expediency of this provision is somewhat doubtful. In the event of the provision being allowed, the Board call attention to the fact that there is no provision as to who is to decide what proportion of the purchase prices "may reasonably be attributed to the mains, plant, and works so purchased."

Clause 45. (Authorising agreements between companies for mutual assistance):—The Board observe that the provisions for joint management and working of the generating stations and undertakings, and for the appropriation and division of receipts, and the provision of capital, are not necessary for the general purposes of the Bill as regards mutual supply of energy in bulk, and the Board think that an agreement under the clause for the purposes aforesaid might lead to some confusion as to who would be the undertakers liable to the public in any particular district. The Board suggest for the consideration of the Committee, that the clause should be limited to a provision enabling the companies to supply electrical energy in bulk one to another.

Case for the Opposition to the "Eight-Company" Bill.

WEST HAM.

Mr. MORTEN, for the West Ham Corporation, said the whole point on preamble between him and the promoters was as to the supply of energy for railways, docks, canals, &c. If it could be made clear by any form of words that there would be no competition in respect of docks, &c., in West Ham, then practically the whole case of the Corporation would go, and he would only have a few clause matters to discuss later. Of the two Bills, the Corporation much preferred the present one.

FRIDAY, JUNE 19TH. (TWENTY-FOURTH DAY.)

Some Explanations of the Scope of the "Eight-Company" Bill.

At the commencement of proceedings the Chairman put a number of questions, in order, he said, to clear up in the Committee's minds the effect of the purchase clause and one or two other clauses connected with it. He said it appeared to him that, under the purchase clause, the Joint Committee could purchase generating stations or works of any electrical supply companies or distributing authorities. Did that mean the whole system?

Mr. CRIPPS, for the promoters, said that it was not intended to apply to the distributing system, and the words could be altered if they were too wide at present. The promoters only intended the words to apply to the generating side of the undertaking, including, of course, the mains as far as, and including, sub-stations.

The CHAIRMAN next pointed out that under Clause 43 any generating station and works purchased by the Joint Committee ceased to become the property of the electric lighting company. In that event, he read the Bill to mean that, whereas these undertakings, so transferred, would, in the ordinary course, be purchasable under the terms of the Electric Lighting Acts, after transfer they belonged to the Committee, and would not be sold at the then value. He assumed the purchasing authority would then have to purchase the Joint Committee's stock at par, *plus* compensation for the loss of business by all the companies for the next 20 years, although if the Committee did not purchase any of the electric lighting companies' undertakings, these undertakings would be purchasable under the Electric Lighting Acts.

Mr. CRIPPS said that might be the effect of the Bill as it stood at present.

The CHAIRMAN: Surely it is the effect, and it would obviously be an enormous advantage to the companies to sell to the Joint Committee.

Mr. CRIPPS said that this had been brought to the notice of the promoters, and they were considering it at the present moment. Although he would like to postpone discussion of it in the absence of Mr. Balfour Browne, he would like to point out that no transfer could take place to the Joint Committee without the consent of the Board of Trade, and, further, the capital powers of the Joint Committee were quite insufficient for purchasing any undertaking.

Lord SAUNDERSON asked, if the purchasing authority did not purchase until 1952, could any one of the local authorities purchase the undertakings in their areas in 1932?

Mr. CRIPPS said the local authorities could not purchase then.

Opposition to the "Eight-Company" Bill (Continued).

CITY OF LONDON CORPORATION.

Sir RALPH LITTLER, for the City Corporation, said he opposed the Bill for the reason that it aimed at utterly defeating the objects of past legislation with regard to purchase, so far as the City Corporation were concerned. When the City & Charing Cross Companies were granted orders for supply in the City, a bargain was made with the Corporation by which they were given a right to purchase so much of the two undertakings as was necessary for the purpose of the City of London, on certain terms, in 1914. Under the Bill this right would be absolutely overridden without any consideration whatever. If the undertakings of the two companies supplying the City were transferred to the Joint Committee, the Corporation could not purchase at all, and he maintained that the one object of the

Digitized by Google

Bill was to make the £13,000,000 capital of the companies of London more valuable than it was at present.

LORD LYTTON asked how the City would be affected by the "linking up" powers.

SIR RALPH LITTLER replied that the City would not be affected at all, provided new mains were not laid in the City.

WILLESDEN.

Mr. BLENNERHASSETT, addressing the Committee on behalf of the Willesden Urban District Council, complained that, as the Bill stood at present, his Council could not obtain a supply from the promoters of this Bill without the consent of the North Metropolitan Power Co., Willesden being marked as an area already supplied by a bulk company. As a matter of fact, the North Metropolitan Power Co. had no compulsory powers of supply in Willesden, and were merely supplying the Council under an agreement. Therefore, when this agreement came to an end, the Council wished to be free to go to the Joint Committee for a supply if this Bill passed. At present they would have to obtain the consent of the North Metropolitan Power Co. under the Bill.

Lord SAUNDERSON said that if Willesden was not in the area of the North Metropolitan Power Co., as Mr. Blennerhassett had stated, then he failed to see how they would have to get their consent.

Mr. BLENNERHASSETT said that he only wanted it made clear that the consent of the North Metropolitan Co. would not be required before Willesden could go to the Committee.

Mr. CRIPPS, for the promoters, said that at present Willesden was supplied by the North Metropolitan Power Co., and, therefore, was in the area of supply. His opinion was that when this agreement expired, Willesden would have a free hand.

WESTMINSTER, ST. JAMES'S AND PALL MALL, NOTTING HILL, AND KENSINGTON COMPANIES.

Mr. SEYMOUR BURKE, K.C. for these four companies, said that so far as the Bill was based on the principle of association between companies for mutual assistance, it commanded his entire sympathy and support. But he objected to the Joint Committee, for the reasons already put forward by other opponents, and he also objected to the purchase clause, for reasons which would be very clearly set forth by Mr. Blennerhassett, on behalf of the Westminster City Council. Apart from that, the sympathy of his companies was entirely with the promoters.

The CHAIRMAN: Has the question of linking up your stations with those of the other companies been considered?

Mr. BURKE said he supposed it could quite well be done, but he had not considered the question, and was not prepared to express an opinion.

MARYLEBONE.

Mr. E. R. DEBENHAM, Chairman of the Marylebone Electric Lighting Committee, said that the measure of public control provided by the Joint Committee was insufficient, for the reason that, whilst the Marylebone Council approved of the idea of a Joint Committee, this one was not representative of the whole supply authorities of London. In addition to the voting power of the companies being sufficient to out-vote the Councils, it appeared that a minority on the Committee could only go to the standing arbitrator on a question which affected their own local interests, and not on a question of general policy. In order to get proper control, every local authority should have the opportunity of guaranteeing to the extent of their own particular interests. Probably in this way local authorities would prefer to take a supply in bulk and guarantee, rather than spend further capital on new plant themselves. He also objected to fixing the price of power for seven years under the Bill.

Mr. C. A. Cripps, K.C., cross-examining for the promoters, asked for the witness's views as to what sufficient public control should consist of. Mr. Debenham said the only way appeared to him was that everybody should be compelled to come on to a Joint Committee, and guarantee either in proportion to their output or capital expenditure. Mr. Cripps suggested that at present all the local authorities could come on to the Committee and have the same voting power, if they guaranteed stock to the same amount, but Mr. Debenham saw no chance of the local authorities coming on to the Committee as the result of a private Bill.

Mr. Cripps next asked witness's views as to the arbitration clause, and Mr. Debenham said that supposing only the Marylebone Council came on to the Committee, and the Committee proposed to erect a new generating station which the Marylebone representative did not think was sufficiently good for London as a whole, or even for Marylebone, he would have no power to refer to the arbitrator. He wanted the minority to have the power of bringing questions before the arbitrator.

In re-examination, witness said that, as things were at present, local authorities could not join the Committee and guarantee stock without the consent of the Local Government Board.

Mr. A. B. CANE, addressing the Committee on behalf of the St. Marylebone Borough Council, said they opposed with the greatest reluctance, because they recognised that the principles upon which the Bill was founded, or purported to be founded, were the right principles upon which a solution of the problem of supply of electricity in London must proceed. In any such scheme the existing undertakings should be made use of, and a semi-public body formed to manage the supply, and to utilise the foundations laid by the pioneer concerns rather than to demolish them. But he argued that, with the committee constituted as proposed by the Bill, if there were two courses open, the companies would, by the aid of their majority of votes, naturally adopt the course which would be best suited to their own interests. Another objection to the scheme was that everybody was to have one vote irrespective of the size of their undertakings. The Marylebone Council had a very large undertaking, and felt they would have a right to a greater weight in the councils of the Committee than would be given under the scheme. At present, the companies were finding the money, and he agreed that, in these circumstances, they must have the control, but if passed in its present form the scheme would tend to create an electrical trust which would make the solution of the problem more difficult than ever. With regard to Clause 43, regulating the power prices to be charged by authorised distributors, this would not affect the Marylebone Council very much, as they were able to supply well within the proposed charges, but it was an unprecedented thing to alter general legislation in a private Bill.

MONDAY, JUNE 22ND.—(TWENTY-FIFTH DAY.)

Mr. CRIPPS, referring to the Chairman's question on Friday with regard to purchase, said the promoters had considered the point, and it was never the intention to obtain an enhanced price for any works which were at present purchasable under the terms of the Electric Lighting Acts, and words had been inserted in the purchase clause to make it absolutely clear that the works now purchasable under the Electric Lighting Acts should remain so. Thus it would not be to the advantage of the companies to transfer their undertakings to the Joint Committee from the point of view of ultimate purchase.

WESTMINSTER.

Mr. BLENNERHASSETT, for the Westminster City Council, said that over portions of seven companies the Council had powers of purchase in 1931, and they wished these powers to be maintained intact. The Bill was a gross attempt to deprive them of these powers without any compensation whatever, and anything more like confiscation he had never heard of. It had been said that the local authorities of London could not exercise their purchase powers owing to the fact that many of the generating stations supplied more than one area. But the question was a simple one in Westminster, as the Council could purchase the whole of the undertakings of the Westminster, St. James's, and Central Co.'s, with power stations, in addition to the greater part of the Kensington & Knightsbridge Co. The whole effect of the Bill was to make the Westminster City Council a distributing authority, a position which they refused to take up. The Council also strongly opposed the scheme of linking up under clause 45, because, although in theory the rights of purchase would not be affected, in practice they could not be enforced, for the reason that once all the undertakings were linked up any purchasing authority proposing to purchase their own local company would have to pay such heavy compensation for severance from the whole linked-up undertaking that the purchase powers could not be put into effect.

Mr. JOHN HUNT, Town Clerk of Westminster, gave evidence in support. Mr. Hutchinson, in cross-examination, put it to witness that the Westminster Council had two alternatives, either to pay a heavy price for severance, in addition to "their value," or, if they only purchased those companies which were wholly within Westminster, then they would be subject to competition from the companies not purchased. Mr. Hunt did not dispute these facts, but said the Bill would impose an extravagant claim for severance in respect of those companies which were at present wholly within Westminster.

CAMBERWELL.

Mr. TALBOT, K.C., for the Camberwell Borough Council, mentioned the special position of that body with regard to the purchase of the County of London Electric Supply Co.'s undertaking in that area. The Council could purchase at any time before 1931 by repaying the capital expenditure properly expended by the company in respect of Camberwell, plus 33 per cent., and also the making up of the company's dividends to 5 per cent. from the commencement; or they could purchase at "their value," plus value of goodwill, to be determined by arbitration, whilst they had, in addition, the ordinary rights in 1931 of purchase under the Electric Lighting Acts. The whole of these rights were to be taken away under the Bill, without any justification whatever, and he asked that Camberwell should be excluded from the purchase clause of the Bill.

In answer to the Chairman, Mr. Talbot said that the Camberwell Council had petitioned against the London and District Electric Power Bill, but the promoters of that measure had agreed to a clause safeguarding the purchase rights of the Council, and they did not now oppose the other Bill.

Digitized by Google

BARNES.

Mr. READER HARRIS, K.C., asked for exclusion on the following grounds:—(1) There would be no advantage to the Council by the passing of the Bill; (2) the district of Barnes was not necessary to the success of the Bill; (3) there was no precedent for including Barnes.

STEPNEY.

Mr. WILLIAMS, for the Stepney Borough Council, said they had tried to give the Bill the most favourable consideration. In fact, they were favourable to the linking-up powers, but there were several matters which were detrimental to the Stepney Council's interests. For instance, they claimed the right to demand a supply in bulk on reasonable terms, but the maximum prices named in the Bill were unreasonable. His next point was that the agreements between the companies and Joint Committee were not binding, and that to ensure the terms not being altered hereafter, the agreements should be scheduled to the Bill. He also objected to competition, although the Council and the promoters had practically come to terms, the remaining points being more in the nature of clause questions. Mr. Williams' next objection was to the proposal to alter the charge which shall be made for electrical energy for power purposes, and challenged the right of an independent body, such as the Joint Committee, to alter the present charges, or, as the clause provided, to bring the authorised distributors to arbitration on the question. The whole point was foreign to a private Bill, and in support of a request to have the clause struck out he quoted the Board of Trade report on the Bill.

MIDDLESEX.

Mr. POLLOCK, K.C., for the Middlesex County Council, asked to have all portions of that county struck out of the Bill, especially as a very much smaller portion was included in this Bill than in the last one. Discussing the details of the Bill, he complained that the Middlesex County Council would have no power, under the Bill, to representation upon the Joint Committee. This demonstrated the difficulties the promoters felt themselves to be in, and justified the position the Middlesex County Council took up, viz., that complications were certain to be encountered the moment the area of more than one county council was dealt with. The only reason put forward by the promoters for including Middlesex was the report of Mr. Luke White's Committee, and, with every respect, he suggested that the Committee should not be guided by this report on such an important matter.

At the midday adjournment, Mr. CRIPPS handed in clauses providing that in sanctioning any transfer of the companies' undertakings to the Joint Committee, the Board of Trade shall have regard to the terms upon which the undertaking is purchasable by the local authority, and also that the Joint Committee shall not receive any enhanced value in comparison with the present purchase terms.

The CHAIRMAN announced that, pending a decision upon the London and District Bill and the present Bill, the Committee proposed to postpone hearing the Bill of the other four companies.

ISLINGTON.

Mr. W. F. DEWEY, Town Clerk to the Islington Borough Council, said his Council strongly opposed the Bill, although they were not appearing by counsel.

LONDON COUNTY COUNCIL.

Mr. FREEMAN, K.C., in opposing the Bill for the London County Council, said that body was still of the opinion that the solution of the problem was one comprehensive scheme over an area greater than London alone, and not a mere linking up of the existing undertakings for general purposes. The County Council was entirely in favour of the powers in Clauses 45 and 46 (which authorised the companies to give mutual assistance), with the exception of the provision that new generating stations could be set up by a combination of the companies. These voluntary powers, so far as the companies themselves were concerned, gave all that could be required, apart from the comprehensive scheme. Thus the companies would be enabled to fill up the gap, and meet the demand, whilst a larger and more comprehensive scheme was being brought into existence. But the proposal to create the Joint Committee, the County Council did not regard as in the public interest. The Council did not desire to take part in any combination of trading companies and local authorities, for the reason that this, in their opinion, could not form a satisfactory solution of the problem. Dealing with the clause providing for the transfer of undertakings to the Joint Committee, Mr. Freeman pointed out that, inasmuch as the Board of Trade in their report refused to accept the duty of sanctioning such agreements, it must be struck out, for it was contrary to Parliamentary practice to thrust upon a Government Department duties which they did not desire to have. The same remark applied to the modification of the purchase clause put in that day, because the Board of Trade was again brought in against its will. Another provision to which exception was taken was the unprecedented power, in a private Bill, of altering the existing prices of supply, both as regards local authorities and companies. The County Council saw no reason for the creation of the Joint Committee, and failed to see what it could accomplish, which the companies, so far as they themselves were concerned, could not accomplish under Clause 45, viz., the power to associate. The real reason for the Joint Committee was on the financial question, for the Joint Committee was empowered to raise stock which might be issued at 70 or 80, and which would have to be redeemed at par by the purchasing authority in 1932 or 1952. And further, in the same connection, the effect of the amendment to the purchase clause with regard to taking over the existing undertakings was that these were removed from the category of separate undertakings, and placed in that of the undertaking upon which the capital expenditure had to be repaid; he admitted that it removed the extra 20 years' purchase granted by the Bill as drafted, but it did not alter the terms of purchase. Summing up the position of the County Council in this matter, Mr. Freeman said that they were very much in favour of there being a central authority which could purchase all the generating stations at a particular period, and they were very strongly in favour of the terms of purchase remaining those of the Electric Lighting Acts, viz., the then value, which was a perfectly well recognised commercial basis. But the Council did object to the elaborate machinery of the Joint Committee, and all that was implied in it, for the reason that they said it was not necessary for the purpose of carrying on the supply of electricity in London. They regarded it merely as machinery for fictitiously enhancing the value for purchasing purposes, and it ought not to be allowed. The Council would strike out everything from this Bill except the power to the companies to associate, and to supply authorised distributors in bulk.

Mr. FREEMAN, in reply to the chairman, said that the attitude of the London County Council with regard to the first Bill was that whereas the Council was in favour of bulk supply from one large generating station, they objected in the first place to the clause substituted for the Kitson clause, and also to the purchase clause, but, as a matter of fact, several interviews had taken place between the promoters of the London and District Electric Power Bill and the London County Council, and he was in a position to say that the two parties were now substantially in agreement as regards these two clauses.

The Chairman then put some questions with regard to the financial prospects of the London and District Electric Power Bill, in reply to which Mr. Freeman said that the Council did not think they were in a position to express any opinion upon this apart from the raising of the £600,000 during the first twelve months, which had been agreed to by the promoters. The question of finding the further capital, the Council desired to leave to the committee after having heard all the evidence.

The CHAIRMAN said that obviously neither the House of Lords, the House of Commons, the London County Council, nor the promoters could say definitely whether the capital would be raised until the promoters endeavoured to get it.

One other question from the Chairman elicited the answer from Mr. Freeman that whilst the London County Council regarded the proposal of the combined companies with regard to linking up as a means of filling a gap, it should not be allowed as a permanent proposal.

PROMOTERS OF LONDON AND DISTRICT ELECTRIC POWER BILL.

The Honourable J. D. FITZGERALD, K.C., then commenced his speech on behalf of the promoters of the London and District Electric Power Bill against the Companies' Bill, in which he combined his reply to the case against his own Bill. He said that the opposition to his own Bill resolved itself into three sets of opponents, viz., the Local Authorities, the Companies, and the County Councils. There were 93 local authorities in the area within which it was proposed to supply, of which 34 were authorised distributors, and of these only ten appeared before the Committee. There were also the special oppositions of the City of Westminster and the City of London. So far as the latter were concerned, he hoped that the modified Kitson clause, which he would suggest later, would meet the views of Westminster, whilst with regard to their opposition to the clause allowing the promoters to acquire undertakings, he was quite ready to show that any modifications to this clause should not be assented to. So far as the City was concerned, he confessed he was at a loss to understand their opposition, for the only contribution which this historic body had made towards the elucidation of the problem of the electric supply in London had been the expressed wish that mains should not be laid in the City. Passing to the opposition of the authorised distributors, he said this was based mainly upon two grounds: first, that they did not want a supply in bulk because they could generate more cheaply themselves, and secondly, they objected to the competition. For his part, he maintained the position he took up in opening the Bill, namely, that the opportunity of obtaining a supply in bulk from a large generating station was a valuable option to the authorised distributors, and at the same time there was no obligation of any kind upon them to take it. But he rather thought the fear of competition was at the bottom of all the opposition to the Bill, and he asked the Committee to keep in their minds what was the character of the competition that was to be set up, and whether it was

Digitized by Google

of a kind that ought to be prevented or obstructed by Parliament. Undoubtedly the greater proportion of the income of the present authorities was from lighting, and in the case of both the companies and the local authorities the competition of the power company would be in respect of only one-tenth of their total business. The suggestion had also been made that the clause providing that 20 per cent. of the supply given to a power user might be used for lighting was too liberal in view of the use of metallic filament lamps. No material facts had been given to the Committee on this point, but if any evidence could be produced to show that 20 per cent. was too high a proportion under the new conditions he was prepared to have this reduced. So far as the competition with consumers of over 250 kilowatts was concerned, he maintained that this was a perfectly reasonable competition. Why should not large manufacturers get their current at the cheapest possible rate. In the interests of the public alone, he asked the Committee to pass the Bill. The companies and local authorities in possession, lost sight of the fact that in opposing his Bill they were ignoring the interests of the manufacturer, but the manufacturer in London was exposed to competition both at home and abroad, and in opposing competition in the supply of electric power the existing authorities looked upon the large manufacturer merely as a source of income. There was one aspect of the case to which he was bound to refer. Both local authorities and companies were emphatic on the point that they could supply more cheaply than the power company, but if this was so, what had they to fear from competition. They could not have it both ways. It had been said, in some cases by the same witness, that the authorised distributor would be ruined by competition, and then that he could supply much more cheaply than the power company. Special reference was then made to the opposition of the Stepney Company, which had made an agreement with the Administrative Company in 1905, and during his cross-examination of the promoters' witness, Mr. Williams for the Stepney Council, had asked whether this company would be prepared to give similar terms. In reply to this, the promoters asked Mr. Williams to submit a clause, but no such clause had yet been submitted, and he could only presume that the Stepney Council, as in 1905, was waiting to see whether the Bill passed the House of Lords before they came forward with a proposal. In his case for the companies against the Bill, continued Mr. Fitzgerald, Mr. Balfour Browne had made a feature that there had been a Parliamentary bargain which in effect would prevent Parliament from passing this power Bill, and, of course, from passing any other power Bill for London. Was there any sort of foundation for such a suggestion? On the contrary, Parliament went out of its way to give notice to every company and local authority having a provisional order under the Act of 1882 that they were not to acquire in any shape a monopoly, and that they might be subject to competition hereafter.

At this point the CHAIRMAN interrupted Mr. Fitzgerald to inform him that the Committee did not wish to hear any more from him with regard to the case against his Bill, with the exception of his remarks upon the modified Kitson clause, and the Purchase clause. Beyond this, would he confine himself to his opposition to the Companies' Bill?

TUESDAY, JUNE 22ND. (TWENTY-SIXTH DAY.)

Mr. FITZGERALD handed in a number of substituted clauses which have been agreed in order to get over the opposition of the London County Council to the London and District Electric Power Bill. We give the substance of the vital clauses below.

All reference to supplying consumers taking 250 kw. and over is deleted from the Bill, and the ordinary form of Kitson clause inserted, giving the promoters authority to give a supply in any area with the consent of the authorised distributor, subject to reference to the Board of Trade if that consent is unreasonably refused or withheld. There is one addition, at the instance of the London County Council, viz., that the Board of Trade, in any arbitration proceedings as to the consent of the authorised distributor, shall be directed to have regard to the financial position of the latter.

A clause providing for a sliding scale of dividends in relation to price has been inserted in the Bill, but the maximum dividend of eight per cent. still remains.

The whole of the original purchase clause has been deleted.

A separate "maintenance and renewals" clause has been drafted, which provides that, before ascertaining the profits of the company, a sum not exceeding 1½ per cent. per annum of the capital expenditure may be set aside as a maintenance and renewals fund. This will prevent the plant being allowed to get into a state of disrepair, but as a matter of fact, in view of the altered terms of purchase, it will be seen that this clause does not assume very great importance.

The "insurance fund" clause, to meet exceptional demands from strikes or accidents, now relates to this only; it formerly included the "maintenance and renewals" clause.

The new purchase clause provides that "The undertaking shall be liable to purchase by any county council or Joint Committee of county councils, body of trustees, or other public authority, who may be authorised by Parliament to purchase the undertaking." The period of purchase has been fixed at 52 years, viz., 1961, upon "then value" terms, on twelve months' notice, but the right is given to purchase in 1951 or any subsequent 10 years on condition that in this event, in addition to "then value" of the undertaking, compensation is paid for any profits that might have been made during the period between the date of purchase and the year 1961. The "then value" is to be determined by arbitration, if necessary. All maintenance and renewals, reserve, and insurance funds remain the property of the company.

A revision of prices clause has also been inserted.

In all these matters the London County Council and the promoters are agreed, the only outstanding point being that the promoters object to specifically naming the former in the Bill as the purchasing authority, owing to the strong opposition of other county councils, and the implied threat of obstruction in the House of Commons should this be done. The promoters also object to Parliament settling this question so many years in advance, although they have no objection to the London County Council *per se*.

The CHAIRMAN decided to leave this point over for discussion on clauses, should these be reached.

Upon one other matter the promoters of the London and District Power Bill, and the London County Council have also agreed, viz., that £600,000 of capital shall be raised within one year, and a substantial commencement of works made within two years.

Mr. FITZGERALD then addressed the Committee in opposition to the "eight company" Bill. He said he could not regard this Bill as a serious attempt to deal with the problem of electric power supply in London. It was not a businesslike or workable proposal, and if it were passed it would only have the effect of leaving matters very much as they were now. Whatever happened, the six "guaranteeing" companies would control the whole of the voting on the proposed Joint Committee. Even if the whole of the local authorities came on to the Committee, the companies would still be in the predominant position as to voting. He could conceive of nothing else than constant appeals to the standing arbitrator, and the whole constitution and working of the Joint Committee would be more like a board set up in a comic opera with the standing arbitrator brought on to dance a breakdown. Even with the Committee controlled by the "guaranteeing" companies, it would not be a very happy family, for these companies were for the most part in strong competition with each other. Coming to the other side of the question, what was the Committee proposing to do; merely to utilise the surplus plant in the existing stations, and if necessary to erect new plant, which would be worked by the individual companies. The argument as to the capacity of any of the companies to give a cheap bulk supply was beyond question. They could not, from the position and circumstances surrounding their stations, give such a supply. Both the Metropolitan and Charing Cross Co.'s had had bulk supply powers for several years, but they had never been able to put them into force owing to the high prices which they had of necessity to quote. The four large stations from which they proposed to supply in bulk were all upon different systems, and the new plant would be upon yet another system. He characterised it as a patchwork, peddling scheme, and asked the Committee to say that it was not one which would solve the problem of electric supply in London.

In answer to the CHAIRMAN, as to the position of the London County Council with regard to the purchase of electrical undertakings in the area, Mr. Freeman said it was the desire of the County Council that either itself, or some other purchasing authority, should have power under the Bill to purchase all the generating stations, in order to bring them into one hand. At present they regarded the purchase rights of the local authorities as of very little value indeed, owing to the stations supplying several districts. He admitted that this would take away the rights of the local authorities, but the justification for it was that it would turn an illusory power of purchase into a real one.

Mr. BALFOUR BROWNE, K.C., in replying to the case against his Bill, said he was obliged for this explanation by Mr. Freeman, for what the County Council desired was provided for in this Bill. It showed that the County Council agreed with the aim of the Bill, viz., that a central authority for unifying the present state of affairs was a necessity. This, therefore, contradicted Mr. Fitzgerald's statement that this Bill was not a serious attempt to deal with the problem. Replying generally on the case, he contended that to allow a power company to compete would be a breach of a Parliamentary bargain, for the Electric Lighting Acts distinctly said there might be competition only by provisional order or licence. In respect of bulk supply, both these Bills were similar, with the difference that this one did not interfere with any existing rights, and the result was seen in the attitude of the local authorities in regard to the two Bills. The local authorities fiercely opposed the London and District Bill, whereas they approved the principle of his Bill. On the question of purchase, he asked the Committee to recollect that his clause provided for purchase in 1952, whereas in the other Bill the period was fixed at 1961, The earlier date was, of course, much more in the interests of the public, and he could not understand this attitude of the London

Digitized by Google

County Council. The London County Council had also wished to limit the powers of the Bill to coupling up of the companies, but this was not the main object of the Bill. If this were done, there would be no option to authorised distributors to demand a compulsory supply, and there would be no central authority to unify the systems in the area. Dealing with the criticisms of the working of the Joint Committee. Mr. Balfour Browne said that no evidence had been called as to difficulty in working such bodies, whereas such Committees, as Mr. Conacher had said, were working all over the country in a perfectly satisfactory manner. The whole reason why the companies with bulk supply powers had not been able to put them into force was because of the jealousies of local authorities, which would all be swept away if the Joint Committee were formed and they could get the local authorities to come on to it. Coming to the report of the Board of Trade upon the Bill, Mr. Balfour Browne said the Board had no right to dictate to Parliament as to the duties put upon it. Parliament had every right to put duties upon public departments, and had done so in hundreds of cases—in fact, under the Electric Lighting Acts, the Board of Trade had to sanction transfers of undertakings, which was the point in dispute, so far as putting duties upon the Board was concerned. On the principle of the purchase clause, Mr. Balfour Browne pointed out that the evidence of Sir Hugh Bell for the other Bill was that there could be no guarantee of raising the capital unless investors were certain of getting their money back. But the new purchase clause was upon the "then value" basis, and, therefore, there seemed to be no guarantee that the capital for the London and District Bill would be raised.

Mr. TALBOT, for the promoters of the London and District Bill, interrupted to point out that Sir Hugh Bell had been the chief party in the consultations which had led up to the new purchase clause.

Mr. BALFOUR BROWNE, continuing, said that, so far as raising the £1,000,000 under this Bill was concerned, he would be willing to a clause stipulating that the stock must not be raised at less than 95. Mr. Balfour Browne then drew the attention of the Committee to restrictions under which the existing companies are now working, and urged that to allow a new power company to compete would be most unfair. For the next six or seven years the scheme of the companies was certainly the best, and he asked that it be allowed to proceed.

The Committee then adjourned until two o'clock yesterday.

L.C.C. TRAMWAYS

Provision for Renewals: Audit of Accounts

A REPORT has been presented to the Council by the Highways Committee dealing with the question of the amount which should be set aside in order that the tramways renewals fund may be established and maintained on an adequate basis. The general directions between repairs, which should be met out of revenue and renewals, for which a special fund should be provided, is dealt with in some detail under the following heads :—

Permanent Way.—This is the most important item to be provided for in a renewals fund, but in considering the amount of the provision necessary to be made, the question arises, what shall be regarded as renewals as distinguished from repairs in view of the fact that short lengths of rail are continually being replaced out of revenue in the work of repair of the permanent way? The officers suggest :—

(i.) That the cost of replacing rails shall be charged as repairs, and met directly out of revenue, if for less than a quarter of a mile of single line (and as renewals if for more than that length), provided that the replacement of special work and curved lines of less than 400 ft. radius shall always be regarded as renewal, irrespective of the length of the line affected. This proviso is necessary, as there is a large amount of wear and tear on the special work at junctions and on sharp curves, and there is no difficulty in distinguishing such renewals from repairs.

(ii.) That, subject to the foregoing, the provision for renewals shall include the replacement of rails (both track rails and slot rails), repaving in connection therewith (but not in connection with repairs), conductor tees, road boxes, &c., but that concrete foundations and the conduit shall be omitted from the computation as being practically permanent and not requiring renewal from time to time.

Cables.—The officers suggest that replacement of lengths of 100 yards and upwards should be classed as renewals, anything less than 100 yards being charged as repairs.

Cars.—These are continually being renewed in parts, and every year each car has to be thoroughly overhauled for the purpose of obtaining the annual licence issued by the Commissioner of Police of the Metropolis. The result of this is that the cars are always kept in first-rate condition, and the question of renewal beyond that which takes place from year to year does not arise. It would be extremely difficult to separate repairs from renewals, and the most satisfactory plan would appear to be to defray the whole cost of repairs and renewals of cars directly out of revenue account as the expenditure is incurred, and to exclude cars from the operation of the renewals fund. Moreover, as the number of cars is very large, and the expenditure on renewing parts of the cars falls to be incurred at various dates, the burden of repairs and renewals tends automatically to equalise itself. We are advised that, apart from the question of obsolescence, the necessity for replacing cars will not arise.

Other Electrical Rolling Stock and Traversers.—The officers suggest that the same rule as in the case of cars should be applied to other electrical rolling stock, and to the comparatively small item of traversers in the car sheds, which require a good deal of upkeep, and are closely identified with the cars.

Sub-station Machinery and Switchgear, and Sundry Plant and Tools.—The machinery and switchgear in the sub-stations are governed by considerations very similar to those applying to rolling stock. The main switch cells are built into the structure, and may be regarded as permanent, but the smaller parts have to be constantly attended to and kept in a state of efficiency by small renewals, and the officers suggest that they should be dealt with in the same manner as cars, as should also sundry plant and tools, including insulators.

Ducts.—The officers state that the stoneware ducts laid by the Council are, for all practical purposes, permanent, and will not have to be renewed. Cables are drawn through the ducts, and old cables can be withdrawn and new ones substituted without interfering with the surface of the streets in which they are laid. In the opinion of the chief officer, there is no likelihood of larger ducts being needed, and the original ducts will therefore serve for an indefinite period without any expenditure on renewals.

Track in Car-sheds.—This is a comparatively unimportant item. The track is only used for the passage of cars into and out of the sheds, and will last for a very long period without renewal.

Motor-cars and Lorries.—All electrically-driven vehicles travelling on the tramway tracks should, we are advised, be classed with cars and excluded from the provision for renewals. Provision should, however, be made in the renewals fund for the other vehicles used in connection with the tramways, which comprise motor-cars (petrol), petrol lorries, steam lorries, ticket vans, cable vans, and sundry horse vehicles.

Generating Station.—The whole of the equipment of the station must necessarily be kept in a high state of efficiency, and, as the cost of repairs and small renewals of parts of machines is met directly out of revenue, the renewals fund will only be called upon for large replacements—that is, when a whole machine or boiler is worn out.

Generally.—The question arises, if the renewal of certain items, such as cars and sub-station machinery, is to be paid for directly out of revenue account, and excluded from the provision for renewals, how far the present charge on revenue account for repairs falls short of what may be considered to be the normal average. There can be no question that in the first two or three years after a line is electrified the cost of repair and maintenance is less than afterwards, but the chief officer is of opinion that the time quickly arrives when this expenditure approaches a normal average. For example, he considers that the expenditure now being charged to revenue in respect of the lines south of the Thames may be regarded as having already reached an average figure, bearing in mind that considerable expenditure is being charged to revenue in respect of anchoring rails, which will be completed within the next year or two. Moreover, if, on the one hand, the undertaking should be slightly benefiting for the time being by the charge for repairs being somewhat less than the full average charge which will presently accrue, it must be remembered, on the other hand, that the system adopted by the Council of liquidating the tramways debt by equal instalments of principal will result in later years in a large diminution in the charge for interest, and thus provide what may be regarded as a substantial reserve, available for contingencies, such as any unexpected increase in the cost of repairs.

The final recommendation appended to the report is as follows :—

That provision be made for renewals in respect of the Council's electric tramways undertaking in accordance with the proposals set forth in the above report at the rate of two-thirds of a penny per car mile on the total car mileage run on the electric tramways each year; and that the question of the adequacy or otherwise of this provision be again considered at the expiration of five years from the present time.

Digitized by Google

This report of the Highways Committee has been considered by the Finance Committee, who submit a further report thereon in general agreement with that of the opinions of the Highways Committee, and concluding with the following recommendations :—

(*a*) That the "Renewals Reserve Fund" established in connection with the Council's tramways be in future called the "Renewals Fund."

(*b*) That a "General Reserve Fund" to provide for general contingencies be established in connection with the Council's tramways; and that, for a period of five years from April 1st, 1908, any surplus which may be available, after a sufficient sum has been credited to the renewals fund to bring it up to the full amount necessary on the basis of two-thirds of a penny per car mile run by electric traction, be paid into the general reserve fund.

(*c*) That the sum of £34,634, being the amount of £30,772, transferred to the renewals reserve fund on April 1st, 1904, in respect of the horse system, together with interest accumulated to March 31st, 1908, be transferred to the general reserve fund.

The Finance Committee's Report on the "Commercial Audit"

THE report of the Finance Committee of the London County Council upon the report of Mr. W. B. Peat, President of the Institute of Chartered Accountants, and Mr. F. W. Pixley, upon the accounts of the tramways department (see ELECTRICAL ENGINEERING, March 26th, page 465), has now been presented.

With regard to the question of obsolete capital, that is, the losses on displaced assets of the horse system, the accountant estimated that the approximate loss still to be provided for must exceed £1,000,000, and said, "while we recognise that the Council had no means of writing off at once the loss on the displaced assets of the horse system, we consider that such loss should be provided for out of revenue more rapidly than by the charging of the annual instalments in repayment of the debt. Until these losses are provided for, there can be no profits applicable for the relief of the rates." The Finance Committee express the opinion that the Council should accept the advice of the accountants in regard to writing off this obsolete capital, and proceed in their report to consider the date from which the new charge should commence, the amount of obsolete capital to be dealt with, and the extent to which the repayment of debt should be accelerated. It is suggested that the repayment of debt represented by obsolete capital should be deferred until the reconstruction of the horse tramways is practically complete, and give March 31st, 1914 as an appropriate date from which to commence the more speedy writing off of the obsolete capital, which will then be outstanding. After going into some detail, the actual obsolete capital not written off is put as £961,954, and it is proposed to write it off in fifteen equal annual instalments, so that the whole is paid off by March 21st, 1929.

With regard to provision for renewals, the committee write as follows :—"We are entirely in favour of the establishment of an adequate renewals fund in connection with the tramways undertaking, and are in accord with the accountants in holding that no moneys from the undertaking can be considered as available for relief of the rates until full provision for such a fund on a proper scale has been made. We are not able, however, to agree that such a provision for renewals has no relation to the provision required to be made for the repayment of capital. The question of the relation between a renewals or depreciation fund and the repayment of capital by a local authority is one upon which difference of opinion prevails even amongst expert accountants. It seems to us that the statutory obligation resting upon a local authority to repay its capital within a period approximating to the life of the undertaking constitutes a fundamental difference between the position of an undertaking worked by a municipality and one operated by a company which cannot be ignored in any comparison between the two." One or two smaller points are then dealt with, and, in general, agreement is expressed with the accountants' report.

The Finance Committee's report continues :—"The accountants refer to the growing cost of repairs. This is a feature of the accounts which has not escaped attention, but it may be pointed out that there has been no difficulty in meeting the cost out of current revenue, while there has been an increase in the amount available for and appropriated to the renewals reserve fund. In connection with this point, reference may be made to the method adopted by the Council for repayment of debt by equal annual instalments of principal, so that the interest charge diminishes each year by the amount of interest on the debt paid off, and this constitutes a very substantial margin against the increasing cost of repairs or any other head of expense." Tables are then given illustrating this point.

The question of apportioning the cost of street improvements is admitted to present great difficulty. In general terms the accountants express the opinion that "the proportion of the cost of the street improvements and widenings which should be charged to the tramways should bear a direct relation to the benefit derived or to be derived by the tramways :—

"(*a*) When the improvements were undertaken wholly to accommodate the tramways and were not otherwise necessary.

"(*b*) When improvements were undertaken along a route concurrently with the construction of a tramway.

"(*c*) When the improvements were undertaken with the object of accommodating general traffic and also providing a sufficient width of thoroughfare for a contemplated construction of tramways.

"(*d*) When the tramways although constructed derive, in common with the general traffic, benefit from the improvement." And they say, further, that "in assessing the benefit apportionable to tramways the Council should be guided by the advice of experts, who would take into account all the circumstances of each particular case."

As regards the improvements falling in group (*a*) the Council resolved on November 20th, 1906, that the whole cost of such improvements should be charged to the tramways account. It is believed that the majority of improvements connected with proposals for tramways fall under heads (*b*) and (*c*), and it is in regard to these that the difficult questions arise.

The Finance Committee do not propose in this report to discuss the propositions laid down by the accountants in this matter, as they have received a memorandum from the Improvements Committee suggesting a conference with the Highways Committee in reference to the Council's resolutions of November 20th, 1906, on this subject, and think that the whole question, together with the accountants' report thereon, should be considered by the three committees with the view to a joint report to the Council.

The report continues :—"With regard to the suggestion of the accountants that expert advice should be obtained, we think it would be difficult to find an outside expert who could usefully advise the Council in a matter of this kind, and the expense would be considerable."

In conclusion the recommendations are given as follows :—"(*a*) That the amount of capital expenditure rendered obsolete from time to time owing to the conversion of the horse traction system to electric traction, and the provision made *per contra* for the liquidation of the debt thereon, be in future shown in the balance-sheet of the tramways undertaking; (*b*) that, subject to the approval of H.M. Treasury being obtained in due course, provision be made within a period of 15 years from March 31st, 1914, for the repayment of the debt in respect of obsolete capital expenditure outstanding on that date on the horse tramways; (*c*) that the sum of £5,547 be charged to the revenue account of the tramways as on March 31st, 1908, for additional central office establishment charges for the period prior to April 1st, 1907, when the standing order, No. B 198, made by the Council on July 31st, 1908, came into force : (*d*) that it be referred to the Finance, Improvements, and Highways Committees to consider the resolutions of November 20th, 1906 as to the allocation of the cost of street improvements connected with tramways, together with the report of Messrs. Peat and Pixley on the same subject, and to report jointly to the Council as to the action which should be taken thereon."

The Highways Committee have also presented a report on the same subject, which is in general agreement with the conclusion of the Finance Committee.

After a discussion lasting several hours on Tuesday, the Finance Committee's report was adopted by 73 votes to 41.

Electric Railway from Frankfurt to Wiesbaden.—It has been proposed to connect these two towns by an electric railway, part of which (between Rossmarkt and the Mainzer Landstrasse) would be underground. Permission to prepare preliminary designs was granted last April to the Elektricitäts-Aktiengesellschaft vormals W. Lahmeyer & Co., of Frankfurt.

International Electrical Congress at Marseilles.—According to *La Revue Electrique* (Paris), the arrangements for the international congress on the applications of electricity, to be held from September 14th to September 20th in connection with the Marseilles Exhibition, are well advanced. The object of the congress is defined as the examination of technical, commercial, and administrative problems, which have arisen in practice during the last few years. These different questions will be treated in reports, which will be submitted for discussion. The fee for membership is 20 francs, and particulars can be obtained from M. le Trésorier du Congrès international des Applications de l'électricité, 63 boulevard Haussmann, Paris. Special arrangements for reduced fares to members on the French railways are being made. Visits will be paid during the congress to works and objects of technical interest in the neighbourhood. The congress will be divided into the following sections : I. Legislation. II. Construction and protection of distributing systems. III. Technical and commercial developments. IV. Lighting and domestic applications. V. Applications to industry, mining, traction, and agriculture. VI. Electrochemistry and electrometallurgy. VII. Telegraphy and telephony. VIII. Education and measurements. IX. Applications to hygiene and medicine. In these sections over 60 discussions will be opened by well-known French engineers and others.

THE THIRTEENTH CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION

THE Incorporated Municipal Electrical Association will hold its thirteenth annual Convention in Nottingham next week, under the presidency of Mr. H. Talbot, Chief Electrical Engineer to the Borough of Nottingham. Mr. Talbot has been connected with the Association since its formation in 1896, and was elected to the Council in 1901. In 1906–7 he was elected Vice-President, and at the Convention in Sheffield last year he was chosen as President for this occasion. Although it is usual that the meeting should be held in the town in which the President for the year is engineer-in-chief, there is no absolute rule to this effect, and at first it was an open question whether another town should not be chosen, chiefly because the hotels in Nottingham are comparatively small, and it would not be possible to accommodate all the members under one roof. Several members were in favour of a seaside town being chosen this year, but eventually Nottingham was decided upon.

A feature of the meetings of the Association is that only a portion of the time is taken up by the reading and discussion of Papers, and a considerable part is devoted to excursions and visits to works. At Nottingham this arrangement is being followed. The whole of the second day, Wednesday, will be taken up by an excursion to Dovedale; train is taken from Nottingham to Matlock Bath, and thence the members will drive through some of the finest scenery in the neighbourhood.

H. FARADAY PROCTOR
(*City Electrical Engineer, Bristol*),
Hon. Sec. to the I.M.E.A.

H. TALBOT
(*Chief Electrical Engineer, Nottingham*),
President of the I.M.E.A.

C. MCARTHUR BUTLER.
Secretary of the I.M.E.A.

JOHN ALDWORTH.
(*General Manager of the Nottingham Corporation Tramways.*)

THE MAYOR OF NOTTINGHAM
(COUNCILLOR SPALDING).

SIR JOHN TURNEY, J.P.
(*Chairman of the Nottingham Electricity Committee*).

On Tuesday afternoon, after a luncheon to which the Association has been invited by Sir John Turney, J.P., Chairman of the Electricity Committee, a visit

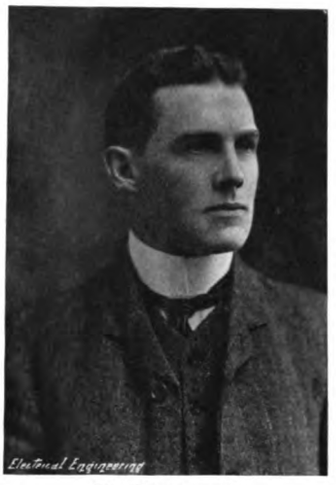
Digitized by Google

will be made to the Trent Bridge car-sheds of the Nottingham tramway undertaking, and to the St. Ann's Power House.

At the car-sheds, in addition to the interest that attaches to the sheds themselves, the workshops and the recreation rooms for the men, attention should also be given to matters of technical detail. For instance, some of the cars are fitted with the new B.T.H. "electro-mechanical" track brake, a magnetic track brake which can also be applied by hand, and there is also a trolley wheel with renewable centre, used on a large number of the cars, which creates considerable saving in trolley-wheel renewals. The replacement of the wooden shoes of the ordinary hand track brake is also worth noting, as is also the method employed for fixing loose armature spiders. A description of these, together with a brief sketch of the tramway undertaking generally, appears on page 971 of this issue.

Those who have been able to resist the counter-attractions of the Trent Bridge cricket ground on the other side of the river will, after inspection of the car-sheds and workshops, proceed to the St. Ann's Power House, which is one of the three generating stations of the Nottingham Electricity Department, described in some detail on page 965. These stations supply D.C. current at 500 and 2×220 volts for the lighting and tramways respectively, and are interconnected by 0·75 sq. in. trunk mains. The St. Ann's station is a typical "small unit" non-condensing station, and contains nine Willans-Siemens 440 kw. sets, all practically identical.

The following list of towns in which previous Conventions have been held will be of interest:—



Year.	Town.	President.
1896.	London	Arthur Wright (Brighton).
1897.	Manchester	C. H. Wordingham.
1898.	London	A. H. Gibbings (Bradford).
1899.	Bristol	H. Faraday Proctor.
1900.	Huddersfield	A. B. Mountain.
1901.	Glasgow	W. A. Chamen.
1902.	London	J. H. Rider.
1903.	Sunderland.....	J. F. C. Snell.
1904.	Derby	T. P. Wilmshurst.
1905.	Edinburgh	F. A. Newington.
1906.	London and Kingston-on-Thames	J. E. Edgcome.
1907.	Sheffield	S. E. Fedden.

At practically every Convention of the Incorporated Municipal Electrical Association, a Paper on a subject more particularly of interest to the Chairmen and Councillors is set down for discussion. There is frequently some difficulty in finding an author and a subject, but this year Bailie R. A. WIGHTMAN, Convener of the Govan Electricity Committee, has stepped into the breach with a chatty Paper on "The Experiences of a Convener in the Establishment of an Electricity Undertaking." Mr. Wightman, who is an architect by profession, entered the Govan Town Council in 1893. He was elected Convener of the Watching and Lighting Committee in 1897, and served his first term as magistrate in 1899. In 1900 he was chosen as Convener of the Electricity Committee, in 1906 he was appointed Justice of the Peace in the county of Lanark, and in 1907 he served his second term as magistrate. The Govan electricity works was started in 1900; Mr. T. C. Parsons is the Burgh Electrical Engineer.

BAILIE R. A. WIGHTMAN, J.P.

Mr. H. RICHARDSON, whose Paper on "Some Considerations on the Design of a Generating Station," is down for reading on Thursday, is Chief Electrical Engineer of the Dundee electricity undertaking. Mr. Richardson served his mechanical apprenticeship with Messrs. Frank Ashwell & Co., London and Leicester, and subsequently entered upon his electrical training with Messrs. Siemens Bros. & Co., with whom he remained for three years. He next joined the National Supply Co. at Preston, previous to taking up an appointment as assistant electrical engineer during the construction and inauguration of the Newcastle-upon-Tyne tramways service. Relinquishing this post in December, 1902, he took up the position of Chief Electrical Engineer to the City of Dundee lighting and tramways undertaking, which important position he has since held. His latest work is the erection and equipment of a new H.T. generating station, situated on the banks of the river Tay, with sub-stations, the plans and designs for which he prepared. It is expected that this scheme will cost about £100,000. It has now been got well under way, and the work is being pushed forward with all possible speed; it is anticipated that everything will be complete and ready for next winter's load.

H. RICHARDSON.

Mr. C. M. SHAW, author of the Paper on "The Reconstructions of an Electric Lighting Scheme, with Observations on the Working of a Combined Steam and Water Power Plant," the second on the list for Thursday, is Chief Electrical Engineer at Worcester. Mr. Shaw, who is now 31 years of age, served his apprenticeship with Messrs. Blakey, Emmett and Co., of Halifax, and Messrs. Fairbarn, Naylor & McPherson, of Leeds. In 1894 he was appointed junior assistant in the Dewsbury Corporation electricity works, and remained with them until 1897. He resigned his post as assistant at Dewsbury in 1897, and went as a pupil to the Yorkshire House-to-House Electricity Supply Co., Leeds. In the second week of his pupilage he received the appointment of senior mains engineer. During the four and a half years he was at Leeds 200 miles of high- and low-tension cables and 30 miles of telephone cable were laid, and 55 transforming chambers were erected under his supervision. In May, 1902, he was appointed City Electrical Engineer at Wakefield, where he was responsible for large extensions, and redesigned and altered, the original single-phase system to polyphase supply. In January, 1905, he took up the post of Chief Electrical Engineer at Worcester.

C. M. SHAW.

A. M. TAYLOR.

Mr. A. M. TAYLOR, Assistant Engineer at Birmingham, reads a Paper on "A.C. Accumulator Sub-stations, and the Use of Accumulators on Peak Loads," on the last day of the meeting. Mr. Taylor's

Digitized by Google

record is a long one. After passing through a course in electrical engineering with Ayrton & Perry in 1881–4, Mr. Taylor entered Messrs. Siemens Bros.' works at Woolwich. Some of the important work he did for this firm took him abroad, and he also spent two or three years in India on behalf of Messrs. Siemens. Returning from India, Mr. Taylor was at the firm's London office until 1898, when he left to take up the post of chief engineer to the National Electric Traction Co. Mr. Taylor next came to Birmingham as the personal assistant to the Chief Engineer, in which position he has remained ever since.

H. A. RATCLIFF.

Mr. H. A. RATCLIFF, the reader of the last Paper, "The Work and Equipment of a Testing and Standardising Department," is a native of Nottingham, and has been on the staff of the Manchester Corporation Electricity Department since his twenty-first year. Entering their service in 1897, he served first for a short time in the mains surveyor's department, and then in the installation department. On the formation of a separate testing department in 1899, he was promoted to take charge of it, and was mainly responsible for all the detail work in connection with the equipment of what is one of the finest municipal testing departments in the country.

The following gentlemen had notified their intention of attending the Convention up to yesterday (Wednesday):—

Accrington—H. Gray.
Acton—J. M. Blair.
Barking—H. S. Howard, A. W. Smith.
Barnes—C. S. Davidson.
Barrow-in-Furness—H. R. Burnett.
Beckenham—J. E. Tapper.
Bedford—R. W. L. Phillips, S. Kilpin.
Belfast—T. Bloxam.
Birkenhead—W. Wyld, W. Bates.
Birmingham—A. M. Taylor.
Blackburn—P. P. Wheelwright, Mr. Higham.
Blackpool—C. Furness.
Bolton—A. A. Day, Ald. J. Berry.
Bootle—T. D. Clothier.
Bradford—T. Roles, A. Wood.
Bray—W. J. U. Sowter.
Brighton—J. Christie.
Bristol—H. Faraday Proctor, Ald. G. Pearson.
Broughty Ferry—J. L. Turnbull.
Burslem—Aston Bremner, T. Willett.
Burton-on-Trent—P. J. Pringle.
Bury—S. J. Watson, R. D. Duxbury.
Canterbury—C. A. Blascheck.
Carlisle—S. T. Allen.
Cheltenham—W. J. Bache.
Chester—L. E. Britton.
Chesterfield—R. L. Acland.
Colne—A. G. Cooper.
Coventry—Ald. West, Councillor Pridmore.
Croydon—A. C. Cramb, Ald. D. Miller.
Darlington—J. R. P. Lunn.
Derby—T. P. Wilmshurst.
Dewsbury—R. N. Campion.
Ealing—J. D. Knight.
Easthourne—J. K. Prydges.
Eccles—H. W. Angus, Ald. W. Pearson.
Edinburgh—F. A. Newington, Councillor A. Murray (Convener), Bailies A. Stevenson and Neill.
Falkirk—J. McMillan.
Farnworth—R. B. Leach.
Glasgow—W. W. Lackie.
Govan—T. C. Parsons, Bailie R. A. Wightman.
Greenock—J. A. Robertson, N. M. Brown.
Grimsby—W. Vignoles.
Halifax—W. M. Rogerson.
Hanley—C. H. Yeaman.
Harrogate—G. Wilkinson, R. McCourt.
Hastings—R. F. Ferguson, F. A. Langham.
Heywood—T. Popple.
Hornsey—N. Staniland.
Hoylake—C. J. Turner.
Huddersfield—A. B. Mountain, Ald. Chatterton, Ald. Jepson.
Hull—H. Bell, J. Wilkinson.
Ilford—A. Shaw.
Ilkeston—A. C. Gilbert.
Ipswich—F. Ayton.
Kettering—W. A. Walker.
Kilmarnock—A. H. Burbidge.
Kingston-on-Thames—J. E. Edgcome.
Lancaster—W. A. Lester, James Heald, T. Huntington.
Leith—A. Rutherford, Judge G. Craig.
Lincoln—S. Clegg.
Liverpool—A. Clough, E. Lloyd.
Londonderry—R. V. Macrory.
Luton—W. H. Cooke, Ald. Wilkinson.
Maidenhead—C. O. Milton.
Maidstone—E. E. Hoadley, E. Vaughan.
Manchester—S. L. Pearce, H. A. Ratcliff, E. S. Hurlbatt, G. D. Seaton, W. Yates.
Mansfield—E. H. Hewlett.
Morecambe—A. V. Bland.
Newport (Mon.)—H. C. Bishop.
Norwich—F. M. Long.
Nottingham—H. Talbot, Sir John Turney, J. Aldworth.
Oldham—S. Newington.
Paisley—C. Parkinson, Bailie A. Fisher.
Partick.—W. Sillery.
Plymouth—E. G. Okell.
Rochdale—C. C. Atchison, J. P. Fielden.
St. Helens—E. M. Hollingsworth, Ald. J. Beecham.
Salford—V. A. H. McCowen, Councillor Barrett, F. Hill.
Sheffield—S. E. Fedden, A. Cridge.
Southport—A. S. Black.
Stockton-on-Tees—J. J. Smith.
Stoke-on-Trent—P. J. S. Tiddeman.
Sunderland—A. Blackman.
Swansea—A. Sinclair.
Tynemouth—C. Turnbull.
Wakefield—H. A. Nevill.
Wallasey—J. A. Crowther.
Walsall—A. S. Barnard.
Warrington—F. V. L. Mathias.
West Bromwich—W. A. Jackson.
West Hartlepool—H. F. Fredericks.
Weymouth—J. H. Bolam.
Whitehaven—W. Sankey, Ald. W. Hashwell.
Willesden—J. G. Bruce, B. A. Griffin.
Wimbledon—H. Tomlinson-Lee.
Woking—J. G. McLean.
Wolverhampton—C. E. C. Shawfield.
Worcester—C. M. Shaw.
Wrexham—W. Pickvance.
York—J. W. Hame.

Fox (Willans & Robinson), F. Foulds (Faraday House), W. E. Freir, T. E. Gatehouse, G. P. Gregory (B.T.-H. Co.), Robert Hammond, Haydn Harrison, A. Hopkinson (J. Hopkinson, Ltd.), J. Huddleston (Siemens Bros & Co.), F. A. Jerbury, M. Martin, A. Musall (W. T. Glover & Co.), N. New (Gen. Elec. Co.), F. C. Raphael (ELECTRICAL ENGINEERING), T. R. Renfree (British Electric Transformer), J. H. Rider (L.C.C. Tramways), J. Robinson, Prof. W. Robinson (University College, Nottingham), H. S. Russell, R. Schofield (Ferranti, Ltd.), H. Scholey (Dick, Kerr & Co.), E. Sharp (Venner & Co.), Prof. R. H. Smith, J. F. C. Snell, J. J. Stenitz (Brush Co.), N. Sutherland, A. Webster (ELECTRICAL ENGINEERING), B. Welbourn (British Insulated & Helsby Cables), A. G. Whyte, C. Wilson (Robertson Lamp Works), J. H. Wilson.

PROPOSED NEW HOME FOR THE INSTITUTION OF ELECTRICAL ENGINEERS

FOR some time schemes have been under consideration for the provision of new quarters for the Institution of Electrical Engineers, which shall not only possess the increased office and library accommodation so badly needed, but shall render it unnecessary for the Institution to be obliged to depend on the hospitality of the Institution of Civil Engineers and the Society of Arts for the holding of meetings. Generally a headquarters is desirable, worthy of the body representing the electrical engineering profession and industry. The special building fund established with this view has been gradually growing, and a site

Digitized by Google

in Tothill Street, Westminster, from which rents are now being drawn, was acquired in the year 1903. This site was subsequently added to and now embraces Nos. 15 to 18, Tothill Street. An opportunity has, however, presented itself for a different solution to the problem, and a scheme is now under consideration for the purchase of an existing building, and the disposal of the site already acquired.

The new home proposed for the Institution is the building on the Victoria Embankment between Waterloo Bridge and the Savoy Hotel, known as the Medical Examination Hall, a view of which is shown in the accompanying illustration.

In connection with the scheme, notice has been given of a Special General Meeting of members, associate members, and associates of the Institution, to be held in the lecture theatre of the building itself on Tuesday, June 30th, at 5.30 p.m., for the purpose of considering and, if thought fit, passing the following resolution:—

"That the purchase of the lease of the site and building known as 'The Medical Examination Hall,' situate on the Victoria Embankment, now the property of the Royal College of Physicians of London and the Royal College of Surgeons of England, for the sum of £50,000, be sanctioned and approved, and that the Council be authorised to sell such of the investments of the Institution and to make such other financial arrangements (including the disposal of the site in Tothill Street now owned by the Institution) as the Council may consider necessary for the above purpose."

It should be pointed out, that the passing of this resolution in no way forces the Council to proceed with the scheme; it is merely permissive in its effect, and has for its object the expression of approval of the body of membership to the scheme. Although the negotiations may be regarded as fairly complete, neither party concerned in the sale and purchase is legally bound until the contract of purchase has been executed, which cannot be done until after the General Meeting. The owners of the property are the Royal College of Physicians of London and the Royal College of Surgeons of England, who hold it from the Duchy of Lancaster on a ninety-nine years' lease dating from 1885, the unexpired portion being therefore seventy-six years. The Council proposes to purchase this lease for £50,000, plus the ground rent of £2,201 per annum. As already stated, the building stands on the Victoria Embankment. It faces one of the Embankment Gardens, and is situated between the Savoy Hotel and Waterloo Bridge. It is midway between Charing Cross and Temple Stations on the District Railway, is within a few minutes' walk of Waterloo, Charing Cross, and St. Paul's Stations, is close to the Strand Station of the Underground Electric Railways, and is almost at the point of junction of the tramways of the north and south of London.

The building occupies a nearly square site of over 20,000 sq. ft., and contains a floor space (exclusive of corridors, entrance halls, and passages) of more than 40,000 sq. ft. The theatre is rather small, but the Council considers that it can be increased and improved without very serious expense. In order to enable members to see the building, the Royal Colleges have kindly allowed the use of the theatre for the special General Meeting, and will permit inspection of the principal rooms of the building after 5 p.m., half an hour before the time of the meeting, on Tuesday, June 30th.

From an inspection of the building it is obvious that it contains a larger number of rooms than would be required at present for the purposes of the Institution, so that a portion of the building would be sublet, and this must, of course, be borne in mind in considering the financial position.

THE EXAMINATION HALL OF THE ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, THE PURCHASE OF WHICH BY THE INSTITUTION OF ELECTRICAL ENGINEERS IS PROPOSED.

The main part of the building, which was built 22 years ago by the Royal Colleges of Physicians and Surgeons, forms four wings surrounding a quadrangle, into which project the main staircase and the semi-circular back of the lecture theatre, and consists of a basement, ground, first, second, and third floors, each containing a number of large and lofty rooms. One of the finest rooms in the building is on the first floor in the front which runs the whole width of the house, but can be sub-divided by folding doors if necessary. The majority of these various rooms are used as offices, examination rooms, class-rooms, laboratories, &c., by the Colleges of Physicians and Surgeons, but a portion is sub-let and used as offices by other tenants. The lecture theatre forms a part of the rear wing, but, as we have said, projects into the central space. It is constructed with semi-circular tiers of seats sloping back one above the other, and a gallery, but at present a temporary level floor is fitted, covering the well. It will accommodate about 450 persons, which is about the same as the hall of the Institution of Civil Engineers, but, by setting back the semi-circular wall, it could be enlarged to hold at least 750 persons. There are four side entrances as well as the main front entrance, and a goods entrance in a private road at the back.

THE NOTTINGHAM CORPORATION ELECTRICITY SUPPLY UNDERTAKING

A SUPPLY of electricity for lighting, power, and tramway purposes in Nottingham is given by the Corporation from three continuous-current generating stations at different parts of the town. The undertaking had its inception in 1894, when the original station was opened. The electricity department has been presided over during the whole 14 years of its existence by Sir John Turney, chairman of the Electricity Committee, and Mr. H. Talbot, this year's President of the Municipal Electrical Association, has been Chief Electrical Engineer to the Corporation since the commencement of the undertaking.

A glance round the three stations shows examples of plant of various types of design which have had great vogue at different times in this country, and it is of some interest to trace the successive periods marked by the extensions which have been made to the plant from time to time, the more so, perhaps, because practically the whole of the electrical plant is the product of a single firm of manufacturers. The three stations comprise the original Talbot Street station, to which considerable extensions have been subsequently added, the more recently built St. Ann's Power House in St. Ann's Well Road, from which the greater part of the tramway supply is taken, and the Eastcroft refuse destructor station. At the present time most of the supply for private lighting and power is taken from Talbot Street, but, as will be seen hereafter, there

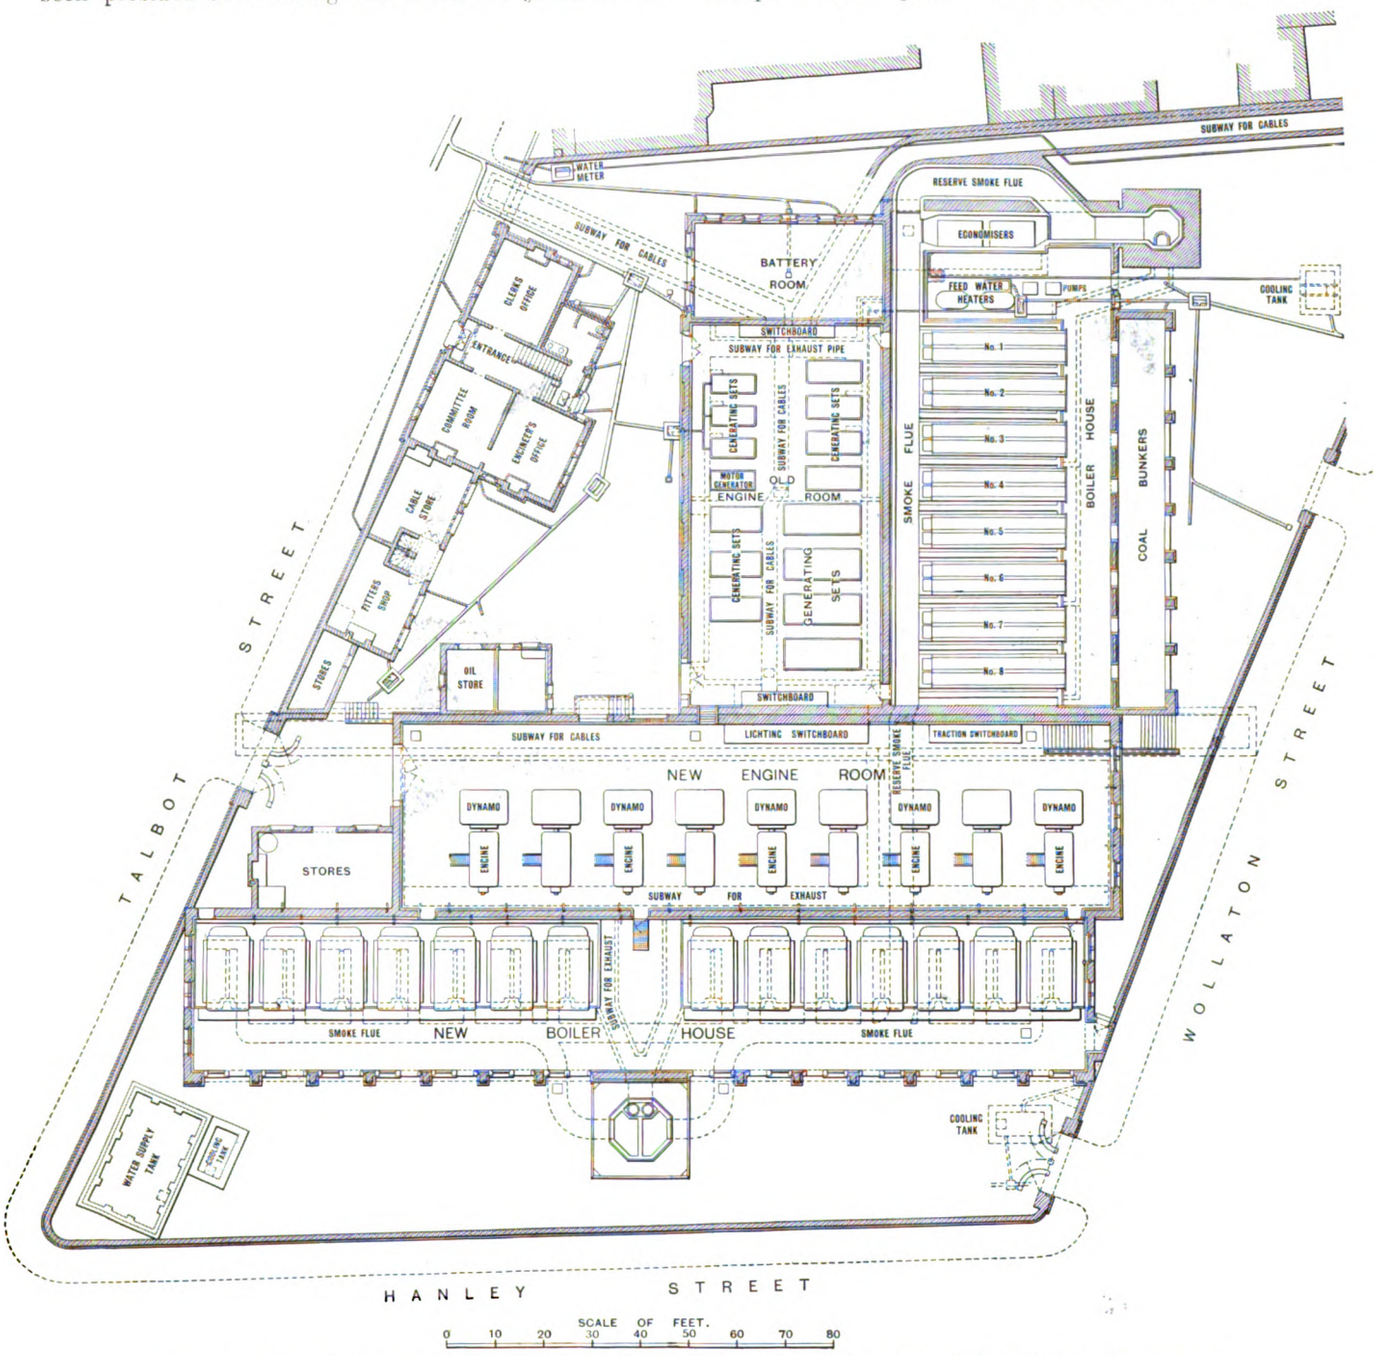

FIG. 1.—PLAN OF TALBOT STREET GENERATING STATION, NOTTINGHAM CORPORATION ELECTRICITY DEPARTMENT.

Digitized by Google

are three 440-kw. sets which can be used for traction if required. The St. Ann's station, although originally built for the tramways, also supplies a certain amount of the lighting load. These stations are interconnected by 0·75 sq. in. trunk mains, and a certain number of feeders are brought up to the switchboards in each station. The third station is purely for the utilisation of steam from the destructor, and has connected to it one lighting feeder and one traction feeder.

A plan of the Talbot Street station is shown in Fig. 1, and Fig. 2 is a view of the older engine-room. The original portion, part of which can be seen in the foreground, contained, when first opened, six sets. Three of these were 100-volt Siemens bipolar machines driven by 80 h.p. two-crank Willans' central valve engines, and the other three were 220-volt machines

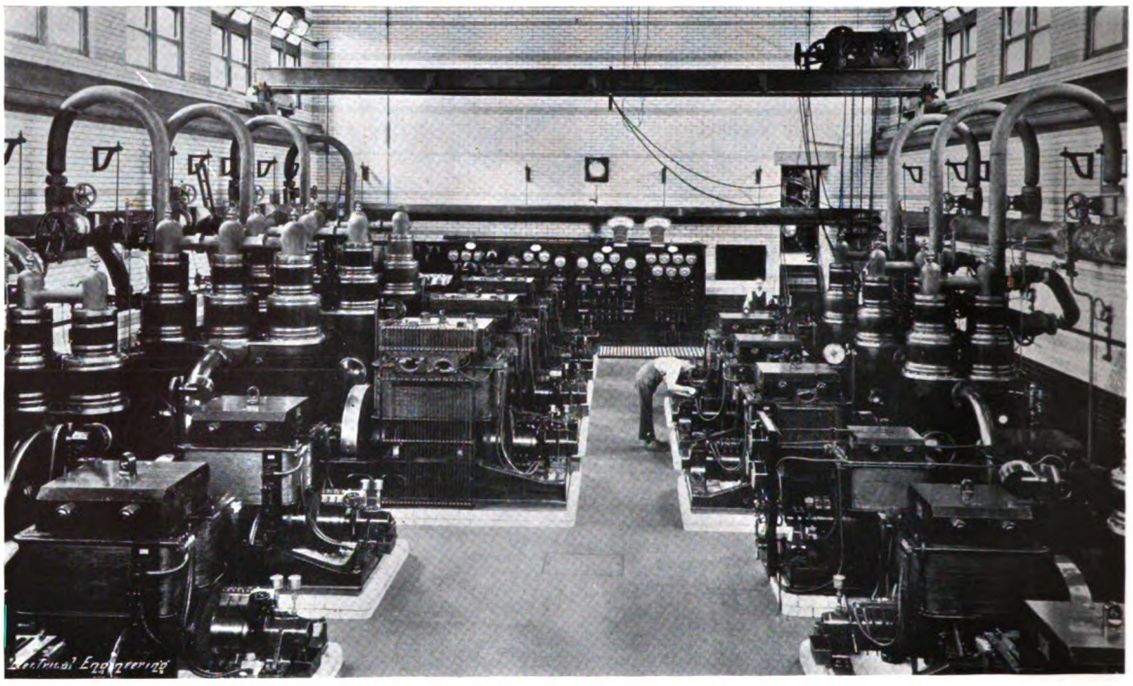

FIG. 2.—VIEW OF OLD ENGINE-ROOM, TALBOT STREET STATION.

driven by 135 h.p. Willans engines. A further set of this size was subsequently added in this part of the engine-room. The sets seen in the background in Fig. 2 were put down when the first extension to the

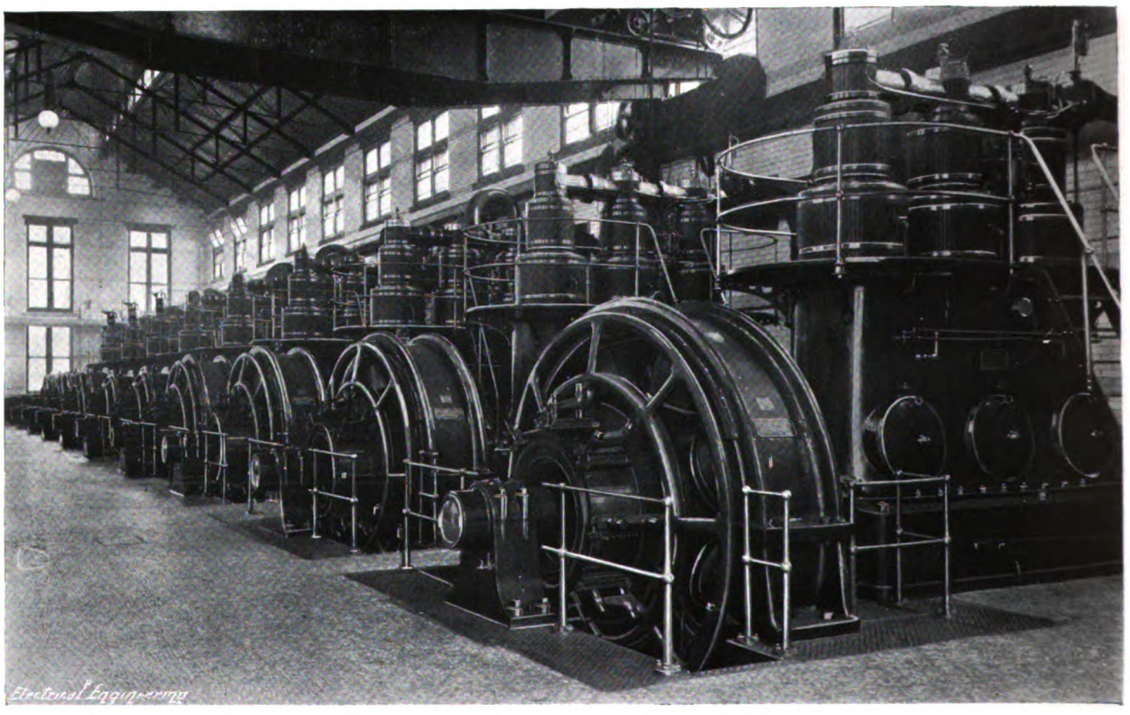

FIG. 3.—VIEW OF NEW ENGINE-ROOM, TALBOT STREET STATION.

engine-room was built in 1896, and consist of three more 135 h.p. sets, and the four larger sets seen on the left, which are driven by three-crank compound Willans engines. The positions of these various sets are shown clearly on the plan in Fig. 1. All the

Digitized by Google

engines are exactly similar, except for differences in size, and the fact that some are of the two-crank and some of the three-crank pattern. All run non-condensing, and, indeed, it is due mainly to the absence of condensing water that turbines have not been adopted in any of its stations. The dynamos are all examples of the famous bipolar "H.B." smooth core type, built by Messrs. Siemens Brothers at their Woolwich works in the 'nineties. All these machines are shunt wound. The original 100-volt sets, which, however, can be worked up to about 148 volts, are now principally used for battery charging, and the 220-volt machines are used for balancing on the 440-volt three-wire network. The motor-generator set seen on the right in Fig. 2 is used on one side of the system with the battery on the other for balancing at times when none of the 220-volt sets are running. Its output is 150 amps. at 210 to 230 volts.

The second extension took place in 1899, when an entirely new engine-room at right angles to the original engine-room and with a separate boiler-house was constructed. The generating plant in this section marks the transition from the bipolar smooth core machine with copper brushes to the multipolar generator with slotted core and carbon brushes, as well as the gradual increase in size of the sets, although, as compared with modern practice, the sets are small and numerous. The imposing appearance of the nine sets which, arranged in a single row, form the equipment of this engine-room is seen in Fig. 3. Each set consists of an eight-pole Siemens 440 kw. continuous-current generator driven by a three-crank compound 705-h.p. Willans engine of the size known as three S's. The three furthest machines are compound wound, and can be on the traction load if required, with an output of 800 amperes at from 500 to 550 volts. The engines driving these sets are fitted with Sankey's patent variable cut-off gear. The remaining six machines are shunt wound for running on the 440-volt lighting mains. These engines, like those in the older engine-room, run non-condensing.

Each of these three groups of generating sets has its own switchboard. Taking the more recent plant first, we find in the new engine-room a marble traction board opposite the three traction generators provided with three generator panels and six feeder panels, and interconnected with the St. Ann's station. This board was supplied by Messrs. Siemens Brothers, and is equipped with Messrs. Elliot Brothers' recording instruments. The change-over switches to the three traction generators are placed behind the board. The lighting board, also by Messrs. Siemens Brothers, is shown in Fig. 4. It is provided with nine single-pole generator switches, with minimum releases at the bottom of the board, and provision for twelve feeders and three trunk mains. There are three separate sets of bus-bars, on to which any of the generators or feeders may be connected by means of plugs. These bus-bars may be connected together or can be kept at different voltages if desired. The centre panel is devoted to the middle wire and connections for the pilot wire voltmeters. All the feeders are provided with duplex fuses with change-over switches. The instruments are of the moving coil pattern in ambroin cases, and are of Messrs. Siemens Brothers' own manufacture. The old engine-room has two boards, one at each end, corresponding to the older and newer sections of the generating plant. The board seen in Fig. 2, at the other end of the room, was supplied by Messrs. Blackburn & Starling, of Nottingham, and contains provision for seven generators and six feeders. This board is interconnected with the lighting board in the new engine-room just described, so that supply can be exchanged from one to the other. The original board at the other end of the old engine-room was supplied by the Electric Construction Co., and has six feeders connected up to it. The centre forms a battery panel with regulating switches, but we understand that the battery is not used now so much except for testing and balancing in conjunction with the motor generator already mentioned. Some of the switchgear on this board is interesting from a historical point of view as

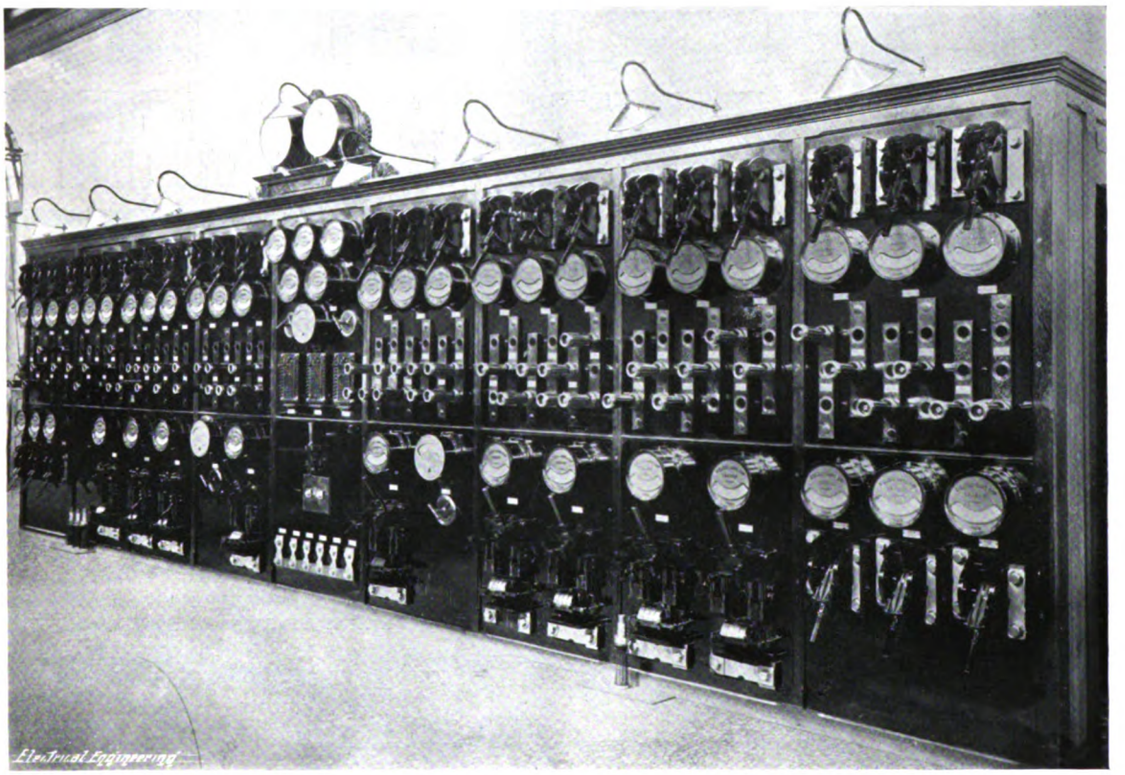

FIG. 4.—LIGHTING SWITCHBOARD IN NEW ENGINE-ROOM, TALBOT STREET STATION.

Digitized by Google

embodying a method of regulation of back E.M.F. cells.

The positions of the two boiler-houses are shown on the plan in Fig. 1. The old boiler-house contains eight Lancashire boilers (28 ft. × 7 ft.), made by Messrs. E. Danks & Co., of Oldbury, each of an evaporative capacity of 5,500 lbs. per hour. These boilers are arranged in a single row, and are hand fired. The feed water, which is obtained from the town water supply, is passed through a Berryman feed heater. Weir steam-driven feed pumps are used, but there is also one electrically driven feed pump which is generally kept as a stand-by. A Green's economiser is provided, and we noticed a CO_2 recorder of the Simmance-Abady type in use. Both "Sentinel" and "Giepel" steam traps are fitted to the steam piping. The new boiler house contains a row of fourteen dry-back boilers, each capable of evaporating 10,000 lbs. of water per hour, by the same makers. These are also hand-fired, and the bunkers supplying the mechanical stokers. All this conveying plant is driven from a single 15-h.p. motor, but arrangements are made for an alternative drive from the other end of the shaft by a steam engine, which can be connected when required through a clutch. Green's economisers and Berryman feed-water heaters are used, and, as at the other stations, all the steam piping is electrically welded. The exhaust is carried in a pair of 24-in. pipes to the top of the chimney, which is 220 ft. in height, and it has been found necessary to provide a special silencer for the steam pumps to avoid the deep organ note which was produced by this pipe when first installed and was audible for miles around.

The switchgear is on similar lines to the latest board at Talbot Street, and does not need detailed description. The board, which is also by Messrs. Siemens Brothers, has provision for dealing with eleven feeders. It is interconnected with the switchgear at Talbot Street.

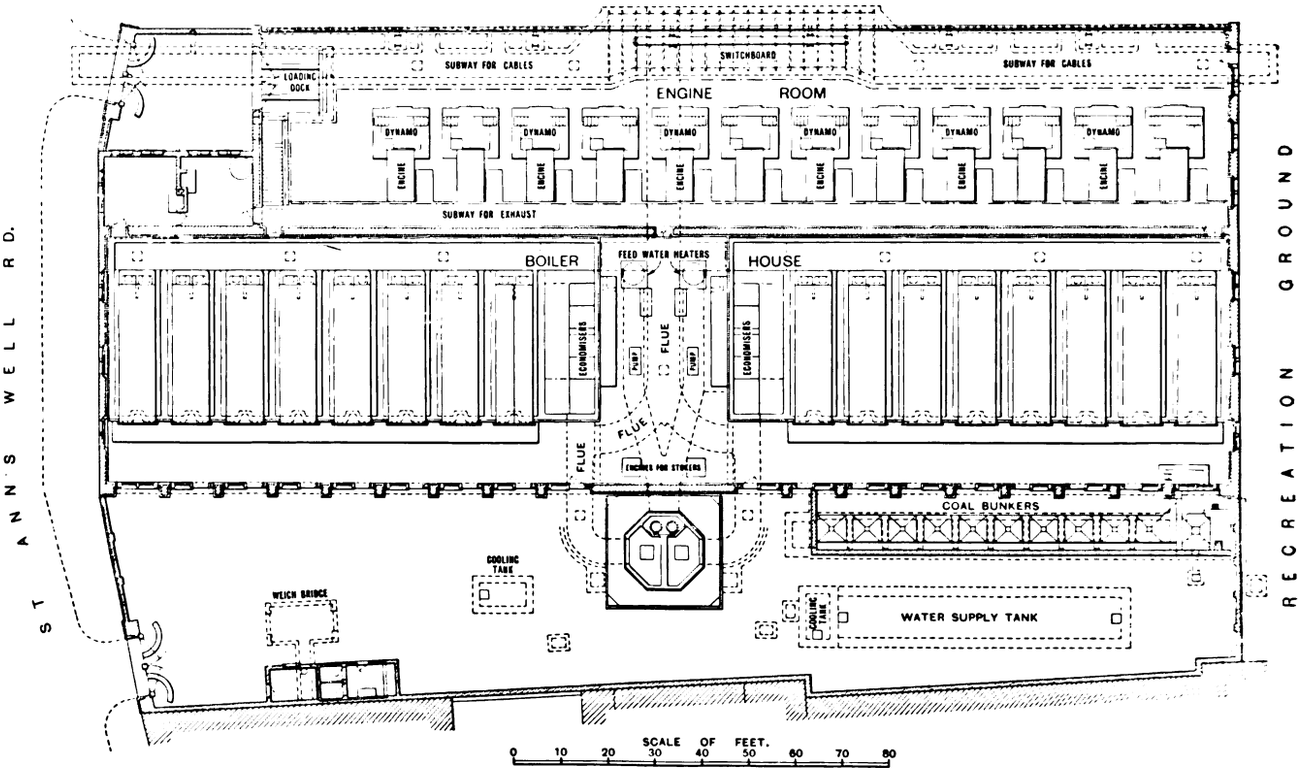

FIG. 5.—PLAN OF ST. ANN'S GENERATING STATION.

similar arrangements for feed heating, &c. are provided to those in the old boiler-house. The steam pipes, and also the feed-water pipes, are interconnected in the two boiler-houses, and in order to maintain the efficiency of the arrangement the alternative supply is made use of regularly once a week.

A plan of the St. Ann's station is given in Fig. 5. The generating plant is practically a replica of that in the new engine-room at Talbot Street, consisting also of a row of nine Willans-Siemens 440-kw. sets. The boiler-house contains eight Lancashire boilers by Messrs. Yates & Thom, of Blackburn, fired by Vicars' automatic stokers, and four hand-fired Lancashire boilers by Messrs. E. Danks & Co. A further set of four Lancashire boilers, by Messrs. Danks, is now being erected. A special form of simply arranged coal-conveying plant is installed in connection with the mechanically fired boilers. A belt conveyor runs under the hoppers in front of the boiler-house, into which the coal is tilted from carts, and from the end of this conveyor an inclined bucket conveyor raises the coal to a further overhead conveyor, from which it is fed into

A plan of the destructor station is given in Fig. 6. The generating plant consists of three six-pole Siemens' continuous-current generators of the type known as 31·2 H for an output of 147 kw. at 440 volts, driven by triple-expansion Willans' two-crank engines at 360 r.p.m. These machines are of a later type than the plant at Talbot Street and St. Ann's, and exhibit one or two differences of design, especially in the construction of the field frames, which are of cast-iron of elliptic section, with the poles cast in, instead of cast-steel of H section, with the poles screwed on. The engines are fitted with Sankey's cut-off gear, similar to that in use on the traction sets at Talbot Street. The switchboard, also of Siemens' manufacture, also marks a transition to later designs, especially as regards the automatic cut-outs, and has connections for one lighting and one traction feeder.

Steam is supplied from six Babcock & Wilcox boilers, arranged in the twelve-cell destructor. This destructor, of the standard type, is by Messrs. Manlove, Alliott & Co., of Nottingham. The boilers are provided with apparatus for coal firing, but this is not

Digitized by Google

now used. A feature of the arrangement of the destructor is the way in which the refuse is stored in the actual charging truck on the charging platform over the cells. The clinker from the cells is taken to a paving-stone making plant adjoining the destructor, all the machinery in which is electrically driven. The Electricity Department pay all the wages in connection with the generation of electricity, but the Health Department tip the refuse on to the charging platform and maintain the boilers. During the last year 28,302 tons of refuse were destroyed, and 1,069,885 units were

Some further interesting figures are given below:—

Load factor, lighting, and power	15·28 per cent.
,, traction	33·12 ,,
,, combined	20·56 ,,

	1906/7.	1907/8.
Maximum load, lighting	4216 kw.	4336 kw.
,, traction	1549 ,,	1820 ,,
Total	5765 kw.	6156 kw.

The increase in the traction load is mainly accounted for by the opening of an additional tramway route during the year.

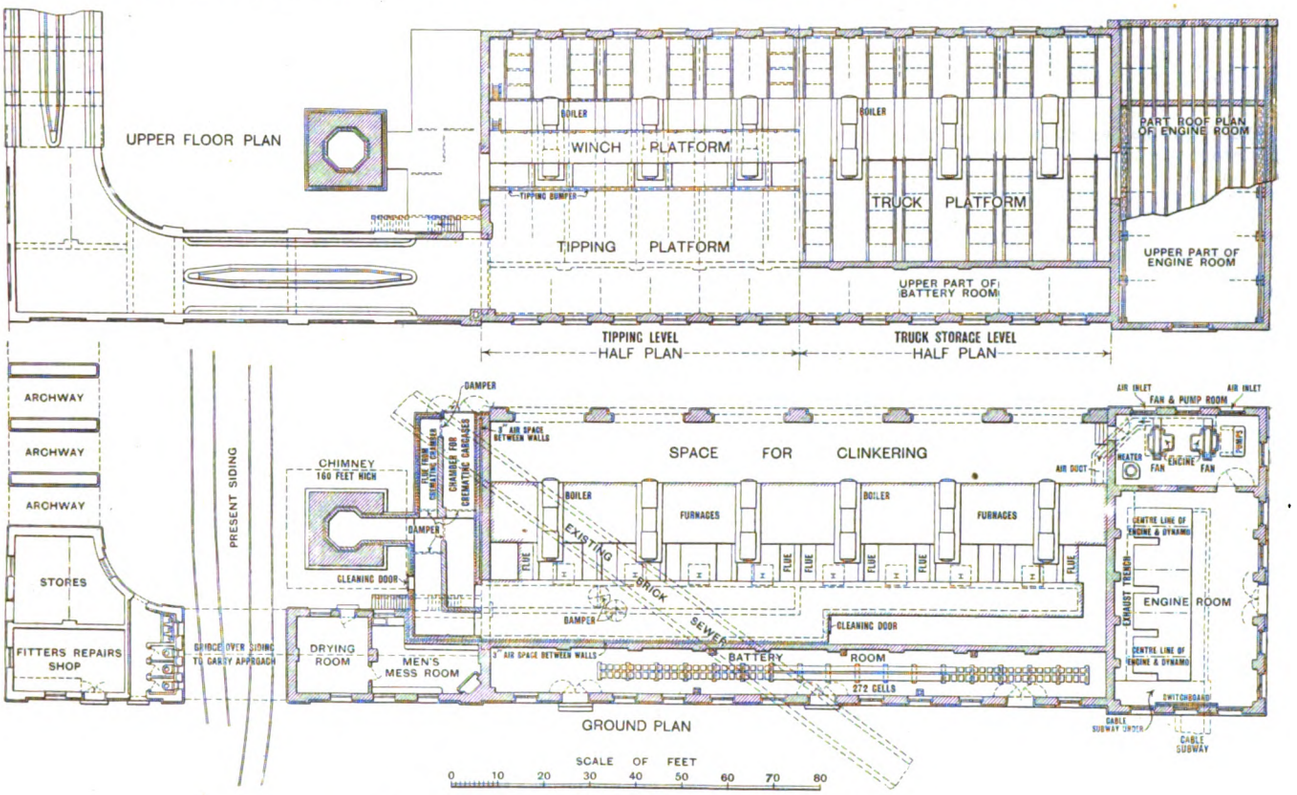

FIG. 6.—PLANS OF EASTCROFT DESTRUCTOR STATION.

generated therefrom, or an average of 37·8 units per ton. The wages paid averaged 0·48d. per unit. All the buildings of the three stations were designed by Mr. Arthur Brown, City Engineer.

The mains throughout the town were supplied by Callander's Cable & Construction Co., and the different portions laid out at different times form examples of the bitumen conduit, drawn in, direct in ground and solid systems respectively. There are three sub-stations containing boosters, and one, at Isandula Road, contains a battery. A certain amount of street lighting is done by 152 arc lamps on the tramway routes affixed to the centre poles. It is probable, however, that these lamps will be done away with when certain projected alterations to the overhead tramway equipment are carried out. Metal filament lamps are not used as yet for street lighting, although they have been very extensively adopted in the town for private lighting.

An idea of the magnitude of the undertaking and the proportions of the lighting, power, and tramway loads may be obtained from the following table of units sold during the last financial year:—

Units sold for private lighting	3,947,167
,, ,, public lighting	165,481
,, ,, power	1,709,208
,, ,, tramways	5,294,979
Total	**11,116,835**
Total units sold in previous year	9,530,096

The costs per unit sold for the last two years are given below:—

	1906/7.	1907/8.
Coal	0·32d.	0·406d.
Oil, waste, water, and stores ...	0·07	0·063
Wages	0·17	0·154
Repairs and maintenance	0·12	0·117
Total works cost	**0·68**	**0·74**
Rates, taxes, &c.	0·17	0·15
Management charges	0·13	0·12
Total cost (excluding capital charges)	**0·98**	**1·01**
Sinking fund, &c.	0·72	0·62
Total cost (including capital charges)	**1·70**	**1·63**

It will be seen that the increase in costs is entirely due to the high price of coal, as every other item has been reduced. The average price received per unit was 1·96d. The charge for power is a flat rate of 1¼ per unit, and we understand that the power load is increasing very rapidly. There are not, however, in Nottingham many factories of large size, but there is a marked tendency to adopt electrical driving in the lace industry, and it is declared by some manufacturers, who are already taking power, that the steadi-

Digitized by Google

ness of the electric drive results in the production of an improved quality of lace.

It should be said that since the commencement of supply in September, 1894, only one brief interruption of supply has taken place, and that was due to no worse accident than a switchboard attendant switching in a " dead " machine in error.

In conclusion, we should express our thanks to Mr. H. Talbot, City Electrical Engineer, Mr. A. Armitage, his chief assistant, and other members of his staff, for kindly according us facilities for obtaining the information on which this article is based, for putting at our disposal the drawings from which the accompanying plans have been prepared, and permission to take photographs in the station.

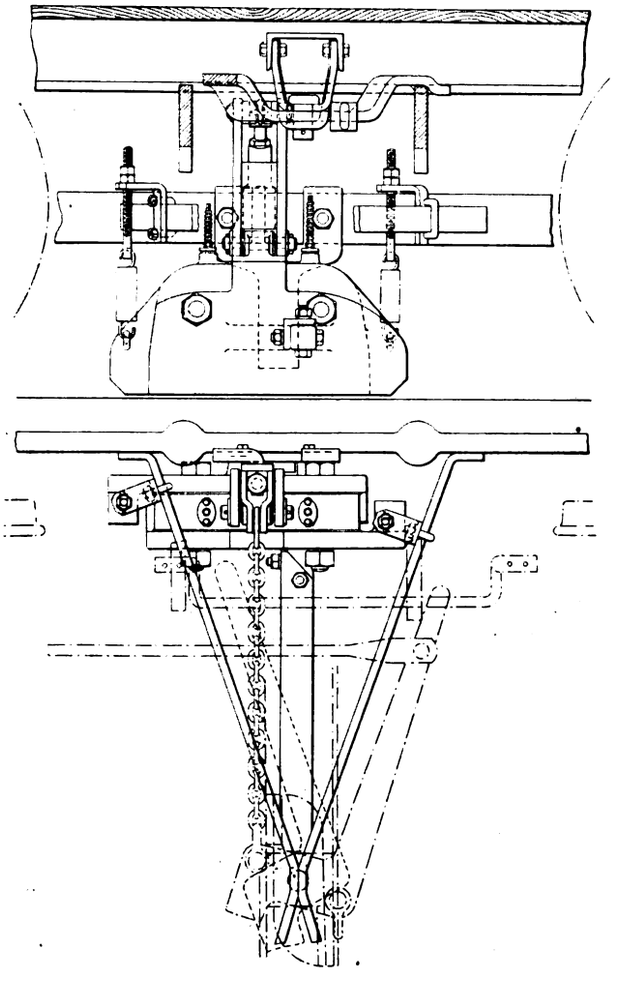
The Telephone Service in Paris.—We have received the following interesting in formation with regard to the telephone situation in Paris :—The agitation caused by the inefficiency of the telephone service continues to find expression in the Press and in public meetings of protest. The Association of Telephone Subscribers, organised four years ago to voice the complaints of the exasperated telephone users, has recently circulated a petition to Parliament calling the attention of the Government to the many defects of the present telephone service, and praying either for a complete reorganisation of the telephone branch of the French Post Office, or, failing that, for the return of the telephone service to private enterprise, from which it was taken by the Government nearly twenty years ago. The new central battery exchange in the Passy district of Paris has increased, instead of decreasing, the volume of the public complaint against the telephone service. Owing to the mistaken policy of the French Administration in maintaining in service the old instruments at the subscribers' stations, which are of a variety of types, and are not adapted to central battery working, the service of the new exchange is even worse than that of the old. The interest of Parliament having been aroused by the intensity and persistence of the public complaints against the telephone service, a Parliamentary Committee of members of the Chamber of Deputies for the various divisions of Paris last week invited the Council of the Association of Telephone Subscribers to attend the committee with a view to giving detailed information regarding the existing difficulties with the telephone service. At this meeting the Association of Telephone Subscribers was represented by the Marquis de Montebello (President), Mr. Archdeacon (Vice-President), and Mr. H. Laws Webb (Consulting Engineer to the Association). The Parliamentary Committee, presided by M. Georges Berry, consisted of some fifteen members representing various divisions of Paris, who gave a sympathetic hearing to the case for the telephone-using public. M. de Montebello explained that the principal difficulties arose from the fact that the telephone service is at present operated merely as a branch of the Postal and Telegraph Administration, and he urged that for efficient working it was necessary to organise the telephone service as a separate department in all respects. A complete reform was necessary, not only in the technical methods of the telephone administration, which had been allowed to fall far behind the times, but also in the selection and training of the staff, in the general business administration of the department and in its financial management. Mr. Archdeacon followed along the same lines, and gave examples of the disorganisation at present existing among the staff of the telephone branch of the French Post Office, quoting figures to show the greatly higher development of the telephone in the other principal European countries and the more favourable tariffs for telephone service which are offered to the public of other countries. Mr. Laws Webb explained to the Committee the essential difference between the telephone service and the postal and telegraph services, and pointed out that for an efficient city telephone service uniformity of plant and special training of the staff are essential requisites. The Committee asked numerous questions of the deputation; and several members made short speeches in which, while strongly opposing the suggestion that the French telephone service should be handed back to private enterprise, they stated that they fully agreed with the views of the deputation that the telephone branch of the French Post Office should be entirely reformed, and should be organised and conducted on the same lines as a commercial concern. Members of the Committee themselves complained very forcibly that they were unable as matters were now conducted to obtain any figures or information giving precise data of the results of the telephone branch of the French Post Office; the Administration did not know itself what it was doing so far as finance was concerned. The Committee unanimously promised to support the Association of Telephone Subscribers, and to take the matter up actively in Parliament, with the object of securing appointment of a special Commission of members of the Chamber and representatives of the telephone subscribers for the purpose of making a thorough investigation of the difficulties under which the French telephone service now labours.

AMERICAN AND CANADIAN ELECTRICAL CONVENTIONS

THE annual convention of the American Institute of Electrical Engineers will be held at Atlantic City, under the presidency of Mr. H. C. Stott, almost simultaneously with the convention of our Incorporated Municipal Electrical Association at Nottingham, viz., from Monday, June 29th, to Thursday, July 2nd. The following Papers will be discussed :—"Modern Developments in Single-Phase Generators," by Mr. W. L. Waters; "A New Large Generator for Niagara Falls," by Mr. B. A. Behrend; "The Relative Proportion of Copper and Iron in Alternators," by Mr. C. J. Fechtheimer; "Application of Fractional-Pitch Winding to Alternating-Current Generators," by Mr. J. Bache-Wiig; "Voltage Ratio of Split-Pole Converters," by Prof. C. A. Adams; "Induction Motors for Multispeed Service with Particular Reference to Cascade Operation," by Mr. H. C. Specht; "The Determination of the Economic Location of Substations in Electric Railways," by Mr. G. B. Werner; "From Steam to Electricity on a Single-Track Road," by Prof. J. B. Whitehead; "Conductor-Rail Measurement," by Mr. S. B. Fortenbaugh; "Fundamental Considerations Governing the Design of Transmission-Line Structures," by Mr. D. R. Scholes; "Tests with Arcing Grounds and Connections," by Mr. E. J. Berg; "High-Voltage Experiments at Niagara," by Mr. R. D. Mershon; "Standard Tests for High-Voltage Line Insulators," by Mr. C. E. Skinner; "Measurements of Lightning, Aluminium Lightning-Arresters, Earth Resistances and Kindred Tests," by Prof. E. E. F. Creighton; "Engineering Features of the Southern Power Company System," by Mr. J. W. Fraser; "The Application of Storage-Batteries to the Regulation of Alternating-Current Systems," by J. L. Woodbridge; "Steam Turbine Plant : Some Possibilities Resulting from Recent Engineering Developments," by J. R. Ribbins; "Thirty-Day Test on Producer-Gas Plant : Discussion of Results in Relation to Cost of Energy," by Mr. J. R. Ribbins; "Three-Phase Power-Factor," by Mr. A. Burt; "Graphical Treatment of the Rotating Field," by Mr. R. E. Hellmund; "The General Equation of the Electric Circuit," by Dr. C. P. Steinmetz; "A Minimum-Work Method for the Solution of Alternating-Current Problems," by Dr. H. Pender; "Notes on the Electric Heating Plant of the Biltmore Estate," by Mr. C. E. Waddell; "Relation of the Manufacturing Company to the Technical Graduate," by Mr. M. W. Alexander; "Relation of the Manufacturing Company to the Technical Graduate," by Mr. B. A. Behrend; "Relation of the Manufacturing Company to the Technical Graduate," by Mr. D. B. Rushmore; "The Measurement of Rotary Speeds of Dynamo Machines by the Stroboscopic Fork," by Dr. A. E. Kennelly and Mr. S. E. Whiting; "Wireless Telephony," by Mr. R. A. Fessenden; "A Study of Multiple-Office Automatic Switchboard Telephone Systems," by Mr. W. L. Campbell; "Primary Standard of Light," by Dr. C. P. Steinmetz; "Water Power Development in the National Forests : A Suggested Government Policy," by Mr. F. G. Baum; "An Imperfection in the Usual Statement of the Fundamental Law of Electromagnetic Induction," by Mr. C. Hering.

The eighteenth annual convention of the Canadian Electrical Association was held at Toronto on Wednesday, Thursday, and Friday of last week in the university buildings, under the presidency of Mr. R. S. Kelsch. Special features of the convention, in addition to the Papers and discussions, were an exhibition of electrical supplies and apparatus, a practical demonstration of electro-metallurgical apparatus, and various excursions and entertainments. The following Papers were down for discussion :—"Power Rates and Factors which Influence Them," by Mr. W. N. Ryerson; "How to Increase the Station Load," by Mr. George Williams; "Lost and Unaccounted for Current," by Mr. C. R. McKay; "Electrical Plant Earnings Per Capita," by Mr. W. A. Bucke; "Various Electrical Power Plants by European Designers," by Mr. C. H. Mitchell; "Modern Arc Lighting," by Mr. A. E. Fleming; "Regulation of Electric Currents or Circuits," by Mr. W. G. Chace; "Various Distributing Systems Adaptable to Cities and Towns," by Mr. R. G. Black; "Electrical Franchises, their Legal Status and Basis of Valuation," by Jas. Bicknell; "Contracts," by Robert McKay; "Grounding of Transformer Secondaries," by W. L. Macfarlane; "The National Electrical Code," by Mr. H. F. Strickland; "The Oscillograph," by H. W. Price. A lecture was also given on "Large Power Plants of America," by Mr. R. J. Clarke.

Wireless Telegraphy in Germany.—According to *The Times*, it has been officially announced that from July 1st the German telegraph service will undertake the dispatch of telegrams by wireless telegraphy. The rates will comprise coastal, ship, and ordinary tariffs.



New Mountain Railway in Bavaria.—According to the *Glasgow Herald*, an electric railway to the Zugspitze, the highest Alpine peak on German territory, has been proposed. The Zugspitze could be reached from Munich in three hours with the aid of the new railway.

Digitized by Google

THE NOTTINGHAM TRAMWAYS

BY the permission of Mr. John Aldworth, General Manager of the Nottingham Corporation Tramways, whose personal courtesy to us on a recent visit of inspection we desire to acknowledge, we are enabled to give the following information, which will be of interest to members of the Incorporated Electrical Association who will travel on the lines and inspect the car-shed and repair-shops next Tuesday.

At Nottingham there are 19¼ route miles of tramways, equivalent to 38½ track miles, as almost the whole is double track. Standard gauge is employed. The overhead construction is partly with centre poles, partly single bracket poles, and partly span wire. Span wire construction with side poles is being employed on all new work, and in some cases centre poles are being replaced by span wires, chiefly to remove the obstruction in the streets. On the new work, also, grooved wire with mechanical ears is used, and in all replacements mechanical ears are being adopted for the existing 000 B. & S. gauge circular wire.

Current is supplied to the line from the Corporation's combined lighting and traction stations, and is metered to the Tramways Committee at 1½d. per unit.

The cars ar chiefly single truck: there are 109 single truck cars, 10 with "maximum traction" trucks, and 6 with double trucks and 4-motor equip ments. Top covers are popular, and are fitted on the later cars that are purchased, while at the same time covers are being gradually added to the existing cars in the Corporation's own repair-shops.

The lines are fairly hilly—the steepest gradients are 1 in 11½ and 1 in 13, so that the brake equipment is important. Nottingham is one of the first towns to employ the new British Thomson-Houston "electro-mechanical" track brake, which has already been fitted on 10 single-truck cars. This is a magnetic track brake, the shoes of which can also be lowered mechanically by a hand-wheel if desired. The cars fitted with these brakes have hand-brakes for ordinary traffic stops, and the hand-wheel of the track-brake is concentric with the ordinary brake handle.

The brake is applied electrically by turning the controller handle on to the braking notches, thus connecting the exciting coils of the magnets to the motor circuits; while the exciting current generated by the motor is regulated by the rheostats. The magnetic action of the shoes cause them to be drawn down upon the rails with a force of several tons.

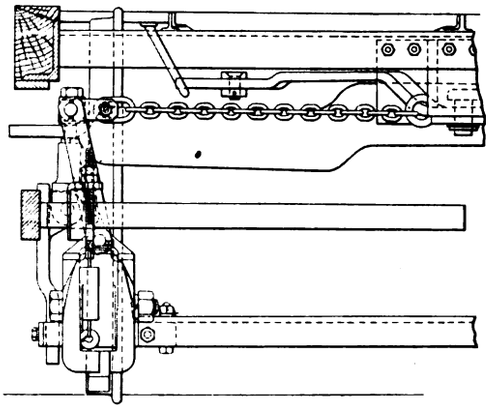


FIG. 1.—THE B.T.H. ELECTRO-MECHANICAL BRAKE.

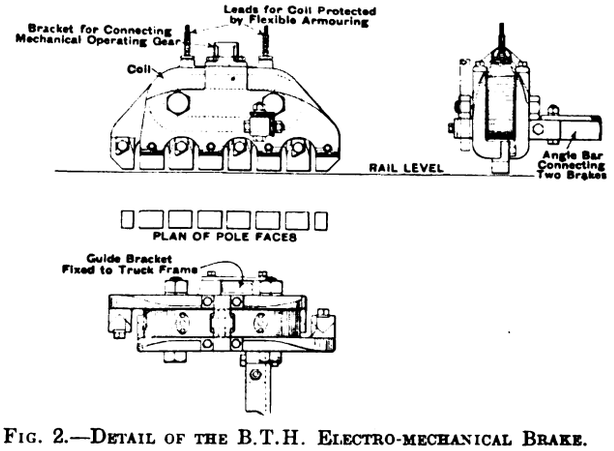

FIG. 2.—DETAIL OF THE B.T.H. ELECTRO-MECHANICAL BRAKE.

To enable the track brake to be applied by hand, a floating lever is supported by a suitable bracket to the centre of the car underframe. The long arms of the lever are each connected in the manner shown in the illustration, by pull-rods to the brake spindle. The short arms of the floating lever transmit the pull through chains to rocking levers on the truck side frames. Each rocking lever consists of an adjustable link, pivoted to a bracket, and of a compression link, the lower end of which is connected to the brake magnet. When the upper ends of the rocking levers are drawn towards the centre of the car by the chains, the compression links force the brake

Digitized by Google

magnets downwards on the rails. A drawing of the arrangement is given in Fig. 1.

The use of this combined magnetic and mechanical track brake should afford great security in the operation of cars on steep gradients. By applying the brake mechanically at the top of a gradient, the speed of the car when descending may be maintained at any desired rate, and the car may be brought to rest by further applying the brake either by hand or magnetically. The British Thomson-Houston Co. inform us that tests have recently been made on a car fitted with this brake on a gradient of 1 in 12, and that even with the track brake applied mechanically only, very rapid stops were made at speeds up to 16 or 17 miles per hour. Very satisfactory results were obtained both on wet and very greasy rails. Remarkably rapid stops were made with the brake applied electrically, the rate of braking on level track reaching 12 ft. per second per second.

The brake itself (Fig. 2), consists of a pair of electro-magnets, provided with renewable track shoes. The magnets are connected together by a bar spanning the track, and are suspended from the truck frame by spiral springs, seen in Fig. 1, which normally hold them clear of the rail. The thrust occasioned by the retarding action of the brake is taken on a tongue-shaped steel bracket, which is bolted to the truck and engages with jaws on the side of the magnets. Brackets are also fastened to the upper part of the magnet, to provide connection to the lever for operating the brake mechanically.

The design of the magnet is multipolar. Each magnet consists of two main steel castings which, bolted together, form a spool with deep elongated

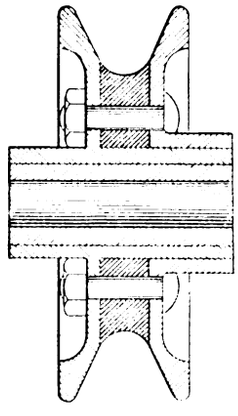

FIG. 3.—SECTION OF TROLLEY WHEEL WITH REVERSIBLE CENTRE.

flanges. The lower edge of each flange terminates in a number of lugs projecting inwards, the two sets of lugs interlacing with each other but separated by air gaps. To these lugs the wearing shoes are fastened. They consist of blocks of iron or steel shaped in such a way as to facilitate renewal and provide a strong rigid connection to the magnet. The magnet coil is completely enclosed in a watertight metallic cover. The terminals of the coil are insulated leads, brought out through stuffing boxes, and covered with flexible armouring, and arranged for connecting to the controller cables.

The 16 bogie cars have Newell track brakes, and the single-truck cars not fitted with the B.T.-H. brake have a mechanical slipper-brake, in addition to the ordinary hand and rheostatic brakes. On these hand track-brakes cast-iron shoes are being substituted for wooden shoes with excellent results, and they have also an adjustable bracket designed by Mr. W. Boot, the Works Superintendent, in conjunction with Mr. Aldworth, which enables the wear of the brake-shoe to be compensated for so that the full leverage is still obtained on the brake-shoe, even when considerably worn.

Twenty cars have been fitted with Dick-Kerr run-back preventers, which consist of an alteration in the connections of the controller by which the motors are short-circuited when the handle is in the off position, without the armature connections being reversed. It is found that a car will only run back down a steep grade at about one mile per hour under this arrangement when the controller is left in the off position.

Another interesting departure from standard design that members will be able to see when visiting the car-sheds is a type of trolley-wheel, with renewable centre and bushes. This is the joint invention of Mr. Aldworth and Mr. Boot, and is being manufactured by the Railway & General Engineering Co., of Nottingham. The renewable centre is simply a gun-metal disc, and solid graphite bushes are used. It is estimated that the sides of the wheel will last out some 20 centres or more. The life of the centres is about 5,000 miles, and of the graphite bushes about 8,000 miles. A section of the wheel is shown in Fig. 3.

In Nottingham, as elsewhere, trouble has occasionally been experienced with loose armature spiders, resulting sometimes in the conductors being torn off at the commutator lugs. As a means of tightening these, a useful workshop "kink" has been adopted, which, although it may appear a rough method, has, we are assured, been found thoroughly effective. The armature spindle upon which the spider has become loose is coated with hard solder, which is turned down in a lathe to a thickness of, say, $\frac{1}{64}$ in. The spider is pressed on to this, and keyed in the usual way, and a thoroughly tight fit is obtained.

There are three depôts. Two smaller ones have accommodation for 45 cars each, and the third at Trent Bridge, which is the one to be visited by the Association next week, has room for 88 cars, and is a good example of practical and useful design. The car-shed proper is about 90 yards long and 45 yards wide. Behind it is the main repair-shop, extending back another 40 yards, and occupying 23 yards of the width, and next to this is a shorter shop, in which the top covers are being fitted, taking up the remaining width. This latter shop contains a few wood-working tools, and the top covers are made and fitted there.

The main repair-shop has two 10-ton electric cranes, one over each of the two lines of repairing pits which occupy the centre, and along each side is a line of machine tools, each line of shafting being driven by an electric motor. There are three lathes, a double-bedded shaping machine, a radial drill, a boring machine, wheel-grinder, wheel-press, and other essential machines. A gas oven has been put in for baking out armatures, and a portion of the shop is partitioned off for armature winding. Practically all repairs to the cars are done in these shops, including metalling the bearings, but no actual car building, with the exception of the top covers already alluded to and the conversion of a motor-'bus into a tower-waggon, which is at present in progress in a smaller shop. Three motor-'buses were tried for a short time on a route not yet equipped for tramways, but these were found to require so much attention that, for the time being, they have been replaced by horse 'buses.

The car-shed contains eleven pits, and there is a traverser at the end by means of which a car can be transformed from any line of pits to any other. The shed is lighted with open arc lamps, a series of ten off the tramway circuit and two series of four off the lighting network. No sockets are provided for plugs for examination lamps for use in the pit, as these are taken off the car circuits when required.

Digitized by Google

Among the cars in the shed is a combined snow-plough and store-waggon. This is mounted on an ordinary single truck with standard equipment, and is provided with salt hoppers large enough to hold 5 or 6 tons of salt, which is sufficient to salt the whole track of the town. By means of rollers worked by chain gear, the salt is brought down to each rail in just sufficient quantity to melt the snow on the rail.

At the back of the depôt building, comfortable recreation rooms have been provided for the men. There is a skittle alley, a large reading-room with a billiard-table and table skittles, and a music-room. This has been so much appreciated that it is proposed to have similar rooms on a smaller scale in the other two depôts for the men who are off duty for short periods.

THE GLASGOW TRAMWAY ACCIDENT

THE following is an abstract of the report of Col. H. A. Yorke to the Board of Trade on the accident that occurred on January 3rd to a tramcar belonging to the Glasgow Corporation while it was on the journey from Springburn to Mount Florida under circumstances reported in ELECTRICAL ENGINEERING, January 9th, p. 42.

As Car No. 986 was proceeding down the High Street with about 40 passengers on board, it appears to have got out of control on the hill called Bell of the Brae, between Rotten Row (or Drygate) and George Street (or Duke Street), and ran away for a distance of about 1,000 yards, until it came to rest in the Saltmarket, near the corner of Steele Street, where the gradient is almost flat. After passing Duke Street the car came into collision with eight lorries in succession, the first four collisions occurring between College Street and Ingram Street, and the remainder at intervals between Ingram Street and Glasgow Cross. The results of these collisions were disastrous, two persons being killed and about ten injured, in a few cases seriously. The leading end of the tramcar was demolished, the front platform and dashboard being smashed in, the staircase twisted out of shape, and the controller wrenched from its position and thrown backwards against the door of the car. The car was a four-wheeled double-deck car without top cover; it was fitted with the magnetic track brake, hand brake, trigger lifeguard, and two sanders, viz., one at each end.

The only place where the gradients are at all severe is on the portion of the route called Bell of the Brae Hill, between Rotten Row and George Street, where there are short lengths of 1 in 16, 1 in 18, and 1 in 20. On account of these gradients the speed down this portion of the route is limited by the Board of Trade regulations to eight miles an hour, and there are compulsory stops at the corner of Rotten Row (or Drygate), and at the corner of Duke Street, these being fixed in order to ensure as far as possible that the speed of cars shall be moderate.

The car left the Langside Depot at 5.17 a.m., and the three drivers who had charge of it before it was handed over to driver Dolan, who was in charge of the car at the time of the accident, all testified that the car was in perfect order during the whole time they had charge of it. Dolan received the car at Mount Florida, and drove it from there to Springburn, back to Mount Florida, and again to Springburn. On reaching Springburn on the last occasion, Dolan left the car for a few minutes, and asked a driver named R. McKenzie, who chanced to be there, to take the car across on to the other track ready for the return journey. In order to do this it was necessary to remove both the power handle and the reversing handle from the controller at the Springburn (or No. 1) end of the car, and put them on the controller at the Mount Florida (or No. 2) end. McKenzie found that he could not take off the reversing handle of No. 1 controller. While these men, together with Conductor Child, were trying to get the handle off, two other men arrived on the scene, viz. time-keeper Falconer and inspector Muirhead, who, in his anxiety to clear the road, decided to leave the reversing handle at No. 1 end of the car as it was, and to allow the car to return to Mount Florida without a reversing handle at No. 2 end, which then became the leading end of the car. Muirhead therefore gave Dolan instructions to this effect, at the same time telling him that the fact that the reversing handle was left in the forward position at No. 1 end would make no difference to the driving or braking of the car (by means of the electro-magnetic brake) at No. 2 end. The controller handle was then taken to No. 2 end, and Muirhead, having placed the reversing barrel at that end in the proper position for the journey to Mount Florida, by means of a pair of pliers, himself drove the car across from the north-bound track to the south-bound track, where, as everything appeared to work satisfactorily, he handed it over to Dolan.

All seems to have gone well until he reached the corner of Cathedral Street. From Cathedral Street to Rotten Row, which is the next stopping place, the distance is 200 yards, and the gradient 1 in 33·37. The evidence indicates that Dolan failed to stop at Rotten Row, where what is known as the Bell of the Brae hill commences, upon which there are short lengths of inclination of 1 in 16·72 and 1 in 18·54. At the bottom of this hill, namely, at the corner of Duke Street, which is rather more than 200 yards from Rotten Row, there is another compulsory stop, and again Dolan failed to stop his car. By this time the speed was high, being, according to the evidence, as much as 25 to 30 miles an hour. It was evident at that time that Dolan had entirely lost control of the car. Shortly after this the first and second collisions occurred, and Dolan fell into the roadway. After this the car proceeded on its journey unchecked, and collided with six other lorries in succession before reaching Glasgow Cross. Conductor Child realised that something had gone wrong, but was unaware that the motorman had been injured or that he had fallen from the car. He did not at that time apply his hand brake, because he did not receive the brake signal, viz., four rings on the electric bell, from the driver, and Col. Yorke is of opinion that, under the circumstances, he was right in not applying the hand brake, as he might have skidded the wheels and so have interfered with the action of the magnetic track brake in case this had been applied by the motorman. The car should have stopped at Glasgow Cross, where the tramway crosses two other tram lines, and where the traffic is usually very congested. Fortunately, it got across this busy spot without further mishap. As the gradient was getting flatter, the speed was being gradually reduced, and conductor Child, being by that time aware that something serious must have happened to the motorman, applied his hand brake and brought the car to a stand in the Saltmarket. It is a somewhat remarkable fact that the car did not leave the rails. Owing to the death of motorman Dolan and the absence of any direct evidence as to what happened at the front end of the car, it is impossible to say with certainty how it was that Dolan lost control of it, or why he failed to stop at the two important places, viz., Rotten Row and Duke Street. An examination of the gear of both the magnetic track brake and the hand brake after the accident indicated, so far as their damaged condition would permit, that no defect had existed in either of them prior to the accident.

Four methods of braking were, under normal circumstances, available on the car, as explained in the book of rules and regulations issued to their men by the Glasgow Corporation, viz., (1) By means of the hand brake; (2) by means of the magnetic track brake; (3) by reversing the motors: the reversing handle being placed in the backward position; (4) by short-circuiting the motors while acting as generators: the reversing handle being placed in the backward position, and the controller handle placed on the highest power notch. This method to be used only as a last resort. Of these, (3) and (4) were not available to Dolan, owing to the fact that he had no reversing handle at his end of the car. The rule in Glasgow is that on gradients such as those on the Bell of the Brae Hill cars should coast down with the magnetic track brake applied sufficiently to maintain the speed at eight miles an hour, but, assuming for a moment that something was wrong with the magnetic brake, there would have been no difficulty whatever in coasting down that hill by the use of the hand brake, had it been applied at the top of the hill at Rotten Row, and the speed never allowed to exceed the eight-mile limit. In either case the brake should be applied while the car is at rest at the top of the hill. Judging from evidence, Dolan was using both the magnetic brake and the hand brake at the time of the first collision. If the speed was then anything like 25 to 30 miles an hour, the hand brake would be practically useless, and the only result of applying it would be to interfere with the action of the magnetic track brake by causing the wheels to skid. And although the track brake, if properly used, would be able to stop a car travelling at that speed, given sufficient time or distance, it seems that the first collision occurred before any reduction of speed could have been effected. Had the reversing handle been available at the front end of the car, it is probable that Dolan, following the usual custom, would, if time had permitted, have made use of No. (4) method of braking, which, as already stated, is to be used only as a last resort. This method is in reality nothing more than another form of wheel brake, the power of which is limited by the coefficient of friction between the wheels and the rails, and it is not nearly so effective as No. (2). Under these circumstances, I do not think, writes Col. Yorke, that

Digitized by Google

the fact that Dolan was unable to use No. (4) method of braking had any bearing upon the accident, inasmuch as this method would not have had time to take effect before the collisions occurred and Dolan received his fatal injuries. When the car came to rest, the hand brake was found to be off and the controller handle in the full braking position, the effect of which would be to apply the magnetic track brake with full force. But as the front of the car was very much damaged, and the hand brake spindle bent and the controller case broken and forced backwards out of its position, it is impossible to say definitely whether the handles were in these positions when Dolan fell off the car, though it is not improbable that they were.

It is difficult to explain why Dolan failed to stop his car in the usual manner at the top of the Bell of the Brae Hill, and allowed it to descend the incline at an excessive rate of speed so that by the time it reached the bottom of the hill it was entirely out of control. There seem to be only two ways of accounting for the occurrences. Either Dolan was driving carelessly or even recklessly, and allowed the speed of the car to increase too rapidly before he took any steps to check it, or else some portion of the magnetic track brake gear which he should have been using must have failed him. Dolan was an experienced motorman, and bore a good character for steadiness and sobriety.

Col. Yorke reports that he has gone very thoroughly into the construction of the controller in question, and the effect of leaving the reversing handle in the forward position at No. 1 end of the car, upon the driving and braking of the car by means of the controller at No. 2 end. No. 90 pattern of controller differs from other tramway controllers in that the movement of the reversing handle does not directly move the reverse drum itself, this not being actually rotated until the main handle is moved from the "off" position towards either the power or the brake notches. The ratio of the gear, by means of which the reverse drum is rotated by the movement of the main drum, is such that a very slight movement of the main (controller) handle causes the contacts of the reverse drum to make connection with their corresponding fingers. The placing of the reversing key of the controller in the forward position at one end of the car has, so long as the handle of the controller at that end is accurately in the "off" position, absolutely no effect upon the driving or braking of the car by means of the controller at the other end. But if by any chance the controller handle at the first end is displaced even to a small extent towards the brake notches, contact is made between the reversing drum and its corresponding fingers, with the result that when the controller handle at the other end is moved to the braking position the armatures of the motors are short-circuited, and the magnetic track brake cannot be applied. Similarly, if the main handle at one end of the car is slightly displaced towards the driving notches, the reversing key being as before, it would prevent the car from being started by means of the controller at the other end.

If, when Inspector Muirhead told Dolan to remove the controller handle from No. 1 end of his car to the other end, the pointer was exactly in the "off" position, he was right in saying that the reversing handle at No. 1 end of the car being left in the forward position would make no difference whatever to the driving or braking of the car by means of the controller at No. 2 end. But if, in removing the controller handle from No. 1 end, it was displaced even to a very slight degree in the direction of the braking notches, it would render it impossible to operate the magnetic brake from the controller at No. 2 end. Should anything of this sort have happened, it is possible that when Dolan came to apply his magnetic track brake on the Bell of the Brae hill, it did not operate, not on account of any defect in it, but simply because the electrical connections were wrongly made. This would take him by surprise, and, not knowing the reason for the failure of the brake, he might have made more than one attempt to apply it. By the time he realised that for some reason, which he did not understand, the magnetic track brake was out of use, the speed would have got beyond the power of the hand brake, and the car would then be out of control. It is impossible to say that the accident actually occurred in this manner, but it is undoubtedly a possible and not improbable explanation of the disaster.

Whether this is the correct explanation or not, Col. Yorke considers that inspector Muirhead committed a grave error of judgment in allowing the car to leave Springburn with the reversing handle in the forward position at the rear end of the car, and without any reversing handle at the driving end. For, disregarding altogether the suggestion made above, it is not to be disputed that Dolan was deprived of the third and fourth methods of braking the car which are specified in the Glasgow Tramway Rule Book. Muirhead's duty, and Dolan's duty if Muirhead had not happened to be present, was to cause the car to be taken to the nearest depot as soon as the difficulty with the reserving handle occurred, and, if the car had been sent there, there would have been no occasion for it to descend the hill until the defect had been put right.

It is quite easy to guard against the possibility of removing the controller handle when it is not absolutely in the "off" position by casting on the lid of the controller case an overhanging lip round the spindle of the main drum, with only one gap in it, viz., immediately opposite the "off" position, attaching at the same time to the handle a lug which would engage in the lip in such a way that the handle could only be put on or taken from the controller in the correct position. Such a lip is provided on controllers of other types, and the manufacturers (the British Westinghouse Co.) agreed to act upon this recommendation in future when manufacturing controllers of No. 90 pattern.

When the case of the controller was opened after the accident, the jamming of the reversing handle at No. 1 end of the car was found to be due to the screw pivot stud at the top of the reverse interlocking pawl having become unscrewed, thus allowing the pawl to get out of position and preventing it from passing through the slot in the sprocket wheel, the result being that the interlocking gear became jammed and the reverse handle could not be moved in either direction. The defect is easily remedied, either by inserting a small plug of wood or metal in the pivot hole on the top of the pivot stud, or, better still, by lengthening the pivot stud itself, and the manufacturers promised to attend to it.

In conclusion, Col. Yorke points out that the custom on the Glasgow Corporation Tramways of using the hand brake for ordinary stops, and of reserving the magnetic track brake for emergency stops and when coasting down hills, is not, in his opinion, the proper manner in which to employ the magnetic or any other form of "power" brake; it is a mistake in tramway practice to regard any brake as an "emergency" brake, and as one which is only to be used on rare occasions. When this custom is followed, there is a risk that the brake will either be wrongly applied, or for some reason or other will fail when the occasion for its use arises. In tramcar driving the "emergency" is ever present, and the motormen should be instructed to use at all times the most powerful braking device at their disposal. The tramcar to which this accident occurred, and most of the tramcars belonging to the Glasgow Corporation, are fitted with only two sand-boxes—viz., one at each end of the car. This means that sand can be applied to only one rail at a time, so that when the rails are greasy, and the efficiency of the braking appliances is of the utmost importance, it happens that the brakes, of whatever description, only do good work on one side of the car, which, in other words, means that when the rail conditions are at their worst, only half the brake power is available. This seems to be a very unsatisfactory arrangement, and I strongly recommend that the Glasgow Corporation should take early steps to fit all their cars with four sanders—viz., two at each end.

Electrification of the Bavarian Railways.—A large number of Bavarian manufacturing concerns have presented a memorial to the Bavarian Government, in which it is urged that the contracts for the supply of the electrical equipment necessary for the utilisation of the country's water-power and for the electrification of the railways, should be let out to the various firms specialising in the different classes of machinery, and should not be put in the hands of one or a few large firms. To entrust the whole of the work to one or a few large firms would, the memorial states, be injurious to the industry and to the country, on both economical and political grounds.

Manchester Electrical Exhibition.—A meeting of the General Committee was held in Manchester on Tuesday, the 16th inst. last, in the offices on the Exhibition site, Platt's Park, Fallowfield. Satisfaction was expressed at the progress which has been made in the erection of the huge building, the skeleton of which is now complete. The management reported that very satisfactory support was being received from all branches of the industry. Already over 100 spaces have been let, representing a total of between 140 and 150 individual exhibitors. That the importance of this exhibition is now generally recognised is evinced by the fact that Dr. Edward Hopkinson, of Messrs. Mather & Platt, Mr. Rushton, of Messrs. Dobson & Barlow, and Mr. W. T. Stubbs, of Messrs. Joseph Stubbs & Sons, have each accepted a seat on the General Committee, as representing the allied engineering trades. Schemes for the decorating ad lighting of the building inside and out were discussed, and the management were instructed to prepare plans and estimates for same. Special arrangements are being made with the railway companies all over the country for cheap fares and excursions to Manchester during the progress of the exhibition. A further General Committee meeting is fixed to be held in the exhibition offices on Tuesday, July 7th next, by which time it is hoped that the buildings generally would be in an advanced state. The management propose arranging for a demonstration of wireless telegraphy between the exhibition buildings and some important town within a radius of, say, 50 miles, of Manchester. Numerous other attractive demonstrations of electricity are also being arranged for, full details of which we shall hope to furnish our readers with later, and the members of the Gas and Oil Engine Manufacturers' Association, recognising the important bearing which the exhibition will have in the engineering world, have decided to arrange for a number of complete working exhibits of special plants as applied to the generation of electricity.

ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY

AT the last meeting of the Chemical Society, June 18th, Professor Tilden contributed an interesting Paper upon "The Rusting of Iron." It has frequently been stated that rusting only takes place when one has present iron, carbon dioxide, oxygen and water, although some investigators have contested this point, and said that it is possible to get rusting when you only have present iron, oxygen and water. In America, recently, W. H. Walker and collaborators (ELECTRICAL ENGINEERING, Vol. II., p. 576) consider that the rusting is an electrolytic action, and this they have proved in several ways. They think that owing to the impossibility of obtaining iron which is quite pure, that the composition of the metal is never uniform, that therefore owing to the impurities being unevenly distributed throughout its mass, the surface of the iron when in contact with water behaves as if it were a number of small electrolytic cells. There are consequent differences in potential, and therefore a portion of the metal will behave as cathode and another portion as anode. As a consequence, oxidation takes place and the metal rusts.

Prof. Tilden has carried out a long and laborious series of experiments, in which he has taken every precaution to prevent the presence of carbon dioxide in the oxygen he has employed. The iron was most carefully cleaned and placed in small silica boats contained in a glass tube, the whole apparatus was heated and connected up with a vacuum pump. Then water was introduced by heating crystallised barium hydrate; this will absolutely prevent carbon dioxide being present. Afterwards oxygen was introduced into the tubes, and it was noticed that in a short time the iron became tarnished, but generally speaking red rust was not produced. Professor Tilden has also proved that iron will dissolve to an analysable extent in pure distilled water, and he considers it invariably goes into solution in the form of ferrous hydroxide, and that red rust is afterwards produced by oxidation. He also referred to the well-known fact that washing the iron in a solution of chromic acid had the effect of preventing it being acted upon, and that not only did it temporarily effect it, but the effect appeared to be of a lasting character. It cannot, however, be said that the large amount of work which has recently been carried out in connection with the rusting of iron has led to any very tangible results. Most of the work which has been done of late has simply shown that under conditions which do not occur ordinarily, rusting will take place, but they have hardly yet told us how to prevent rusting taking place in iron exposed to ordinary atmospheric conditions.

In the *Chemiker Zeitung* of June 17th, Dr. W. Conrad contributes an article upon the "Advances in the employment of large electric furnaces for the manufacture of Calcium Carbide and high grade Ferrosilicon." Although the two processes are very different chemically, yet the same form of electric furnace can be used for the manufacture of both products. In the one case we have $CaO+3C=CaC_2+CO$, and in the other $SiO_2+2C=Si+2CO$, the latter reaction taking place in presence of iron or iron oxide. To produce 1,000 kilog. of chemically pure calcium carbide, 874 kilog. lime and 562 kilog. carbon are required, whereas to form 1,000 kilog. silicon, 2,140 kilog. of pure quartz and 860 kilog. carbon are necessary. The carbide process is in the main a melting one, but with ferrosilicon it is more in the character of a reducing process. The first forms of furnace employed consisted of a crucible forming one pole and a hanging electrode the other pole. But owing to the large amount of dust produced, and to the sudden bursting out of tongues of flame the process was troublesome and rather dangerous. Therefore, instead of withdrawing the charge as the reduction proceeded, the carbide was allowed to form until 300–400 kilog. had been produced; the furnace then cooled, and the blocks of carbide broken out. This intermittent process was carried on for a number of years, particularly in Norway, Austria, and Switzerland. It was then found that by employing two electrodes the yield could be increased by nearly 20 per cent. Series furnaces were then introduced, and with these blocks of carbide weighing more than 1 ton each could be obtained.

In order to build large furnaces for the production of ferrosilicon it is essential to so arrange the electrodes that they readily burn away, so that they become coated with a gas layer. A good furnace lining is of importance; the current also should not be led in by the floor of the furnace. The electrodes are formed of hard, burnt carbon, which is stamped and pressed into shape. The largest, which are made in Germany, are 18 cm. long and 33 cm. wide; consequently, in order to produce larger electrodes, they have to be clamped together. In France, some of the electrodes have a breadth of 50 cm. The raw material for the carbide manufacture consists of chalk or limestone, coke, anthracite, or wood charcoal. For ferrosilicon, quartz, anthracite, or wood charcoal and iron. 1 kilog. carbide requires 4 kilowatt hours, 1 kilog. silicon 12 kilowatt hours. Therefore, 1 kilowatt day would yield 6 kilog. carbide, or 4 kilog. 50 per cent. ferrosilicon. In the Alps and Norway, where water power is very cheap, the cost is 16s. to 40s. for 1 ton of carbide, and 24s. to 60s. for 1 ton of 50 per cent. ferrosilicon.

It has sometimes been asked why not manufacture carbide and ferrosilicon in the induction furnace. The reply is that steel may be produced with a temperature of not more than 2,000°; but it is another matter to work with 3,000°, which is the temperature required for the production of carbide in an induction furnace, because at 3,000° there is no heat-resisting substance which does not become a conductor. Ferrosilicon is extremely resistive against the action of acids, and it is suggested that it should be employed for making apparatus for use in the acid industry, *e.g.*, vessels and evaporators for boiling sulphuric acid.

In *Electrochemical and Metallurgical Industry* of June, attention is drawn to the uses to which aluminium may be put. It is used largely in the manufacture of motor-cars and of cooking utensils; the Japanese army was equipped during the Russo-Japanese war with aluminium mess kettles, which proved highly satisfactory. In the New York Subway some of the cars are lined with aluminium. It is also finding a largely increased use in chemical industries, as, for example, in acetic acid plants, for nitric acid condensers, ammonia concentrators, and in paper pulp mills. In America, in a few electric power stations aluminium bus-bars are employed, while for high-tension current transmission lines the employment of aluminium wire is largely increasing. "Bi-metallic" wires are also being introduced; these are steel wires coated with aluminium.

At the recent meeting of the American Electrochemical Society, Mr. E. E. F. Creighton described a method for studying the effect of temperature during annealing upon the magnetic properties of iron. The piece of metal to be tested is made the secondary of a transformer, so that it is possible, at the same time, to heat the iron by means of induction currents, and test it for its magnetic properties. As the temperature increases, the permeability increases. The magnetism, it was found, disappeared at 800° C. The temperature was then raised higher, and subsequently brought back, and it was found that the magnetism returned at exactly the same temperature at which it originally disappeared.

Telegraph Stations in Venezuela.—The telegraph stations of the Compagnie des Cables Télégraphiques at La Guaira, Pto. Cabello, Coro, and Maracaibo, have been closed by the Venezuelan Government since January 11th, 1906. According to a British Consular report, telegrams from Venezuela are sent by way of the island of Curaçoa, in consequence of which the income of the French Cable Co. has enormously increased, as the rates charged are very high.

Fishing by Electricity.—The Teltow Canal, which forms the cord to the loop of the river Spree, on which Berlin is built, is provided with a system of electric haulage, the barges being drawn by small locomotives which run on a track alongside the canal, and are supplied from an overhead wire. According to the Berlin correspondent of the *Daily Telegraph*, a man has been arrested for fishing in the canal on a wholesale scale with the aid of electricity. A wire connected to the overhead wire and thrown into the water is said to have so stupefied the fish within ten yards that they could be caught with hand nets.

Consolidated Electric Supply Co.—The case of the Consolidated Electric Co., Ltd., against the Consolidated Supply Co., Ltd., which was a debenture holder's action, came before Mr. Justice Swinfen Eady on Saturday last. Mr. Whitmore Richards asked for judgment in default of defence. Appearance had been entered, but the defendants did not now appear. A breach of condition took place by reason of the non-payment of interest for two months, and there was a notice calling in the money pursuant to the condition of the debenture. His lordship gave judgment accordingly.

Damage to Cables by Trawlers.—With reference to this matter (see ELECTRICAL ENGINEERING, June 4th, p. 842), the Chambers of Commerce, Exchanges, and Trade Associations throughout the United States are adopting resolutions, and forwarding memorials to the Government at Washington, appealing for the protection of submarine cables off the Irish coast. A memorial has been addressed to the President of the Board of Trade by the Liverpool Chamber of Commerce, suggesting an inquiry. The Bristol Chamber of Commerce has decided to act in concert with that of Liverpool.

Faraday House Old Students' Association.—The fourth annual dinner of this Association was held at the Queen's Hotel, Leicester Square, on Thursday, June 18th, with the President of the Association—Mr. Gerald W. Partridge, Engineer-in-Chief of the London Electric Supply Corporation—in the chair. The company included Mr. W. M. Mordey (President of the Institution of Electrical Engineers), Mr. Robert Hammond, Major O'Meara, Mr. Hugo Hirst, and Mr. Philip Dawson, who proposed the toast of the evening, "Faraday House and its Old Students." As is usual at these gatherings, beyond this toast there were no other speeches, the dinner being followed by a smoking concert.

ELECTRICAL SCIENCE

British and American

Rectification Effect in Vacuum Tubes.—In the June number of the *American Journal of Science*, a novel experiment is described by H. A. Perkins. The author had noticed that a tube exhausted to a pressure of about half a millimetre of mercury glowed feebly when placed in an alternating electrostatic field. He examined the phenomenon more minutely by a special experiment. A conducting ring surrounding but not touching the vacuum tube was connected to one terminal of the secondary of a transformer excited from the public service, and the other terminal of the secondary was connected to earth. The tube was provided with a sealed-in electrode at each end, and the electrodes were connected outside through a switch and galvanometer. If now the primary circuit of the transformer was closed, the ionisation of the vacuous gas was made evident by a glow within the tube, and by a current through the galvanometer. These effects were very small unless the potential of the ring attached to the transformer secondary was greater than 550 volts, and the magnitude of the current through the gas varied with the position of the ring along the tube. With a tube 20 cm. long it was found that the current was zero if the ring were within 5 cm. of an electrode, was a maximum at about 8 cm., and was zero again at 10 cm., the middle of the tube. On moving the ring further the current changed sign, attained a maximum, and fell to zero at about 5 cm. from the second electrode. The gas current always left the tube at the electrode nearest to the ring. On the other hand, if the galvanometer were replaced by an electrostatic voltmeter the largest readings were obtained when the ring was near the electrodes. The curve representing the measurements made to connect gas current as ordinates with transformer E.M.F. as base starts suddenly upwards at 550 volts, and thereafter rises slowly as far as 2,000 volts, the limit of the experiments. The author gives a mathematical theory of the whole of the phenomena on the assumption that there is a uniform potential gradient between the ring and the sealed-in electrodes, and the calculated curves agree fairly well with the experimental curves.

Measurement of Current through an X-Ray Tube.—At the Röentgen Society's meeting on June 4th, the President, Mr. W. Duddell, F.R.S., gave a very interesting address on the measurement of the current through an X-ray tube. Many lantern slides of oscillograph tracings were shown to demonstrate the wave form of the discharges under varying conditions. When a spark gap was employed as a rectifier, the waves were very short and steep, and but little sign of inverse discharges could be detected. When the X-ray tube was removed and a water-resistance of about three megohms was substituted for it, the wave form was practically unchanged. An interesting side light upon the behaviour of the spark-gap was thrown by the tracings, and the lecturer mentioned that he had compared three forms of spark-gap, *i.e.*, point and ball, point and plate, and point and cup, the point being positive. Of these three varieties, the point and cup was the most effective. The ratio between the mean current through an X-ray tube and the instantaneous values was about as 1 : 30, that is to say, for a mean current of 0·5 milliampere the maximum value was 15·0, and for a mean of one milliampere it was 30 milliamperes. Curves to show the current waves through the tube when no rectifier was in circuit demonstrated a considerable inverse current, and finally, curves of the discharge of the coil on short circuit gave waves of a very different form. Measurements of the potentials at the terminals of the tube, and at the terminals of the coil, showed that the spark-gap rectifier caused a considerable voltage drop, from 60,000 to 30,000 volts in one instance. The indications of the milliamperemeter gave a very satisfactory measure of the mean current, but the instruments in common use for X-ray work were shunted by a condenser, and this the lecturer condemned.

A New Mercury Interrupter.—Mr. Wright afterwards showed a new form of mercury interrupter, which gave very powerful discharges in the secondary circuit of the coil. It consisted of a turbine arrangement for pumping up mercury into a narrow reservoir, where it met a revolving metal arm, which made and broke the circuit. The mercury being continually renewed in the reservoir, a clean surface was presented to the revolving blade, and very efficient contacts were obtained. By the overflowing of the reservoir the mercury was kept in constant circulation.

Royal Society Studentships.—The Council of the Royal Society have awarded the Mackinnon studentship in physics for the year 1908 to Mr. J. A. Crowther, of St. John's College, Cambridge, for an investigation of the passage through matter of the β-rays from radio-active substances.

Continental

Binant Electrometer.—The quadrant electrometer is governed by Maxwell's formula:

$$\alpha = C(Q_1 - Q_2)\left[N - \frac{Q_1 + Q_2}{2}\right]$$

where Q_1 Q_2 are the potentials of the quadrants, N is that of the needle, and α the deflection. This necessitates commutation if the deflection is to be proportional to the potential to be measured. Commutation is very difficult in working with saturation currents and automatic records. In the *Annalen der Physik*, No. 7, F. Dolezalek eliminates these difficulties by dividing the needle into two parts, the right-hand arm being as much above the potential of the chamber as the left-hand arm is below it. Instead of quadrants, the chamber consists of semicircles. Hence the new name, "binant electrometer." The principle was first proposed by Curie. The equation of the new instrument is

$$\alpha = C(N_1 - N_2)(Q_1 - Q_2).$$

The needle consists also of two semicircles. Both the needle and the chamber surface are concentric spherical surfaces, which give greater stability. The proportionality of deflection and p.d.'s $(Q_1 - Q_2)$ extends over an angle seven times as great as in the case of the quadrant electrometer, and, besides, the needle may be charged to higher potentials. Where the sensitiveness of a quadrant electrometer has a maximum at 250 volts, the binant electrometer is increasing in sensitiveness even at 900 volts. The range of the new instrument is very large, extending from 100 volts down to a few millivolts. The needle consists of thinnest aluminium foil. One semicircle is charged through the platinum wire suspension, and the other through a fine platinum spiral dipping into a liquid conductor. The usual charges are +65 and −65 volts.

Electrodynamical Mechanics.—A work of considerable interest to the student of the profounder theory of electricity is that published by H. Witte in the *Annalen der Physik*, No. 7. It is an elaborate investigation, covering 77 pages, of the rival attempts to explain electromagnetism by mechanics, and *vice-versa*. The author distinguishes two main classes of electromagnetic theories, those that postulate action at a distance, and those that postulate a continuous field. These, again, whether based upon emission or undulation, or both, may give rise to nine different types, and in some of these electromagnetic energy is all potential energy, in others it is kinetic, and in others again it is both. The author shows, first, that an interstellar ether is necessary. He then proves that it cannot be incompressible. For a moving electron would give a finite rotation, and then the rotation would cease to be proportional to the curve of the displacement. A continuous ether cannot be brought into harmony with mechanical principles. We must therefore fall back upon a discontinuous ether, and this is not indicated by any physical observation. It is against the principle of economy (or "parsimony") to assume any unnecessary complication when a simpler theory suffices. Therefore we must resign discontinuous ether, and renounce the attempt to construct a mechanical theory of electromagnetic phenomena. We are thus left with the dualism of mechanics and electromagnetism. To reduce this to a monism we must either find an electric theory of mechanics, a system which the author calls "electricism" as distinct from materialism, or we must reduce both mechanics and electromagnetism to a more fundamental system. The only attempt to do this is in the energetics of Ostwald. W. Wien has made some advance towards an electrical monism. The objection that nothing is gained by reducing mechanics to electricity as we are not acquainted with the "nature" of the latter, is easily answered by the plea that we know nothing of the nature of matter.

Faraday House.—A series of lectures on "The General Principles Involved in the Economical Production of Electrical Power" are being delivered by Mr. H. M. Hobart to the students of Faraday House. The course commenced on June 18th.

The Berlin Radiotelegraphic Convention.—It is announced that the British Government has notified Germany of its adherence to the Wireless Telegraph Convention, both on behalf of Great Britain and of all the British Colonies except Newfoundland and the Orange River Colony, the latter of which, being inland, has no direct interest in the matter.

Hampstead Tube Breakdown.—Considerable inconvenience was caused to passengers travelling on the Charing Cross, Euston & Hampstead Railway on Wednesday, June 17th, owing to the suspension of traffic on the south-running line between Mornington Crescent and Charing Cross after 5.50 p.m. The rear axle of the trailing bogie belonging to the motor-car of a three-car train broke soon after this train had left Mornington Crescent. The train, however, managed to reach Euston. The current was switched off from that section of the line, and traffic was maintained by a single six-car train, running between Mornington Crescent and Charing Cross on the north running line. The single journey, which was made without stops at Tottenham Court Road and Euston Road stations, occupied 7½ minutes, so that a 15-minute service from Charing Cross was kept up. From Mornington Crescent northwards the trains ran as usual. In the meantime, the workmen were attending to the damaged bogie, and by 1 o'clock on Thursday morning the south-running line was clear again.

Digitized by Google

LOCAL NOTES

ACCRINGTON: *Electricity Supply.*—On June 18th Mr. North, the Local Government Board Inspector, conducted an inquiry at Accrington Town Hall respecting an application by the Corporation to borrow an additional sum of £7,500 for the electricity undertaking. The Chairman of the Electricity Committee, the Town Clerk, and Mr. Gray (Electrical Engineer) were present. Mr. Aitken said they asked 20 years for the repayment of the loan. The money was required owing to increased demand for electrical energy, both for lighting and power. The Board of Trade units supplied for the last quarter in December last were 642,500 against 265,639 for the corresponding quarter of 1906. A great part of the increase was due to one large firm taking an amount of the electricity for power. They had now purchased new works and enlarged them, and suddenly asked the Corporation to largely increase the supply. The firm was one of the largest in England for producing cotton-spinning machinery. In answer to the Inspector, the net loss on the electricity undertaking of £1,323 in 1903 was stated to have been gradually converted into a net profit of £604 last year, and it was estimated there would be a profit running into four figures for the current year. The total loans for the department had been £67,960, of which £12,202 had been paid off, leaving outstanding £55,758.

ACTON: *Electricity Accounts.*—The Electricity Committee reported at the last meeting of the District Council that the undertaking showed a gross profit for the year ended March, 1908, of £1,082 2s. 2d., but after providing for loans, instalments, interest, &c., there was a net deficiency of £2,934 18s. 3d. Mr. Lord remarked that a company in similar circumstances would be able to declare a profit.

AUSTRALIA: *Kalgoorlie.*—The Kalgoorlie Electric Power & Lighting Co. has shipped additional plant for its generating station, including what is said to be the largest engine and dynamo yet sent to Australia.

BELEEK FALLS (IRELAND): *Proposed Water Power Scheme.*—At the monthly meeting of the Lough Erne Drainage Board, held in Enniskillen last week, a letter was read from Mr. W. A. Lindsay, of Belfast, asking if the Board would be disposed to encourage the development of electrical energy at Beleek by the use of the Falls. He had been recently trying to induce some English and American friends to investigate the practicability of establishing a power station there, but naturally they wished to know, before taking any steps, on what terms the necessary rights could be obtained. Mr. Irwin said he would reply, stating that the Board were anxious to encourage them as much as possible, but that they would like to have some definite proposal as regards terms first. The Secretary mentioned that other electrical companies had approached him on the same subject, and he thought it would be better to take no definite action until they would see from whom they would get the best terms. It was decided to write to Mr. Lindsay, stating that the Board were in sympathy with the project for establishing an electrical power station at Beleek, but that they could take no action in the matter until more definite particulars and proposals were submitted to them.

BELFAST: *Tramway Agitation.*—A mass meeting was held in the Ulster Hall on the evening of the 16th inst., for the purpose of considering what has been described as the "present position of the Belfast tramways." Mr. D. J. Campbell, delegate to the Belfast Trades Council, presided, and the whole affair may be looked upon as a political and trades union agitation against the Corporation. Addresses were delivered, and a resolution was passed which declared that the meeting viewed with alarm the unsatisfactory state of the tramway undertaking, and called on the Corporation to have an accountant appointed to report on the financial standing of the undertaking.

BILBAO (SPAIN): *Tramways.*—The *Gaceta* of June 10th notifies that a concession has been granted to the Compañia del Tranvia Urbano de Bilbao for the construction of an electric tramway in the town of Bilbao.

BOSTON (AMERICA): *Water-power Plant.*—The Franklin Power Company have begun the construction of a 200-ft. log and concrete dam for the development of the power furnished by the falls known as Cleveland Rips, on the Carrabassett River, between the towns of Embden and North Anson. The dam will create a head of 25 ft., and the power obtained will be used in the generation of electricity for lighting and power in the towns of New Vineyard, Farmington, and Wilton. A line of poles and wires 16 miles long is now being erected to convey the current to Farmington.

BRENTFORD: *Tramways.*—The District Council has been in communication with the Board of Trade relative to the state of the tramway track through Brentford, and at the last meeting of the Council it was stated that the Board had written that the remedy for the condition of affairs complained of was in the hands of the clerk. The clerk reported that he had replied that the Council had no authority over the track itself, but the Board refused to order an inspection, and suggested that the Council had the power to compel the tramway company to keep the track in repair under the terms of the Tramway Act. The clerk decided to forward a copy of the correspondence to Dr. Rutherford, M.P., with a view to a question being asked in Parliament. In reply to a question, the Chairman (Mr. Evan Phillips, J.P.) said that the Council could not obtain an injunction to prevent the trams from running. It was only a question of a penalty, and they had to get the track properly inspected first, which would be an expensive proceeding.

BRIGHTON: *Electricity Accounts.*—The statement of account of the Electricity Department for the year ended March 31st shows a loss of £3,657, as compared with £10,253 for last year. The total receipts were £88,082, as against £85,684 for the previous year, and the expenditure was reduced from £51,713 to £40,753. Interest and sinking fund amounted to £44,987. The deficit is to be met from the reserve fund, which becomes reduced to £7,413. The total costs per unit sold were 1·26d., made up as follows:—Coal, 0·55d.; oil, waste, water, and engine-room stores, 0·01d.; wages, 0·17d.; repairs and maintenance, 0·16d.; rents, rates, and taxes, 0·13d.; management expenses and charges, 0·24d. The total units sold have increased from 7,849,194 to 8,002,376.

Tramways.—The scheme placed before the Corporation by Messrs. Stephen Sellon and Partners, consulting engineers, of London, referred to in our last issue, for running a service of tramways from Kemp Town through St. James's Street, North Street, and Western Road to Worthing, came before the Corporation on Thursday. As we announced last week, the scheme was recommended by the Tramways Committee, and in presenting the proposal to the Corporation, the Chairman said that the syndicate proposed to purchase the old horse tramways between Hove and Shoreham, and to electrify these, at the same time extending them to Kemp Town *via* Brighton. After a long discussion the scheme was rejected by 36 votes to 10.

CLECKHEATON: *Electricity Undertaking.*—The accounts of the electricity undertaking for the past year show a surplus of £99, compared with a deficit of £193 for the previous year.

COLCHESTER: *Street Lighting.*—It has been decided to gradually replace 316 Nernst and other incandescent street lamps by Osram lamps. The average cost of conversion is given at £1 3s. 6d per lamp. It is expected that the annual cost per lamp will be reduced from its present figure of £3 19s. 6d. to £3, reckoning the renewals at three pairs of Osram lamps per post per annum. A scheme was proposed for superseding the existing gas lamps by Osram lamps, but this was not agreed to.

DUNDEE: *Electricity Accounts.*—The accounts of the Electricity Department for the year ending April 30th, 1908, have just been issued, and show a very satisfactory state of affairs. The number of units generated is 4,719,085, an increase of 708,000 over last year, while the revenue is £34,973, an increase of £3,870. A very large item in this year's accounts is the increase in the coal account, which is fully £3,000 over last year. The gross profit amounted to £15,259, out of which has to be paid interest and sinking fund amounting to £9,578; while the Committee again adopted Mr. Richardson's recommendation to reduce the capital debt of the undertaking by transferring £5,380 from the capital account to revenue, the balance, with the balance from last year, leaving a net profit of £1,078. During the last four years the sum of almost £24,000 has been paid out of revenue account, a large part of which has gone to reduce the capital debt, while the balance has been for the large alteration at the power station. The Committee have adopted Mr. Richardson's suggestions with regard to the price to be charged to power-users, which in future will be on the sliding scale, with a maximum of 2½d. per unit, while large consumers with a very large load-factor can have power as low as 0·45d. per unit. The price of current for the tramways has also been reduced from 1¼d. to 1½d. per unit. The minimum charge has been abolished entirely, as Mr. Richardson considered it was more of an irritant to consumers than it was really worth. A new feature of the charges for next year is that for electric signs, which should tend to make this form of advertisement very popular. For the first 200 units the charge is 3½d. per unit. All above this amount 1½d. per unit. The work of erecting the new generating station is being pushed on with all speed, most of the contracts having now been placed, and it is hoped that everything will be completed and the station running in time for next winter's load.

DUDLEY: *Electricity Accounts.*—The report for the year ended March 31st records a steady growth of business, especially as regards motor-load. The year's working has resulted in a gross profit of £5,977, being an increase of £733 over that made last year. Financial charges for interest, repayment, and bank charges absorb £5,641, an increase of £465 over the previous year's requirements, the surplus for the year being £336. The load factor has risen from 13·96 per cent. last year to 14·65 per cent. this year. The works costs have decreased from 0·8555d. per unit sold last year to 0·81d. per unit sold this year, or a decrease of 6 per cent. in the works costs per unit sold, notwithstanding an increase of 11 per cent. in the cost of coal. It is not anticipated that the works costs per unit sold will fall

Digitized by Google

much below 0·8d. until there is a larger increase in the load factor. The units sold during the year amounted to 2,022,207, made up as follows :—Private lighting, 422,333; power, 413,727; public lighting, 135,237; and tramways, 1,050,910. Last year's total was 1,812,193 units.

DUNFERMLINE: *Electric Lighting.*—A further report has been received from Sir Alexander Kennedy recommending the Council to lease its electric lighting Provisional Order to the Fife Electric Power Co., with the option of re-acquiring it 50 years hence. At the monthly meeting of the Council last week this report was adopted.

EALING: *Power Supply.*—It has been decided to reduce the charge for current for heating and power after this month from 2d. to 1½d. per unit.

Electricity Supply Accounts.—According to the report of the Borough Electrical Engineer (Mr. J. Douglas Knight) for the year ended March 31st last, which has just been issued, the business of the electricity undertaking during the twelve months was one of steady progression, satisfactory results having been achieved without any appreciable increase in expenses. Notwithstanding increased cost of fuel, increasing competition, and the introduction of the metal filament lamp, the working costs were again lowered in almost every direction, the reduction in the coal costs being most noticeable. The full effect of the last reduction in price of current was felt for the first time during the year, the average price per unit sold obtained from private consumers being 0·08d. less than the previous twelve months. The income would have been increased by £402 if the department had obtained the previous year's price on the output for the year ended March 31st. Units were sold to the number of 1,527,893, this being an increase of nearly 2¾ per cent. There was a decrease of 5 per cent. in the units used for public lighting; the increase on the supply to private consumers was 5 per cent. The income, totalling £26,947, showed an increase of 3·3 per cent. There was an increase of 11 per cent. in slot meter collections. The capital spent during the year totalled £2,628, the lowest on record in the history of the undertaking. The gross profit, after deducting charges for rent, rates, taxes, and cost of maintenance and management, amounted to £14,228, equivalent to 7·37 per cent. of the total capital expenditure to date. From this sum had to be taken the charges for interest and sinking fund, reserve for doubtful debts, Parliamentary charges, and audit fees, leaving a net profit of £2,013. This, added to the reserve fund, would raise the reserve to £8,654, equal to nearly 4½ per cent. on the capital expenditure, which to March 31st totalled £192,986. The assets exceeded the liabilities by £51,367, and the whole of the plant being maintained in efficiency out of revenue, the sum to reserve, says the Electrical Engineer, is sufficient to cover any depreciation of the value of the assets of the undertaking, representing 26·6 per cent. of the capital spent. During the year the cost of supplying each unit was lowered from 3·87d. to 3·849d. If the charges for interest and sinking fund be eliminated, the reduction was from 1·993d. to 1·390d. per unit sold—over 30 per cent. reduction. The total number of consumers on March 31st. was 3,620. An extension of plant and mains will be necessary in the immediate future. Condensing plant, transformers, and high-tension feeder mains are the items most urgently required.

ECCLES: *South Lancashire Tramways Co.*—It has been decided to seek an injunction preventing the South Lancashire Tramways Co. running its cars upon certain of the lines of the Council without consent.

EDINBURGH: *Redemption of Loan.*—At the last meeting of the Town Council the question of the equated period for the redemption of loans upon the electrical undertaking was considered, the Joint Committee of the Electric Light and Treasurer's Committee having recommended that the period should be reduced from 30 to 25 years. There were three proposals before the Council :—(1) That the shorter term should apply to future capital expenditure; (2) that it should apply to past expenditure; and (3) that it should apply to the last loan. After some discussion the first proposal was carried.

ERITH: *Tramway Position.*—At the last meeting of this Council a sub-committee appointed with a view to lessening the annual loss on the tramways undertaking and to make the system self-supporting, if not profitable, reported that the losses had rapidly increased year by year, and that Erith had the unenviable reputation of being the third from the lowest of 72 municipally-operated undertakings in regard to traffic earnings per car mile. The working expenses and administration of the department could not be reduced very materially, having regard to the safety and efficiency of the system, whilst having regard to the necessity for certain repairs, it was impossible to continue carrying on the system without a large increase in the working expenses. The net loss on last year's working (notwithstanding the low working expenses of 6·2d. per mile) was £4,449. Should the receipts continue to fall in the same ratio as last year—and they had every appearance of doing so—the current year's traffic receipts would show a decrease of 1d. per mile, and the Tramways Manager stated that the necessary repairs referred to would increase the working expenses by at least 1d. per car mile. The total loss, it was estimated, would be something over £7,000 to be provided for out of the rates. The Council agreed to the committee's recommendations to abolish ½d. fares, and to issue transfer tickets, to make certain changes in respect of workmen's tickets, and to abolish free riding by members of the Council, staff, and employees, except in the case of the uniformed staff (the last-named to be allowed to travel free to and from duty only).

GLASGOW: *Tramway Accounts.*—The financial statement for the tramways undertaking for the year ending May 21st shows a gross revenue of £916,566. The expenditure, including traffic, general, repairs, and power, amounted to £509,995, and there has been set aside for renewals and depreciation £188,603, leaving a balance of £217,968. From this has to be deducted the rent of the Govan lines, rent of the Paisley District Tramways, interest, sinking fund, income tax, Parliamentary expenses, and Common Good, amounting to £179,138. The balance of £38,830 has been appropriated as to £4,061 to special depreciation, and £34,769 to general reserve.

GRAYS: *Electric Supply Tariff.*—On and after July 1st, the rates charged for lighting will be reduced as follows :—The 5d. rate to 4d., 4¾d. to 4¼d., 4½d. to 4d., and 4d. to 3¾d.

GRIMSBY: *Electricity Finances.*—The Town Clerk reports that the electricity undertaking has a sum of £5,000 lying to its credit at its bank, which had been raised on mortgage of the rates and on property. He suggested that when the committee were next applying to the Local Government Board for a loan, the attention of the Board should be drawn to this sinking fund, and application made to use it as capital.

New Generating Plant.—Mr. W. A. Vignoles, the Borough Electrical Engineer, reported at the last meeting of the Corporation that he had been to Birmingham in connection with the tests of the new 500 kw. set which is to replace two small sets at present in the works. All the tests were satisfactory, with the exception of steam consumption, but this had again been tested and found satisfactory after certain adjustments had been made.

Electricity Works Staff.—An application by Mr. Channon, Chief Assistant Engineer at the Electricity Works, for an increase of salary from £150 to £175 per annum has been refused.

HASLINGDEN: *Tramways.*—The Corporation of Haslingden and Accrington have adjusted their difficulties with regard to electric trams. For nine months Accrington will supply Haslingden with cars and current over the two miles length. The cost to Haslingden will be 7d. per mile. The cars will run to and from Haslingden to Accrington, and the arrangement will re-establish traffic between the two boroughs.

HORNSEY: *Electricity Accounts.*—Submitting the financial statement for the half-year ended March 31st, at the last meeting of the Borough Council, Councillor Berrenger, Chairman of the Finance Committee, said that a year ago the electricity undertaking had to be subsidised to the extent of £1,421 to meet a deficit on the previous two years' working, but the hope held out when the subsidy was granted had been fully realised, viz., that should the undertaking increase its business at anything like the same rate as it did during the previous twelve months, the future call upon the rates ought to be very small, if any. The outcome of the Electricity Supply Committee's trading during the six months ended March 31st had been in every way encouraging, and it was the first time in the history of the undertaking that a profit over and above interest and instalments of loan had been shown. The balance carried to net revenue account as the result of the half-year's working was £6,253, being a net increase over the corresponding period of the previous year of £853, the income having increased by £1,366, and the expenditure by £513. The debit balance totalled £6,204, which, deducted from the amount transferred from revenue account, left a surplus of £49.

HOVE: *Electricity Omnibuses.*—It is stated that the service of electric omnibuses will be started very shortly.

ILFORD: *Tramways.*—At the last meeting of the Council it was stated that during the year ended March 31st, 1904, the trams carried 5,057,000 passengers, and the number increased year by year up to the twelve months ended March, 1907, when the total was 6,586,000, this figure being reduced last year to 6,385,000. However, one Easter and part of another were included in the 1907 returns, and this accounted for 120,000 of the decrease. The remaining 80,000 decrease had been lost by the cessation of inter-running with Barking, by disastrous holiday weather, and by two months' motor-'bus competition included in the period.

JAPAN: *Import of Electrical Appliances.*—The following figures as to the comparative value of imports of electrical appliances into Japan from the United States and other countries for the years 1905 and 1906 are given in an American consular report. Imports from the United States :—Electric light apparatus and instruments : 1905, $232,251; 1906, $170,203. Electric motors : 1905, $929,874; 1906, $430,964. Imports from other countries :—Electric light apparatus and instruments : 1905, $316,328; 1906, $247,785. Electric motors : 1905, $1,227,712; 1906, $704,158.

JARROW: *Tramways.*—A through service between Jarrow and South Shields was inaugurated on Thursday. The new service is the outcome of an arrangement between the Jarrow & District Electric Traction Co. and the South Shields Corporation.

Digitized by Google

LEIGH: *Electricity Accounts.*—At the last meeting of the Corporation the Chairman of the Tramways and Lighting Committee, in reference to the Electrical Engineer's report, said that the loss was about £12, compared with £407 last year. There would have been a small profit this year but for the fact that the Lighting Committee had to pay a special rate amounting to £71, and also the cost of the current in connection with the opening of the Town Hall, amounting to about £20.

LONDON: *London County Council: Hammersmith-Harlesden Tramways.*—The Board of Trade has inspected the Hammersmith-Harlesden tramways, and has issued a report stating the speeds which are to be observed on the line.

Battersea.—The Finance Committee of the London County for a loan of £1,847, repayable in 20 years, for electric lighting, be granted. The loan is required for the provision of a Council recommend that the application of the Borough Council 200-kw. feeder booster, for which a tender has been accepted.

The Electrical Engineer has reported to the Electricity Committee with reference to a fault in the lighting mains which occurred near the Central Public Library, Lavender Hill, on May 26th. The fault was soon attended to, and there was no interruption in the supply, although for a time the pressure fluctuated. Callender's Cable & Construction Co., Ltd., have agreed, in accordance with the terms of their contract, to bear the cost of the repairs, estimated at about £60. The Electricity Committee has approved a scheme for public and private lighting on Battersea Rise House Estate, which provides for laying distributing mains in various thoroughfares, and a feeder from Northcote Road to the estate, and for erecting ten additional arc lamps along Clapham Common, west side, and 37 lamp columns fitted with brackets similar to those on Heathfield Estate, but with Osram metallic filament lamps of 100 c.p. each for the side streets. The estimated cost will be £5,362. Negotiations are in progress with the various builders who contemplate erecting houses on the estate, and one of them, Mr. George, has already undertaken to wire 60 houses for electric light. Mains will be laid in the various parts of the estate as they become developed, so that no expenditure will be incurred before a supply of current is required. The committee has approved, subject to the usual sanction, the purchase for £230 of an additional cross-over steam main, to be erected from one of the boilers to the main steam range. This will guard against breakdown and enable the three boilers to be used at the same time. An alternative connection will be available in case of emergency, and the arrangement will permit of a minimum amount of main being used during the greater part of the day.

Southwark.—The Electric Light and Finance Committees of the Borough Council reported on Monday having had under consideration the District Auditor's report on the accounts of the electricity undertaking for the year ended March 31st, 1907, in which he urged the advisability of adopting the recommendation of the Departmental Committee on the accounts of local authorities by including in the accounts proportions (calculated up to March 31st) of fixed charges (loans, interest, instalments, &c.), which fall due for payment after that date. He pointed out that if this course was adopted the result would be to show an adverse balance on the net revenue account, but the true profits for the year would not be affected. The Electric and Finance Committees have decided to adopt the recommendation of the Departmental Committee, but in order not to entirely deplete the reserve account they have agreed that £754, the full interest and half the instalment of principal accruing to the end of the financial year, be charged to the renewals reserve account, and placed in the accounts for the year ended March 31st, 1908, leaving the balance chargeable to the current year. The Electricity Committee has agreed that £36 of £90 expenditure incurred in opposing the L.C.C. Electric Supply Bill, London Electricity Supply Bill, and the Bermondsey Electric Lighting Order, be charged to the revenue account of the undertaking, but they protest against expenditure being incurred in respect of the undertaking without the Committee being consulted or having any voice in the matter.

St. Pancras.—The Borough Council had a late sitting on Wednesday, the 17th inst., the main subject for discussion being the proposed confirmation of the provisional decision of the Electricity Committee to wire houses in the borough through the medium of private contractors at accepted schedules of prices. Councillor Shearing, in opposing the recommendation, said that if the proposal were adopted, traders in the borough engaged in electrical works would suffer great injustice. The effect would be that contractors would be invited to schedule their prices, and the contractor offering the best discount would be accepted; presuming that the discount was 15 per cent., that would form a basis to govern practically the whole of the electrical work in the borough. The principle was a bad one, and the supply of fittings and the wiring of houses should be left to private individuals. Alderman Gauntlett said that by adopting the powers suggested, it would be possible to put on nine additional consumers to every mile of mains, in which they had a quarter of a million of money invested. At present only 3,000 of 24,000 houses in the borough were wired for electric light, because of the initial expenditure involved. Councillor James, as an electrical contractor, favoured the proposal, and hoped that before many years had passed, St. Pancras Council would have the complete control of the borough electrical undertaking. The Electricity Department should give the same facilities to householders as the Gas Light & Coke Co., who fitted up every requirement on the hire-purchase system. The reason the borough was badly off for electric light consumers was because of the cost. Councillor Paterson, as a contractor who was hardly hit by municipal trading, thought that the electric light undertaking should be municipalised, and thought the departure proposed would mean a great increase in work and profit for the electrical contractors in the borough. Alderman Davies severely criticised the hire-purchase system, and, hoping the Council would not undertake the scheme recommended, said that there was quite enough trouble with the Electricity Department, and quite enough extravagance. It having been suggested, in view of difference of opinion, that the whole matter should be referred back for further consideration and report, Alderman Matthews said the excuse for adopting the suggested powers under the L.C.C. (General Powers) Act, 1906, was that, under the present system, the poorer residents could not have electric light, but he held that electricity for an exclusive light was not suitable for poor people, for the expense of cooking and heating by electricity was such that even the King had not got it. The Council had had to cease electric supply to municipal dwellings because they could not let the rooms to the working classes without gas. Councillor Ingram, Chairman of the Electricity Committee, said that the undertaking was threatened with outside rivalry from electrical companies which wished to enter the district. The companies argued that they could produce current cheaper than the Council. This, on behalf of the Council, was denied, but when once these outside companies "got their foot in," it would mean ruin to the St. Pancras undertaking. Unless more consumers were obtained, the current could not be produced more economically by the Council. There were many thousands of houses in the borough where electric light might be used. It was cheap, and would be cheaper, but the one thing that stood in the way of the small consumer was the cost of wiring and fittings. The principle recommended had been adopted by the boroughs of Hackney, West Ham, Ealing, and at Wolverhampton, Norwich, and Brighton. By 36 votes to 14, it was decided to refer back the matter for further consideration and report.

Stepney.—At a meeting of the Thames Conservancy on Monday it was reported that application had been made by the Borough Council for permission to construct an embankment and place two 36-in. suction and discharge pipes in the river at their electricity generating station, Blyth's Wharf, Limehouse. Reports having been received from the engineer and Harbour Master on the matter, the permission asked for was granted, subject to protective conditions.

MALAGA (SPAIN): *Wireless Telegraph Station.*—A consular report states that a station for wireless telegraphy has recently been erected on the highest point of the Alcazaba, the old Moorish castle, overlooking the port, for the purpose of communicating with Melilla, on the African coast. This station has been erected by order of the Ministry of War, and will only be used by that department. It is stated that it will be working in the course of a month or two.

NOTTINGHAM: *Tramways.*—A ratepayers' meeting has been held approving the Bill of the Nottinghamshire and Derbyshire Tramways Co., by which the Corporation take over the powers of the latter with respect to certain tramways.

RUGBY: *Reduction of Power Charges.*—It has been decided to reduce the charge for power to 2⅛d. per unit for all customers having a consumption of 150 units per quarter for each horse-power installed.

SWANSEA: *Electricity Accounts.*—At the meeting of the Corporation last week, Colonel Sinclair, in presenting the report of the Tramways and Electric Lighting Committee, stated that there had been a profit for the year of £1,466, which enabled them to square off all outstanding accounts, and to still have a net balance over and above all the liabilities of the undertaking. But for the increase in the price of coal, the profits would have been another £400. Contrary to most other places, there had not been a decline in the revenue due to the use of metallic filament lamps, and he was pleased to say that the revenue was a growing one. The detailed accounts of the electricity department show a credit balance of £789, after providing for interest and sinking fund. The total revenue was £20,235, of which £11,861 was from private consumers, £1,806 from public lighting, and £6,567 from power supply.

TOTTENHAM: *Tramways.*—The Metropolitan Electric Tramways, Ltd., have asked the Urban District Council to carry out the widening of the High Road, opposite High Cross, in the same way as the road improvements in Seven Sisters Road and the High Road near Bruce Grove. The company are to be informed that the works will be put in hand as soon as the necessary deposit, viz., £620, is placed with the Council. The Metropolitan Electric Tramways, Ltd., further asked for permission to fix an automatic point controller at the junction of the High Road and Bruce Grove, and the request is to be acceded to. The Engineer is to meet the tramway company's Engineer and to fix a suitable site.

Digitized by Google

WATFORD: *Electricity Supply.*—At the last meeting of the Urban District Council, Councillor W. F. Goodrich announced that the balance of income over expenditure in connection with the electricity undertaking for the past year ended March was £915, and it was proposed that this amount should be transferred to the relief of the general rate fund. Next year he believed there would be an even more substantial profit on the undertaking; the outlook for the future was exceedingly satisfactory. The Acting Electrical Engineer reported that there were 640 consumers connected. The Council decided to inform Messrs. Nicole & Co. that they would be in a position to cope with additional current for that firm next winter to the extent of 100 h.p.

WEST HAM: *Tramways.*—Negotiations are proceeding between the Borough Council and the East Ham and Ilford authorities with regard to through running on the Romford Road tramways route. In view of the fact that the development of land adjoining Prince Regent's Lane has not proceeded as rapidly as was anticipated, the Electric Lighting and Tramways Committee has decided that application be made to the Board of Trade for an extension for two years of the powers given by the Provisional Order for the construction of the Prince Regent's Lane tramway and the unfinished portion of the junction between Barking Road, Prince Regent's Lane, and Greengate Street.

YARMOUTH: *Electricity Accounts.*—The total receipts during the year have increased by £1,523 as against last year, but the works cost have increased from £10,225 to £12,442, entirely owing to the rise in the price of coal. Interest and sinking fund absorbed £6,190, and there is a final deficit of £14 on the year's working.

Tramway Accounts: The total receipts during the year have amounted to £24,777 and the expenses to £16,350; of the balance, £1,605 remained as surplus after payment of sinking fund, and interest of this sum, £1,500, has been transferred to the renewals fund and the remainder carried forward.

TENDERS INVITED AND PROSPECTIVE BUSINESS

AUSTRALIA: *Melbourne.*—The Council invite tenders for the supply of 5,060 yards insulated copper cables. Specifications, &c., from Messrs. McIlwraith, McEachern & Co. Proprietary, Ltd., agents for the Council, Billiter Square Building, London, E.C., to whom tenders by July 3rd.

BRAY.—At the last meeting of the Council a report of the Electric Light Committee recommending the expenditure of £5,000 upon extensions and improvements of the electric light works was adopted.

DUBLIN.—The Corporation invite tenders for a twelve months' supply of machinery oils for the Pigeon House Fort generating station. Particulars from the Town Clerk, and tenders to the Chairman, Supplies Committee, City Hall, Dublin, by June 29th.

Tenders are invited for the supply and erection of boiler plant at the Pigeon House Fort generating station. Particulars from the Electrical Engineer (fee, one guinea, returnable), and tenders to the Chairman of the Lighting Committee, Cork Hill, Dublin, by July 13th.

EDINBURGH.—Tenders are required for the installation of electric lighting and power in the new engineering laboratory at the Heriot-Watt College. Particulars from Mr. J. Anderson, Superintendent of Works. Tenders by July 3rd to Mr. P. Macnaughton, Clerk, Heriot Trust Office, 20 York Place, Edinburgh.

FARNWORTH.—The local District Council have applied to the Local Government Board for sanction to borrow £7,000 for purposes of electric lighting. An inquiry into their application has been fixed for July 7th, to be conducted by Mr. H. Shelford Bidwell.

FINCHLEY.—Extensions are to be carried out at the electricity works.

GRAVESEND.—The Electricity Committee invite tenders for the supply and erection of yellow-flame arc lamps, columns, &c. Particulars from the Electrical Engineer (fee two guineas, returnable), and tenders to the Town Clerk by June 27th.

LONDON: *London County Council.*—The Council invite tenders for the manufacture and delivery of high-tension main switchgear and low-tension auxiliary switchgear for the Greenwich generating station. Particulars from the Clerk, fee £2, returnable, and tenders by July 7th.

The Highways Committee recommend that capital expenditure to the extent of £1,900 be sanctioned for the purchase of tramway feeder pillars.

Fulham.—The Guardians invite tenders for a vertical high-speed engine and a 20-kw. dynamo, both British made. Full particulars from the Clerk, Guardians' Offices, 129 Fulham Palace Road, to whom tenders by July 2nd.

ODESSA.—The Town Council invites tenders for the installation and working, as a concession, of an electric station, with a capacity of not less than 6,000. Tenders to the Town Uprava (Executive Committee of the Town Council) by 12 o'clock noon of the 1-14 September of the present year, 1908. A deposit of a thousand roubles must be made as security for their proposal. Detailed particulars of the concession and other information may be obtained of the Building Department of the Town Uprava on working days (i.e., days when members are in attendance), from 1 to 3 o'clock.

PONTYPRIDD.—The Council invite tenders for the supply and delivery of six double-deck tramcars. Full particulars from the Tramways Engineer, Mr. T. Teasdel, fee £2 2s. returnable, and tenders to the Town Clerk by June 30th.

ROSSENDALE VALLEY.—The Rawtenstall Corporation are in negotiation with the Rossendale Valley Steam Tramways Co. for the purchase of their undertaking. Meanwhile, they have decided to construct an electric tramway from the existing line at Crawshawbooth to the borough boundary at Loveclough, and have empowered the Tramways Committee to accept tenders for converting the whole of the tramways of the borough to electric traction.

ROTHERHAM.—At the last meeting of the Board of Guardians the suggestion was made that the House and General Purposes Committee should take into consideration the advisability of substituting electricity for lighting the workhouse, and that tenders for electrical plant should be advertised for.

SALFORD.—Tenders are invited for re-wiring at the Royal Technical Institute. Particulars from Mr. V. A. H. M'Cowen, Borough Electrical Engineer, Electricity Works, Frederick Road, Pendleton. Tenders by July 1st. Fee one guinea.

SHEFFIELD.—A Local Government Board inquiry was held last week in connection with an application by the Corporation for a loan for £1,900 for the installation of an electric light plant at the Lodge Moor Hospital.

ST. ANNE'S-ON-SEA.—A feeder cable is required by the Council. Particulars from the Electrical Engineer (fee one guinea, returnable), and tenders to Town Clerk by June 27th.

SOUTH TOTTENHAM.—At the meeting of the Metropolitan Asylums Board on Saturday the Hospitals Committee brought forward a scheme for lighting the North-Eastern Hospital by electricity. The Engineer-in-Chief (Mr. Hatch) had prepared a statement of the actual cost of gas lighting for the last two years, from which he estimated that the total cost of electric light and gas (a small quantity being required for cooking, heating, and emergency) would be £700 per annum compared with the present expenditure of £1,200, or a saving of £500. The estimate was based on a quotation of the North Metropolitan Electric Power Supply Co., to supply the current required at "less than 2d. per unit." The Hospitals Committee pointed out that electric light had an advantage over gas in that it could be more favourably arranged in the wards, and was also more convenient, more hygienic, was attended with less risk from fire, and was generally accepted as the most suitable light for institution purposes. The Board unanimously approved the scheme. The cost of installation will be £4,500, the whole of the hospital, and not the permanent buildings only being included.

TENDERS RECEIVED AND ACCEPTED

EALING.—An order has been given to Oliver Arc Lamp, Ltd., for a number of "Oriflamme" flame arc lamps for street lighting.

GRAVESEND.—The two boilers on the training ship *Exmouth*, having proved inadequate for the work required in connection with the heating and lighting of the ship, and the cooking arrangements, the Metropolitan Asylums Board on Saturday approved the provision, at a cost of £275, of a battery of accumulators, with a small additional dynamo. The Engineer-in-Chief reported that the maintenance would cost £16 10s., and he estimated a net saving of £50 per annum at the lowest. The battery could be charged during light loads, and would be used to assist the dynamos at times of maximum demand.

LEYTON.—A large order for "Oriflamme" flame arc lamps for street lighting has been placed with Oliver Arc Lamp, Ltd.

LIVERPOOL.—A repeat order has been given to Messrs. Royce, Ltd., for one 5-ton three-motor electric overhead crane and steel gantry, 700 ft. long, for Messrs. Farnworth & Jardine, timber merchants, Seaforth, Liverpool.

LONDON: *London County Council.*—The Highways Committee recommend that a contract be entered into with Mr. W. Manders, of Leyton, for the road-work and platelaying in con-

Digitized by Google

nection with the reconstruction of the Lea Bridge Road tramways, at an estimated cost of £3,990, which includes provisional sums of £250 and £340 for extra works, including the diversion of gas and water mains, &c. In this same connection, a contract with Messrs. Hadfield's Steel Foundry, Ltd., for special track work at £200 is also to be entered into. The offer of the Leyton District Council to supply, deliver, and erect the overhead equipment at cost price of material and labour, plus 10 per cent., is also recommended for acceptance.

The Highways Committee also recommend that the existing contract with Messrs. Dick, Kerr & Co., for the supply, delivery, and equipment of overhead equipment for the tramways from Beresford Square, Woolwich, to Wickham Lane, Plumstead, be extended to include the reconstruction of the Brixton-Camberwell Green tramways.

The tender of Messrs. Watlington & Co. and Messrs. Pfeil & Co., for certain switches and forge shop tools at the central car repair depôt on the Woolwich route, have been accepted.

The tenders of the British Electrical Transformer Co., Ltd., for a transformer, and Messrs. Spagnoletti for a distribution switchboard at the Bow car shed at £91 10s. and £53 respectively, have been accepted; also that of the Edison & Swan United Electric Light Co., for main switch-blocks and lighting materials at the Bow and Hammersmith car sheds at £212 12s.

The tender of Mr. W. A. Green for 50 five-ton tramcar jacks at 35s. 6d. each has been accepted.

The tender of Messrs. Mountain & Gibson for 400 anchor plates at 1s. per pound has been accepted.

The following tenders have been received for two electrically-driven centrifugal pumps to be erected at the Greenwich power station :—

	£	s.
Dick, Kerr & Co., Ltd. (accepted)	3,320	–
The General Electric Co., Ltd.	3,333	6
The British Electric Plant Co., Ltd. ...	3,335	10
Drysdale & Co., Ltd.	3,358	–
Worthington Pump Co., Ltd.	3,375	–
General Electric Co., Ltd. (alternative tender)	3,375	7
British Westinghouse Electric & Manufacturing Co. Ltd.	3,379	17
Worthington Pump Co., Ltd. (first alternative tender)	3,406	–
Dick, Kerr & Co., Ltd. (alternative tender)	3,415	–
Electric Construction Co., Ltd.	3,501	–
Worthington Pump Co., Ltd. (second alternative tender)	3,530	10
Thomas Parker, Ltd.	3,706	–
John Cochrane	3,757	10
Gwynnes, Ltd.	3,866	–
Greenwood & Batley, Ltd. (alternative tender)	4,004	10
,, ,, ...	4,074	10
Entwistle & Gass, Ltd.	4,342	–

The Highways Committee report that tenders have been obtained as follows for the supply of (i.) four single-phase static transformers, and (ii.) eight three-phase motors, and four auto-transformer starters, required in connection with the electric installation at the tramways central car-repair depot. Only one firm—namely, the British Electric Transformer Co., Ltd.—is in a position at the present time to supply the static transformers, and, as these are urgently required, the tender of this firm is recommended for acceptance. The tenders for the supply of the three-phase motors and auto-transformer starters were as follows :—

	£	s.
Electric Construction Co., Ltd. ...	427	10
British Westinghouse Electric & Manufacturing Co., Ltd.	468	–
General Electric Co., Ltd.	595	18
Dick, Kerr & Co., Ltd.	Incomplete tender.	

The following tenders have been received for the wiring and fitting for electric lighting of the Hackney car-shed. The tenders were as follows :—

	£	s.
Jenkins & Cawte	702	4
A. C. Smith	775	2
Perry & Co. (recommended)	911	–
S. J. Suter & Wood	961	–
W. G. Cannon & Sons	1,010	16
Pinching & Walton	1,014	19
Comyn, Ching & Co., Ltd.	1,099	8
G. Weston & Sons	1,158	8
G. E. Taylor & Co.	1,189	13
Cross & Cross	1,209	–
H. J. Cash & Co., Ltd.	1,245	–
Tilley Bros.	1,397	16

Metropolitan Asylums Board.—The tenders of the following firms for annual supplies of electrical accessories were accepted on Saturday :—General Electric Co., Pryke & Palmer, G. Braulik, Stirling Telephone & Electric Co., British Insulated and Helsby Cables, Ltd., W. T. Henley's Telegraph Works Co., Ltd., Edison & Swan United Electric Light Co., Ltd., Davies Kent & Stewart, Ltd., Callender's Cable and Construction Co., Ltd., Connolly Bros., India Rubber, Gutta Percha & Telegraph Works Co., Ltd., Goossens, Pope & Co., Sunbeam Lamp Co., Ltd., Cryselco, Ltd., H. G. Mayer & Co., A. P. Lundberg & Sons, Galsworthy, Ltd., J. H. Tucker & Co., London Electric Wire Co., Ltd., Siemens Bros. & Co., Ltd., Heap & Johnson, G. McLellan & Co., Macintosh & Co., Ltd. The Contracts Committee state that it is impracticable to give any reliable estimate of the probable total value of the supplies, as they are required almost entirely for replacements and renewals.

The Board has accepted the tender of Edmundson's Electricity Corporation, Ltd., at £194 (less 5 per cent. to the builder) for wiring and fitting for electric lighting the Belmont Laboratory, Sutton, Surrey.

MANCHESTER.—Messrs. Royce, Ltd., have received a repeat order from Messrs. Galloways, Ltd., Manchester, for two 40-ton three-motor electric overhead cranes and gantry for their boiler works, Ardwick.

WEST HAM.—The West Ham Borough Council Electric Lighting & Tramways Committee has received the following tenders for the supply of a 3,000 kilowatt turbo-generator :—

	£
Electrical Co.	11,400
Richardsons, Westgarth.—Brown Boveri ...	9,675
Richardsons, Westgarth-Parsons	9,400
Electric Construction Co., Richardsons, Westgarth	9,400
Richardsons, Westgarth-Electric Construction Co.	9,300
Willans & Robinson—Dick, Kerr	9,182
Howden-Dick, Kerr	8,865
Howden-Westinghouse	8,750
General Electric Co.-Richardsons, Westgarth ...	8,745
Richardsons, Westgarth-Dick, Kerr	8,520
Howden-Siemens	8,500
Parsons-Parsons	8,184
Richardsons, Westgarth-Siemens	8,175
Electric Construction Co.-Parsons	7,704
Parsons-Dick, Kerr	7,494
General Electric Co.-Parsons	7,349
British Westinghouse Co. (provisionally accepted)	6,100

The contract with the British Westinghouse Co. is to provide for delivery in five months, with two years' maintenance, and to contain clauses giving to the Council the option of purchasing a further similar turbo-generator within two years for £6,800. The Electrical Engineer's estimate for the first of these two turbo-generators amounted to £10,000.

MISCELLANEOUS CITY NOTES

ANGLO-ARGENTINE TRAMWAYS CO.—An extraordinary general meeting will be held at Winchester House, Old Broad Street, London, on Tuesday next.

BRUCE PEEBLES & CO.—In connection with the scheme of reconstruction, it is proposed that a new company shall be formed with a nominal capital of £250,000 in £1 shares. The holders of 5 per cent. debentures of the old company will exchange for 6 per cent. debentures in the new company for an equal amount, whilst ordinary creditors will receive ⅜ of the amount due in 6 per cent. unsecured debentures, and ⅝ in fully-paid shares. The holders of the 5 per cent. preference shares, as already announced, will have three shares of £1 each, 13s. 4d. paid for each preference share, and £5 ordinary shares will be exchanged £1 shares 10s. paid. It is understood that the scheme of reconstruction has received the approval of the committee of creditors and shareholders, and will come before the Court of Session in Edinburgh on July 10th.

HOBART ELECTRIC TRAMWAYS CO.—A dividend of 1s. per share free of tax is recommended.

PROVINCIAL TRAMWAYS CO.—An interim dividend of 3s. per share upon the ordinary shares is recommended.

RIO DE JANEIRO TRAMWAY, LIGHT & POWER CO.—An issue of £900,000 5 per cent. bonds have been offered to the public by the Bank of Scotland and the Canadian Bank of Commerce at 80. The bonds are part of an authorised total of £3,500,000, and have a specific charge on the assessable and immovable property of the company subject to the prior claims of $25,000,000 first mortgage bonds.

SHAWINIGAN WATER & POWER CO.—A dividend of 1 per cent. for the quarter ending June 30th has been declared.

THE AMERICAN WESTINGHOUSE CO.—The special correspondent of the *Birmingham Daily Post* reports that the Westinghouse Electric & Manufacturing Co. has passed into the control of a syndicate associated with Mr. Pierpont Morgan. The purchase price is given at 40,000,000 dollars.

Electrical Laboratory at Oxford University.—The Drapers' Co. have granted a sum of £22,000 for the building and all the accessories of an electrical laboratory which is to be presented to Oxford University, and have instructed Mr. T. G. Jackson, the company's architect, to carry out the work. It is announced that in a Convocation to be held on October 20th next it will be proposed that the University accept the munificent offer and express its grateful appreciation of the company's generosity.

COMPANIES' MEETINGS AND REPORTS

ALUMINIUM CORPORATION.—At the annual general meeting last week, the report and accounts given in our last issue were adopted. Sir James Sivewright, K.C.M.G., the chairman, who presided, said that since the beginning of the year the production of aluminium had been commenced, the first furnace having been worked in March. The number of furnaces had been added to since, and the quality of the aluminium was such that in no case had it fallen below 99 per cent. of pure metal. They were prepared to face competition, and in order to do so more effectively had decided to put up their own alumina works. In the past they had been buying their alumina in the open market, but the company had secured an extremely valuable bauxite property in the Var district of France, the material running to 60 per cent. alumina and 1 per cent. of silica. The chairman also stated that the company had taken authority to create £150,000 5 per cent. debentures, of which £100,000 would be issued very shortly.

BRITISH ELECTRIC TRACTION.—This company's report for 1907 will be found on page 985.

BUENOS AYRES ELECTRIC TRAMWAYS (1901).—The report for the fifteen months ended March 31st, 1908, states that, after allowing for debenture interest and transferring £2,530 to the sinking funds for redemption of debenture stock, and deducting the credit balance brought from the last balance-sheet, amounting to £2,639, there remains a debit balance of £1,931 to be carried forward, and when this balance has been wiped out, depreciation of rolling stock, plant, &c., will be duly provided for. The meeting is to-morrow.

BUENOS AYRES GRAND NATIONAL TRAMWAYS.—The annual report states that the gross receipts of the lines operated by the Buenos Ayres Grand National Tramways Co., Ltd. (consisting of the lines of this company and those of the Buenos Ayres New Tramways Co., Ltd.), have amounted to £380,969 6s., as compared with £321,256 9s. for the previous year. The working expenses amounted to £242,117 19s. 9d., as compared with £220,389 8s. 4d. The net receipts amounted to £138,851 6s. 3d., as compared with £100,867 0s. 8d. The Grand National Co.'s share of the above net receipts under the agreement has amounted to £91,446 18s. 8d., as compared with £68,405 14s. 4d. for the previous year. After payment of London administration expenses, interest on debentures, &c., there remained a balance of £37,840 15s. 11d., from which the sum of £3,502 has been transferred to debenture reserve funds and £3,726 3s. to income bondholders' interest account, and there has been paid on February 15th, 1908, £11,250, being the interim dividend of 2½ per cent. on the 5 per cent. cumulative preference shares, leaving £19,362 12s. 11d., which the directors recommend should be appropriated as to £11,250 to the payment of a further 2½ per cent., payable on August 1st, 1908, on the preference shares (making 5 per cent. for the year to March 31st, 1908), £3,293 8s. 11d. to contingency fund (bringing that fund up to £7,000), and that the balance, £4,819 4s., be carried forward. Since the last ordinary general meeting of the Company continued progress has been made with the work of converting for electric operation the joint system of this company and of the Buenos Ayres New Tramways Co., Ltd., and of constructing further lines authorised by concessions from the municipality of Buenos Ayres. At March 31st, 1908, there had been converted a total length of 85¾ miles, of which about 81 miles were being operated.

ELECTRICITY SUPPLY COMPANY FOR SPAIN.—The report for 1907 shows that after deducting debenture interest and expenses amounting to £11,139, administration expenses, income tax, and interest £2,148, there is a profit of £26,666. This, together with the debenture sinking fund of £46,250, and the carry over from 1906 of £12,034, has been applied in writing down the Company's assets in Madrid.

GLOBE TELEGRAPH & TRUST.—The report for the year to May 31st last states that the net revenue for the year, after deducting expenses, amounts to £210,294, and makes, with the balance of £26,565 brought forward, a total of £236,860. From this amount there has been distributed £131,769 in interim dividends, leaving an available balance of £105,090. The directors now recommend the payment of the following final dividends—namely, 3s. per share, less income-tax, on the preference shares, making with previous distributions a total dividend for the year on those shares at the rate of 6 per cent. per annum, less income-tax, and 5s. 9d. per share net on the ordinary shares, making, with previous distributions, a dividend on these shares at the rate of 5⅞ per cent. net for the year. These dividends will absorb £77,884 and leave a balance of £27,206 to be carried forward. The meeting is on the 30th inst.

INDIAN ELECTRIC SUPPLY & TRACTION.—The report for the year ended December 31st, 1907, states that up to June 30th, 1907, expenditure was debited to capital account, and on July 1st, 1907, the revenue account was opened. The capital expenditure has proved to be in excess of the estimates, partly owing to the plague, which delayed completion of the works, and partly because revenue has not come in to meet the debenture interest so soon as was expected. It will be necessary, in the early part of next year, to raise further capital to pay off the indebtedness incurred, and to provide for extensions of the company's mains, which are required for the development of the undertaking. The result of the first half-year's working has been a loss of £6,681, including payment of interest on construction debenture stock, amounting to £3,750. The working loss is mainly due to the tramway, the returns from which have fallen far short of the expectations formed of them. The meeting is on Monday.

J. G. WHITE.—The report for the year to February 29th, 1908, shows a net profit of £36,162. Profit has only been taken into the accounts on work actually completed at the date of the balance-sheet. Included in the completed works at that date was the tramways system for the town of Luton, which is now being operated successfully by the company under a leasing agreement. The company is now actively carrying out work in Buenos Aires, Montevideo, Para (Brazil), Dumbarton, and at other places. Since the date of the balance-sheet contracts have been secured for an electric supply installation at Arbroath, for the supervision of tramway works in Santos (Brazil), and for other tramway construction. With regard to the company's investments, since the date of the balance-sheet securities valued at £24,752 have been sold at a profit, which will come into the current year's accounts, leaving £119,496 as the valuation of the remaining securities. After bringing in £18,311 from the previous account, deducting the interim dividend paid on the preference shares at January 1st, 1908, and making provision for percentages due to directors and staff, there is a balance of £47,749. The directors recommend a dividend of 6 per cent. per annum on the cumulative preferred shares for the half-year to February 29th, 1908; a dividend of 6 per cent. per annum on the ordinary shares for the year to February 29th, 1908; and a bonus of 2 per cent. on the full amount of the preferred and ordinary share capital (making 8 per cent. for the year). £20,000 are placed to reserve, and £16,249 carried forward. The meeting is on Monday.

LEAMINGTON & WARRINGTON ELECTRICAL.—The report for the year ended December 31st, 1907, states that the capital expenditure during the year amounted to £2,295, of which £426 was incurred in connection with the reconstruction and equipment of the electric tramways and £1,866 in connection with the power station and equipment for the supply of electricity. The amount owing to the British Electric Traction Co. for advances in connection with the reconstruction and equipment of the tramways and power stations, &c., is £28,233, which it is proposed to repay as soon as arrangements have been made for issuing a portion of the authorised debenture stock. In the meantime interest at the rate of 4½ per cent. is being paid on the loan. The accounts show a net credit balance of £4,731 from tramways and electricity supply, and sundry receipts amount to £68. Deducting administration and general expenses, payments to the superannuation fund, interest on loans, and provision for renewals, there remains a balance of £2,356, to which has to be added £1,257 brought forward, making a total amount available for distribution of £3,613. The directors recommend increasing depreciation and reserve account to £4,300 by adding £300, a dividend of 4 per cent. on the ordinary shares for the year, leaving £139 to be carried forward. Before arriving at the profit, the directors have debited the profit and loss account with a sum of £350, which has been placed to a provision for renewals account. This, with the further sums of £650, which they now recommend should be placed to other reserves, is double the amount so provided last year. Owing to the inclement weather during the summer the tramway receipts show a falling off of £615. The expenses of operation, however, show a reduction of £407. The supply of electricity resulted in a loss of £240 on the year's working, but the expenses have been exceptionally heavy owing to trouble with the plant. At the meeting on Tuesday, the report and accounts were adopted.

MONTREAL LIGHT, HEAT & POWER.—For the year ended April, 1908, the net revenue amounted to $2,140,561, of which fixed charges absorbed $493,494. After paying $1,020,000 as dividends, there is a surplus of $627,466, and the amount to be carried forward, when added to the surplus from last accounts, amounts to $1,332,314. Since the company started operations seven years ago, the working expenses have been reduced from 53 per cent. to 43 per cent. of the revenue.

NEW GENERAL TRACTION.—The report for the year ended March 31st last states that the revenue amounts to £18,892, against £14,767 in the previous year. General expenses, including directors' fees and legal charges, amounted to £2,509, as against £2,485 in 1907. The amount paid for debenture interest remains the same as for the previous year—namely, £13,200—before deducting income-tax thereon. The item of "interest on loans, discount, and commission" figures as £3,292, against £1,836. The accounts for the year show a small profit of £264, thus reducing the balance of loss previously shown to £26,519.

Digitized by Google

The Coventry Tramway Co.'s system has shown satisfactory results, enabling that company, besides paying an increased dividend, to reduce its indebtedness to this company by the sum of £4,000. The Norwich tramway traffic returns are disappointing. The returns from the Douglas property have again been satisfactory. The meeting is on the 30th inst.

OSWESTRY ELECTRIC LIGHTING & POWER.—At the annual general meeting held at Oswestry last week the report and accounts were adopted. The balance sheet shows a profit of £557, and after paying a dividend of 4 per cent., a sum of £150 is carried to reserve fund. During the year an automatic stoker has been added to the Lancashire boiler in the power station, which it is hoped will result in a considerable saving in fuel.

R. WAYGOOD.—At the annual general meeting last week the report and accounts were adopted. Mr. Henry C. Walker, the chairman and managing director, said the company's business was expanding at such a rate that the directors would soon have to decide whether the works should again be removed. The profit for the year was £61,527, which was a considerable advance on the previous year, but, of course, there had been extra expenses and general charges. A dividend of 7 per cent. on the ordinary shares, making 6 per cent. for the year, was approved.

MISCELLANEOUS BUSINESS NOTES

CHANGE OF ADDRESS.—We are informed by Messrs. Bramwell & Harris, consulting engineers, that owing to the Government authorities having purchased the lease of No. 5 Great George Street in accordance with the scheme of the Public Offices Sites (Extension) Act, 1908, they are about to move to new offices at No. 11 Great George Street, Westminster, S.W., which they hope to occupy by the end of this month.

G. M. BODDY & CO.—This firm asks us to state that they have now a scale of discounts in force applying to their "Metalik" lamps, which represents an allowance on an increasing scale, starting at 25 per cent. for 50 lamps. These discounts are offered to Corporations and the trade only. Full particulars will be sent on application to Messrs. Boddy's Newington Works, Liverpool, or their branch depôt, Castle Hill, Sheffield.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A meeting of the Rand Central Electric Works, Ltd., will be held at the offices of Mr. H. Rogers, the liquidator, 120 Bishopsgate Street Within, London, on July 21st, at 12 noon, for the purpose of hearing the liquidator's account of the winding up.

F. Egginton, Electrical Engineer and Contractor, 11 Tempest Street, Wolverhampton, has been adjudicated bankrupt.

The first meeting of the creditors of Ernest Goacher, Gateford Road, Worksop, Nottinghamshire, electrical engineer, &c., was held last week at the Official Receiver's offices, Figtree Lane, Sheffield. It appeared that the debtor started business in 1901 without any capital. At the end of 1907 he opened a shop in Whitwell, and last April another at Cresswell, while in February last he disposed of another business which he had carried on for about two years. It was stated that no statement of affairs had been lodged, the debtor having gone away, but it had been estimated that the liabilities amounted to something like £600, while the assets had realised £78, but there were some outstanding book debts. The failure was alleged to be due to interest on borrowed money, bad trade, and illness. It was decided that the matter should remain with the Official Receiver, who, therefore, acts as trustee.

The first meeting in the bankruptcy of F. B. Eggington, Electrical Engineer and Contractor, 11 Tempest Street, Wolverhampton, will be held on July 2nd, at 11 a.m., at the Official Receiver's Offices, Wolverhampton, and the public examination will take place at the Wolverhampton County Court on July 22nd, at 11 a.m.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. V. Mason, Manager of the Devonport & District Tramways Co., has been appointed General Manager of the South Metropolitan Electric Tramways & Lighting Co.

Mr. E. D. Long, Electrical Engineer to the Grays Urban District Council, has had his salary increased by £25 per annum.

Kelvin Lecture.—The Institution of Electrical Engineers have published a verbatim report of the Kelvin Lecture delivered by Prof. Silvanus P. Thompson, F.R.S., before the Institution on April 30th. Copies may be obtained from Messrs. E. & F. N. Spon, Ltd.

The Supply of Electricity Bill.—The Stepney Borough Council is circularising the other London Borough Councils, and also the local authorities of Greater London, asking that representatives be appointed to a deputation which it is proposed shall wait upon the President of the Board of Trade with a view to the re-introduction of the Supply of Electricity Bill as brought forward in the Session of 1906.

PARLIAMENTARY INTELLIGENCE

LONDON ELECTRIC POWER BILLS.—Our report of the proceedings before Lord Cromer's Committee will be found on pages 952 and 955 to 959.

AUDIT OF ELECTRIC LIGHTING COMPANIES' ACCOUNTS.—In the House of Commons on Thursday, Mr. Cleland asked the President of the Board of Trade whether the auditors employed by the South London Electric Supply Corporation had been appointed official auditors of the same accounts for the purposes of the Board of Trade audit; whether these auditors had failed to question the charging to capital account of certain proportions of the salaries of the company's permanent officials, a practice which the Local Government Board declined to allow local authorities to pursue; whether this company had also charged directors' fees to capital account, and had made an inadequate depreciation provision; and whether, in view of the fact that capital expenditure was always an important factor in determining the price a local authority had to pay for a company's undertaking, the Board of Trade would in future appoint independent official auditors other than those employed by the companies, and would make regulations under its statutory powers with the object of ensuring that the audit should be efficient and effective. Mr. Churchill, in reply, said that the auditors in question had been appointed by the Board of Trade in the manner suggested, and in their report stated that they saw no reason to question the principle upon which the proportion of salaries had been charged to capital account in respect of the time occupied by them on capital work. The auditors had called attention to the fact that the sum in respect of directors' fees charged to capital account in and before the year 1900 still remained. They also reported that they did not consider the provision made for depreciation by the company was inadequate. Whilst the Board of Trade had at various times endeavoured unsuccessfully to induce the company to remove the charge for directors' fees from capital account, he was bound to point out that they had no power to enforce the auditors' recommendation. As stated in a reply last week (ELECTRICAL ENGINEERING, June 18th, page 945), the arrangement made for the audit of electric lighting accounts for 1907 was being carefully watched in case it should need any changes. The Board of Trade had also issued instructions to auditors appointed by them with the object of ensuring that the audit should be efficient and effective.

PATENTS ACT.—In the House of Commons on Thursday, the President of the Board of Trade was asked whether representations had been received as to the effect of the Patent Act of 1907 upon United States manufactures, and what was the general purport of these representations, and the replies thereto. Mr. Churchill stated that representations had been received with regard to certain provisions of the Act affecting patents worked exclusively or mainly abroad. The United States Government appeared to be under some misapprehension in the matter, but correspondence with the United States Government was still proceeding.

PATENTS AND DESIGNS BILL.—In the House of Commons on Friday Mr. Hearley, on behalf of the Board of Trade, moved the second reading of this Bill, the object of which, he said, was to make clear the Patents and Designs Act of last year. Some doubt seemed to exist in the minds of some patent lawyers as to whether the appeal to the House of Lords in case of revocation of a patent by a lower court was safeguarded.

POST OFFICE ENGINEERING ESTIMATES.—In the House of Commons on Wednesday last week, Mr. Field asked whether the Postmaster-General would give directions that all future estimates for the Post Office Engineering Service shall show the expenditure in Ireland as distinct from Great Britain. The Postmaster-General, in reply, stated that he would consider the question before the estimates of 1909-10 were prepared, but the matter was not free from difficulty.

TRAWLERS AND SUBMARINE CABLES.—In reply to a question in the House of Commons on Thursday, Mr. Churchill said that he had seen a report to the effect that the cable steamer *Buccaneer* had hailed four steam trawlers off the south-west coast of Ireland, in which small area there were five cables belonging to two Atlantic companies, representing a value of over £2,000,000. He was considering the question of holding a small interdepartmental committee on the question.

UNOPPOSED BILLS.—The North-East London Railway Bill was before the Unopposed Committee of the House of Lords on Tuesday, and was ordered to be reported for third reading. The Bill amends the North-East London Railway Acts of 1905 and 1907, so that the period during which half the capital must be subscribed shall be four years instead of twelve months from 1905.

Electric Lighting Provisional Order Confirmation Bills Nos. 1, 2, and 3 were ordered to be reported for third reading by the Unopposed Committee of the House of Lords on Tuesday.

PROGRESS OF ELECTRICAL BILLS.—The Burnley Corporation Bill, and the Ayr Corporation Tramways Provisional Order Confirmation Bill, were read a third time and passed in the House of Commons last week.

Wolverhampton Corporation Bill and the Doncaster Corpora-

Digitized by Google

tion Bill were read a second time in the House of Lords last week; the Great Northern, Piccadilly, and Brompton Railway Bill was read a third time, and the Central Ireland Electric Power, and Birmingham Corporation Bills a first time.

The Great Northern, Piccadilly, and Brompton Railway Bill, the Keighley Corporation Bill, and the Metropolitan District Railway Bill were read a first time in the House of Commons on Wednesday last week.

The Central Ireland Electric Power Bill, the Burnley Corporation and Electric Lighting Provisional Order Confirmation Bills, Nos. 1 and 2, were read a second time in the House of Lords on Thursday.

The North-East London Railway Bill, the Keighley Corporation Bill, and the Metropolitan District Railway Bill, were read a third time in the House of Lords on Wednesday.

ROYAL ASSENT.—Royal assent was given to the following Bills, last week, among others:—Edinburgh Corporation Tramways Order Confirmation; Loch Leven Water Power Order Confirmation; Tramways Order Confirmation No. 1, and the Rochdale Corporation.

NEW COMPANIES

BOURNE END ELECTRIC INSTALLATION CO.—This company was registered on June 19th, with a capital of £5,000 in £1 shares, to take over the business of suppliers of electric light and energy, engineers, and fitters, carried on at Bourne End, Bucks. The subscribers are:—F. C. Frye, H. S. Wilton, J. R. Collins, H. Wetton, H. C. Brannan, W. R. Chapman, E. R. Gibbs. No initial public issue. The number of directors is not to be less than two nor more than four; the first are F. C. Frye (chairman), H. S. Wilton, J. R. Collins, and W. P. Wilson. Qualification, £50.

ELECTRIC PREPAYMENT METERS.—This company was registered on June 5th, with a capital of £5,000 in £1 shares, to acquire from the Electrical Apparatus Co., Ltd., the benefit of certain existing inventions relating to improvements in meters for recording the supply of electricity, to adopt agreements: (1) with the said company, and (2) with the said company and others, and to carry on the business of manufacturers of electricity meters, suppliers of electric light and power, mechanical and electrical engineers, &c. The subscribers are:—P. R. Reeves, W. J. Park, W. Eacott, S. Jordan, W. J. McNelly, R. Bott, R. J. Hawkins. No initial public issue. The number of directors is not to be less than three nor more than seven; the first are B. Bernheim, W. H. Fowler, and J. T. Jervis. Qualification £100. Remuneration £50 each in any year when 10 per cent. dividend is paid. Registered office: Caxton House, Tothill Street, Westminster.

ELECTROCAB DEVELOPMENT CO.—This company was registered on June 13th, with a capital of £100 in £1 shares, to carry on the business of electrical, mechanical, and general engineers, manufacturers of and dealers in electrocabs, electro-omnibuses, and other electric vehicles, tyres, wheels, motor-cars, motor-omnibuses, bicycles, carriages, and vehicles of all kinds, &c. The subscribers are J. Williams, R. James, D. Cony, C. Dew, A. Budd, R. H. Hammant, J. Booty. No initial public issue. Registered without articles of association.

ELECTRO-MECHANICAL BRAKE CO.—This company was registered on June 6th with a capital of £10,000 in £1 shares to acquire the benefit of certain existing inventions referred to in an agreement with J. B. Hamilton, A. W. Maley, G. Conaty, and G. Law, Jun., and to carry on the business of brake makers, electrical and mechanical engineers, manufacturers of and dealers in tramway carriages, trucks, motors, accumulators, and dynamos, &c. The subscribers are: J. B. Hamilton, general manager Leeds City Tramways; A. W. Maley, G. Conaty, G. Law, Jun., J. Hamblet, H. Denison, D. H. Wilmer. No initial public issue. The number of directors is not to be less than three, nor more than seven; the first are J. B. Hamilton, A. W. Maley, G. Conaty, G. Law, Jun., and J. Hamblet. Qualification, £250. Remuneration (except managing director), £100 per annum, dividend. Registered office: Eagle Works, Moor Street, West Bromwich.

LONDON ELECTROCAB CO.—This company was registered on June 13th with a capital of £100 in £1 shares. Other particulars as in Electrocab Development Co., Ltd. (q.v.)

REVY, PHILLIPS & CO.—This company was registered on June 18th, with a capital of £10,000 in 9,000 shares of £1 each, and 8,000 shares of 2s. 6d. each, to take over the business of electrical, telegraph, general, and sanitary engineers, contractors, manufacturers of cooking and other appliances, and heating and ventilating engineers, carried on by J. W. Revy and P. F. Besch, at 181 Queen Victoria Street, E.C., and at the Iliffe Iron Works, Amelia Street, Penton Place, Southwark, S.E., as "Revy, Phillips & Co." The subscribers are T. J. F. Bird, W. S. Roberts, A. P. Banting, F. Wilkinson, T. O. Wilkinson, F. Besch, T. Wilkinson. No initial public issue. The number of directors is not to be less than three, nor more than nine; the subscribers are to appoint the first. Qualification, £50. Remuneration as fixed by the company. Registered office, 181 Queen Victoria Street, E.C.

PAIGNTON ELECTRIC LIGHT AND POWER CO.—This company was registered on June 19th, with a capital of £15,000 in £1 shares, to acquire the benefits, rights, powers, authorities, obligations, and liabilities of J. A. Purves, D.Sc., and W. T. Purves, M.A., (trading as the Western Electricity Corporation), under a Provisional Order granted in 1907 to the said parties under the Electric Lighting Acts, 1882 and 1888, in respect of the urban district of Paignton, and confirmed by the Electric Lighting Orders Confirmation (No. 3) Act of 1907, and to carry on the business of suppliers of electricity in all its branches. The subscribers are:—W. J. Ham, J. A. Burland, W. Lambshead, J. N. Osborne, F. Sarson, T. H. Ward, R. Waycott. Minimum cash subscription, £6,000 shares. The number of directors is not to be less than four nor more than ten; the first are W. J. Ham, Major-General G. D'A. Jackson, T. H. Ward, M.D., J. A. Burland, L.R.C.P.I., R. Waycott, F. Sarson, W. A. Axworthy, and J. N. Osborne. Qualification, 100 shares. Remuneration as fixed by the company. Registered office: 5 Palace Avenue, Paignton.

NEW PUBLICATIONS

"Switchboard Measuring Instruments for Continuous Polyphase Systems." By John C. Connan. (London: E. & F. N. Spon.) Price 5s.

"Aldum's Pocket Folding Mathematical Tables," for the use of engineers, architects, students, &c. (London: E. and F. N. Spon.) Price 4d.

"Journal of the Institution of Electrical Engineers," June, including index to Vol. 40, also verbatim report of Kelvin Lecture. (London: E. & F. N. Spon.)

"Electrometallurgy." By John B. C. Kershaw. (London: Archibald Constable & Co.) Price 6s.

"Natural Sources of Power." By Robert S. Hall. (London: Archibald Constable & Co.) Price 6s.

Teaching Children to Cross the Road.—At Tuesday's meeting of the London County Council, in reply to a question from Mr. W. Reynolds as to whether, in view of the large increase of accidents to children through the use of motor vehicles and electric trams, he would arrange for teachers in the Council schools to give brief lessons daily, warning children of such dangers, Mr. Cyril Jackson, Chairman of the Education Committee, said that he would see if he could not arrange for teachers to warn children of the risks they ran in crossing busy thoroughfares.

Telegraph Traffic.—An interruption to telegraphic communication has occurred between Saigon and Bankok, but messages are being sent via Obone, subject to delay. The via Fao route has been restored. We shall, in future, not report interruptions and restorations of the Fao route. They occur very nearly daily, and need not be taken into account. The cable to Prince Edward Island is still down, and messages are being sent by mail via Pictou. The Cayenne-Salinas cable has also not yet been repaired, and the route to Brazil via Hayti is therefore still not available. The cable between Nantucket Island and Wood's Hole has been interrupted for some time, and it would appear that no attempt is being made to repair it. The break in the cable cuts off the wireless station at Siasconsett. The cable of the Direct United States Cable Co., interrupted by trawlers at the same time as those of the Commercial Cable Co., is still in the same condition.

Dispute as to Overhead Wires.—At Chorley County Court last Thursday an action was brought by William Holden, of Brinscall, against Thomas Barton, electrician, of Blackburn, for £14 damage alleged to have been sustained by reason of defendant's trespass in the erection of telephone wires. Plaintiff said in 1900 he found a telephone wire had been affixed to a chimney, for which he gave no permission. In August, 1907, workmen were on the roof fixing a second wire, and subsequently water came in, and he had had to pay various sums for damage to the roof and chimney. For the defence, Mr. J. W. Garsden, another Blackburn electrician, said in '99 he had control in the erection of a line from Brinscall to Manchester, and plaintiff verbally agreed to the bracket being fixed on the usual acknowledgment of 1s. per year. Defendant said he had laid 500 miles of telephone wires, and had never had litigation before. He had since had the wires removed from the property. His Honour gave a verdict for the defendant.

TRAVELLER.—Additional Traveller required for London for Arc Lamps, Transformers, and Accessories. Apply FOSTER ARC LAMP & ENGINEERING CO., Ltd., Wimbledon, S.W., by letter first, giving full details.—ADVT.

Digitized by Google

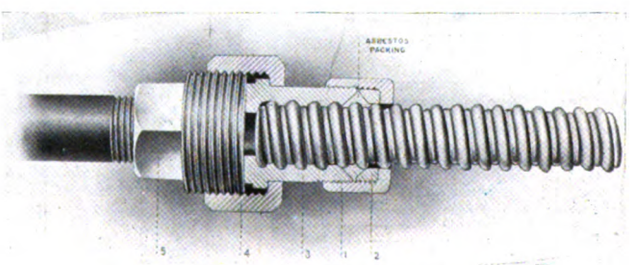
BRITISH ELECTRIC TRACTION COMPANY'S REPORT

THE report for the year ended March 31st, 1908, in view of the fact that nearly the whole of the capital of the company is invested in a large number of associated companies, submits not only particulars of the company's interests in the associated companies, but also many particulars concerning the associated companies, the object being to enable the shareholders to form a correct view of the position of the company. The subscribed share and debenture capital of the company remains the same as at March 31st, 1907, viz., £4,949,969. The amount standing at the credit of reserve account is £567,420. In addition, reserves have been made out of profits against loss or depreciation of specific assets, of which reserves a balance of £41,117 is unappropriated. These, however, are not the only reserves, inasmuch as the various associated companies have created depreciation and reserve funds of their own, which amounted at December 31st, 1907, to £902,728. The associated companies have recently on the recommendation of the company adopted resolutions with a view to increase their provision against depreciation and also to define more clearly the purposes of their reserve funds. The resolutions are to the effect that the companies should make minimum provisions before payment of dividends, for (1) permanent way renewals, (2) redemption of capital, and (3) general depreciation purposes. The gross profits for the year 1907-8 amount to £250,539, and the expenses, including £73,682 interest on the 5 per cent. debenture stock and £23,802 interest on the 4½ per cent. debenture stock, for the year, amount to £144,829, leaving a balance of £105,709, to which is added the amount brought forward from preceding year, viz., £13,115, leaving to be dealt with £118,824. The gross profits include £49,954, profits on the Bombay undertaking, which have been fully explained in previous reports, and also £10,882 net profit on sale of investments. The expenses include £17,500, an amount reserved to meet depreciation of undertakings worked by the company (apart from investments), buildings, doubtful debts, and expenditure on undertakings not proceeded with.

The directors have given the question of the distribution of the balance of profit their earnest consideration, and are unanimously of opinion that, in advising the preference shareholders to agree to a postponement of a part of their dividend, they are recommending a course which will materially strengthen the position of the company, and which, by improving the prospects of increased profits, offers future compensation to both classes of shareholders for their present sacrifices. They therefore recommend that the full dividend on the preference shares at the rate of 6 per cent. per annum be paid for the six months ended September 30th, 1907, being at the rate of 3 per cent. for the financial year, which will absorb £48,431. They further recommend that there be added to general reserve (increasing the same to £602,420) the sum of £35,000, and that there be carried forward to next account £35,393.

The number of passengers carried last year upon the tramways and light railways was slightly less than in the year 1906, notwithstanding the increase in the number of miles worked. This reduction was due partly to the unfavourable weather and partly to the fact that several miles of tramways in the city of Birmingham reverted to the Corporation at the end of 1906, and that the new lines opened in various places do not as yet equal in density of traffic the routes which have been lost. The traffic on the lines which have been in operation for some time is, however, on the whole developing satisfactorily. Efforts have been made during the past year to improve the position of the undertakings by increasing the fares, by shortening the fare stages, and by eliminating unremunerative services. The increases of fares were not made till the second half of the year, and it will necessarily take some time before the full effects of these changes can be ascertained. Meanwhile, the directors regret the average fare for the past year has fallen to 1·21d. per passenger, compared with 1·22d. in 1906, and 1·38d. in 1901.

The expenses for the last nine months of the year have been discharged on a co-operative basis by the British Electrical Federation, but the directors are able to report a further reduction in the expenses. This reduction is not an advantage to the company in so far as it is a concomitant of reduced volume of business; it is satisfactory, however, that the management and general expenses are beng reduced in a larger ratio than the profits. In 1906-7 the gross profits were £267,757, and the management and general expenses £48,689, the proportion being 18·1 per cent., whilst in 1907-8 the gross profits were £250,539, and the expenses £27,446, a proportion of 10·9 per cent. Another matter which has been receiving attention is the price paid by the associated companies for the electrical energy for working the cars. This is a very large item in the working expenses, and in many cases, where the local authority owns an electricity supply station, an obligation has been placed upon the company to take current at what is now a high price, the local authority supplying other and much smaller consumers at considerably lower prices. The matter is receiving the attention of the directors with a view to securing better terms from the local authorities. With few exceptions the electricity supply undertakings owned by the subsidiary companies have now passed the pioneer stage, and are more than covering expenses, and their returns are steadily improving.



A federation of all the companies and undertakings associated with the company was formed in July, 1907 (in succession to the advisory committee for associated companies formed in 1902), for the purpose of co-operation and joint action in matters of common interest. About sixty undertakings have thus been federated for co-operative purposes, and a council has been constituted, consisting of the chairman or managing director of each of the federated undertakings. Among the more important matters dealt with by the federation are the following: Joint head offices and staffs, stores, insurances, &c. The council of the federation has also appointed expert officers to advise the companies in regard to rates and assessments, automobile matters, books and forms, and other like questions. The federation has been constituted on the basis of making no profit, and the expenses are distributed among the various companies in proportion to the services required by each. In the course of some general remarks as to the conditions under which the company is working in many places, the report states that the directors are giving consideration to some of the proposals for electrical enterprise submitted to them from countries where the conditions for the investment of capital are more favourable than in this country, and although such proposals require extensive examination before commitments can be made, the directors are hopeful that they will be able in the near future to employ the resources of the company to the further advantage of the shareholders in this direction. The meeting is to-day.

CATALOGUES AND PAMPHLETS RECEIVED

CARBON BRUSHES.—A list has been issued by Messrs. W. Geipel & Co., of the well-known graphitic carbon brushes, which are manufactured by the firm of Fabius Henrion, of Nancy (France). Particulars are given of several qualities of medium conductivity, high conductivity, and traction brushes, together with some useful notes as to their use. Messrs. Geipel are also agents in this country for Henrion arc lamp carbons and carbon incandescent lamps.

ELECTRIC GAS-LIGHTER.—A leaflet is to hand from Messrs. L. E. Wilson & Co., of 20 Cross Street, Manchester, describing the Thomson patent electric gas-lighter. The actual lighter consists of a glower of a special alloy, heated by current from a similar battery to that used in the firm's well-known pocket lamps. The special feature of the apparatus is, however, a small incandescent lamp worked off the same battery, which enables the apparatus to be used conveniently in the dark.

FLEXIBLE METALLIC TUBING.—A well illustrated catalogue is issued by the United Flexible Metallic Tubing Co., giving details of and describing the application of this firm's well-known metallic flexible tubing, which is rapidly superseding rubber hose, especially in cases where high pressures and temperatures have to be dealt with. Besides its application to steam at high pressures, the same form of tubing is largely

JOINT FOR FLEXIBLE METALLIC TUBING.

employed for conveying liquids, &c., in sizes up to 8 in. in diameter. A great deal of the success of such tubing depends upon the nature of the joint adopted, and especially where rigid and flexible tubes are connected together. The figure gives a section of the joint used by the company for this purpose; 1 is an octagon back nut, and 2 a bevelled ring. The sleeve 3 is screwed to the pitch of the tubing, 4 is hexagon nut, and 5 a plug for screwing into standard steam barrel. Asbestos thread or similar material is twisted round two corrugations of the tubing in the space left at the bottom of the sleeve, and the space in the corrugations of the tubing is completely filled up with alternate layers of red-lead and packing.

METAL FILAMENT LAMPS AND SHADES.—A price sheet from Simplex Conduits, Ltd., deals with a series of metal filament lamps with an efficiency of 1¼ watts per candle, and an average useful life given as 1,000 hours. The sizes listed are 25 c.p. at 50 volts; 32, 50, and 100 c.p. at 70 to 130 volts; and 50 and 100 c.p. at 200 to 250 volts. The company take all risk of breakage in consignment of not less than 50 or 100 lamps, if the damaged lamps are returned immediately. Several patterns of adaptor and pendant fitting for two lamps in series are illustrated, together with special designs of long shades.

A LARGE VERTICAL WESTINGHOUSE GAS ENGINE

THE accompanying illustration represents a 1,000-h.p. vertical eight-cylinder four-crank tandem vertical gas engine, which has just been erected at the works of the Castner-Kellner Alkali Co., Ltd., Runcorn, and was started up by Mr. Percy Allen, engineer to the company, on June 6th. The engine, which is of the latest standard vertical type, was supplied by the British Westinghouse Co., and is connected to a direct-current generator, supplied by the same makers. It forms an extension to the existing installation at Runcorn, where four 750-B.H.P. engines of the same make have been in operation for some considerable time in connection with the electrolytic process of the above firm. The cylinders, in pairs, are placed over four cranks, by which arrangement the makers claim that they can give the most even turning moment of any gas engine on the market. In these engines, with several cylinders of small size, water cooling is not required for the pistons, valves, or other moving parts, and the danger of breakage of pistons, which is occasionally a source of trouble in connection with large horizontal engines, is avoided. Forced lubrication is used throughout. The oil-pumps are in duplicate, and are so arranged that they can be examined and the oil-sieves changed whilst the engine is in operation. The valve-gear is very simple. All valves are positively operated by means of straight push-rods actuated directly from the camshaft. These are also arranged with adjustable screws, so that any play or wear can be taken up on these valves whilst the engine is in operation.

It is pointed out by the makers that this particular engine marks an epoch in the gas-engine industry, as it is the largest vertical gas engine yet manufactured and put into successful operation.

In addition to the five Westinghuose engines of this type now installed at the Castner-Kellner works, three of 750-B.H.P. capacity have been supplied to Messrs. Pilkington Bros., St. Helens, for their glass works, one of 750 B.H.P. to the Hollis Mill Co., Marple, which has been working for some considerable time, and visitors to the Franco-British Exhibition will have noticed one of these large engines in the right-hand corner of the Machinery Hall. Those who are interested in gas-engine work should take advantage of the opportunity thus afforded of inspecting an example of a type entirely British both in design and manufacture, presenting several features worthy of study which distinguish it from other designs of gas engine.

1,000-H.P. WESTINGHOUSE GAS ENGINE AT THE WORKS OF THE CASTNER-KELLNER ALKALI CO. AT RUNCORN.

THE KENT COLLIERIES PUMPING PLANT DISPUTE: JUDGMENT

ON Tuesday last, in the Official Referee's Court, Mr. Muir Mackenzie delivered judgment in the claim brought by Messrs. Ernest Scott & Mountain, Ltd, against the Kent Collieries, Ltd., for £3,249, the balance of the contract price of £5,780 for electrical plant supplied, besides money paid by the plaintiffs for wages. The defendants alleged that the plant was not in accordance with the contract, and counterclaimed for £48,000 (see ELECTRICAL ENGINEERING, April 16th, p. 601; May 7th, p. 684; May 21st, p. 798). The Official Referee, in delivering judgment, said that the defendants resisted payment of the greater part of the plaintiffs' claim, because the machinery was not in accordance with the specifications. With regard to the counterclaim, the defendants, he said, were not ready to receive the plant, and that the delay was due to the fact that the appliances provided for dealing with the plant were not strong enough. No claim for damages due to delay could therefore be considered. As the defendants had decided to work one pump at a time instead of two alternatively as the plaintiffs had advised, they could not recover losses due to breakdown unless the breakdown was due to the plaintiffs. The motors were, according to the specification, designed for giving the stated output for six hours continuously, and not indefinitely. The generators, he found, were not according to the specifications. They had an output of 255 kw. instead of 300 kw., and consumed 38 lb. of steam per kw. hr. instead of 28 lb. For this the defendants were entitled to compensation. He could not make the extra cost of fuel a basis for the compensation, but would take as a basis the difference between the value of the machinery as delivered and that specified. He awarded the plaintiffs £2,943 as the balance of the contract price. On defendants' counterclaim he found that they were entitled to £417 on account of the failure of the machines to comply with the specifications, and a further sum of £700 for damages, making a total of £1,117. Deducting this from £2,943, he gave judgment for the plaintiffs for £1,826. As the defendants had succeeded in some of the issues, the costs would be divided.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 18th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.
Names in brackets indicate communicators of inventions from abroad.

1907 Patents

9,397, S. DE PONT. A hard, non-inflammable, water- and oil-resisting insulating material, consisting of 50 per cent. plaster of Paris, 30 per cent. wood pulp, 15 per cent. copal, 15 per cent. pitch, 13 per cent. lampblack, 8 per cent. clay, and smaller percentages of cowrie or lac, wax, aniline, and mica. The mixture is dried, treated with bisulphide of carbon, or benzoline, and then rolled between steam rollers at a temperature of 120° to 180° F. The product is moulded at a temperature of from 250° to 300° F., and then subjected to a pressure of from 3 to 4 tons per cubic inch of the material. The final product is quite hard, and can be sawn or turned like vulcanite. One claim.

13,285, G. ELLISON. A combined starting rheostat (for the rotor circuit), overload cut-out, and no-voltage release for three-phase induction motors. The solenoid of the overload cut-out is in one phase of the rotor circuit, and the solenoid of the no-voltage release is in one phase of the stator circuit. The overload cut-out operates by opening the circuit of the no-voltage release solenoid, which in turn releases the starting handle, which is pulled round to the off position by a spring. In the case of high voltages the no-voltage release solenoid would be operated from a small transformer. The arrangement is applicable to single-phase motors. Five claims, three figures.

18,245, R. B. RANSFORD (*Compagnie Parisienne des Voitures Electriques, procédés Krieger*). A method of control for petrol-electric vehicles. A compound generator is used, which has only a weak shunt excitation sufficient to keep the machine excited when the engine is running slowly. A series winding is provided, and also a demagnetising series winding, which, during normal running, is short-circuited. When this last winding is in circuit it more than neutralises the ordinary series winding, and the voltage of the generator is so much reduced that the motors receive practically no current. This affords a means of stopping the motors without breaking the main circuit. The motors can be pure series motors, or can also be supplied with a shunt winding across the armature brushes. Five claims, three figures.

1908 Patents

66, G. M. LITTLE. A magnetite arc-lamp electrode for use with alternating current, and consisting of 60 parts magnetic oxide of iron (Fe_3O_4) to form the main conducting material, 27 parts of titanium oxide (TiO_2), 6 parts of ferrous chromite (Cr_2O_3, FeO) for preventing rapid consumption of the electrode, 20 parts of potassium silicate (K_2SiO_3) for obviating the unsteadiness and flickering of the arc, and 5 parts of calcium fluoride (CaF_2) for increasing the luminosity of the arc. For this last purpose, salts of strontium, barium, or magnesium can also be used. Six claims.

665, A. P. STROHMENGER. A material for separating or enclosing the plates of secondary batteries. A cellulose fabric, such as ordinary muslin, is coated with pulp cellulose, and the resulting porous sheet is nitrated to a sufficient degree to be unaffected by the acid electrolyte. The finished material, which is porous and sufficiently strong to resist cracking, tearing, or abrasion in actual use, is either wrapped round the plates or merely interposed between them, effectually preventing short circuits through dislodgment of the active material. One claim.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.
Summaries of the more important of these patents will appear in our next issue.

1907 Patents

10,072, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Electric motor control systems.
10,293, COLLINS, HAYES & WATSON. Trolley heads.
12,353, AUSTIN. Receivers for wireless telegraphy.
12,406, SEDGWICK. Signalling apparatus.
12,407, GRANT (*Haggarty*). Ships' telegraphic apparatus.
12,578, HEYLAND. Self-regulating machines for alternating or direct current.
12,857, TONRY. Ball and socket joints for electric light fittings.
12,969, HELLMANN. Synchronous working of apparatus.
13,032, EASTWOOD. Systems for electric railways.
14,572, HAYWOOD, AND MCKENZIE & HOLLAND, Ltd. Electrically detecting the position of the switch tongues and locking bolts of railway points.
18,013A, KESSLER & JELICH. Contact arrangement and stand for electric lamps.
18,308, ELLISON & JACOBS. Telephonic apparatus.
19,073, FUSSER. Supports for electric lamps.
19,447, MOORE. Automatic time switch mechanism.
19,734, GROSS. Arc lamps.
20,119, MARCONI & MARCONI'S WIRELESS TELEGRAPH CO. Transmitters.
24,753, SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*). Means for rectifying alternate currents.
25,206, HARRISON (*Electric Railway Improvement Co.*). Welding.
25,350, ARENAS Y GARCIA. Dynamo-electric machines of the homopolar type.
26,621, CUMONT & COMPAGNIE DE SIGNAUX ELECTRIQUES POUR CHEMINS DE FER. Signal and point mechanism.
27,379, AMALGAMATED RADIO-TELEGRAPH CO. (*Scibt*). Radio-telephony.
28,516, JOHNSON (*Felten & Guilleaume Lahmeyerwerke Akt.-Ges.*). Electrical driving gear for motor vehicles.

1908 Patents

2,488, WOLHAUPTER. Insulated joints for rails.
3,701, POLYPHOS ELEKTRIZITÄTS-GES. Method of transmitting photographs.
4,444, DOWSING. Electrical radiators.
4,621, FRIEDHEIM. Manufacture of heat interchangers by an electrolytic process.
5,225, ALLGEMEINE ELEKTRICITÄTS-GES. Electrodes for arc lamps.
5,610, ALLGEMEINE ELEKTRICITÄTS-GES. Incandescent lamps.
6,050, SIEMENS & HALSKE AKT.-GES. Process for hardening tantalum.
7,910, SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*). Pyrometers and thermometers.

Complete Specifications open to Public Inspection before Acceptance.

1907 Patents

15,798, KUZEL. Metal filament lamp.
27,608, GEISSINGER. Electric thermostat.

1908 Patents

11,415, NORSK HYDRO-ELEKTRISK KVOELSTOFAKTIESELSKAB. Production of pure sodium nitrite.
11,633, ALLGEMEINE ELEKTRICITÄTS-GES. Alternating-current commutator machines.
11,870, HARTMANN-KEMPF. Apparatus for indicating the frequency of electrical oscillations.

Applications for Amendment

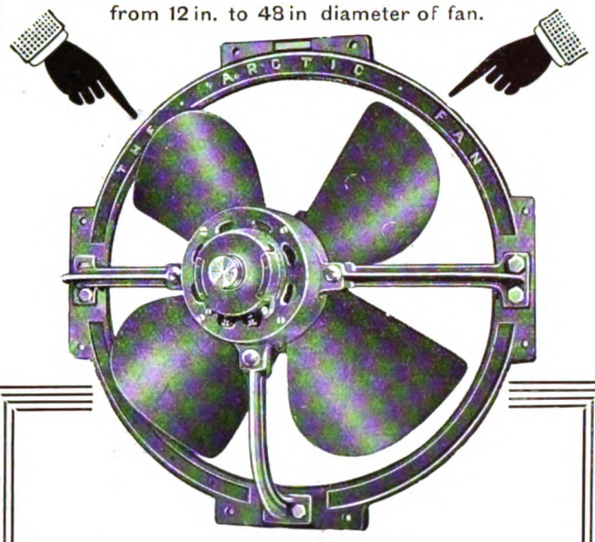
Further particulars and instructions as to procedure in opposition to amendment will be found in the Official Journal of the Patent Office of June 17th, 1908.

23,899 of 1904. THE WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, LTD., seek leave to amend this specification, granted to ALEX. JUST and FRANZ HANAMAN, for "Improvements relating to the manufacture of incandescent lamps," on the ground of doubtful validity of some of the claims. The amendments consist in striking out all reference to molybdenum and limiting the invention to tungsten.

11,949 and 20,175A of 1905; also 3,225, 3,684, and 4,081 of 1906. THE WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, LTD., seek leave to amend these specifications, granted to Alex. Just, F. Hanaman, and others, for the same reason as stated above with reference to No. 23,899 of 1904.

Expiring Patents

The following patents expire during the current week, after a life of fourteen years :—



12,407 of June 26, 1894. H. A. TAYLOR. An improved form of Wheatstone automatic transmitter for submarine telegraphy. The battery contact is prolonged relatively to the earth contact and the durations of these contacts are adjustable.

12,552 of June 28th, 1894. G. H. NISBETT. Sealing and junction boxes for lead-covered cables, for preventing access of moisture to the open ends of the cables. The cables enter the inner chamber of the box through solder glands. The inner chamber is filled with ozokerite or similar material, and the outer chamber contains terminals and fuses.

PATENTS AND DESIGNS ACT, 1907.

Notice is hereby given, that the WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, Limited, of 31 Copthall Avenue, London, E.C., seek LEAVE to AMEND the SPECIFICATION of LETTERS PATENT No. 25899 of 1904, granted to Alexander Just and Franz Hanaman, for Improvements relating to the Manufacture of incandescent electric lamps.

Particulars of the proposed amendment were set forth in the Illustrated Official Journal (Patents), issued on June 17th, 1908.

Any person, or persons, may give Notice of Opposition to the Amendment (on Patents Form No. 18), at the Patent Office, 25 Southampton Buildings, London, W.C., within one calendar month from the date of the said Journal.

C. N. DALTON, Comptroller-General.

PATENTS AND DESIGNS ACT, 1907.

Notice is hereby given, that the WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, Limited, of 31 Copthall Avenue, London, E.C., seek LEAVE to AMEND the SPECIFICATION of LETTERS PATENT No. 11949 of 1905 granted to Alexander Just, Franz Hanaman, and Vereinigte Electricitäts Actien-Gesellschaft, for Improvements in and relating to the manufacture of incandescing Filaments for electric incandescent lamps.

Particulars of the proposed amendment were set forth in the Illustrated Official Journal (Patents), issued on June 17th, 1908.

Any person, or persons, may give Notice of Opposition to the Amendment (on Patents Form No. 18), at the Patent Office, 25 Southampton Buildings, London, W.C., within one calendar month from the date of the said Journal.

C. N. DALTON, Comptroller-General.

B.T.H.

MAGNETIC TRACK BRAKE

The use of this brake makes it impossible for a car to get out of hand at any time, and eliminates the danger of skidding wheels.

It combines the advantages of a powerful and reliable slipper brake, applied by hand, and a convenient and efficient magnetic brake, applied through the controller.

If desired, both methods of application can be used at the same time in order to secure greater braking effect.

Tests made in actual service, both on wet and greasy rails, have demonstrated its thorough reliability.

Metal Filament Lamps.

THE "METALIK"

THE BEST 220-VOLT LAMP

Please write for particulars of the SPECIAL DISCOUNTS we have arranged for CORPORATIONS and the TRADE.

The originals of the following letters are in the hands of the Editor of "ELECTRICAL ENGINEERING."

Messrs. G. M. BODDY & Co.,
Liverpool. *June 6th*, 1908.

Dear Sirs,

In reply to your letter of the 4th inst., we beg to inform you that we tested three "METALIK" lamps 220 volt, 50 c.p. in a sloping position burning with alternating current. These lamps were burning continually without switching in and out more than about once every 100 hours. The life of the first lamp was 970 hours, of the second 1856 hours, while the third lamp is already burning 2,775 hours, and is *still in good condition.* The light of the lamps is not materially less than as they were new. The blackening of these lamps is practically so slight that we may say there is no blackening.

We also tested five lamps in our laboratory on direct current. These lamps showed the same behaviour as the above mentioned three lamps; they have not yet burned more than about 300 hours. The candle power was, new, 40 Heffner [35 British C.P.], and is steadily increasing, so that it is now 49 Heffner [43 British C.P.] after 250 hours; the consumption is constant 58 watt. These lamps are switched in and out about every 10 hours.

Electricity Offices
Messrs. G. M. BODDY & Co., *March 9th*, 1908.
Liverpool.

Dear Sirs,

Some time ago we had two sample 50 c.p. "METALIK" Lamps from you for testing purposes. These lamps had an average life of 1407 hours, and would have run longer had not the filaments become shorted by twisting.

It is our opinion that the supporting arrangements of all lamps of this class should have more consideration, as in all the lamps tested by us failure has generally been the result of partial shorting of the filament in the first case.

We shall be glad to have your best price for the supply and delivery carriage paid at our.....Stores of "METALIK" lamps in the 32 c.p. size suitable for series burning on a 230 volt direct current circuit.

Yours faithfully,
City Electrical Engineer.

Corporation Electricity Works,
Messrs. G. M. BODDY & Co., ..., *May 28th*, 1908.
Liverpool.

Dear Sirs,

In reply to yours of the 27th inst., so far your "METALIK" lamps have been burning very satisfactorily and shall be obliged if you will quote me your best price for 100 lamps, as we shall probably be wanting some more before long.

Yours faithfully,
City Electrical Engineer.

Metal Filament Lamps.

THE "METALIK"

THE BEST 220-VOLT LAMP

Please write for particulars of the SPECIAL DISCOUNTS we have arranged for CORPORATIONS and the TRADE.

The originals of the following letters are in the hands of the Editor of "ELECTRICAL ENGINEERING."

Messrs. G. M. Boddy & Co.,
Liverpool. *June 6th*, 1908.

Dear Sirs,

In reply to your letter of the 4th inst., we beg to inform you that we tested three "METALIK" lamps 220 volt, 50 c.p. in a sloping position burning with alternating current. These lamps were burning continually without switching in and out more than about once every 100 hours. The life of the first lamp was 970 hours, of the second 1856 hours, while the third lamp is already burning 2,775 hours, and is *still in good condition*. The light of the lamps is not materially less than as they were new. The blackening of these lamps is practically so slight that we may say there is no blackening.

We also tested five lamps in our laboratory on direct current. These lamps showed the same behaviour as the above mentioned three lamps; they have not yet burned more than about 300 hours. The candle power was, new, 40 Heffner [35 British C.P.], and is steadily increasing, so that it is now 49 Heffner [43 British C.P.] after 250 hours; the consumption is constant 58 watt. These lamps are switched in and out about every 10 hours.

Electricity Offices .....

Messrs. G. M. Boddy & Co.,
Liverpool. *March 9th*, 1908.

Dear Sirs,

Some time ago we had two sample 50 c.p. "METALIK" Lamps from you for testing purposes. These lamps had an average life of 1407 hours, and would have run longer had not the filaments become shorted by twisting.

It is our opinion that the supporting arrangements of all lamps of this class should have more consideration, as in all the lamps tested by us failure has generally been the result of partial shorting of the filament in the first case.

We shall be glad to have your best price for the supply and delivery carriage paid at our .....Stores of "METALIK" lamps in the 32 c.p. size suitable for series burning on a 230 volt direct current circuit.

Yours faithfully,

.... *City Electrical Engineer.*

Corporation Electricity Works,

Messrs. G. M. Boddy & Co.,
Liverpool. ....., *May 28th*, 1908.

Dear Sirs,

In reply to yours of the 27th inst., so far your "METALIK" lamps have been burning very satisfactorily and shall be obliged if you will quote me your best price for 100 lamps, as we shall probably be wanting some more before long.

Yours faithfully,

.... *City Electrical Engineer.*

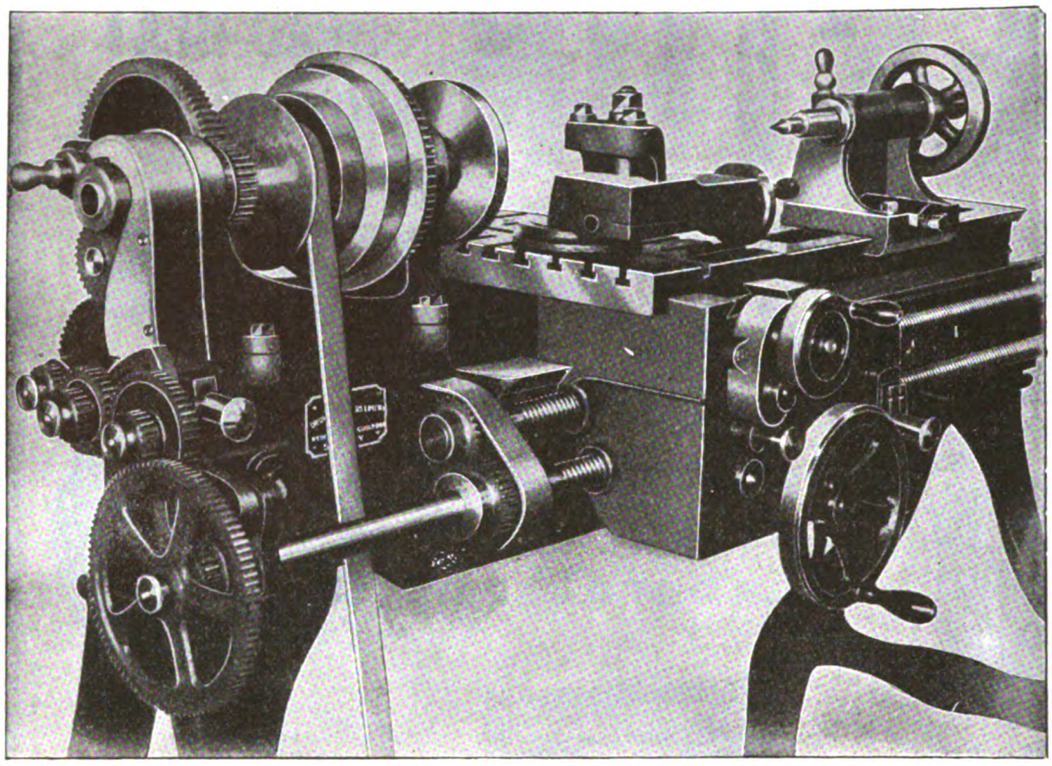
DESCRIBING THE MULTIMETER.

Model 16.
STANDARD PORTABLE DEAD-BEAT WATTMETER for A.C. and D.C. Circuits.

Model 1.
STANDARD PORTABLE DOUBLE RANGE VOLTMETER.

LONDON OFFICE AND LABORATORY:



AUDREY HOUSE, ELY PLACE, HOLBORN, LONDON, E.C.

WESTON ELECTRICAL INSTRUMENT CO.

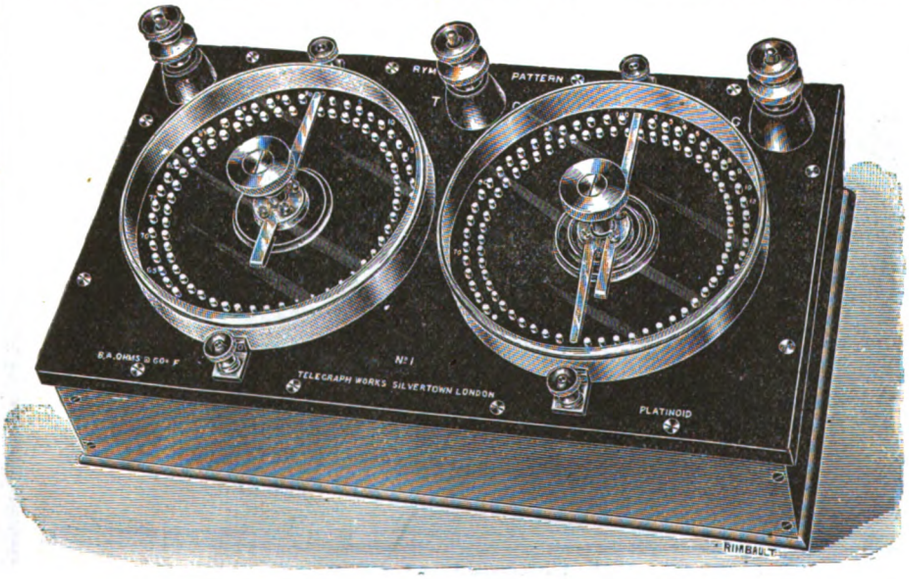
LATHES

OF THE HIGHEST CLASS and MOST MODERN DESIGN,
For TOOL ROOM, EXPERIMENTAL, or REPAIR WORK.



THESE Tools are capable of doing a much greater variety as well as heavier and more accurate work than any other Lathes of their size.

Years ahead in design
Perfectly made.
Moderate in Price.
Sent on Approval.

A LARGE VERTICAL WESTINGHOUSE GAS ENGINE

THE accompanying illustration represents a 1,000-h.p. vertical eight-cylinder four-crank tandem vertical gas engine, which has just been erected at the works of the Castner-Kellner Alkali Co., Ltd., Runcorn, and was started up by Mr. Percy Allen, engineer to the company, on June 6th. The engine, which is of the latest standard vertical type, was supplied by the British Westinghouse Co., and is connected to a direct-current generator, supplied by the same makers. It forms an extension to the existing installation at Runcorn, where four 750-B.H.P. engines of the same make have been in operation for some considerable time in connection with the electrolytic process of the above firm. The cylinders, in pairs, are placed over four cranks, by which arrangement the makers claim that they can give the most even turning moment of any gas engine on the market. In these engines, with several cylinders of small size, water cooling is not required for the pistons, valves, or other moving parts, and the danger of breakage of pistons, which is occasionally a source of trouble in connection with large horizontal engines, is avoided. Forced lubrication is used throughout. The oil-pumps are in duplicate, and are so arranged that they can be examined and the oil-sieves changed whilst the engine is in operation. The valve-gear is very simple. All valves are positively operated by means of straight push-rods actuated directly from the camshaft. These are also arranged with adjustable screws, so that any play or wear can be taken up on these valves whilst the engine is in operation.

It is pointed out by the makers that this particular engine marks an epoch in the gas-engine industry, as it is the largest vertical gas engine yet manufactured and put into successful operation.

In addition to the five Westinghuose engines of this type now installed at the Castner-Kellner works, three of 750-B.H.P. capacity have been supplied to Messrs. Pilkington Bros., St. Helens, for their glass works, one of 750 B.H.P. to the Hollis Mill Co., Marple, which has been working for some considerable time, and visitors to the Franco-British Exhibition will have noticed one of these large engines in the right-hand corner of the Machinery Hall. Those who are interested in gas-engine work should take advantage of the opportunity thus afforded of inspecting an example of a type entirely British both in design and manufacture, presenting several features worthy of study which distinguish it from other designs of gas engine.

1,000-H.P. WESTINGHOUSE GAS ENGINE AT THE WORKS OF THE CASTNER-KELLNER ALKALI CO. AT RUNCORN.

THE KENT COLLIERIES PUMPING PLANT DISPUTE: JUDGMENT

ON Tuesday last, in the Official Referee's Court, Mr. Muir Mackenzie delivered judgment in the claim brought by Messrs. Ernest Scott & Mountain, Ltd, against the Kent Collieries, Ltd., for £3,249, the balance of the contract price of £5,780 for electrical plant supplied, besides money paid by the plaintiffs for wages. The defendants alleged that the plant was not in accordance with the contract, and counterclaimed for £48,000 (see ELECTRICAL ENGINEERING, April 16th, p. 601; May 7th, p. 684; May 21st, p. 798). The Official Referee, in delivering judgment, said that the defendants resisted payment of the greater part of the plaintiffs' claim, because the machinery was not in accordance with the specifications. With regard to the counterclaim, the defendants, he said, were not ready to receive the plant, and that the delay was due to the fact that the appliances provided for dealing with the plant were not strong enough. No claim for damages due to delay could therefore be considered. As the defendants had decided to work one pump at a time instead of two alternatively as the plaintiffs had advised, they could not recover losses due to breakdown unless the breakdown was due to the plaintiffs. The motors were, according to the specification, designed for giving the stated output for six hours continuously, and not indefinitely. The generators, he found, were not according to the specifications. They had an output of 255 kw. instead of 300 kw., and consumed 38 lb. of steam per kw. hr. instead of 28 lb. For this the defendants were entitled to compensation. He could not make the extra cost of fuel a basis for the compensation, but would take as a basis the difference between the value of the machinery as delivered and that specified. He awarded the plaintiffs £2,943 as the balance of the contract price. On defendants' counterclaim he found that they were entitled to £417 on account of the failure of the machines to comply with the specifications, and a further sum of £700 for damages, making a total of £1,117. Deducting this from £2,943, he gave judgment for the plaintiffs for £1,826. As the defendants had succeeded in some of the issues, the costs would be divided.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 18th, 1908

A full list of these was published in our last issue. The following are abstracts of the more important specifications.
Names in brackets indicate communicators of inventions from abroad.

1907 Patents

9,397, S. DE PONT. A hard, non-inflammable, water- and oil-resisting insulating material, consisting of 50 per cent. plaster of Paris, 30 per cent. wood pulp, 15 per cent. copal, 15 per cent. pitch, 13 per cent. lampblack, 8 per cent. clay, and smaller percentages of cowrie or lac, wax, aniline, and mica. The mixture is dried, treated with bisulphide of carbon, or benzoline, and then rolled between steam rollers at a temperature of 120° to 180° F. The product is moulded at a temperature of from 250° to 300° F., and then subjected to a pressure of from 3 to 4 tons per cubic inch of the material. The final product is quite hard, and can be sawn or turned like vulcanite. One claim.

13,285, G. ELLISON. A combined starting rheostat (for the rotor circuit), overload cut-out, and no-voltage release for three-phase induction motors. The solenoid of the overload cut-out is in one phase of the rotor circuit, and the solenoid of the no-voltage release is in one phase of the stator circuit. The overload cut-out operates by opening the circuit of the no-voltage release solenoid, which in turn releases the starting handle, which is pulled round to the off position by a spring. In the case of high voltages the no-voltage release solenoid would be operated from a small transformer. The arrangement is applicable to single-phase motors. Five claims, three figures.

18,245, R. B. RANSFORD (*Compagnie Parisienne des Voitures Electriques, procédés Krieger*). A method of control for petrol-electric vehicles. A compound generator is used, which has only a weak shunt excitation sufficient to keep the machine excited when the engine is running slowly. A series winding is provided, and also a demagnetising series winding, which, during normal running, is short-circuited. When this last winding is in circuit it more than neutralises the ordinary series winding, and the voltage of the generator is so much reduced that the motors receive practically no current. This affords a means of stopping the motors without breaking the main circuit. The motors can be pure series motors, or can also be supplied with a shunt winding across the armature brushes. Five claims, three figures.

1908 Patents

66, G. M. LITTLE. A magnetite arc-lamp electrode for use with alternating current, and consisting of 60 parts magnetic oxide of iron (Fe_3O_4) to form the main conducting material, 27 parts of titanium oxide (TiO_2), 6 parts of ferrous chromite (Cr_2O_3, FeO) for preventing rapid consumption of the electrode, 20 parts of potassium silicate (K_2SiO_3) for obviating the unsteadiness and flickering of the arc, and 5 parts of calcium fluoride (CaF_2) for increasing the luminosity of the arc. For this last purpose, salts of strontium, barium, or magnesium can also be used. Six claims.

665, A. P. STROHMENGER. A material for separating or enclosing the plates of secondary batteries. A cellulose fabric, such as ordinary muslin, is coated with pulp cellulose, and the resulting porous sheet is nitrated to a sufficient degree to be unaffected by the acid electrolyte. The finished material, which is porous and sufficiently strong to resist cracking, tearing, or abrasion in actual use, is either wrapped round the plates or merely interposed between them, effectually preventing short circuits through dislodgment of the active material. One claim.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.
Summaries of the more important of these patents will appear in our next issue.

1907 Patents

10,072, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Electric motor control systems.
10,293, COLLINS, HAYES & WATSON. Trolley heads.
12,353, AUSTIN. Receivers for wireless telegraphy.
12,406, SEDGWICK. Signalling apparatus.
12,407, GRANT (*Haggarty*). Ships' telegraphic apparatus.
12,578, HEYLAND. Self-regulating machines for alternating or direct current.
12,857, TONRY. Ball and socket joints for electric light fittings.
12,969, HELLMANN. Synchronous working of apparatus.
13,032, EASTWOOD. Systems for electric railways.
14,572, HAYWOOD, AND MCKENZIE & HOLLAND, Ltd. Electrically detecting the position of the switch tongues and locking bolts of railway points.
18,013A, KESSLER & JELICH. Contact arrangement and stand for electric lamps.
18,308, ELLISON & JACOBS. Telephonic apparatus.
19,073, FUSSER. Supports for electric lamps.
19,447, MOORE. Automatic time switch mechanism.
19,734, GROSS. Arc lamps.
20,119, MARCONI & MARCONI'S WIRELESS TELEGRAPH CO. Transmitters.
24,753, SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*). Means for rectifying alternate currents.
25,206, HARRISON (*Electric Railway Improvement Co.*). Welding.
25,350, ARENAS Y GARCIA. Dynamo-electric machines of the homopolar type.
26,621, CUMONT & COMPAGNIE DE SIGNAUX ELECTRIQUES POUR CHEMINS DE FER. Signal and point mechanism.
27,379, AMALGAMATED RADIO-TELEGRAPH CO. (*Scibt*). Radio-telephony.
28,516, JOHNSON (*Felten & Guilleaume Lahmeyerwerke Akt.-Ges.*). Electrical driving gear for motor vehicles.

1908 Patents

2,488, WOLHAUPTER. Insulated joints for rails.
3,701, POLYPHOS ELEKTRIZITÄTS-GES. Method of transmitting photographs.
4,444, DOWSING. Electrical radiators.
4,621, FRIEDHEIM. Manufacture of heat interchangers by an electrolytic process.
5,225, ALLGEMEINE ELEKTRICITÄTS-GES. Electrodes for arc lamps.
5,610, ALLGEMEINE ELEKTRICITÄTS-GES. Incandescent lamps.
6,050, SIEMENS & HALSKE AKT.-GES. Process for hardening tantalum.
7,910, SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*). Pyrometers and thermometers.

Complete Specifications open to Public Inspection before Acceptance.

1907 Patents

15,798, KUZEL. Metal filament lamp.
27,608, GEISSINGER. Electric thermostat.

1908 Patents

11,415, NORSK HYDRO-ELEKTRISK KVOELSTOFAKTIESELSKAB. Production of pure sodium nitrite.
11,633, ALLGEMEINE ELEKTRICITÄTS-GES. Alternating-current commutator machines.
11,870, HARTMANN-KEMPF. Apparatus for indicating the frequency of electrical oscillations.

Applications for Amendment

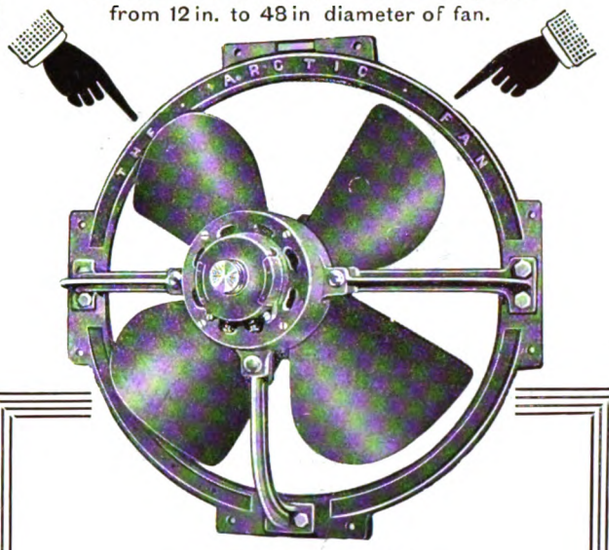
Further particulars and instructions as to procedure in opposition to amendment will be found in the Official Journal of the Patent Office of June 17th, 1908.

23,899 of 1904. THE WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, LTD., seek leave to amend this specification, granted to ALEX. JUST and FRANZ HANAMAN, for "Improvements relating to the manufacture of incandescent lamps," on the ground of doubtful validity of some of the claims. The amendments consist in striking out all reference to molybdenum and limiting the invention to tungsten.

11,949 and 20,175A of 1905; also 3,225, 3,684, and 4,681 of 1906. THE WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, LTD., seek leave to amend these specifications, granted to Alex. Just F. Hanaman, and others, for the same reason as stated above with reference to No. 23,899 of 1904.

Expiring Patents

The following patents expire during the current week, after a life of fourteen years :—



12,407 of June 26, 1894. H. A. TAYLOR. An improved form of Wheatstone automatic transmitter for submarine telegraphy. The battery contact is prolonged relatively to the earth contact and the durations of these contacts are adjustable.

12,552 of June 28th, 1894. G. H. NISBETT. Sealing and junction boxes for lead-covered cables, for preventing access of moisture to the open ends of the cables. The cables enter the inner chamber of the box through solder glands. The inner chamber is filled with ozokerite or similar material, and the outer chamber contains terminals and fuses.

PATENTS AND DESIGNS ACT, 1907.

Notice is hereby given, that the WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, Limited, of 31 Copthall Avenue, London, E.C., seek LEAVE to AMEND the SPECIFICATION of LETTERS PATENT No. 23899 of 1904, granted to Alexander Just and Franz Hanaman, for Improvements relating to the Manufacture of incandescent electric lamps.

Particulars of the proposed amendment were set forth in the Illustrated Official Journal (Patents), issued on June 17th, 1908.

Any person, or persons, may give Notice of Opposition to the Amendment (on Patents Form No. 18), at the Patent Office, 25 Southampton Buildings, London, W.C., within one calendar month from the date of the said Journal.

C. N. DALTON, Comptroller-General.

PATENTS AND DESIGNS ACT, 1907.

Notice is hereby given, that the WOLFRAM (TUNGSTEN) METAL FILAMENT LAMPS, Limited, of 31 Copthall Avenue, London, E.C., seek LEAVE to AMEND the SPECIFICATION of LETTERS PATENT No. 11949 of 1905 granted to Alexander Just, Franz Hanaman, and Vereinigte Electricitats Actien-Gesellschaft, for Improvements in and relating to the manufacture of incandescing Filaments for electric incandescent lamps.

Particulars of the proposed amendment were set forth in the Illustrated Official Journal (Patents), issued on June 17th, 1908.

Any person, or persons, may give Notice of Opposition to the Amendment (on Patents Form No. 18), at the Patent Office, 25 Southampton Buildings, London, W.C., within one calendar month from the date of the said Journal.

C. N. DALTON, Comptroller-General.

B.T.H.
MAGNETIC TRACK BRAKE

The use of this brake makes it impossible for a car to get out of hand at any time, and eliminates the danger of skidding wheels.

It combines the advantages of a powerful and reliable slipper brake, applied by hand, and a convenient and efficient magnetic brake, applied through the controller.

If desired, both methods of application can be used at the same time in order to secure greater braking effect.

Tests made in actual service, both on wet and greasy rails, have demonstrated its thorough reliability.

Metal Filament Lamps.

THE "METALIK"

THE BEST 220-VOLT LAMP

Please write for particulars of the SPECIAL DISCOUNTS we have arranged for CORPORATIONS and the TRADE.

The originals of the following letters are in the hands of the Editor of "ELECTRICAL ENGINEERING."

Messrs. G. M. BODDY & Co.,
Liverpool. *June 6th*, 1908.

Dear Sirs,

In reply to your letter of the 4th inst., we beg to inform you that we tested three "METALIK" lamps 220 volt, 50 c.p. in a sloping position burning with alternating current. These lamps were burning continually without switching in and out more than about once every 100 hours. The life of the first lamp was 970 hours, of the second 1856 hours, while the third lamp is already burning 2,775 hours, and is *still in good condition*. The light of the lamps is not materially less than as they were new. The blackening of these lamps is practically so slight that we may say there is no blackening.

We also tested five lamps in our laboratory on direct current. These lamps showed the same behaviour as the above mentioned three lamps; they have not yet burned more than about 300 hours. The candle power was, new, 40 Heffner [35 British C.P.], and is steadily increasing, so that it is now 49 Heffner [43 British C.P.] after 250 hours; the consumption is constant 58 watt. These lamps are switched in and out about every 10 hours.

Electricity Offices
Messrs. G. M. BODDY & Co., *March 9th*, 1908.
Liverpool.

Dear Sirs,

Some time ago we had two sample 50 c.p. "METALIK" Lamps from you for testing purposes. These lamps had an average life of 1407 hours, and would have run longer had not the filaments become shorted by twisting.

It is our opinion that the supporting arrangements of all lamps of this class should have more consideration, as in all the lamps tested by us failure has generally been the result of partial shorting of the filament in the first case.

We shall be glad to have your best price for the supply and delivery carriage paid at our.....Stores of "METALIK" lamps in the 32 c.p. size suitable for series burning on a 230 volt direct current circuit.

Yours faithfully,
City Electrical Engineer.

Corporation Electricity Works,
Messrs. G. M. BODDY & Co., ..., *May 28th*, 1908.
Liverpool.

Dear Sirs,

In reply to yours of the 27th inst., so far your "METALIK" lamps have been burning very satisfactorily and shall be obliged if you will quote me your best price for 100 lamps, as we shall probably be wanting some more before long.

Yours faithfully,
City Electrical Engineer.
